Corporate Social Responsibility (CSR) is an integral part of OGDCL's business model as the Company believes in responsible business conduct while treating society as a stake holder beside, obligatory commitments with the Federal, Provincial and local Government, Company also earmarks a portion of its profit for public welfare programs. A low-pressure area developed over the Bay of Bengal that moved very rapidly towards westward and can be seen in the charts given below over Central India on both 850 hpa and 500 hpa geopotential heights on 15<sup>th</sup> of August. The low turned into well-marked low and remained persistent for the next two days with its extension over Southeast Sindh. Meanwhile, another Low-Pressure system was developed over the Bay of Bengal and moved very rapidly towards westward and merged with the seasonal low on 20-27<sup>th</sup> of August, 2022.

OGDCL has always been the first to come to the rescue of affected communities in times of national emergencies such as famine, drought, earthquakes, floods, accidents etc. The Company provides immediate financial or material support to people in financial crisis. The types of assistance offered are:

- Tents
- Rashon Bags
- Hygiene kits
- Mosquito nets
- Medical Camps/ Assistance

In recent Mega Flood in Sindh affected 2 million People in Sindh. CSR of OGDCL provided Rashon bags, Medical camp and cook foods, tents, Hygiene Kits, and Mosquito nets to the various flood affected area in Sindh, Baluchistan, Punjab and KPK.

Pakistan began receiving abnormally heavy rain in mid-June, and, by late August, drenching downpours were declared a national emergency. The southern part of the Indus River, which traverses the length of the country, became a vast Manchar lake District Dadu. Villages have become islands, surrounded by putrid water that stretches to the horizon. More than 1,500 people have died. Rain/Floodwaters could take months to recede.

The deluges were made worse by global warming caused by greenhouse-gas emissions, scientists said Thursday, drawing upon a fast-growing field of research that gauges the influence of climate change on specific extreme weather events soon after they occur and while societies are still dealing with their shattering consequences.

During recent flood Sindh recorded highest rain fall range 1200 mm to 15,00 m.m due to Poor governance and mismanagement, thousands of people were dying and also 20,000 livestock animals drown during the flood.

A Public health expert, who was part of response teams led by an international non-profit organisation after the 2022 flood hit millions of people in Sindh Province badly affected Dadu District. “With most of the flood affected areas having limited access to safe drinking water, the biggest threat is from waterborne diseases such as diarrhoea, typhoid, and cholera. Also, mosquito breeding that has increased because of stagnant water may also lead to high numbers of malaria and dengue cases, which Pakistan has already been grappling with three district which were badly affected i.e Dadu, Kamber Shahdadkot and Khairpur Mirs.

**ABSTRACT**

Refrigeration plays a significant role in the wellbeing of occupants in rural and urban areas while it also contribute positively to daily activities in domestic, commercial and industrial sectors. However, the conventional refrigerants used has a negative impact on the ecosystem while the power intake of refrigeration systems using these refrigerants is equally high, necessitating the need for reduction in energy intake and the menace caused by the working fluid. The performance of eleven (11) different sample compositions of hybrid-nanofluids zeotropic blend ( $\text{TiO}_2/\text{Al}_2\text{O}_3/\text{CuO}$  by weight) based on exergy tools was investigated in this study. The primary objective was to understudy the various sample compositions using second law approach, identify the areas and locations where irreversibility occurs in each sample, and to determine the best optimum performance in order to identify the one with superior enactment within the selected ratios. Different tests on global parameters and thermophysical properties were experimentally examined, and almost all the samples were observed to enhance healthy upshots, indicating superior heat transmission efficiency. Similarly, the viscosity survey revealed that the novel refrigerants rendered suitable outcome than the orthodox base oil, signifying better propelling capacity of compressors with optimum operating parameters. Therefore, with proper selection in composition, hybrid-nanofluids zeotropic mixtures are environmentally friendly with good characteristics healthier than CFCs and HCFCs, and can offer healthier compressor/refrigerator working fluid substitute for future applications.

**Key Words:** Exergy efficiency, Exergy destruction, Power consumption, Heat transfer, Hybrid-nanofluids zeotropic, Eco-friendly refrigerant.

## 1. INTRODUCTION

One of the greatest achievement by scientists in the 20<sup>th</sup> century was the conception of refrigeration system which has over the years contributed vastly to global comfort, commercial and domestic mainstays for viable development. However, it is imperative to reduce the negative discharge of refrigerants on the atmosphere and energy ingestion of fridges and air conditioners. Perkins 1830s introduced the first generation of refrigerants, with the discovery of vapor-compression device. Afterwards, any fluid that could enable refrigeration system function effectively was used as refrigerants, most of which are toxic, while others were highly volatile (Babarinde *et al.*, 2014). Chlorofluorocarbons (CFC) 11 and Hydrochlorofluorocarbons (HCFC) 22 from discoveries in 1930s were the refrigerants of choice used in the cooling industry. Anxieties aroused between 1970s and 1980s, about the weakening of ozone stratum or whether CFCs could be liable to the abrupt escalation of universal warming danger for wellbeing of the planet. The threat pose on the environment paved way for Montreal protocol in 1987 at the Vienna Resolution to enforce the rejection of ozone draining substances (ODSs) and subsequent prohibition of any HCFC consumption on refrigerators. This intensified scientific researches on improving refrigeration energy efficiency, greenish performance and other methods towards developing a novel technique of heat transmission fluids in refrigeration systems. By so doing, nano-zeotropic and nanolubricants which show a proven boost on the service effectiveness of cooling systems were embraced. The idea was to observe where irreversibility occurs based on second law of thermodynamic, so as to identify the areas where losses occur in the system and to determine the way to go about improving the system. Nano-zeotropic mixtures show brilliant physiognomies and material properties, which stand to advance effective working process of refrigerators. Vapour compression systems discharges quite a number of heat to the surroundings which take place through a finite temperature difference. In view of this, exergy analysis as well as exergy equilibrium offer adequate understanding on how and where the enhancement in the system (Yumrutas *et al.*, 2002). Meanwhile, several scholars have investigated the various methods of improving the performance of refrigeration system (Rasti and Hatamipour, 2013; Joybari *et al.*, 2013), but merely concentrated on the reform of the system design modules.

A number of investigational report have been established in literature concerning HC and HFC as well as their combination substitutes to R134a. Amongst these studies is the combination of three hydrocarbons (30% propane, 55% n-butane, 15% iso-butane) which showed a brilliant

output as compare to R134a. Similarly, Fatouh and Kafafy (2006) carried out an experimental study on the performance of household refrigerator operating with LPG and various controls to substitute R134a. The results revealed that energy intake, cooling time and compression ratio with the LPG were lesser than those of R134a with almost 4.3%, 7.6%, and 5.5% respectively. Furthermore, LPG performance coefficient was 7.6% greater than that of R134a. From the outcome, LPG is a striking standby for R134a in home fridges. Taiwo *et al.* (2015) conducted an experiment on the performance of VCRS via LPG as auxiliary to R134a. Results indicated a COP of 9.5 % with a reduction energy consumption of 12% paralleled to R134a. Thermal conductivity reduction affected the energy storage, melting and solidification degrees, hence, causing a lengthy system reaction time. Nevertheless, this drawback can be improved by fins with nanoparticles concentration on advancement solid-liquid boundaries (Mahdi and Nsofor, 2017). Pryazhnikov *et al.*, (2017) conducted a study, and established that thermal conductivity of nanofluids is not only influenced by unit application but also by mass, product size and the particular fluid itself. Dossat and Horan (2001) used  $Al_2O_3$  nano-refrigerants to explore the numerical augmentation of heat transfer in refrigeration system. An improved heat removal physiognomies with better thermo-physical possessions was obtained by refrigerant as a result of more particles observed, resulting with improved performance of refrigeration system. According to the results of the experimental research, the refrigeration system containing nano-refrigerant operated normally. They found that with a blend of inorganic oil/  $Al_2O_3$ , the freezing capacity increased by 11.5 % while the power consumption decreased by 11.5%.

For performance evaluation of a VCRS employing several alternative refrigerants, Dalkilic and Wongwises (2010) used a variety of alternative refrigerants. In this paper, results of a theoretical performance examine using mixtures such as R134a/R152a, R32/HC290 as well as HC1270/HC600a were presented, and the outcomes of the study compared with R12, R22, and R134a revealed that the said mixtures are potential alternatives.

Abhishek and Gupta (2011) carried out an experimental survey to compare the performance of zeotropic mixtures between two environmentally pleasant fluids (R134a and R404a) to substitute R134a in a small refrigerator. The findings revealed that utilizing the refrigerant R-404a, produced a better efficiency with the specified parameters than with R-134a. When R134a was employed, the system consumed less energy. R404a performed consistently better than R134a in the residential refrigerator under all operating conditions, demonstrating that it may be utilized as a replacement for R134a in this application. The use of  $Al_2O_3$  as an additive in

R22, R600, R600a, and R134a refrigerants in polyol ester lubricant oil (POE oil) in a VCRS using  $\text{Al}_2\text{O}_3$  as an additive in R22, R600, R600a, and R134a refrigerants was considered. A significant enhancement in refrigeration ability was achieved while experiencing a significant reduction of 11.5 percent energy intake (Kumar and Singh, 2017)

In a related study conducted by Ajayi *et al.* (2017) on substance flowing capacity of Cu Nanoparticles additive of R600a and R134a refrigerant using duct adiabatic tube in a VCRS, and found that isothermal region for Cu/R6000a and Cu/R134a Nano refrigerant was greater when compared to pure R600a and R134a refrigerants. When compared to the results obtained with that of R600a/Cu and R134a/Cu, it indicated a slow heat removal with low rising temperature. Apart from that, the systems' coefficient of performance had been raised as well. The present study aims at carrying out a performance assessment of hybridize-nanofluids zeotropic mixtures as working fluids (refrigerant) replacement in VCRS using second law of thermodynamic model. The objectives are to: forecast the heat transmission performance of hybridized nanofluids of  $\text{Al}_2\text{O}_3$ ,  $\text{TiO}_2$ /CuO with zeotropic fluid; determine different zeotropic mixtures fraction volume concentration (contents and sizes) for HFC nanofluid refrigerant; determine the effect of different nanofluid-zeotropic composition based upon system operational efficiency; and to evaluate the best operating zeotropic mixtures for optimum performance of the VCRS. The rationale behind this experimental survey is that noticeable thermo physical variations occur by increase particles concentration, causing rise in thermal conductivity. On the other hand, zeotropic mixtures viscidness stood reduces, enabling unrestricted fluid flow movements, as well as improvement in performance of VCRS when compared to conventional refrigerants. This work is limited to evaluating the effect of varied nanofluid-zeotropic composition to determine the best optimum performance. The scope also includes measurement of some global parameters along the inlet and exit axis. Areas that are not covered in this study includes leak analysis and characterization.

## **2. MATERIALS AND METHODS**

In this study, a VCRS test rig was developed. Two inlet and outlet pressure gauges were attached to record the suction and discharge pressure during testing. Thermometer fixed at the evaporator cabinet to measure the temperature variations at the specified interval at both the inlet and outlets. Provision was made at the inlet of the compressor and expansion device as service ports for injecting and flushing out the used mixtures. Vapor removal was inputted in

the system through the fitted amenity harbors. It was allow for about 80% charge and readings were taken at the standard atmospheric conditions. The experiment was repeated in duplicate for everyone sample for the various mixtures. POE (Poly Ester) compressor oil was used with nanofluid-zeotropic mixtures of (23% Difluoromethane; 25% Pentafluroethane and 52% Tetrafluroethane). The results of the different combination of the hybridize-nanofluids zeotropic mixtures based-nanofluids were compared with those in the open literature. Figure 1 shows the pictorial view of the VCR test rig.

**Figure 1:** Vapour compression refrigeration test rig

## **2.1. Nanofluids**

Related to usual solid-liquid deferments, nanofluids have greater heat removal amongst particles and fluids owing to high external area; enhanced dispersal stability with principal Brownian signal; lower particle congestion and propelling power related to base fluid. It can be mix with refrigeration compressor oil or with refrigerant. In cooling structures, they improve tribological physiognomies, compressor efficiency.

## **2.2. Nanofluids Preparation**

Nanoparticles of  $\text{Al}_2\text{O}_3$ ,  $\text{TiO}_2$  and  $\text{CuO}$  were introduced to refrigerant by dispersing it in the host lubricant POE (Poly Ester) in the compressor of the VCRS. Various samples with different concentration were measured by digital weight balance. Each mass fraction of the particles is mixed with base lubricant and the amount of each sample of nanolubricant prepared varied based on individual composition. Resultant nanofluid was homogenized for 15 minutes followed by stirring for up to an hour using drilling machine.

### 2.3 Model Formulation

The following assumptions were made: steady-state flow operation is assumed in all the system individual parts; the working fluid has varied percentage composition throughout the cycle; pressure losses along each component are neglected with 75% isentropic proficiency. Model equations for various processes of VCRS on the basis of energy and exergy analysis are given as follows:

#### 2.3.1. Energy Analysis of VCRS

By applying the energy balance mathematical model expression given by (Bolaji *et al.* 2011) as:

a) Work consumed by the compressor ( $\dot{W}_C$ ) is given according to Equation 1;

$$\dot{W}_C = \dot{m}(h_1 - h_2) \quad (1)$$

b) Mass flow rate ( $\dot{m}$ ) = QE =  $\dot{m} \times RE$  (2)

c) Heat rejected in the condenser ( $Q_c$ ) is thus:

$$Q_c = \dot{m}(h_2 - h_3) \quad (3)$$

d) For capillary tube (expansion valve)

$$h_3 = h_4 \quad (4)$$

e) Heat absorbed in the evaporator ( $Q_e$ )

$$Q_e = \dot{m}(h_1 - h_4) \quad (5)$$

f) Coefficient of performance (COP)

$$COP = \frac{Q_e}{\dot{W}_C} \quad (7)$$

#### 2.3.2. Exergy Analysis of VCRS

(a) Particular exergy at every given point is by Equation 8;

$$(h - h_0) - T_0(s - s_0) \quad (8)$$

(b) Compressor exergy destruction

$$I_{comp} = ED_{xd\ 1-2} = \dot{m}T_0(\psi_{out} - \psi_{in}) + W_{el} = \dot{m}T_0(S_1 - S_2) + \dot{W}_C \quad (9)$$

(c) Condenser

$$I_{dest,cond} = ED_{xd\ 2-3} = T_0S_{gen} = \dot{m}T_0 \left( S_3 - S_2 + \frac{q_c}{T_c} \right) \quad (10)$$

(d) Expansion valve

$$I_{dest,exp} = ED_{xd\ 3-4} = T_0S_{gen} = \dot{m}T_0(S_4 - S_3) \quad (11)$$

(e) Evaporator

$$I_{dest, evap} = ED_{xd\ 4-1} = \dot{m}T_0 \left( S_1 - S_4 - \frac{q_{Evap}}{T_{Evap}} \right) \quad (12)$$

(f) Overall exergy destruction in all the locations is given by

$$\dot{X}_{Total} = (ED_{xd\ total}) = ED_{xd\ 1-2} + ED_{xd\ 2-3} + ED_{xd\ 3-4} + ED_{xd\ 4-1} \quad (13)$$

(g) Product exergy rate =  $Q_e^*(1-T_0/T_r)$  (14)

(h) Exergy efficiency =  $(Q_e^*(1-T_0/T_r))/\dot{W}_C$  (15)

### 2.3.3. Performance Evaluation of the Thermo-Physical Properties

This is given from bulk concentration by Bhattad *et al.* (2018):

(a) Particle bulk concentration

$$\omega_{no} = \frac{m_o}{(m_o + m_R)} \quad (16)$$

(b) Particle Bulk (volume) concentration

$$\psi_n = \frac{\omega_{no}\rho_o}{[\omega_{no}\rho_o + (1-\omega_{no})\rho_n]} \quad (17)$$

(c) Density of Hybrid-Nanofluids-Zeotropic Mixtures

$$P_{nf} = (1 - \phi_s)\rho_f + \phi_s\rho_p \quad (18)$$

(d) Isobaric Specific Heat of Hybrid-Nanofluids-Zeotropic Mixtures

$$C_{nf} = \frac{(1-\phi_s)P_f C_f + \phi_s P_p C_p}{P_{nf}} \quad (19)$$

(e) Thermal Conductivity of Hybrid-Nanofluids-Zeotropic Mixtures

$$K_{nf} = kbf \left\{ \frac{[(1+2\phi)(1 - ((kbf/K_{TiO_2})))/(2(kbf/K_{TiO_2})+1)]}{(1-\phi)(1 - (kbf/K_{TiO_2}))/((kbf/K_{TiO_2})+1)} \right\} \quad (20)$$

(f) Dynamic Viscosity of Hybrid-Nanofluids-Zeotropic Mixture

$$\mu_{nf} = \mu_{bf}(1 + 2.5\phi) \quad (21)$$

(g) Surface tension of nanorefrigerants,

$$\sigma_{r,n,o} = \sigma_r + (\sigma_{n,o} - \sigma_r)X_{n,o}^{0.5} \quad (22)$$

## 3. RESULTS AND DISCUSSIONS

The outcomes obtained for both measured and calculated values in the experimental assessment of the VCRS were made according to ISO 8187. Variations in the Coefficient of Performance (COP) is shown in Figure 2.

**Figure 2:** Plot of COP versus evaporator temperature and volume fraction.

The COP variation of systems working with hybridize-nanofluids zeotropic blends (in the ratio of 011; 100; 112; 211 by weight) has the evaporating temperature increases the condensing temperature decreases from 11 to 16 °C and -11 to -5 °C, as shown in Figure 2. It is revealed from the Figure that COP of the system using hybrid combination of (011) zero gram-TiO<sub>2</sub>, 7.5g-Al<sub>2</sub>O<sub>3</sub>/CuO blend is the highest, followed by (211, 112 and 100) among all examined ratios, and was 3.1%, 0.83%, 0.71% and 0.69 % higher than others because of its smaller compressor work requirement and higher refrigeration capacity as compared to the results obtained by (Babarinde *et al.* 2014; Bhattad *et al.* 2018; Ajayi *et al.* 2017) with 5.5% and 6.2% rise in COP using R134a and R134a/LPG (28:72) systems. The variations of mass flow rate against evaporating temperatures regarding hybridize-nanofluids zeotropic blend examined refrigerants as depicted in Figure 3.

**Figure 3:** Plot of mass flow rate vs evaporator temperature

As shown in Figure 3, it was perceived that mass flow rate of (100) 15g- CuO, zero gram of Al<sub>2</sub>O<sub>3</sub>/TiO<sub>2</sub>, refrigerant charge of 0.236 kg and 0.226 kg is higher than when the system used 121 % fraction and 112 blend refrigerants mass charge because of its lower liquid density. Hence, lower compressor work requirement at 0.21 kg is expected because the variation in mass flow rate in terms of evaporating temperature was observed to drop in this particular work, because, the variation regarding evaporating temperature of the assessed refrigerants is actually neglected. Moreover, theoretical results also revealed that fluid bulk stream rate increased by increase in the evaporator temperature. Variations in the Compressor power consumption using the refrigerant is shown in Figure 4

**Figure 4:** Plot of compressor power consumption versus evaporator temperature

Compressor power requirement of a VCRS using hybridize-nanofluids zeotropic blend refrigerants are presented in Figure 4. The situation revealed that the compressor power requirement working with mixtures of (001, 100, 010) TiO<sub>2</sub>, Al<sub>2</sub>O<sub>3</sub> and CuO with a less volume fraction and evaporation temperature has firmness for lowering power consumptions in a refrigeration system from 2.199 kW to 0.696 kW for array of evaporator temperatures amid -11°C and -9°C. In addition to this, the Figure depicts that compressor power intake in VCRS rises with an upturn in evaporator temperature due to the rise in bulk flow ratio of refrigerants.

#### 4. CONCLUSION

Experimental investigation of ecological alternative refrigerant in VCRS using hybrid-nanofluids zeotropic blends of varying different nanoparticles of (TiO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub>/CuO by weight) for replacing conventional refrigerant was carried out to determine the best optimum

performance blends amongst the selected ratios using compressor work efficiency, COP, and power consumption rate as the leading enactment parameters. The study was executed by varying eleven different combination ratios, and results obtained were in use as the reference point for contrast with theoretical work. The optimum performance composition of the different blend was selected based on the experimental performance results, such that system yield highest coefficient of performance over three different fraction ratios between (011,112 and 111) operating settings. Result shows that the COP was found to be highest at (011) zero grams-TiO<sub>2</sub>, 7.5g-Al<sub>2</sub>O<sub>3</sub>/CuO blend by about 3.10% and the compressor power output, volumetric cooling capacity and TEGWI were found to increase by 13.51%, 5.78% and 1.06 kg/sec CO<sub>2</sub> respectively. Survey shows that the suspended mixtures rises the heat removal factor even with a small particle portion of 0.003% with the optimum improvement of 0.0075 vol.% application. The outcomes confirmed that hybrid-nanofluids zeotropic blend is an energy efficient and environmental friendly substitute for conventional refrigerant in VCRS.

**XÜLASƏ**

Müstəqilliyinin ilk illərindən başlayaraq Azərbaycan Respublikası, başda ABŞ və Avropa İttifaqı olmaqla, qərb dövlətlərinin marağına cavab verən ölkə olaraq diqqət mərkəzinə yerləşmişdir. Təkcə enerji təhlükəsizliyi baxımından deyil, şərq-qərb, şimal-cənub nəqliyyat dəhlizlərinin kəsişmə nöqtəsində yerləşməsi səbəbilə də, Azərbaycanın XXI əsrin güclü dövlətlərindən birinə çevriləcəyi yönündə bir sıra tutarlı proqnozlar irəli sürülmüşdür. 1994-cü ilin sentyabrında imzalanan “Əsrin müqaviləsi” ilə bu proqnozların doğruluq payını artıracağıının ilk ciddi işarətini verən Azərbaycan, Bakı-Tbilisi-Cehyan Neft Kəmərinin reallaşması ilə dünya enerji təhlükəsizliyinə ixracatçı dövlət kimi uzun illər töhfə vermə yoluna faktiki olaraq daxil olmuşdur. Sonrakı illərdə Bakı-Tbilisi-Ərzurum Gaz Kəmərinin çəkilməsi, bu kəmərin Avropaya uzanan yeni kəmərlərin əsasını təşkil etməsi, qitənin enerji təhlükəsizliyi baxımından etibarlı tərəfdaş olacağını göstərmişdir. Son illərdə ABŞ və Avropa Birliyinin ən həssas məsələ kimi yanaşdıqları məsələlərin başında enerjide Rusiyadan asılılığın aradan qaldırılması məsələsi gəlir. Xüsusilə 2022-ci ilin əvvəllərində Rusiyanın Ukraynaya hücum etməsi ilə başlayan dövrdə, Qərbin Rusiyanı müharibədən çəkindirərkən, özünün enerjide bu dövlətdən ciddi şəkildə asılı olması, onun tətbiq edə biləcəyi sanksiyaların miqyas və gücünü azaltmışdır. Gələcəkdə Avropanın rus qazından tamamilə imtina etməsi və alternativ enerji mənbələrinə yönəlməsi üçün ən az 600 milyard Avroya ehtiyacı olacaq. Bu gün də Avropa dövlətləri Rus qazından imtina etməyin çətinliyini dərk edərkən, alternativ mənbələrə yönəlməkdə, bu zaman Azərbaycan həm istehsalçı, həm transit, ən əsası isə etibarlı tərəfdaş kimi ilk sıralarda yer almaqdadır.

**AZERBAIJAN IS A RELIABLE PARTNER THAT MEETS EUROPE`S ENERGY INTERESTS****ABSTRACT**

Since the first years of its independence, the Republic of Azerbaijan has been in the center of attention as a country that meets the interests of Western countries, especially the United States and the European Union. Not only from the point of view of energy security, but also due to the location at the intersection of the east-west, north-south transport corridors, a number of coherent forecasts were put forward for the transformation of Azerbaijan into one of the powerful states of the XXI century. With the “contract of the century” signed in September 1994, Azerbaijan, which gave the first serious indication that it would increase the share of these forecasts, actually entered the path of contributing to World Energy Security as an exporting country for many years with the implementation of the Baku-Tbilisi-Jeyhan oil pipeline. The construction of the Baku-Tbilisi-Erzurum gas pipeline in subsequent years, the foundation of new pipelines extending to Europe, showed that the continent will be a reliable partner in terms of energy security. At the forefront of the issues that the United States and the European Union have treated as the most sensitive in recent years is the issue of eliminating dependence on Russia in energy. Especially in the period that began with the Russian invasion of Ukraine in early 2022, when the West was deterring Russia from the war, its serious dependence on this state in energy reduced the scale and strength of the sanctions it could impose. In the future, Europe will need at least 600 billion euros to completely abandon Russian gas and focus on alternative energy sources. Even today, while European states are aware of the difficulties of abandoning Russian gas, focusing on alternative sources, Azerbaijan is in the first place as a producer, transit and, most importantly, a reliable partner.

**Key words:** European Union, Azerbaijan, energy security, energy policy, energy cooperation

## GİRİŞ

**Avropanın enerji təhlükəsizliyi problemi.** Avropanın enerji təhlükəsizliyinə problem yaradan Avropa daxili məsələlərdən biri Avropa dövlətlərində milli bazarların enerjinin generasiyası və paylanması sahəsindəki inhisarçı strukturu idi. Bu isə enerji sisteminə üçüncü tərəfin müdaxiləsini qeyri mümkün edir, eyni zamanda da vahid enerji strategiyası aparmağa mane olurdu.

Bu maneənin aşılması üçün ilk addım ilk dəfə 1996-cı ildə Avropa Birliyi elektrik enerjisi bazarında rəqabətin güclənməsi, enerji satışı ilə məşğul olan subyektlərlə azad münasibətlərin qurulması məqsədilə ilk direktivlər qəbul etdi. 2003-cü il direktivləri bu sahədə inteqrasiyanı yenidən gücləndirdi. Eyni zamanda elektrik enerjisi bazarında dövlətlərə qarşılıqlı əlaqədə hərəkət etməyə imkan verdi. Qazın idxalı, paylanması, enerji bazarlarında reallaşdırılması sahəsində də analoji direktivlər 1998, 2003-cü illərdə qəbul edildi [4]. Bazar qərarlarının üçüncü paketi 2009-cu ildə qəbul edildi. Burada vertikal şəkildə inteqrasiya olunmuş enerji şirkətlərinin bölünməsi nəzərdə tutulurdu. 2009-cu ildə qəbul edilmiş Lissabon protokoluna da Avropa Birliyinin enerji təhlükəsizliyi sahəsində strategiyası əlavə edilmişdi. Burada Avropa Birliyinin enerji strategiyasının əsas istiqamətləri öz əksini tapmışdı. Bunlara daxil idi [13]:

1. Enerji bazarının fəaliyyətinin təmin edilməsi;
2. İttifaqda enerji təchizatının təhlükəsizliyini təmin edilməsi;
3. Enerji effektivliyinə və enerjinin effektiv saxlanmasına nail olmaq;
4. Enerji şəbəkələrinin qarşılıqlı əlaqələndirilməsinin təmin edilməsi;
5. Yeni və bərpa edilən enerji resurslarının inkişaf etdirilməsi.

Lakin qəbul edilən bu qərarlara baxmayaraq Avropa Birliyi nəinki öz enerji asılılığını zəiflədə bilmədi, eyni zamanda Avropada sənayenin inkişafı, eyni zamanda infrastruktur və informasiya texnologiyalarının inkişafı Avropa ölkələrinin enerji idxalına ehtiyacını daha da artırdı. Lakin ehtiyacın artması ilə bərabər 2000-ci ildən etibarən Avropanın siyasətində baş verən dəyişikliklər də enerji təhlükəsizliyi məsələsini həddindən çox aktuallaşdırdı. Göstərilən dəyişikliklərin başlıca səbəbi isə NATO-nun və Avropa Birliyinin 2004-cü ildən etibarən şərqlə doğru genişlənməsi oldu. Bu genişlənmə istər istəməz Rusiya ilə toqquşmalara gətirib, çıxarmalı idi. Eyni zamanda Avropa Birliyinə daxil olan ölkələr də əvvəldən bəri Rusiya qazından istifadə edirdilər. Bu da Avropa Birliyi qarşısında enerji təhlükəsizliyi sahəsində mühüm vəzifələrin qoyulmasına gətirib çıxardı. 2005-ci ildə AB ölkələri üç əsas prinsipə

dayanan enerji siyasətini müəyyən etdilər. Bunlar: rəqabətlik, dayanıqlılıq, enerji daşınmasının təhlükəsizliyi [4].

AB-nin şərqə doğru genişlənməsi Avropaya əsas enerji ixracatçısı olan Rusiya ilə Ukrayna, eyni zamanda Rusiya ilə AB ilə enerji ixracatı və başqa iqtisadi-siyasi məsələlərdə müxtəlif mübahisələrin meydana çıxmasına səbəb oldu. 2006-cı ildə Avropada baş verən enerji böhranı AB-ni yenidən enerji təhlükəsizliyi məsələlərinə qayıtmağa məcbur etdi. 2009-cu ildə yaşanan enerji böhranı isə Avropanı bu məsələdə təxirəsalınmaz strategiya müəyyən etməyə sövq etdi. 2009-cu il enerji böhranının başqa səbəbləri də var idi. Əslində bu Ukrayna ilə Rusiya arasında XX əsrin 90-cı illərindən başlayan geosiyasi qarşıdurmanın, enerji sektoruna yansımaları idi. Məhz bu səbəbdən də Rusiya Ukraynanın enerji tranzitindəki roluna zərbə vuran yeni bir enerji layihəsini - Yamal-Avropa qaz kəməri layihəsini gerçəkləşdirməyə başladı. Kəmərin 1994-2006-cı illərdə tikilmiş, uzunluğu 2000 km, diametri isə 1420 mm idi. Kəmərin gücü ildə 32.9 kub.metr idi [16]. Kəmərin Rusiya-Belorus-Polşa-Almaniya marşrutu üzrə fəaliyyət göstərir. Kəmərin Rusiya-Belorus hissəsi “Qazprom” şirkətinin mülkiyyətindədir. 2004-2005-ci ildə Ukraynada baş verən “narıncı inqilab” Rusiya ilə Ukrayna arasında geosiyasi qarşıdurmanı daha da alovlandırdı. Ona görə də Ukrayna Rusiya tərəfindən “enerji tranziti üçün etibarlı olmayan” ölkə elan edildi və Rusiya Ukrayna ərazisindən yan keçən qaz kəmərlərinin inşasına start verdi. 2011-ci ildə Rusiya Ukraynadan yan keçən yeni bir qaz kəməri layihəsini - “Şimal axını” layihəsini həyata keçirdi. Kəmərin Rusiya və Almaniyanı Baltik dənizi vasitəsilə birləşdirirdi. 2014-cü ildə Ukrayna ilə yeni münaqişənin baş verməsi, Avropanın daxilində Rusiyadan qaz ixracı sahəsində yeni problemlərin meydana gəlməsinə səbəb oldu. Belə ki, 2015-ci ildə Rusiya “Şimal axını-2” qaz kəməri marşrutunu tikməyə başladı ki, müasir dövrdə artıq hazırdır. Lakin hazırda Ukraynada baş verən müharibə nəticəsində fəaliyyətini dayandırmışdır [11].

İyul 2009-cu ildə AB-də qəbul edilən üçüncü enerji paketinin də məqsədi məhz AB qaz bazarını Rusiyanın inhisarından qorumaq, daha da əlverişli enerji bazarları tapmaq idi. Lakin bunlara baxmayaraq AB hələ də Rusiyanın enerji resurslarından asılıdır. Bu resursların AB-nə çatdırılması üçün vacib tranzit vasitəçi isə hələ də Ukraynadır.

**Cədvəl 1: Rusiya qazının Qərbi Avropa ölkələrinə idxalının 2017- 2018-ci illər üzrə hərəkəti**

Ölkələr	Aİ-nin Rusiyadan idxal etdiyi qazın həcmi (milyd. m <sup>3</sup> )		İdxaldakı payı (%-lə)		İstehlakdakı payı (%-lə)	
	2017	2018	2017	2018	2017	2018

Mənbə: [7]

2000-ci ildə Avropa Komissiyası “Avropada enerji təhlükəsizliyinin strategiyası” adlı Yaşıl Kitabı qəbul etdi. Lakin bütün bunlara baxmayaraq Avropa hələ də təbii sərvətlər hesabına əldə edilən enerji daşıyıcılarının idxalından asılıdır. Ekspertlərin yekdil rəyinə görə 2030-cu ilə qədər olan perspektivdə Avropa bazarlarının göstərilən enerji resurslarından asılılığı artmaqda davam edəcəkdir. Proqnozlaşdırıldığına görə bu AB enerji tələbatının 70%-ni əhatə edəcəkdir. Bu baxımdan idxal olunan neftə olan tələbat 2030-cu ilə doğru 76%-dən 90%-ə, qaza olan tələbat 40%-dən 70%-ə, kömürə olan tələbat isə 50%-dən 70%-ə yüksələcəkdir [5, 10-11]. Buna doğru demək lazımdır ki, 2019-cu ildə AB-də istifadə edilən enerjinin 39%-i AB ölkələrinin daxilində istehsal edilmiş, qalan 61%-i isə başqa ölkələrdən idxal olunmuşdur.

2019-cu ildə AB-də istehsal edilən enerjinin ümumi çəkisinin 37%-i bərpa olunan məbələrdən, 32%-i atom enerjisindən, 19%-i kömürdən, 8%-i təbii qazdan, 4%-i isə neftdən alınmışdır. İdxal edilən qazın 41%-i Rusiya vasitəsilə əldə edilir. Eyni zamanda Rusiya həm də neftin və kömürün AB-ə olan əsas ixracatçısıdır. Avropaya yeni qoşulan Şərqi Avropa ölkələri üçün isə Rusiyanın enerji resursları onların enerji ixracının 90%-ni təşkil edir [11].

Qazın AB üçün Rusiyadan sonra ikinci ixracatçısı Əlcəzairdir. Lakin bu ölkədə siyasi sabilliyin tez tez pozulması AB-nin enerji resurslarından istifadəsi üçün xeyli risklər yaradır.

Son illərdə AB-n bazarlarına təbii maye qaz resursları da daxil olmağa başlamışdır ki, bunun da əsas ixracatçıları Qatar, Nigeriya daha sonra isə ABŞ-dır. 2018-2019-cu illərdə maye qaz idxalı 75% artmış və ümumi qaz ixracının 25%-ni təşkil etmişdir. 2019-cu ildə maye qazın əsas idxalatçıları İspaniya, Fransa, İtaliya, Niderland və Belçika olmuşdur.

AB ölkələrinin daimi, fasiləsiz və etibarlı şəkildə enerji resursları ilə təminatında yaranan problemlərin bir səbəbi də yeni inkişaf edən Cənub Şərqi Asiya ölkələri, o cümlədən Hindistan, Çinin fəal surətdə dünya enerji bazarına daxil olmaları və onların sürətlə fəal enerji idxalatçılarına çevrilmələridir. Hazırda Çin enerji idxalatına görə AB ölkələrini xeyli qabaqlamışdır ki, bu da təkcə Çinin özünü enerji istehsalçıları üçün cəlbedici bir abzara çevirmişdir. Lakin coğrafi yaxınlıq səbəbindən Çin özünü Mərkəzi Asiya enerji istehsalçılarına tutdu. 2014-cü ildə Çinlə-Türkmənistan arasında 2200 km-lik qaz kəməri haqqında saziş imzalandı [6, 141].

Lakin Şimali Afrikanın və Yaxın Şərq ölkələrinin enerji ehtiyatlarının istifadə edilməsinin bir çox problemlə cəhətləri vardır. Bunlardan birincisi, həmin ölkələrin özündə enerji daşıyıcılarına olan tələbatın artmasıdır. İkincisi, Yaxın Şərq və Şimali Afrikanın ölkələrində inqilablar, bunlardan da meydana gələn hərbi münaqişələrin AB-nin qlobal və çox milyardlıq enerji layihələri, nəticədə də AB ölkələrinin enerji təhlükəsizliyi üçün çoxlu maneələr yaratmalarıdır. Buna misal olaraq Liviyada olan vətəndaş müharibəsini göstərə bilərik. Belə ki, Liviyanın AB ölkələrinin enerji idxalatındakı payı cəmi 1% olduğu halda, Liviyada vətəndaş müharibəsi AB ölkələrində enerji daşıyıcılarının qiymətinin xeyli artmasına təsir etmiş oldu.

**Azərbaycan, Avropa dövlətləri üçün etibarlı tərəfdaşdır.** Yuxarıda qeyd olunanlar, AB ölkələrini yeni enerji daşıyıcıları mənbələri axtarmağa, daha az riski özündə etivə edən layihələri reallaşdırmağa istiqamətləndirdi. Bu baxımdan Qafqaz regionu xüsusilə Azərbaycanın enerji resurslarının AB ölkələri üçün cəlb ediciliyi daha da artmış oldu. Eyni zamanda Azərbaycan Mərkəzi Asiya enerji daşıyıcılarının daha ucuz formada AB ölkələrinə

ixrac edilməsi üçün əlverişli tranzit rolunu oynamalı idi. Beləliklə, AB ölkələrinin Rusiya ilə global qarşılıqlılaşması, Rusiyanın enerji daşıyıcılarından siyasi təsir vasitəsi kimi istifadə etməsi, eyni zamanda Yaxın Şərqi regionu və Şimali Afrikada qeyri stabil siyasi vəziyyət AB ölkələrini daha əlverişli enerji qaynaqları axtarmağa məcbur etdi ki, bu da Azərbaycanın tarixi bir fürsəti qazanmasına səbəb oldu. Lakin Azərbaycanın enerji daşıyıcılarının aşkar edilməsi və istismara verilməsi, eyni zamanda Azərbaycanın Mərkəzi Asiya ölkələrinin enerji daşıyıcıları üçün əlverişli tranzit dəhlizinə çevrilməsi imkanları AB qarşısında başqa bir problemin ortaya çıxmasına səbəb oldu. Bu isə Avropaya təhlükəsiz birbaşa nəqliyyat dəhlizinin açılması idi. Azərbaycandan Avropa bazarlarına XX əsrin 90-cı illərində açılan enerji nəqliyyat dəhlizləri Rusiya vasitəsilə açılırdı ki, bu da Avropa ölkələrində məlum səbəblərdən o qədər də maraq doğurmurdu. Buna görə də təbii şəkildə Avropaya ən yaxın ölkə kimi Türkiyənin əhəmiyyəti xeyli artmış oldu. Göstərilən amil eyni zamanda XX əsrin 90-cı illərində yenidən müstəqillik almış Azərbaycana siyasi dəstək verən Türkiyə ilə Azərbaycan arasında əməkdaşlıq perspektivlərini daha da genişləndirmiş oldu.

Avropa ölkələrinin Azərbaycanla enerji əməkdaşlığının ilk addımları hələ 1989-cu ildə atılmışdır. Lakin 1993-cü ildə hakimiyyətə ümummilli lider Heydər Əliyevin gəlməsindən sonra Azərbaycanla AB arasında enerji siyasəti sahəsində əməli əməkdaşlığın əsası qoyulmuş oldu. Bu əməkdaşlığın ilk nəhəng addımı 20 sentyabr 1994-cü ildə Azərbaycanla dünyanın 11 böyük neft şirkəti arasında Xəzər dənizinin Azərbaycana məxsus hissəsində Azəri-Çıraq-Günəşli neft yataqlarının birgə emalı və əldə olunan neftin birgə nəqli üçün beynəlxalq müqavilə imzalandı [9, 121]. Müqavilənin imzalanmasında dünyanın yeddi ölkəsindən (Azərbaycan, ABŞ, Böyük Britaniya, Rusiya, Türkiyə, Norveç, Səudiyyə Ərəbistanı) 11 böyük neft şirkəti-Amoco, BP, McDermott, Unocal, «LUKOYL», Statoil, TPAO, Pennzoil, Ramco, SOCAR, Delta- iştirak edirdi. Müqavilənin həyata keçirilməsi üçün isə Azərbaycan və müqaviləyə üzv olan şirkətlər tərəfindən 1995-ci ildə Azərbaycan Beynəlxalq Əməliyyat Şirkəti yaradıldı. “Əsrin müqaviləsinin” müddəti 2024-cü ilə qədər nəzərdə tutulmuşdu. Lakin 2017-ci ilin sentyabrında Azərbaycan və beynəlxalq şirkətlərin konsorsiumu arasında yeni bir “Əsrin müqaviləsi” imzalandı. Müqavilənin şərtlərinə görə Azərbaycanın enerji yataqlarına 2050-ci ilə qədər qoyulacaq investisiyaların məbləği 40 mlrd.dollar olmalı idi. Bu investisiyaların 25%-i İngiltərənin BP şirkətinin payına düşməli, Azərbaycanın Neft fondunun qazancı isə ilə 3.6 mlrd. dollar olmalı idi [9, 112].

SSRİ-nin dağılmasından sonra Cənubi Qafqaz respublikaları AB və ABŞ-ın siyasi və iqtisadi maraqlarını özlərinə cəlb etdilər. Buna səbəb həm AB və ABŞ-ın enerji təhlükəsizliyi aspektləri idisə, eyni zamanda Cənubi Qafqazın xüsusilə də Azərbaycanın Qərb ölkələrinin şübhə ilə baxdıqları İran və Rusiyanın sərhədlərində yerləşmələri, eyni zamanda NATO-nun üzvü olan Türkiyə ilə həmsərhəd olmaları, həm Türkiyənin Qərb ölkələri üçün Rusiya və İrana alternativ nəqliyyat dəhlizi oynaya biləcəyi perspektivi idi.

ABŞ analitik mərkəz olan “Stratfor” cəmiyyətinin rəhbəri Corc Fridman Azərbaycanın ABŞ-ın siyasi, iqtisadi maraqları üçün əhəmiyyətini belə ifadə edirdi: “... Azərbaycanın ABŞ üçün əhəmiyyəti onun mənəvi keyfiyyətlərində deyil, onun Rusiya və İran arasında ayırma xətti olmasındadır... Azərbaycanın mövqeyi strateji əhəmiyyətə malikdir, xüsusilə də İrandakı vəziyyəti nəzarətdə saxlamaq, eyni zamanda Xəzər dənizindən çıxan nəqliyyat kəmərləri vasitəsilə Rusiyanın nüfuzunun azaldılması baxımından daha qiymətlidir” [3, 1].

Yuxarıda göstərilənlərdən əlavə ABŞ Azərbaycanı OPEK-ə alternativ olan neft mənbəyi kimi baxırdı ki, bu da Qərb ölkələrinin enerji təhlükəsizliyini təmin etmək üçün enerji daşıyıcılarının global idxalının diversifikasiyası baxımından çox zəruri idi. Bu baxımdan hələ “Əsrin müqaviləsinin” bağlanması əvvəl 1993-cü ildən başlayaraq alternativ enerji nəqliyyat vasitəsi olan Bakı-Tbilis-Ceyhan neft kəməri layihəsinin ilkin konturları da cızılmağa başladı [1].

29 noyabr 1995-ci ildə isə Azərbaycan Prezidenti Heydər Əliyevin Böyük Britaniyaya rəsmi səfəri çərçivəsində Azərbaycan və Britaniya arasında Sənaye və Ticarət üzrə birgə Azərbaycan-Britaniya birgə şurasının yaradılması haqqında saziş imzalandı. Bağlanmış sazişin nəticəsi olaraq, 15 avqust 1996-cı ildə “Britaniya Yaxın Şərq bankının “Bakı nümayəndəliyi açıldı [1]. Həmin ildə də Britaniyanın, BP şirkətinin təşəbbüsləri ilə Bakıda Britaniya Biznes qrupu yaradıldı. 2000-ci ildə Azərbaycan iqtisadiyyatında Britaniya kapitalına məxsus şirkətlərin sayı 307-ə çatdı ki, bunların da çox enerji sahəsinə maraq göstərirdi.

Onu da göstərmək lazımdır ki, “Əsrin müqaviləsi” Azərbaycanla Türkiyə arasında enerji əməkdaşlığının ilk böyük addımı idi. Əsrin müqaviləsində iştirak edən Türkiyənin TPAO şirkəti müqavilədəki paylardan 6.75%-ə malik idi. Əslində onun payının artması Azərbaycan Dövlət Neft şirkəti olan SOCAR-ın öz payının bəzi hissəsindən imtina etməsi hesabına olmuşdu. TPAO-nun “Əsrin müqaviləsi”ndə iştirak etməsi gələcəkdə iki qardaş ölkə - Azərbaycan və Türkiyə arasında enerji sahəsində strateji əməkdaşlığın başlanğıcını qoyacaqdı.

Avropa Birliyi ölkələrinin Azərbaycan və Türkiyə ilə enerji əməkdaşlığının əslində Rusiyanın “Qazprom” şirkətindən olan aparıcı asılılığı azaltmağa yönəldiyinin Rusiya hakim dairələri də fərqiə varmışlar. Rusiyanın bu baxımdan Azərbaycanla 2009-cu ildə Azərbaycanla Azərbaycan qazının alqı-satqısı barəsində bağladığı müqavilə, əslində Azərbaycanın Avropa bazarlarına birbaşa çıxışını bloklamaq məqsədi güdüdü. 2010-cu ildən başlayaraq Bakı-Novo Filya kəməri vasitəsilə Azərbaycan qazının ixracına başlandı. Lakin 2014- cü ildə Azərbaycan qazının bəzi siyasi səbəblərdən dolayı verilməsi dəfələrlə dayandırıldı [8, 50]. Bu isə qazın Rusiyaya və Rusiya vasitəsilə ayrı-ayrı ölkələrə ixracını sual altına qoymaqla, bərabər Azərbaycan-Türkiyə əməkdaşlığını da strateji zərurətə çevirməkdədir.

2011-ci ildə AB ilə Azərbaycan arasında əməkdaşlıq zəminində “Cənubi Qafqaz qaz dəhlizinin” genişləndirilməsi barəsində bəyannamə imzalandı. 2013- cü il dekabrında “Şahdəniz” yatağının ikinci bölümü istismara verildi. 20 sentyabr 2014-cü ildə “Cənub Qaz dəhlizinin” təməlinin qoyulması mərasimi keçirildi [12, 113].

Avropanın enerji təhlükəsizliyinin təminatı məsələsində xüsusi məsələlərdən birini də Trans Xəzər qaz dəhlizi layihəsi xüsusi yer tutur. Layihə ilk dəfə 1996-cı ildə ABŞ tərəfindən Mərkəzi Asiya enerji resurslarının, xüsusilə də Qazaxıstan və Türkmənistan qazının Xəzər dənizinin altı ilə Qafqaz və Türkiyə vasitəsilə Avropaya nəqlini nəzərdə tuturdu. Kəmərin uzunluğu 300 km olmalı Türkmənistanı Azərbaycanın Səngəçal terminalı ilə birləşdirməli, buradan isə BTC, BTE, TANAP vasitəsilə Avropa bazarlarına və Türkiyə bazarına çıxmalıydı. 1999- cu ildə Türkiyə, Gürcüstan, Azərbaycan, Türkmənistan arasında Transxəzər qaz kəməri layihəsinin həyata keçirilməsi haqqında memorandum imzalandı. Lakin “Şahdəniz” yatağında qaz ehtiyatlarının tapılması, eyni zamanda Rusiya və İranın məsələyə müdaxilə etmələri, layihənin arxa plana keçməsinə səbəb oldu. Lakin 2006- cı ildə Rusiya ilə Ukrayna arasında enerji böhranı bu layihənin yenidən dirçəlməsinə səbəb oldu [2, 1357]. 2011-ci ildən başlayaraq Avropa Birliyi Transxəzər qaz kəməri layihəsinin reallaşması, Türkmənistanın bu məsələyə qoşulması üçün danışıqlarda birbaşa vasitəçi və krator rolunu oynamağa başladı. Lakin Rusiyanın Türkmənistan qazını Çin bazarına yönəltmək, eyni zamanda Nabucco layihəsinin uğursuzluğu, eyni zamanda İranın Türkmənistanla ayrıca qaz kəməri layihələrini bağlaması Transxəzər qaz kəməri layihəsinə bloklamış oldu. Hazırda Çinin idxal etdiyi qazın 45%-i Türkmənistan qazıdır ki, bu da ölkənin Çindən iqtisadi asılılığının artmasına səbəb olmaqdadır [2, 1359].

Türkiyə Azərbaycan enerji əməkdaşlığında xüsusi layihələrdən biri də Trans Anadolu qaz Kəməri layihəsinin həyata keçirilməsidir. Kəməri perspektivlərinin doğrudan da həm Avropa Birliyi üçün, həm də Azərbaycan Türkiyə enerji partnyorluğu üçün mühüm əhəmiyyət daşımasını müasir dövrdə baş verən hadisələr- xüsusilə 2022-ci ilin fevralından başlayan Ukrayna-Rusiya müharibəsi, müharibənin başlanmasından doğan AB ölkələrinin üzvləşdikləri enerji problemləri göstərmiş oldu.

Dekabr 2011- ci ildə Türkiyə ilə Azərbaycan arasında “Şahdəniz “ yatağında istehsal edilən qazın Türkiyə vasitəsilə Avropaya ixracı haqqında memorandum imzaladılar. 26 iyun 2012-ci ildə isə İstanbulda Türkiyə ilə Azərbaycan arasında Transanadolu Qaz kəməri layihəsi - TANAP barəsində müqavilə imzalandı. 2012-ci ildən başlayaraq kəmərin inşası texniki hazırlıq işləri görülməyə başlandı. 2015-ci ilin martından başlayaraq kəmərin tikintisinə başlanıldı və 2018-ci ildə artıq kəmərin tikintisi başa çatdırıldı. Layihənin qiyməti 8.5 mlrd.dollardır. Kəmərin buraxılış həcmi 16.5 mlrd.kubmetr olmaqla yanaşı, 2023-cü ildə onun buraxılış gücünü 23 mlrd.kubmetrə, 2026-cı ildə isə onun həcmi 31 mlrd.kub metrə, uzaq gələcəkdə isə 61 mlrd.kub metrə çatdırmaq nəzərdə tutulur. Türkiyə ərazisində kəmərin uzunluğu 1850 km.-dir. 21 noyabr 2018-ci ildə TANAP layihəsi Türkiyə ilə Yunanıstan sərhəddində Maritsa qəsəbəsi yaxınlığında TAP kəməri ilə birləşdirildi. Bununla da Azərbaycan və gələcəkdə də Mərkəzi Asiya qazının birbaşa Avropaya açılması başa çatdı [15].

31 dekabr 2020- ci ildən başlayaraq TANAP layihəsi üzrə qazın Türkiyəyə nəql edilməsinə başlanıldı. Mart 2021- ci ildən artıq bir mlrd.kub metr qaz ixrac edilmişdir. Belə hesab edildiyinə görə Avropaya il ərzində 10 mlrd.kub metr qaz ixrac ediləcəkdir. TANAP layihəsi hazırda istismar edilən “Şahdəniz-2” qaz ehtiyatlarının nəqli üçün nəzərdə tutulsa da, sonradan layihədə Türkmənistan və Qazaxıstan kimi nəhəng qaz ehtiyatları olan ölkələrin də iştirakı nəzərə alınmışdır. Bundan başqa mart 2021-ci ildə SOCAR Xəzər dənizində “Şəfəq Asiman” qaz qaynaqlarının da yaxın vaxtlarda istifadəyə veriləcəyini açıqlamışdır. Mütəxəssislər “Şəfəq Asiman” qaz yataqlarında 500 mlrd kub metrə qədər az ehtiyatı olduğunu bildirmişlər. 2021-ci ilin sentybarında isə Azərbaycan və Türkmənistan Xəzər dənizində hər iki dövlətin sərhədləri yaxınlığında yerləşən, “Dostluq” adlandırılan qaz yataqlarının birgə istismar ediləcəyi haqqında bəyanat vermişlər [10].

Artıq AB ölkələri qaz idxalatının təhlükəsizliyini təmin edilməsi üçün Xəzər regionu ölkələrindən qaz idxalatının artırılması yönündə TAP vasitəsilə qaz ixracının məhdud formada genişləndirilməsi layihələri üzərində işləyirlər. Bundan başqa Balkan ölkələrinin də TAP qaz

ixracı kəmərinə qoşulması prosesi də sürətlənməkdədir. Belə ki, 2021-ci ildə Serbiyada Yunanıstandan TAP vasitəsilə qaz əldə edilməsinə hesablanan “Niş-Dimitrovqrad-Bolqarıstan qaz kəməri”nin inşasına başlanmışdır. Bu isə Serbiyanın artıq ənənəvi qaz ixracatçısı Rusiya ilə enerji əməkdaşlığına məhdudiyət qoyacağı anlamına gəlir [10]. Aydındır ki, belə bir qaz kəməri layihəsinin işə düşməsi Balkanlarda Türkiyənin siyasi və iqtisadi nüfuzunun da artmasına səbəb olacaqdır, eyni zamanda Azərbaycan və Türkiyə əməkdaşlığının daha yeni səviyyəyə qalxmasına gətirib, çıxaracaqdır.

Azərbaycan TANAP layihəsinə başqa ölkələrin qoşulması üçün də öz fəaliyyətlərini davam etdirir. Xüsusilə də Türkmənistanın TANAP layihəsinə qoşulması və Türkmənistanla birgə enerji layihələrinin həyata keçirilməsi istiqamətində intensiv danışıqlar aparılmaqdadır. Ümumiyyətlə Mərkəzi Asiya ölkələrinin enerji ehtiyatlarının Azərbaycan və Türkiyə vasitəsilə AB ölkələrinə ixrac edilməsi perspektivləri hər iki ölkənin Mərkəzi Asiya ilə iqtisadi əməkdaşlığının yeni mərhələyə qədəm qoymasına, eyni zamanda Azərbaycan və Türkiyənin Mərkəzi Asiyada iqtisadi və siyasi çəkisinin daha da artmasına səbəb olacaq.

13 fevral 2013- cü ildə Albaniya, İtaliya və Yunanıstan TAP layihəsinə siyasi dəstək verilməsi və layihənin həyata keçirilməsi istiqamətində əməli işlər görülməsi barəsində saziş imzaladılar. 2013- cü ilin payızında Shell, Bulgargaz, DEPA, Gas Natural Fenosa, EON, Gaz de France, Hera, Enel, Axpo şirkətləri TAP layihəsinin səhmdarları olaraq təsdiq edildilər və onlar arasında 25 il müddətinə əməkdaşlıq müqaviləsi imzalandı [14].

TAP layihəsinin uzunluğu 870 km olub, TANAP layihəsinin davamı kimi fəaliyyətə başladı. Bunun 550 km-i Yunanıstanın ərazisinə düşür, Albaniya ərazisindən keçən hissə isə 216 km-dir. Dəniz bölgəsinə düşən təxminən 105 km-lik hissə isə Albaniyanın Fieri şəhərindən başlayaraq İtaliyanın cənubundakı qaz nəqliyyat şəbəkəsi ilə birləşir.

TAP Cənub-Şərqi Avropanın bir neçə ölkəsini-Bolqarıstanı, Albaniyanı, Bosniya, Hersoqovina, Monteneqro, Xorvatiyanı qaz ilə təmin etmək gücünə malikdir. Bunun üçün vasitəçi rolunu İoniya Adriatik Qaz kəməri adlanan təsisat oynayır (İAP). TAP-ın maliyyə yükü 4.5 mlrd dollar kəsb etmişdir. TAP layihəsinin ilkin buraxılış həcmi 10 mlrd kub metr müəyyən edilmişdir, lakin gələcəkdə kəmərin buraxılış həcmi 20 mlrd. kub metrə qədər qaldırılması gözlənilir [14].

AB ölkələri TAP layihəsinin baş tutması məsələlərinə böyük önəm verdilər. Lakin Rusiyanın aparıcı şirkətləri Avropanın qaza artan tələbatının fonunda 10 mlrd kub metr qazın yalnız dəryadan damla olduğunu göstərirlər və bunun Rusiyanın “Qazprom” şirkətinin qaz satış

imkanlarına heç cür təsir göstərməyəcəyini deyirlər. Lakin Rusiyanın aparıcı mətbu orqanlarının və hakimiyyət dairələrinin göstərilən layihələri diqqətdə saxlaması Rusiyanın doğrudan da həmin layihələrin həyata keçirilməsindən narahat olduğunu göstərir. Rusiyanın aparıcı analitiklərinin fikrincə göstərilən layihələrin hazırda Rusiyanın ixracat imkanlarına o qədər də yüksək təsiri yoxdur. Lakin həmin layihələr iqtisadi aspektlərdən çox siyasi aspektlər daşıyır.

### **NƏTİCƏ**

Burada qeyd etmək lazımdır ki, AB ölkələrinin enerji təhlükəsizliyi enerji qaynaqlarını təhlükəsiz, siyasi risklər olmadan, daha aşağı qiymətlərlə əldə etmək strategiyasını əldə rəhbər tutur. Lakin enerji tədarükçüsü və enerji tranziti perspektivinə malik olan ölkələr üçün isə enerji təhlükəsizliyi strategiyası enerji daşıyıcılarının Avropa bazarlarına təhlükəsiz çatdırılmasından başqa, həm də bəzi enerji istehsalçısı olan dövlətlərin inhisarından azad olmaq, müstəqil iqtisadi layihələrin gerçəkləşdirilməsində əməkdaşlıq etmək, əldə edilən maliyyə, iqtisadi və siyasi dividendlərdən istifadə edərək öz siyasi və iqtisadi məqsədlərini gerçəkləşdirmək, ölkədə iqtisadi dirçəlişə nail olmaq məqsədi daşıyır. Bu baxımdan Türkiyə-Azərbaycan enerji əməkdaşlığının böyük önəmi vardır. AB ölkələrinin enerji strategiyası hədəfləri Türkiyə və Azərbaycanın enerji əməkdaşlığını qaçılmaz hala çevirir. Ancaq bu əməkdaşlığın bazasında məhsuldar qarşılıqlı əlaqələrin gerçəkləşdirilməsi üçün mühüm zəmin yaranır. Bu zəmin isə yerli iqtisadi layihələrin tətbiqində, qeyri enerji sektorunda iqtisadi proqramların həyata keçirilməsində, Qafqazda və Yaxın Şərqi regionunda siyasi sabilliyin qorunmasında, münaqişələrin məhsuldar dialoqa əsaslanaraq həll edilməsində, eyni zamanda həm Azərbaycan və Türkiyə arasında, həm də başqa türk dövlətləri ilə də iqtisadi, siyasi inteqrasiyanın gerçəkləşməsində mühüm rol oynayır və gələcəkdə də oynayacaqdır.

***Tilia rubra* DC. subsp. *caucasica* V.Engler (KAFKAS İHLAMURU) YAPRAK UÇUCU YAĞININ KİMYASAL BİLEŞİMİ**

**Dr. Öğr. Üyesi Mehmet ÖZ (Orcid ID: 0000-0001-8392-4476)**

Gümüşhane Üniversitesi, Gümüşhane Üniversitesi, Gümüşhane Meslek Yüksekokulu,  
Ormanlık Bölümü, Türkiye

**ÖZET**

İnsanların bitkileri tedavi, ilaç, besin, süs eşyası vb. ihtiyaçları için kullanmaları beşeri hayattaki varlığı kadar eskiye dayanmaktadır. İhlamur türleri (*Tilia* sp.) özellikle kış aylarında grip ve soğuk algınlığı tedavisinde göğüs yumuşatıcı, terletici ve kas gevşetici etkilerinden dolayı vazgeçilmeyen bitkilerdendir. Bu çalışma, *Tilia rubra* DC. subsp. *caucasica* (Kafkas ihlamuru) bireylerinden toplanan yapraklarının su destilasyonu ile elde edilen uçucu yağın yüzde oranı, kimyasal yapısı ve tespit edilen uçucu bileşiklerin kimyasal sınıflarının belirlenmesi amacıyla yapılmıştır. Yaprak örneklerinin uçucu yağı Clevenger aparatı yardımıyla hidrodestilasyon metodu ile elde edilmiştir. Gaz kromatografisi-kütle spektrometresi (GC-MS/FID) cihazı ile yaprak uçucu yağının bileşenleri tespit edilmiştir. Hidrodestilasyon işlemi sonucunda hesaplanan uçucu yağ verimi yüzde olarak %1,04 w/w olarak belirlenmiştir. Yaprak uçucu yağını oluşturan bileşenlerin %99,03'ünün yapısı tanımlanmıştır. Bulunan verilere göre yaprak uçucu yağında 3 bileşen tanımlanamazken 90 adet bileşiğin yapısı belirlenmiştir. En yüksek yüzde orana sahip olan ana bileşikler sırasıyla %45,68 oranında  $\alpha$ -pinen, %15,32 oranında (*E*)-2-hegzanal ve %4,41 oranında hegzanal olmuşlardır. Yaprak uçucu yağında % oran ve bileşik sayısı bakımından en yüksek bulunan kimyasal sınıflar monoterpenler (%49,65 oran ve 13 bileşik), aldehydler (%25,03 oran ve 16 bileşik) ve monoterpenoidler (%8,06 oran ve 17 bileşik) olarak bulunmuştur. Analiz edilen uçucu yağın terpen veya terpenoid sınıfları bakımından incelendiğinde toplamda 38 adet bileşik ve %60,72'lik oranda belirlenirken, en büyük terpen sınıfının monoterpenler (%49,65) olduğu tespit edilmiştir.

**Anahtar Kelimeler:** Kafkas ihlamuru, kimyasal bileşikler, kimyasal sınıflandırma, yaprak uçucu yağ

**CHEMICAL COMPOSITION OF *Tilia rubra* DC. subsp. *caucasica* V.Engler  
(CAUCASIAN LINDEN) LEAF ESSENTIAL OIL****ABSTRACT**

People's use of plants for their needs such as treatment, medicine, food and ornaments is as old as their existence in human life. Linden species (*Tilia* sp.) are indispensable plants in the treatment of flu and colds, especially in winter, due to their chest softening, diaphoretic and muscle relaxant effects. This study was carried out to determine the percentage of essential oil obtained by hydro distillation of leaves collected from *Tilia rubra* DC. subsp. *caucasica* (Caucasian linden) individuals, its chemical structure and chemical classes of determined volatile compounds. The essential oil of the leaf samples was obtained by hydro distillation method with the help of Clevenger apparatus. The components of the leaf essential oil were determined by gas chromatography-mass spectrometry (GC-MS/FID) device. The essential oil yield calculated as a result of the hydro distillation process was determined as 1.04% w/w percent. The structure of 99.03% of the components that make up the leaf essential oil has been defined. According to the data found, while 3 components could not be identified in the leaf essential oil, the structure of 90 compounds was determined. The main compounds with the highest percentage were  $\alpha$ -pinene at 45.68%, (*E*)-2-hexenal with 15.32% and hexanal with 4.41%, respectively. The chemical classes with the highest percentage and number of compounds in leaf essential oil are monoterpenes (49.65% ratio and 13 compounds), aldehydes (25.03% ratio and 16 compounds) and monoterpenoids (8.06% ratio and 17 compounds) were found as. When the analyzed essential oil was examined in terms of terpene or terpenoid classes, a total of 38 compounds and 60.72% were detected, while the highest terpene class was determined to be monoterpenes (49.65%).

**Keywords:** Caucasian linden, chemical classification, chemical compounds, leaf essential oil

## 1. GİRİŞ

Büyük çoğunluğu Orman Genel Müdürlüğü tarafından idare edilmekte olan ormanlarımızın (22,7 milyon hektar, ülke yüzölçümünün yaklaşık % 29,2) tamamına yakını devletin hüküm ve tasarrufu altındadır. Özel mülkiyete ait orman alanı ise yaklaşık 30 bin hektardır (OGM, 2020; OGM, 2021). Ülkemiz içerisinde barındırdığı odunsu taksonlar ve sahip olduğu bitki tür çeşitliliği bakımından düşünüldüğünde zengin bir ülke durumundadır. Türkiye florasında doğal olarak yetişen 300’den fazla yarı çalı, 550’den fazla çalı ve ağaç olmak üzere toplamda 850’nin üzerinde odunsu bitki bulunmaktadır (Koç ve Fakir, 2019).

Ülkemiz sınırları içerisinde doğal yayılış gösteren *Tilia* (ıhlamur) cinsine ait Kafkas ıhlamuru (*Tilia rubra* subsp. *caucasica*), Kış ıhlamuru (*Tilia cordata*), Yaz ıhlamuru (*Tilia platyphyllos*) ve Gümüşü ıhlamur (*Tilia tomentosa*) olmak üzere dört adet tür yer almaktadır (Parlak vd., 2019). Kafkas ıhlamuru Anadolu’nun değişik bölgelerinde, özellikle Kuzeydoğu Anadolu’da çok görülmektedir. *Tilia rubra* subsp. *caucasica* doğal olarak yayılışı Artvin, Balıkesir, Bolu, Giresun, Gümüşhane, Kars, Kastamonu, İzmir, Samsun, Trabzon, Rize ve Zonguldak’ta bulunmaktadır (Erdoğan Genç vd., 2021).

İhlamurlar (TSE Standart No: 3223); yaprak ıhlamur, yapraklı çiçek ıhlamur ve çiçek ıhlamur olarak üç gruba ayrılmaktadır. Sadece çiçek yapraklarından oluşan ve içerisinde en fazla %1 oranında çiçek bulunan grup yaprak ıhlamur olarak adlandırılmaktadır. Çiçek durumları brahteleri ile birlikte toplandığında, yapraklı çiçek ıhlamur olmakta ve ikinci kalite olarak kabul edilmektedir. Çiçek ıhlamur ise sadece çiçek durumlarından ibaret olup içerisinde %1 oranında brahte (çiçek yaprağı ve sapı) bulunabilir ve birinci kalite olarak kabul edilmektedir (Baytop, 1984; Tuttu vd., 2017).

35-40 m’ye kadar boylanabilen Kafkas ıhlamurunun yaprağı 66-128 mm uzunluk ve 52-106 mm genişlikte, genişçe yumurtamsı, yürek şeklindedir. Temmuz ayında çiçek açar ve taç yapraklar ise açık sarı renklidir. Çiçek kurulu 1 kez dallanır, genellikle 3-5 çiçeklidir ve brahtesi ise açık yeşil renklidir. Meyve yapısı 10-11 mm uzunluğunda, elipsoid şekilde nadiren ters yumurtamsıdır (Oral, 2018). Şekil 1’de Kafkas ıhlamurunun ülkemizdeki dağılımı verilmiştir.

Şekil 1. Kafkas ıhlamuru'nun ülkemizdeki dağılımı (Tübives, 2022)

*Tilia rubra* DC. subsp. *caucasica* (Kafkas Ihlamuru) türü Dünya pazarındaki odun dışı orman ürünü olarak yer edinen türlerden biridir. Bu tür bulunduğu ülke ekolojisine ve ekonomisine önemli ölçüde fayda sağlamaktadır. Kafkas ıhlamuru türü ihraç ettiğimiz odun dışı orman ürünleri arasında bulunmaktadır (Özyurt ve Yücesan, 2020). Ihlamur insanlara şifa kaynağı olarak aynı zamanda orman köylümüşe ekonomik gelir kapısı oluşturarak da fayda sağlamaktadır. 2021 yılı sonu itibariyle ormanlarımızda 24 bin hektar alanda 441 ton faydalanılabilir ıhlamur bulunmaktadır. Ihlamurun orman köylüsüne katkısına bakıldığında 2021 yılı itibariyle yaklaşık 6 milyon TL, ülke ekonomisine katkısı ise yaklaşık 35 milyon TL'dir. Türkiye İstatistik Kurumu (TÜİK) verileri ne göre ABD, Almanya, Dominik Cumhuriyeti, Kosova başta olmak üzere 60 farklı ülkeye 2021 yılı sonu itibariyle 186 ton ıhlamur ihracatı yapılmış ve karşılığında 1.966.163 dolar döviz girdisi sağlanmıştır (OGM, 2022).

Bekletildiğinde içindeki aktif maddeler kaybolduğundan dolayı ıhlamur çayının daima taze olarak demlenip, içilmesi tavsiye edilmektedir. Grip sebebiyle yükselen ateşi düşürmek için birçok farklı kültürlerde geleneksel olarak ıhlamur çayı tüketilmektedir. Ihlamur çayının sıcak olarak içildiğinde boğaz ağrısını ve öksürüğü aldığı; çayın buharının burun tıkanıklığını açmaya faydalı olduğu ifade edilmektedir. Aynı zamanda yatıştırıcı etkisinden dolayı ıhlamur çayının gerginliği aldığı, stresi azalttığı ve uykuya geçişi kolaylaştırdığı bilinmektedir. Tabiatı doğal olarak yetişen Ihlamur ağacının çiçek ve yaprakları temmuz, ağustos aylarında toplanır ve kurutularak saklanmaktadır (Tamtürk, 2013). Ihlamur türleri bünyelerinde ürettikleri aromatik, uçucu yağlar ve benzeri sekonder metabolitler bakımından zengin bitkilerdir. Bu sebeple tıp, eczacılık, parfümeri, kozmetik ve gıda gibi alanlar için oldukça önemli bitkilerdir (Koç ve Fakir, 2018).

Bu çalışmada, Gümüşhane ilinde doğal yayılış gösteren *Tilia rubra* DC. subsp. *caucasica* V.Engler (Kafkas İhlamuru) yapraklarından su destilasyonu ile elde edilen uçucu yağın yüzde oranının, kimyasal yapısının ve tespit edilen uçucu bileşiklerin kimyasal sınıflarının belirlenmesi amaçlanmıştır.

## **2. MATERYAL VE METOD**

### **2.1. Materyal**

Kafkas İhlamuru yaprakları 2021 yılı temmuz ayında (çiçek açtığı zaman) Gümüşhane ili, Torul ilçesi, Köstere Köyü, Düzler Mahallesi'nden toplanmıştır. Doç. Dr. Mutlu Gültepe tarafından bitki materyalinin teşhisi yapılarak Karadeniz Teknik Üniversitesi, Fen Fakültesi, Biyoloji Bölümü Herbaryumuna KTUB Gültepe 721 herbaryum numarası ile depolanmıştır. Gölgede ve açık havada kurutulan yapraklar analiz edilinceye kadar uygun koşullarda bekletilmiştir.

### **2.2. Metod**

#### **2.2.1. Hidrodestilasyon İşlemi**

Kurutulmuş bitki yapraklarından (*Tilia rubra* subsp. *caucasica*) alınan 100 gramlık numune, küçük parçalara ayrıldıktan sonra içerisinde 1000 mL saf su bulunan 2000 mL'lik cam balona eklenmiştir. Yaprak numuneleri, yaklaşık 4 saat gömlekli ısıtıcı üzerinde ısıtılmış ve modifiye soğutuculu clevenger tipi cihazda uçucu yağın birikmesi beklenmiştir. Toplanan uçucu yağ kahverengi vialer GC kalitede 1 mL hegzan ile alınmış ve susuz Na<sub>2</sub>SO<sub>4</sub> (sodyumsülfat) ile kalan su kurutularak analizler için -18 C°'de saklanmıştır. Elde edilen uçucu yağ ekstraktından alınan 1 µL'lik çözeltiler GC-MS cihazına enjekte edilerek analiz yapılması sağlanmıştır (Karataş vd., 2021). Çalışmada kullanılan Clevenger düzeneği Şekil 2'de gösterilmiştir.

#### **2.2.2. Uçucu Bileşenlerin GC-MS Analizi**

GC-MS cihazına 1 mL hegzan eklenmiş uçucu yağ ekstraktından alınan 1 µL'lik çözelti enjekte edilmiş ve kimyasal bileşen analizi gerçekleştirilmiştir. Uçucu yağ analizinde Agilent marka gaz kromatografisi (GC Agilent-7890) cihazı ile 5975 E Seri GC/MSD marka kütle spektrometresi cihazları çalışmada kullanılmıştır. Analiz için 30 m x 0.32 mm, film kalınlığı 0.25 µm olan HP-5 apolar kapiler kolondan faydalanılmıştır. Uçucu bileşenlerin analizi için kullanılan Agilent-7890 model GC-MS cihazı Şekil 2'de verilmiştir.

Şekil 2. Çalışmada kullanılan modifiye soğutuculu Clevenger ve Agilent-7890 cihazı

### 2.2.3. Bileşenlerin Aydınlatılması

Elde edilen uçucu yağların kütle spektrumları analizi MS detektöründe, miktar analizleri ise FID detektöründe gerçekleştirilmiştir. Uçucu bileşenler gaz kromatografisi kolonundan ayrıldıktan sonra kütle spektrofotometresinde her birinin tek tek kütle spektrumları belirlenmiştir. Tespit edilen bileşiklerin, alıkonma indeks (RI-Kovats) değerleri deneysel olarak hesaplandıktan sonra belirlenen RI değerlerinin literatür verileriyle ve NIST, WILEY gibi kütüphanelerle karşılaştırılması sonucu yapıları tanımlanmıştır (Adams, 2007).

## 3. BULGULAR VE TARTIŞMA

Kafkas ıhlamuru yaprakları (100 g kurutulmuş) ile gerçekleştirilen hidrodestilasyon işlemi sonucunda hesaplanan uçucu yağ verimi yüzde olarak %1,04 w/w olarak bulunmuştur.

Öz, (2022) Kafkas ıhlamuru (*Tilia rubra* subsp. *caucasica*) çiçekleri ile yaptığı çalışmada, elde edilen çiçek uçucu yağ oranının % 1,10 w/w olduğunu ifade etmiştir. Toker vd., (1999) Kafkas Ihlamuru (*T. rubra*), Yaz ıhlamuru (*T. platyphyllos*) ve Gümüşü Ihlamur (*T. tomentosa*) bitki kısımlarından elde edilen uçucu yağ verimlerini Yaz ıhlamuru (*T. platyphyllos*) yaprak ve çiçeklerinde yağ miktarının sadece %0,03 oranında olduğunu, araştırılan diğer iki ıhlamur türünde ise bu oranın daha düşük olduğunu dile getirmişlerdir.

Çalışmada elde edilen uçucu yağ verimi karşılaştırıldığında, Kafkas ıhlamuru çiçeklerinden daha düşük bulunurken diğer diğer ıhlamur türlerine oranla daha fazla olduğu söylenebilir.

Analiz edilen uçucu yağda belirlenen 90 adet doğal bileşiğin yapısı, alıkonma zamanları ve kütle spektrumları dikkate alınarak GC-MS/FID cihazında bulunan NIST ve Willey kütüphanelerindeki bileşiklerle ve literatürle karşılaştırılarak tanımlanmıştır. 3 bileşiğin yapısı ise belirlenememiştir. Uçucu yağın analizinde tespit edilen bileşiklerin % 99,03'lük kısmı tanımlanmıştır. Uçucu bileşenlerin yüksek eşleşme oranları (en az %80) göstermiş ve alıkonma zamanlarının karşılaştırılması ile kimyasal yapıları aydınlatılmıştır. *Tilia rubra* subsp.

*caucasica* (Kafkas ihlamuru) yaprak uçucu yağının GC-MS/FID analiz sonuçları Tablo 1’de gösterilmiştir.

**Tablo 1.** Kafkas Ihlamuru (*Tilia rubra* subsp. *caucasica*) yapraklarından elde edilen uçucu yağın GC-MS/FID analiz sonuçları

**RT:** Alıkonma Zamanı, **Kovats Indeks:** Deneysel Alıkonma İndeksi, **Literatür Kovats Indeks:** Literatür Alıkonma İndeksi

Yaprak uçucu yağı ana bileşenlerinin %45,68 oranında  $\alpha$ -pinen (monoterpen), %15,32 oranında (*E*)-2-hegzanal (aldehid) ve %4,41 oranında hegzanal (aldehid) olduğu belirlenmiştir.

Tablo 1’de belirtilen ve yapısı tanımlanan bazı terpen ve terpenoidler bileşiklerin;  $\alpha$ -pinen,  $\beta$ -mirsen, borneol, *trans*-geranilaseton,  $\beta$ -ionon ve fitol, bazı aldehid bileşiklerin; hegzanal, (*E*)-2-hegzanal ve nonanal, bazı alkol bileşiklerinin; (*E*)-2-hegzan-1-ol, 1-hegzanol ve (*Z*)-3-hegzan-1-ol, bazı ester bileşiklerin; benzoik asit, 2,6-dimethoksi-, metil ester ve 2,2,4-trimetil-

1,3-pentanediol dizobutirat, bazı hidrokarbon bileşiklerin; metil siklohegzan ve trikosan olduğu görülmektedir.

Kafkas Ihlamuru (*T. rubra*), Yaz ihlamuru (*T. platyphyllos*) ve Gümüşü Ihlamur (*T. tomentosa*) uçucu yağ bileşenlerinin araştırıldığı farklı bir çalışmada Kafkas Ihlamuru yapraklarından damıtılan uçucu yağda (*E*)-kaur-16-ene (%29,3), (*Z*)-3-hegzetil benzoat (%12,0), hegzadekanoik asit (%11,1), geranil aseton (%4,9), nonakosan (%4,8) olarak karakterize edildiğini ifade edilmiştir (Toker vd., 1999).

*Tilia rubra* subsp. *caucasica* çiçek uçucu yağında 49 bileşenin tespit edildiği ve 3 bileşenin belirlenemediği ifade edilmiş ve uçucu yağ ana bileşenlerinin ise nonanal (%8,10), *trans*-geranilaseton (%7,15), trikosan (%7,46), metilsiklohegzan (%5,23), hegzanal (%5,13) ve  $\alpha$ -pinen (%4,84) olduğu bildirilmiştir (Öz, 2022).

*Tilia platyphyllos* (Yaz Ihlamuru) yaprakları ile yapılan bir çalışmada, dört farklı bölgeden toplanan yaprakların koku bileşenleri GC-MS (gaz kromatografisi/kütle spektrometresi) ile kombine edilmiş HS-SPME (Tepe boşluğu-katı faz mikro ekstraksiyon) tekniği ile belirlenmesi çalışılmıştır. Yaprak uçucu bileşenlerinin analizi sonucunda miktar olarak en fazla bulunan etken bileşenler olarak: (%64,84) (*E*)-2-hegzanal, (%22,73) 1-desin, (%15,66) 2-etil furan, (%8,77) benzaldehid tespit edildiğini ifade etmişlerdir (Koç ve Fakir, 2019).

*Tilia cordata* yaprakları (üç farklı genotip) ile yapılan farklı bir çalışmada, Headspace-GC/MS ve GC/MS analizleri sonucunda ortalama olarak baskın bileşenleri:  $\beta$ -Osimen (%43,79), heneikosan (%26,35),  $\alpha$ -kadinol (%19,84), terpinolen (%14,27), limonen (%14,17), epi- $\alpha$ -muurolol (%11,82) olarak ifade edilmiştir (Zorić vd., 2020).

Sarıkaya ve Doğdu (2021) tepe boşluğu katı faz mikroekstraksiyon (HS-SPME) analiz yöntemi ile *Tilia tomentosa* (Gümüşü Ihlamur) yaprak çiçek ve brahte uçucu bileşenlerini tespit etmek amacıyla yaptıkları çalışmada 42 farklı bileşenin belirlendiğini bildirmişlerdir. Analiz edilen uçucu yağın ana bileşenleri olarak %19,35 hegzanal, %18,45 (*E*)-2-hegzanal, %14,30 2,4 heptadienal ve %12,46 limonen bulunduğunu bildirmişlerdir.

Kafkas Ihlamuru (*Tilia rubra* subsp. *caucasica*) yaprak uçucu yağında belirlenen bileşiklerin kimyasal sınıflandırılması, yüzde miktarı, bileşik sayısı ve ana bileşenleri Tablo 2. de verilmiştir.

**Tablo 2.** Kafkas İhlamuru (*Tilia rubra* subsp. *caucasica*) yaprak uçucu yağında belirlenen bileşiklerin kimyasal sınıflandırılması, yüzde miktarı, bileşik sayısı ve ana bileşenleri

Bileşik Sınıfı	% Oranı	Bileşik Sayısı	Ana Bileşen
Monoterpenler	49,65	13	$\alpha$ -Pinen
Aldehidler	25,03	16	(E)-2-Hegzenal
Monoterpenoidler	8,06	17	trans-Geranilaseton
Alkoller	5,12	12	(E)-2-Hegzen-1-ol
Esterler	3,17	7	Benzoik asit, 2,6-dimethoksi-, metil ester
Ketonlar	2,83	8	(E)-3-Hegzen-2-on
Diterpenoidler	1,64	1	Fitol
Hidrokarbonlar	0,91	2	Metil-siklohegzan
Bilinmeyenler	0,97	3	
Diğerleri	0,92	3	2-Etil-furan
Seskiterpenoidler	0,80	3	Hegzahidrofarnesil aseton
Seskiterpenler	0,57	4	$\alpha$ -Farnesen
Terpen benzeri	0,22	3	Öjanol
Eterler	0,11	1	Difenil eter
<b>Toplam</b>	<b>100</b>	<b>93</b>	

Kafkas ihlamuru yapraklarından elde edilen uçucu yağda belirlenen bileşiklerin kimyasal sınıflandırma sonuçları Tablo 2’de incelendiğinde tespit edilen 93 adet bileşiğin 14 gruba ayrıldığı görülmektedir.

Yaprak uçucu yağında belirlenen kimyasal bileşen sınıfları değerlendirildiğinde yüzde oran olarak en fazla bulunan bileşik sınıfının % 49,65 ile monoterpenler, ana bileşenin ise  $\alpha$ -pinen olduğu görülmektedir. Diğer bileşik sınıflarında ise sırasıyla % 25,03 ile aldehidler olup ana bileşenin (E)-2-hegzenal, % 8,06 ile monoterpenoidler olup ana bileşenin trans-geranilaseton ve % 5,12 ile alkoller olup ana bileşenin (E)-2-hegzen-1-ol olduğu bulunmuştur. Bu sınıflarda belirlenen bileşik sayısı bakımından en fazla bulunan bileşik sınıflarının sırasıyla monoterpenoidler 17 adet, aldehidler 16 adet, monoterpenler 13 adet ve alkoller 12 adet olduğu belirlenmiştir. Yaprak uçucu yağ örneklerinde toplamda 38 adet bileşik ve %60,72’lik oranda terpen veya terpenoid sınıfı bileşikler bulunduğu görülmektedir (Tablo 2).

Öz (2022) Kafkas ihlamuru (*Tilia rubra* subsp. *caucasica*) çiçekleri ile yaptığı uçucu yağ analizi sonucunda uçucu yağdaki ana bileşik sınıflarını hidrokarbonlar (% 23,90 ve 7 bileşik), aldehidler (% 22,74 ve 8 bileşik), monoterpenoidler (% 16,48 ve 9 bileşik), monoterpenler (% 12,51 ve 6 bileşik) ve % 9,23 (8 bileşik) ile esterler olduğunu ifade etmiştir.

Zorić vd. (2020) *Tilia cordata* yaprakları (üç farklı genotip) ile yaptıkları analiz sonucunda uçucu yağlardaki ana bileşik sınıflarını monoterpen hidrokarbonlar (%87,05), alifatik hidrokarbonlar (% 36,59) ve oksijenli seskiterpenler (%34,60) olduğunu beyan etmişlerdir.

Koç ve Fakir (2019), yaz ıhlamuru yapraklarının uçucu bileşen analizinde, kimyasal yapılarının aromatik alkol, aromatik aldehid ve monoterpen hidrokarbon sınıflarına ait bileşiklerden oluştuğunu beyan etmişlerdir.

Kafkas ıhlamuru ve diğer ıhlamur türleri ile yapılan uçucu yağ çalışmalarında belirtilen uçucu bileşenler ile çalışmada ortaya çıkan sonuçlar karşılaştırıldığında benzer bileşiklerin  $\alpha$ -pinen, (*E*)-2-hegzanal, hegzanal, geranilaseton olduğu anlaşılmaktadır. Yapılan çalışmalarda uçucu bileşenlerin ait oldukları kimyasal sınıflar olarak monoterpenlerin öne çıktığı ve bu sonucunda bizim çalışmamızla uyumlu olduğu görülmektedir. Tespit edilen bileşenlerin kimyasal sınıflandırılması ve uçucu bileşik miktarları arasında bulunan bazı farklılıkların sebebi olarak çalışmalara konu olan türlerin farklılığı, toplama zamanları, depolama şartları, analiz parametreleri, iklim şartları, farklı yetiştirme yeri, doğal çeşitlilik gibi birçok faktör sayılabilir.

#### **4. SONUÇ ve ÖNERİLER**

Ülkemizin bitki zenginliği içerisinde yer alan Kafkas ıhlamuru yaprak uçucu yağının kimyasal içeriğinin incelendiği bir araştırma niteliğindedir. Çalışma sonucunda su destilasyonu işlemi ile uçucu yağ verimi yüzde %1,04 olarak hesaplanmıştır. Elde edilen uçucu yağın GC-MS/FID ile analizi ile 93 adet bileşik tespit edilmiş ve bu bileşiklerden 90 adet bileşiğin yapısı tanımlanmıştır. Analiz edilen uçucu yağın ana bileşenleri olarak  $\alpha$ -pinen, (*E*)-2-hegzanal ve hegzanal bulunmuştur. Bileşiklerin kimyasal sınıflandırılmasında miktar olarak en fazla bulunan bileşik sınıfı monoterpenler (% 49,65) olmuştur. Çalışma kapsamında, ülkemizde doğal olarak yayılış göstermekte olan dört ıhlamur türünden biri olan ve Gümüşhane ilinde yetişen Kafkas ıhlamurunun yaprak uçucu bileşenleri incelenmiştir. Araştırma sonucunda elde edilen verilerin bitki ile ilgili yapılacak daha sonraki çalışmalara ve parfümeri, kozmetik, tıp, ilaç ve gıda gibi alanlara katkıda bulunabileceği düşünülmektedir.

**ÖZET**

Yabancı otlar şeker pancarı ekim alanlarında önemli verim ve kalite kayıplarına sebep olmaktadır bundan dolayı yabancı otlarla mücadele etmek için önceden yabancı otları bilmek ve tanımak gerekmektedir. Bundan dolayı bu çalışmayı 2022 yılında Ağrı ili şeker pancarı ekim (*Beta vulgaris* L.) alanlarında bulunan yabancı ot türleri, rastlama sıklıkları, yoğunlukları ayrıca bölge çiftçisinin yabancı ot sorunlarını çözmedeki yaklaşımlarını, mücadele yöntemlerini belirlemek amacıyla yürütülmüştür. Çalışma kapsamında 50 şeker pancarı ekim alanlarında sürveyler yapılmış. Ayrıca şeker pancarı üretimi yapan 100 çiftçi ile yüz yüze anket yapılmıştır. Çalışma sonucunda; şeker pancarı ekim alanlarında 1 parazit, 1 dar yapraklı ve 11 geniş yapraklı olmak üzere 13 familyaya ait toplamda 40 yabancı ot türü tespit edilmiştir. Tespit edilen bu familyalar içinde en fazla yabancı ot sayısına; Poaceae (11 tür), Asteraceae (8 tür) ve Brassicaceae (7 tür) familyaları sahip olmuştur. Rastlama sıklıkları en yüksek yabancı ot türleri sırasıyla; *Chenopodium album* L. (%92), *Amaranthus retroflexus* L. (%86) ve *Convolvulus arvensis* L. (%80) olmuştur. Yoğunlukları en yüksek yabancı otlar ise, *Chenopodium album* L. (2,82 adet/m<sup>2</sup>), *Convolvulus arvensis* L. (2,15 adet/m<sup>2</sup>) ve *Amaranthus retroflexus* L. ( 1,86 adet/m<sup>2</sup>) olmuştur. Yapılan anket sonucunda; çiftçilerin %82'si şeker pancarı ekim alanlarında en büyük sorunun yabancı otlar olduğunu ve %75'i tarlalarda yabancı otun çok yoğun olduğunu ifade etmişlerdir. Şeker pancarı ekim alanlarında en fazla yoğunlukta bulunan yabancı ot türlerin *Convolvulus arvensis* L. (%86), *Chenopodium album* L. (%72) ve *Amaranthus retroflexus* L. (%70) olduğunu belirtmişlerdir. Ankete katılım gösteren çiftçilerin çoğunluğu yabancı otlara karşı mekanik mücadele yaptıklarını belirtmiştir.

**Anahtar kelimeler:** Sürvey, Yabancı ot, Anket, Şeker pancarı, Rastlama sıklığı

**WEED PROBLEM IN SUGAR BEET (*Beta vulgaris* L.) CULTIVATION AREAS; THE CASE OF AĞRI PROVINCE****ABSTRACT**

Weeds cause significant yield and quality losses in sugar beet cultivation areas. Therefore, it is necessary to know and recognize weeds in advance to combat weeds. Therefore, this study was carried out in order to determine the weed types, their incidence and density, as well as the approaches and control methods of the farmers in the region in solving the weed problems in the sugar beet (*Beta vulgaris* L.) cultivation areas of Ağrı province in 2022. Within the scope of the study, surveys were made in 50 sugar beet fields. In addition, a face-to-face survey was conducted with 100 farmers producing sugar beet. In the results of study; a total of 40 weed species belonging to 13 families, including 1 parasite, 1 narrow-leaved and 11 broad-leaved, were detected in sugar beet cultivation areas. The highest number of weeds among these identified families were found as; Poaceae (11 species), Asteraceae (8 species) and Brassicaceae (7 species) families. Weed species with the highest frequency rates are respectively; *Chenopodium album* L. (92%), *Amaranthus retroflexus* L. (86%), and *Convolvulus arvensis* L. (80%). The weeds with the highest densities were *Chenopodium album* L. (2.82 plants/m<sup>2</sup>), *Convolvulus arvensis* L. (2.15 plants/m<sup>2</sup>) and *Amaranthus retroflexus* L. (1.86 plants/m<sup>2</sup>). As a result of the survey; 82% of the farmers stated that the biggest problem in sugar beet cultivation areas is weeds and 75% stated that weeds are very dense in the fields. They stated that the weed species with the highest density in sugar beet cultivation areas were *Convolvulus arvensis* L. (86%), *Chenopodium album* L. (72%), *Amaranthus retroflexus* L. (70%). The majority of the farmers who participated in the survey stated that they use mechanical control against weeds.

**Keywords:** Survey, Weed, Questionnaire, Sugar beet, Frequency

## 1. GİRİŞ

Endüstri bitkileri içerisinde yer alan şeker pancarı (*Beta vulgaris* L.) insan ve hayvan beslenmesinde önemli bir yere sahiptir. Şeker pancarı Amaranthaceae familyasından, yazlık, iki yıllık bir endüstri bitkisidir (Özer ve Ertunç, 2005). Şeker pancarı sakarozun (yani şekerin) ekonomik olarak üretilebildiği iki bitki kaynağından biri olan önemli bir endüstriyel bitkidir (Gurel *et al.*, 2008). Şeker ve hayvan yemine ek olarak, şeker pancarı biyoyakıtlar, insan beslenmesi, plastikler ve ilaçlar için birçok katma değerli yan ürün sağlayabilir (Finkenstadt, 2014). Şeker kamışı subtropik ve tropik ve iklim kuşağında yetişirken, şeker pancarı ise Şeker pancarı farklı iklim ve topraklara karşı çok toleranslıdır ve marjinal arazilerde yetiştirilebilir (Stevanato ve Panella 2013). Ayrıca ülkemizin içinde de bulunduğu kuzey yarım kürede 30° güney, 60° kuzey enlemleri arasındaki farklı bölgeler de ve iklim kuşaklar da yetişmektedir (Gencer, 1988). Dünyada ve ülkemizde şeker pancarı ekim alanlarında son yıllarda azalmalar olmuş olsa da Ağrı ilinde şeker pancarı ekim alanlarında artış gözlemlenmiştir (Çizelge 1.1).

**Çizelge 1.1.** Dünya, Türkiye ve Ağrı ili şeker pancarı ekim alanları ve üretim miktarları

Yıllar	Ekim alanı			Üretim miktarı		
	Dünya (ha)	Türkiye (da)	Ağrı (da)	Dünya (ton)	Türkiye (ton)	Ağrı (ton)

**Kaynak:** (FAO, 2022; TÜİK, 2022)

Dünya’da 2000 yılında toplam şeker pancarı ekim alanı 6 milyon hektar civarında iken, 2020 Dünyada 2000-2020 yılları arası kıtalara göre şeker pancarı üretim oranlarına bakıldığında en fazla üretim miktarı %69 oran ile Avrupa birinci sırada yer alırken, bunu sırasıyla Asya (%14) ve Amerika (%13) kıtaları takip etmiştir. Dünyada 2000- 2020 yılları arasında en fazla şeker pancarı üretim birinci sırada Fransa (33.531.894,48 ton) yer alırken, Türkiye 16.519.015,19 ton üretim miktarıyla 5. Sırada yer almaktadır (FAO, 2022)

Dünya nüfusunun sürekli artması tarım ürünlerine olan gereksinimin artması ve sanayi kollarının gelişmesinden dolayı şeker pancarına olan ihtiyaçta artmaktadır. Fakat Dünya’da ve ülkemizde önemli kültür bitkilerinden biri olan şeker pancarı sınırlayan etmenler bulunmaktadır. Bu etmenlerin başında yabancı otlar gelmektedir. Şeker pancarından iyi bir verim elde etmek için mutlaka yabancı otlarla mücadele etmek gerekmektedir. Bu nedenden dolayı ekim alanlarının tümünde yabancı otlara karşı mücadele edilmektedir. Şeker pancarı tohumu, yavaş çimlenir ama yabancı otlar kısa zamanda gelişip büyüdüklerinden erken çimlenen yabancı otlar kısa sürede pancar fidelerini bastırır bundan dolayı şeker pancarında erken dönemlerde daha fazla verimi etkilemektedir (Özer 1993). Yabancı otların şeker pancarında meydana getirdiği ürün kaybı ortalama %5.8 iken, Türkiye’de %6-40 ve Asya ülkelerinde %45 oranlarındadır. Yabancı otlar, sadece ürün verimini değil, ürün kalitesini de ciddi şekilde düşürmektedirler (Jabran and Chauhan 2018). Yabancı otların değişik kültür bitkilerinde oluşturduğu zarar oranı birbirinden farklı olup, bazıları sadece bir kültür bitkisinde sorun oluştururken, diğer bazı türler birden fazla kültür bitkisinde ürün azalmasına sebep olmaktadır (Günçan, 2018). Şeker pancarı ekim alanlarında en fazla tek yıllık yabancı otlar bulunur. Sonrasında çok yıllık yabancı otlar en az ise iki yıllık yabancı ot türleri bulunmaktadır. (Günçan, 2000). Tüm dünyada olduğu gibi ülkemizde de yeni kimyasalların ortaya çıkışı ve tarım yeni tekniklerin ortaya çıkması ile yabancı ot yoğunluğunda ve popülasyonunda sürekli değişikliklerin olduğu ve bun ek olarak belirli dönemlerde büyük problemler yaratan yabancı ot türlerin günümüzde bugün ekonomik zarara neden olmayan türlerin olmuşlardır (Işık ve ark., 2000; Ögüt ve Boz, 2007).

Şeker pancarında yabancı otlar bazı hastalık ve zararlılara yataklık etmekte ve bunların yayılmasına sebep olmaktadır (Er ve İnan, 1987). Tarım alanlarında yabancı otların neden oldukları zararları azaltmak ya da ortadan kaldırmak için yabancı otlarla mücadele gün geçtikçe daha fazla önem kazanmaktadır. Bu sebepten dolayı yabancı otlarla mücadele zamanını iyi tespit edip, maliyetleri en aza indirmek amacıyla günümüzde yeni yöntemler geliştirilmelidir (Malaslı, 2010). Yabancı otlardan dolayı meydana gelen bu kayıpların önüne geçebilmek için etkili bir yabancı ot kontrol stratejisinin takip edilmesi son derece önem arz etmektedir. Yabancı otlarla ekonomik ve etkili bir mücadele yapmanın en temel ilkesi, yabancı ot türlerinin ve bu türlerin biyolojilerinin iyi bilinmesi gerekmektedir (Özer ve ark., 1998). Bunun içinde şeker pancarı üretimi yapılan alanlarda bulunan yabancı otların bilinmesi ve bunların biyolojik/ekolojik özelliklerinin bilinmesi uygulanacak yabancı ot kontrol yönteminin

seçilmesinde ve etkili olmasında büyük önem arz etmektedir. Sonrasında bölgenin ekolojik özellikleri de göz önünde bulundurularak bölgeye göre özel çözüm önerileri geliştirilmelidir (Özaslan ve Kendal, 2014). Bu çalışma Ağrı ili şeker pancarı ekim alanlarında bulunan yabancı ot türleri, rastlama sıklıkları, yoğunlukları ayrıca bölge çiftçisinin yabancı ot sorunlarını çözmedeki yaklaşımlarını, mücadele yöntemlerini belirlemek amacıyla yürütülmüştür.

## 2. MATERYAL VE METOD

Araştırma 2022 yıllarında Ağrı Merkez ve İlçelerine (38° 59' - 40° 02' kuzey paralelleri ile 42° 15' - 44° 36' doğu meridyenleri) bağlı köylerde şeker pancarı yetiştiriciliği yapılan 50 tarlada sorun olan yabancı ot türleri, rastlama sıklıkları ve yoğunluklarını belirlemek amacıyla sürvey çalışması gerçekleştirilmiştir. Buna ek olarak şeker pancarı yetiştiriciliği yapan 100 çiftçi ile yüz yüze görüşmeler gerçekleştirilerek anket çalışması yapılmıştır.

### 2.1. Sürvey çalışması

Ağrı ili şeker pancarı üretim alanlarında görülen yabancı ot türlerini, rastlama sıklıklarını ve yoğunluklarını belirlemek amacıyla yapılan bu çalışma, 2022 yılı vejetasyon dönemlerinde toplamda 50 şeker pancarı tarlasına gidilerek Sürveyler yapılmıştır. Sürvey yapılan ilçeler ve tarlalar 2021 yılı toplam şeker pancarı ekim alanları (da) dikkate alınarak belirlenecektir. (Çizelge 2.1).

**Çizelge 2.1.** Ağrı ilinde ilçelere göre 2021 yılı toplam şeker pancarı üretim alanları ve bu alanlara göre yapılacak Sürvey sayıları (TÜİK, 2022)

İlçeler	Ekim alanları (da)	Örnekleme sayısı
Diyadin	80	1
Eleşkirt	4.250	8
Hamur	252	1
Merkez	2.115	4
Patnos	23.883	33
Taşlıçay	332	1
Tutak	938	2
<b>Toplam</b>	<b>31.850</b>	<b>50</b>

S

ürveylerden önce şeker pancarı ekim alanları belirlenip, sonrasında bu alanlara doğru hatlar halinde gidilerek, her 10 km'de bir rastlantısal olarak durulmuş ve en yakın şeker pancarı tarlasına girilmiştir (Uygur, 1985). Sırma ve ark., (2001)'dan yararlanılarak tarlanın büyüklüğüne göre çerçeveler atılmıştır (Çizelge 2.2).

**Çizelge 2.2.** Sürveylerde tarla büyüklüğüne göre atılan çerçeve sayısı

Tarla büyüklüğü (da)	Atılan çerçeve (adet)
0-5	4
5-10	6
10-20	8
20-50	12
50	16

Sayımlar için 1 m<sup>2</sup>'lik kare çerçeve kullanılmış, kenar tesirinden uzak, 5-10 m içeriden tarlayı temsil edecek şekilde başlayıp ve çerçeve rastgele atılarak içerisine giren yabancı otlar sayılmıştır. Yabancı ot türlerinin teşhisinden, yabancı otların % Rastlama Sıklığı (R.S) (Odum, 1983; Uygur, 1985)'e göre hesaplanmıştır. Rastlama Sıklığı; Bir yabancı ot türünün sürvey yapılan bölgeler içerisinde % kaçında karşılaşıldığını gösteren değerdir. Bu değerlerin hesaplanması aşağıdaki formül ile yapılacaktır.

$$R.S (\%) = 100 \times N/M$$

R.S: Rastlama Sıklığı (%)

N = Bir türün bulunduğu tarla sayısı

M = Ölçüm yapılan toplam tarla sayısı

Yabancı otların yoğunluklarının belirlenmesinde aritmetik ortalama esas alınarak değerlendirme yapılacaktır. Yabancı ot yoğunlukları (adet/m<sup>2</sup>) yapılacak olan sürveylerdeki toplam m<sup>2</sup>'deki yabancı ot sayısı, yapılan sürvey sayısına bölünerek türlerin teker teker yoğunlukları hesaplanmıştır (Odum, 1971).

$$Yoğunluk (adet/m^2) = B/m$$

B; Alınan örnekte toplam birey sayısı

m; Toplam örnekleme sayısı

Sürvey yapılan ekim alanlarında belirlenen yabancı otların rastlama sıklıkları ve yoğunluk değerlerine göre sınıflandırılması ve önemli türlerin vurgulanması amacıyla farklı araştırmacılar tarafından geliştirilen ve uyarlanan skala değerleri (Tepe, 1989; Uludağ, 1993) kullanılmıştır. Skala değerlerinin anlamları (Arslan, 2018)'e göre değerlendirilmiştir. İlgili skala değerleri Çizelge 2.3' te belirtilmiştir.

**Çizelge 2.3. Yabancı otların yoğunluk ve yaygınlıklarının derecelendirilmesi**

Yaygınlık		Yoğunluk			
Ç	: $\geq$ %50	Çok yaygın	A	$\geq$ 10 adet m-2	Çok yoğun
Y	%25-49	Yaygın	B	5,00 - 9,99 adet m-2	Yoğun
O	%13-24	Orta yaygın	C	1,00 - 4,99 adet m-2	Orta yoğun
N	<%12	Düşük yaygın	D	0,10 - 0,99 adet m-2	Düşük yoğun
			E	0,01 - 0,09 adet m-2	Çok düşük yoğun
			F	<0,01 adet m-2	Nadir

## 2.2. Anket çalışması

Araştırma ağırlı ilinde şeker pancarı üretimi yapan 100 çiftçi ile yüz yüze bazı çiftçiler ile tarlalarında bazıları ile köy de evlerinin önünde ve bazı çiftçiler ile de kahvede görüşülerek yürütülmüştür. Çiftçi görüşmeleri TÜİK verilerine göre domates ekim alanları baz alınarak (Çizelge 2.1) yapılmıştır.

Ankete katılan üreticilere;

- Şeker pancarı üretimi ile ilgili karşılaştıkları sorunlar
- Şeker pancarı üretim alanlarında sorun olan yabancı otlar,
- Yabancı ot mücadelesi gibi konularda sorular yöneltilmiştir.

Anket çalışması sırasında çiftçilerin daha iyi tanınması için yabancı ot fotoğrafları ile birlikte bitkilerin canlı materyalleri gösterilmiştir. Üreticilerimizin farklı görüş ve düşüncelerini not edip değerlendirilmiştir.

## 2.3. Veri analizi

Anket sonucunda elde edilen veriler SPSS 20 istatistik paket programında dökümleri alınmıştır. Bulgular frekans ve yüzde dağılımı olarak gösterilmiştir.

## 3. ARAŞTIRMA ve BULGULAR

### 3.1. Araştırmada tespit edilen yabancı ot türleri, rastlama sıklıkları ve yoğunlukları

Araştırmanın yürütüldüğü 2022 yılı Ağrı ili şeker pancarı üretimi yapılan tarlalarda yapılan Sürveyler sonucunda tespit edilen yabancı ot familyaların sahip oldukları yabancı ot tür sayılarına göre dağılımları Şekil 3.1’de sunulmuştur.

**Şekil 3.1.** Tespit edilen yabancı ot familyalarının sahip oldukları yabancı ot tür sayılarına göre dağılımları

Ağrı ili şeker pancarı üretimi yapılan tarım arazilerinde yapılan Sürveyler sonucunda 1 parazit, 1 dar yapraklı ve 11 geniş yapraklı olmak üzere 13 familyaya ait toplamda 40 yabancı ot türü tespit edilmiştir. Tespit edilen bu familyalar içinde en fazla yabancı ot sayısına; Poaceae (11 tür), Asteraceae (8 tür) ve Brassicaceae (7 tür) familyaları sahip olmaktadır. Bu familyaları sırasıyla; Fabaceae (4 tür), Amaranthaceae (2 tür), Polygonaceae (2 tür), Convolvulaceae, Malvaceae, Papaveraceae, Portulacaceae Urticaceae, Scrophulariaceae ve Cuscutaceae (1 tür) familyaları takip etmektedir (Şekil 3.1). Tursun ve ark. (2003), yaptıkları çalışmada, 1 parazit, 1 tohumuz, 2 dar yapraklı ve 18 geniş yapraklı olmak üzere 22 familyaya ait toplamda 41 yabancı ot türü tespit etmişlerdir. Ayrıca en fazla yabancı ot sayısına familyaların sırasıyla Poaceae (8 tür), Asteraceae (5 tür) Fabaceae (3 tür) olduğunu belirtmiştir. Yapılan başka bir çalışmada ise 1 parazit, 1 dar yapraklı ve 16 geniş yapraklı olmak üzere 18 familyaya ait toplamda 56 farklı yabancı ot türü belirlemişlerdir. En fazla yabancı ot sayısına: Asteraceae (15 tür), Amaranthaceae (9 tür) ve Poaceae (8 tür) familyaları sahip olmuştur (Akça ve Işık, 2016). Gökçe (2018), yaptığı çalışmada ise 10 familyaya ait 17 adet yabancı ot türü tespit etmiştir. Tespit ettiği familyalar içinde en fazla yabancı ot sayısına sahip familyaların sırasıyla; Amaranthaceae (5 tür), Asteraceae (3 tür), Poaceae (2 tür) ve Fabaceae (2 tür) olmuştur. Büyükdemir ve Kara (2020), yaptıkları çalışmada sürveyler sonucunda, 17 familyaya ait 25 adet yabancı ot türü tespit etmişlerdir. En fazla yabancı ot sayısına sahip familyaların sırasıyla; Poaceae (5 tür) Asteraceae (3 tür), Amaranthaceae (2 tür) Polygonaceae (2) ve Fabaceae (2 tür) olmuştur. Akar ve Ögüt Yavuz (2020), yaptıkları çalışmada sürveyler sonucunda, 1 parazit,

1 dar yapraklı ve 20 geniş yapraklı 22 familyaya ait toplamda 51 yabancı ot türü tespit etmişlerdir. Ayrıca en fazla yabancı ot sayısına sahip familyaların sırasıyla; Asteraceae (9 tür), Brassicaceae (9 tür) Poaceae (6 tür) olduğunu belirtmiştir. Yukarıda belirtilen çalışmaların sonuçları ile yürüttüğümüz çalışmada elde ettiğimiz sonuçlar büyük oranda benzerlik taşımaktadır. Yapılan sürveyler sonucunda tespit edilen yabancı ot türleri, familyaları, bilimsel adları, Türkçe adları ve yaşam döngüleri Çizelge 3.1’de sunulmuştur.

**Çizelge 3.1.** Tespit edilen yabancı ot türleri, familyaları, bilimsel adları, Türkçe adları ve yaşam döngüleri

Ağrı ili şeker pancarı üretimi yapılan tarım alanlarında yapılan Sürveyler sonucunda 11 geniş yapraklı 1 dar yapraklı ve 1 parazit olmak üzere 13 familyaya ait toplamda 40 yabancı ot türü belirlenmiştir. Bu yabancı otlar 11 dar yapraklı, 28 geniş yapraklı ve 1 parazit türlerinden oluşmaktadır. Tespit edilen yabancı otlardan 23 tür tek yıllık 16 tür çok yıllıktır ve 1 tür parazit türler olmaktadır. Bunlar içerisinde dar yapraklılarda 6 tür tek yıllık ve 5 tür çok yıllık, geniş yapraklı yabancı otlardan ise 16 tür tek yıllık ve 12 tür çok yıllık olmaktadır (Çizelge 3.1). Gökçe (2018), yaptığı çalışmada 10 familyaya ait 17 adet yabancı ot türü tespit etmiştir. Gürsoy (2002), yaptığı çalışma sonucunda, 27 geniş yapraklı, 3 dar yapraklı ve 1 tohumuz olmak üzere 31 familyaya ait toplamda 169 yabancı ot türü tespit etmiştir. Tursun ve ark. (2003), Yaptıkları sürveyler sonucunda; 18 geniş yapraklı, 2 dar yapraklı 1 tohumuz ve 1 parazit olmak üzere 22 familyaya ait toplamda 41 yabancı ot türü tespit etmişlerdir. Özkan ve Kaya (2008), yaptıkları sürveyler sonucunda 18 farklı familyaya ait 1 tohumuz, 5 dar yapraklı, 28 geniş yapraklı 34 yabancı ot türü tespit etmişlerdir. Yapılan başka bir çalışmada, 1 parazit, 1 dar yapraklı 16 geniş yapraklı olmak üzere 18 familyaya ait toplamda 56 yabancı ot türü tespit etmişler (Akça ve Işık 2016). Büyükdemir ve Kara (2020), Yaptıkları sürveyler sonucunda 17 familyaya ait 25 adet yabancı ot türü tespit etmişlerdir. Akar ve Ögüt Yavuz (2020), yaptıkları

sürveyler sonucunda 20 geniş yapraklı, 1 dar yapraklı ve 1 parazit olmak üzere 22 familyaya ait toplamda 51 yabancı ot tespit etmişlerdir. Yukarıda belirtilen çalışmalar da tespit ettikleri yabancı ot türleri ile çalışmamızda tespit ettiğimiz yabancı ot türleri büyük oranda benzerlik taşımaktadır. Ağrı ili şeker pancarı tarlalarında yapılan Sürveyler sonucunda tespit edilen yabancı ot türlerinin yoğunlukları, rastlama sıklıkları ve skala değerleri Çizelge 3.2’de sunulmuştur.

**Çizelge 3.2.** Tespit edilen yabancı ot türlerin rastlama sıklıkları, yoğunlukları ve skala değerleri

Ç: Çok yaygın, Y:Yaygın, O: Orta yaygın, N: Düşük yaygın ve A:Çok yoğun, B: Yoğun, C: Orta yoğun, D: Düşük yoğun, E: Çok düşük yoğun, F: Nadir

Çalışmada tespit edilen 40 yabancı ot türünden 7'sinin rastlama sıklıkları %50 ve (çok yaygın Ç: >%50) üzeri olarak tespit edilmiştir. Bu yabancı otlar sırasıyla; *C. album* (%92), *A. retroflexus* (%86), *C. arvensis* (%80), *S. arvensis* (%72), *C. arvensis* (%64), *R. crispus* (%60) ve *C. bursa-pastoris* (%52) olmuştur. Sürveyler sonucunda tespit edilen yabancı otlardan 7 türün rastlama sıklığı %25-49 (Y: Yaygın) arasında tespit edilmiştir. Ayrıca tespit edilen yabancı otlar içerisinde 14 tür ise orta yaygınlıkta (O: R= %13-24) tespit edilmiştir. Tespit edilen yabancı otlar içerisinde 11 tür nadir (N: R=%0-12) olarak tespit edilmiştir. Buna ek olarak rastlama sıklıkları en düşük yabancı ot türleri sırasıyla: *A. repens*, *D. songuinialis*, *M. neglecta*, *P. rhoeas* ile *S. halepense* (%8), *M. sativa* (%6), *U. sioica* (%4), *V. sativa* (%2) olmuştur (Çizelge 3.2). Özkan ve Kaya (2008), yaptıkları çalışmada rastlanma sıklıklarına göre önemli olarak tespit ettikleri yabancı ot türlerinin; *C. album*, *A. retroflexus*, *C. arvensis*, *S. arvensis*, *C. arvensis*, *P. aviculare*, *E. crus-galli*, *A. azurea*, *C. dactylon*, *C. draba*, *B. tectorum* ve *Sonchus* spp. olmuştur. Sabancı (2013), yaptığı çalışmada şeker pancarı ekim alanlarında sık rastlanan yabancı otların, *C. album*, *L. serriola*, *C. nutans* ve *E. crus-galli* olduğunu belirtmiştir. Akça ve Işık (2016), yaptıkları çalışmada rastlama sıklıkları en fazla olan yabancı ot türleri; *C. album* (%100), *A. retroflexus* (%96), *C. arvensis* (%82), *X. strumarium* (%68), *A. blitoides* (%60), *E. crus-galli* (%49) ve *Cuscuta* sp. (%46) olmuştur. Kulan (2019), yaptığı çalışma sonucunda rastlama sıklıkları en yüksek olan yabancı ot türlerin sırasıyla; *A. retroflexus* (%85), *C. album* (%64), *S. nigrum* (%41), *E. crus-galli* (%17) ve *X. strumarium* (%14) olmaktadır. Yapılan başka bir çalışmada ise rastlanma sıklıkları en yüksek yabancı ot türleri; *Setaria* spp. (%26,91), *C. album* (%20,87), *E. crus-galli* (%20,79), *P. oleracea* (%19,64), *A. retroflexus* (%18,69), *S. nigrum* (%16,19), *H. ellipticum* (%13,73), *S. halepense* (%13,71), *A. theophrastii* (%12,06), *C. dactylon* (%8,52) olmaktadır. (Büyükdemir ve Kara 2020). Akar ve Öğüt Yavuz (2020),

yaptıkları çalışmada ise rastlama sıklıklarının en yüksek olan yabancı ot türlerin; *A. retroflexus* (%100), *C. album* (%100), *C. arvensis* (%87.67) ve *Polygonum* spp. (%73.97) olmaktadır. Yürüttüğümüz çalışmada rastlama sıklıkları en yüksek olarak belirlediğimiz yabancı ot türleri ile yukarıda belirtilen çalışmalarda rastlama sıklıkları en yüksek olarak tespit edilen yabancı ot türleri benzerlik taşımaktadır.

Yapılan Sürveyler sonucunda tespit edilen yabancı otlardan 4 türün yoğunluğu 1 adet/m<sup>2</sup> ve üzeri olup, skala değerlerine göre Orta yoğunlukta ((C) Y=1,00 - 4,99 adet/ m<sup>2</sup>) tespit edilmiştir. Bu yabancı otlar sırasıyla; *C. album* (2,82 adet/ m<sup>2</sup>), *C. arvensis* (2,15 adet/ m<sup>2</sup>), *A. retroflexus* (1,86 adet/ m<sup>2</sup>) ve *S. arvensis* (1,47 adet/ m<sup>2</sup>) türleri olmuştur. Ayrıca yapılan sürveyler sonucunda 15 yabancı ot türü Düşük yoğun ((D) Y=0,10 - 0,99 adet/ m<sup>2</sup>), 12 tür Çok düşük yoğun ((E) Y=0,01 - 0,09 adet/ m<sup>2</sup>) ve 9 tür ise Nadir ((F) Y=<0,01 adet/m<sup>2</sup>) olarak tespit edilmiştir. Yoğunlukları en düşük 5 yabancı ot türü ise *M. neglecta* (0,006 adet/m<sup>2</sup>), *A. repens* (0,005 adet/m<sup>2</sup>), *M. sativa* (0,005 adet/m<sup>2</sup>), *P. rhoeas* (0,002 adet/m<sup>2</sup>) ve *V. sativa* (0,002 adet/m<sup>2</sup>) olarak tespit edilmiş (Çizelge 3.2). Kordalı ve Zengin (2008), yaptıkları çalışmada en fazla yoğunlukta tespit ettikleri yabancı otların *S. arvensis*, *C. album*, *C. arvensis*, *C. arvense*, *A. retroflexus*, *Tragopogon* spp., *S. viridis*, *G. tuberosum*, *F. convolvulus* ve *C. draba* olduğunu belirtmişlerdir. Tursun ve ark. (2003), yaptıkları çalışmada tespit ettikleri yabancı otlar en önemli türlerin sırasıyla; *A. retroflexus*, *C. album*, *C. arvensis*, *S. nigrum* ve *S. arvensis* olarak belirlemişlerdir. Yapılan başka çalışmada ise en fazla yoğunlukta *A. retroflexus*, *C. album*, *C. arvense*, *P. aviculare*, *L. amplexicaule* ve *C. arvensis* yabancı ot türleri tespit etmişlerdir Sutay ve Zengin (2007). Gökçe (2018), yaptığı çalışmada tarafından yoğunlukta, *A. retroflexus*, *A. blitoides*, *X. spinosum*, *C. album* ve *Cuscuta* spp., yabancı ot türleri tespit etmiştir. Akça ve Işık (2016), yaptıkları çalışmada en fazla yoğunlukta *A. retroflexus* (4.01 adet/m<sup>2</sup>), *C. album* (2.41 bitki/m<sup>2</sup>), *E. crus-galli* (2.22 bitki/m<sup>2</sup>), *S. verticillata* (1.96 bitki/m<sup>2</sup>) ve *C. arvensis* (1.45 bitki/m<sup>2</sup>) yabancı ot türlerini tespit etmişler. Büyükdemir ve Kara (2020), yaptıkları çalışmada en fazla yoğunluğa sırasıyla; *Setaria* spp. (2,79 bitki/m<sup>2</sup>), *E. crus-galli* (2,10 bitki/m<sup>2</sup>), *S. halepense* (1,34 bitki/m<sup>2</sup>), *P. oleracea* (1,10 bitki/m<sup>2</sup>), *C. album* (1,03 bitki/m<sup>2</sup>), *A. retroflexus* (0,82 bitki/m<sup>2</sup>), *C. dactylon* (0,79 bitki/m<sup>2</sup>), *S. nigrum* (0,74 bitki/m<sup>2</sup>), *Polypogon* sp. (0,65 bitki/m<sup>2</sup>), *H. ellipticum* (0,61 bitki/m<sup>2</sup>) türleri sahip olmuştur. Akar ve Ögüt Yavuz (2020), yürüttükleri çalışmada yoğunlukları en yüksek yabancı ot türleri; *C. album*, *A. retroflexus*, *C. arvensis* ve *Polygonum* spp. olmuştur. Kulan (2019), yaptığı çalışmada yoğunlukları en yüksek yabancı ot türlerin sırasıyla: *C. album* (39,08 bitki/m<sup>2</sup>), *A. retroflexus* (29,11 bitki/m<sup>2</sup>), *S.*

*nigrum* (17,48 bitki/m<sup>2</sup>), *E. crus-galli* (6,04 bitki/m<sup>2</sup>) ve *C. arvense* (1,60 bitki/m<sup>2</sup>) olarak tespit etmişlerdir.

### 3.2. Anket analizi sonuçları

Araştırmaya katılanların cinsiyetlerine, yaş gruplarına ve eğitim durumları göre dağılımı ile ilgili yöneltilen sorulara verilen cevap frekans ve yüzde değerleri Çizelge 3.3’de verilmiştir.

**Çizelge 3.3.** Çalışmamız katılım gösteren çiftçilerin cinsiyetleri, yaşları ve eğitim durumlarına göre dağılımları

Cinsiyet	%	Yaş	%	Eğitim Durumu	%
Erkek	94	20-30	13	Okumadım	12
Kadın	6	31-40	35	İlkokul	43
		41-50	40	Ortaokul	28
		50+	12	Lise	13
				Üniversite	4
Toplam	100	Toplam	100	Toplam	100

Ankete katılım gösteren çiftçilerin %94’ü erkek ve %6’sı kadın olmakta ve %40’ı 41-50 yaş aralığın da olmaktadır. Çiftçilerin %43’ü ilkokul, %28’i ortaokul, %13’ü lise, %12’si okuryazar değil ve %4’ü üniversite mezunu olmaktadır. Şeker pancarı ekim alanlarında bitki koruma sorunlarını önemine göre sıralayınız sorusuna verdikleri cevapların yüzde değerleri Şekil 3.2’de sunulmuştur.

Şeker pancarı ekim alanlarında bitki koruma sorunlarını önemine göre sıralayınız?

**Şekil 3.2.** Şeker pancarı ekim alanlarında bitki koruma sorunlarını önemine göre sıralayınız sorusuna verdikleri cevapların yüzde değerleri

Ankete katılım gösteren çiftçilerin %82'si şeker pancarı ekim alanlarında en büyük sorunun yabancı otlar olduğunu, %10'u hastalıklar ve %8'i ise böcek zararlıları olduğunu belirtmişlerdir. Çiftçilere yöneltilen Yabancı ot problemi verim için ne derece önemlidir ve tarlanızdaki yabancı ot yoğunluğu ne seviyededir sorularına verilen cevapların yüzde oranları Çizelge 3.4'te verilmiştir.

**Çizelge 3.4.** Yabancı ot problemi verim için ne derece önemlidir ve tarlanızdaki yabancı ot yoğunluğu ne seviyededir sorularına verilen cevapların yüzde oranları

Yabancı ot problemi verim için ne derece önemlidir?		Yabancı ot yoğunluğu tarlanızdaki ne seviyededir?	
	Frekans		Frekans
Hiç önemli değil	0	Hiç yok	0
Az önemli	0	Az yoğun	0
Orta önemli	10	Orta yoğun	3
Önemli	15	Yoğun	22
Çok önemli	75	Çok yoğun	75

Ankete katılım gösteren çiftçilerin %75'i yabancı otların şeker pancarında verim için çok önemli olduğunu ve benzer şekilde çiftçilerin %75'i şeker pancarı ekim alanlarında yabancı otların çok yoğunlukta olduğunu belirtmişlerdir. Çiftçilere yönelttiğimiz tarlanızda sorun olan yabancı ot türleri hangileridir işaretleyiniz Sorusuna verilen cevapların yüzde değerleri Çizelge 3.5'te verilmiştir.

**Çizelge 3.5.** Tarlanızda sorun olan yabancı ot türleri hangileridir işaretleyiniz sorusuna verilen cevapların yüzde ve frekans değerleri

Yabancı otlar	Yaygın adları	%
<i>Amaranthus retroflexus</i> L.	Kırmızı köklü horoz ibiği	70
<i>Chenopodium album</i> L.	Sirken	72
<i>Cirsium arvense</i> (L.) Scop.	Köy göçüren	25
<i>Convolvulus arvensis</i> L	Tarla sarmaşığı	78
<i>Polygonum</i> spp.	Çoban değneği türü	52
<i>Rumex crispus</i> L.	Kıvırcık labada	33
<i>Sinapis arvensis</i> L.	Yabani hardal	45
Diğer		35

Ağrı ilinde şeker pancarı üreticiliği yapan çiftçilerle yapılan anket çalışmasında çiftçilere yöneltilen “Tarlanızda sorun olan yabancı ot türleri hangileridir işaretleyiniz?” sorusuna çiftçilerin sorunlu olarak gördükleri yabancı ot türleri sırasıyla; *C. arvensis* (%78), *C. album*

(%72), *A. retroflexus* (%70), *Polygonum* spp. (%52), *S. arvensis* (%45), *R. crispus* (%33) ve *C. arvensis* (%25) olarak belirtmişlerdir. Ayrıca ankete katılım gösterenlerin %35'ü ise diğer yabancı otlar olarak bildirmişlerdir. Tursun ve Seyithanoğlu (2006), yaptıkları anket çalışmasında anketlerine katılım gösteren çiftçilerin %51,95'i *X. strumarium*, %48,12'si *Cuscuta* spp., %42,00'ü *S. halepense*, %41,62'si *Seteria* spp. ve %35,11'i *C. album* yabancı ot türlerinin şeker pancarı ekim alanlarında yoğunlukta olduğunu bildirmişlerdir. Buda elde ettiğimiz sonuçlar ile benzerlik taşımaktadır. Çiftçilere yönelttiğimiz şeker pancarı ekim alanlarında yabancı otlarla mücadele kararını nasıl veriyorsunuz sorusuna verilen cevapların yüzde ve frekans değerleri Şekil 3.6'da verilmiştir.

**Şekil 3.6.** Şeker pancarı ekim alanlarında yabancı otlarla mücadele kararını nasıl veriyorsunuz sorusuna verilen cevapların yüzde ve frekans değerleri

Çalışmaya katılan çiftçilerin %68'i yabancı ot popülasyonuna bakarak mücadele kararını verdiklerini ifade etmişlerdir. Ankete katılım gösteren çiftçilere yönelttiğimiz yabancı otlar ile hangi mücadele yöntemini uyguluyorsunuz sorusuna verilen cevapların frekans ve yüzde değerleri Şekil 3.7'de verilmiştir.

**Şekil 3.7.** Yabancı otlar ile hangi mücadele yöntemini uyguluyorsunuz sorusuna verilen cevapların yüzde ve frekans değerler

Ankete katılım gösteren çiftçilerin %65'i yabancı otlara karşı mekanik mücadele yaptıklarını, %27'si kimyasal mücadele ve %8'i fiziksel mücadele yöntemlerini kullandıklarını ifade etmişlerdir. Gül, (2019) yaptığı çalışmada çiftçilerin %96,8'i şeker pancarı ekim alanlarında kültürel mücadele yaptıklarını, %97,8'i mekanik mücadele ve %100'ü kimyasal mücadele yaptıklarını belirtmişlerdir. Kullandığınız herbisiti kime danışarak alıyor ve kullanıyorsunuz?" sorusuna verilen cevapların yüzde değerleri Şekil 3.8'de verilmiştir.

**Şekil 3.8.** Kullandığınız herbisiti kime danışarak alıyor ve kullanıyorsunuz? Sorusuna verilen cevapların yüzde değerleri

Ankete katılım gösteren çiftçilerin %82'si Zirai ilaç bayisine danışarak, %15'i kendi karar verdiğini belirtmişlerdir. Kullandığınız herbisitler ne derece etkili sorusuna verilen cevapların yüzde değerleri Şekil 3.9'da verilmiştir.

**Şekil 3.9.** Kullandığınız herbisitler ne derece etkili? Sorusuna verilen cevapların yüzde değerleri

Ankete katılım gösteren çiftçilerin %4'ü orta düzeyde, %29'u çok az ve %24'ü ise çok etkili ve %3'ü kullandığı herbisitlerin tamamen etkili olduğunu ifade etmiştir. Şeker pancarında kullandığınız herbisitlerin etki etmediğini düşündüğünüz yabancı ot türleri var mı varsa isimlerini yazınız sorusuna verilen cevapların frekans ve yüzde değerleri Şekil 3.10'da verilmiştir.

Şeker pancarında kullandığınız herbisitlerin etki etmediğini düşündüğünüz yabancı ot türleri var mı varsa isimlerini yazınız:

**Şekil 4.23.** Şeker pancarında kullandığınız herbisitlerin etki etmediğini düşündüğünüz yabancı ot türleri var mı varsa isimlerini yazınız sorusuna verilen cevapların frekans ve yüzde değerleri

Çiftçilerin %26'sı kullandıkları herbisitini *C. arvensis*'e etki etmediğini, %18'i *Polygonum* spp. ve %14'ü ise *S. arvensis*'e etki etmediklerini belirtmişlerdir. Çiftçiler tarafından belirtilen yabancı ot türleri Dünya'da hepsi, Türkiye'de ise *S. arvensis* herbisitlere karşı dayanıklılık kazanmış yabancı ot türleri olarak rapor edilmiştir (Heap, 2022).

#### **4. SONUÇ ve ÖNERİLER**

Yabancı otlar şeker pancarı ekim alanlarında önemli verim ve kalite kayıplarına sebep olmaktadır. Yabancı otlarla mücadele etmek için önceden yabancı otları tanımak gerekmektedir. Bundan dolayı yürüttüğümüz çalışmada sonucunda Ağrı ili şeker pancarı ekim alanlarında 13 familyaya ait toplamda 40 yabancı ot türü tespit edilmiştir. En fazla yabancı ot sayısına Poaceae, Asteraceae ve Brassicaceae familyaları sahip olmuştur. Tespit edilen yabancı ot türlerinden rastlama sıklıkları en yüksek olan türler sırasıyla *C. album* (%92), *A. retroflexus* (%86) ve *C. arvensis* (%80) olmuştur. Yoğunlukları en yüksek yabancı ot türleri sırasıyla; *C. album* (2,82 adet/ m<sup>2</sup>), *C. arvensis* (2,15 adet/ m<sup>2</sup>) ve *A. retroflexus* (1,86 adet/ m<sup>2</sup>) olmuştur. Ankete katılım gösteren çiftçilerin %82'si şeker pancarı ekim alanlarında en büyük sorunun yabancı otlar olduğunu ve tarlalarda yabancı otun çok yoğun olduğunu ifade etmişlerdir. Ayrıca -çiftçilerin %65'i yabancı otlara karşı mekanik mücadele yaptıklarını ve %68'i yabancı ot popülasyonuna bakarak mücadele kararını verdiklerini ifade etmişlerdir. Çiftçilerin yarısına yakını şeker pancarı ekim alanlarında kullandıkları herbisitlerin orta düzeyde etkili olduğunu ve bazı yabancı ot türlerine etki etmediklerini belirtmişlerdir. Bu sürveyler ve çiftçilerin vermiş oldukları cevaplar doğrultusunda domates alanında sorun olan yabancı otlara karşı daha iyi ve ekonomik mücadele yöntemi belirlemek gerekir.

## **GELECEĞİN TARIM MODELİ KAPALI DİKEY TARIM TESİSLERİ**

**Prof. Dr. Hayriye Yıldız DAŞGAN (Orcid ID: 0000-0002-0403-1627)**

Çukurova Üniversitesi, Ziraat Fakültesi, Bahçe Bitkileri Bölümü

### **ÖZET**

Azalan tarım alanları, değişen iklim koşulları, salgın hastalıklar, artan gıda temini ve tarımdaki işgücü azalması yenilikçi teknolojilerin kullanımını zorunlu kılmaktadır. İklim değişikliğinin artan olumsuz etkileri ve salgın hastalıklar, insanlarda ve hükümetlerde gelecekte gıdaya kolay ulaşamama endişesi oluşturmaktadır. Gelecekte hedef tarım stratejilerimizi değiştirmek, suyu, enerjiyi ve yetiştirme alanlarını optimum şekilde kullanan bitki fabrikalarında dikey olarak topraksız yetiştiricilik projelerini devreye sokmak gerekebilecektir. Bitki yetiştiriciliği için gerekli tüm koşulların (CO<sub>2</sub>, sıcaklık, ışık, aydınlık-karanlık zaman, ortam nemi, kök ortamında mineral besin maddeleri, pH, EC, oksijen) optimum şekilde kontrol edilebildiği, iklim değişikliğinden bağımsız, dikey katlar şeklinde, alanın ve suyun en ekonomik kullanıldığı “Bitki fabrikaları” gıda üretiminin teminatı rolü ile popüler üretim modeli olarak karşımıza çıkmaktadır. Ülkemizin sahip olduğu ekolojik zenginlik ve su kaynakları iklim değişikliğinden payını almaktadır. Ülke olarak gelecek yıllarda gıda güvenliği konusunda tedbir almak adına, kapalı mekânlarda kontrollü dikey tarım yetiştiriciliğinin bitkisel, endüstriyel ve ekonomik açılarından her yönüyle incelenmesi gerekmektedir.

**Anahtar kelimeler:** Atık enerji, sera ısıtması, termik santral

## **GELECEĞİN TARIMI**

Bitki fabrikaları, yeni nesil sanayileşmiş tarımı temsil etmektedir. İnsan sezgisine dayanan tarımdan kesin veri yönetimine dayanan bir değişimi simgelemektedir. Tarımın endüstri ve diğer sektörler ile ilişkiye girmesine fırsat sunmaktadır. Bu yeni nesil tarım için şu aşamada bazı belirsizlikler varsa da, özellikle marjinal bölgelerde yakın gelecekte piyasanın önemli ölçüde bu tarım şekline kayabileceği ve artacağı tahmin edilmektedir (1). Bitki fabrikaları, doğadaki iklimsel değişimlerden bağımsız olması ve metropol büyük kentlerin içerisinde tarımsal üretim yapmaya olanak tanınması nedenleriyle gelecekte gıda gereksinimi için etkili bir çözüm olarak gösterilmekte ve son yıllarda oldukça ilgi görmektedir.

Bitki fabrikaları, kapalı bir mekanda (bina, konteyner vb) bitkilerin katlı raflarda dikey yetiştirildiği iklim koşullarından CO<sub>2</sub>, sıcaklık, ışık, aydınlık-karanlık, zaman, ortam nemi, kök ortamında mineral besin maddeleri, pH, EC, oksijen, su koşullarının optimum düzeyde kontrol ve otomatizasyonunun sağlanabildiği tarımsal yapılardır. Bitki fabrikalarında iç ortam iklim koşulları bitkilerin istediği seviyelerde kontrol edilerek, klasik dış mekân tarımsal yetiştiriciliğinden 10 kata kadar daha hızlı sebze üretebilmektedir. Bitki fabrikalarında çoklu yetiştirme katları kullanıldığı için, sebzelerin küçük bir alanda kesintisiz kitlesel, seri üretimi kolaylaşmaktadır (1).

Küresel ısınma nedeniyle iklim değişikliğinin etkilerinin sıklaştığı, suyun çok değerli olduğu günümüzde bitki fabrikalarında aeroponik gibi sistemlerde yapraklı sebzeleri yetiştirmek için açık alanda gereken suyun sadece % 1'i, serada gerekli olan suyun sadece % 2'si veya daha azı yeterli olabilmektedir (1). Bitki fabrikaları bu nedenle suyun çok değerli olduğu özellikle Çin, Ortadoğu, Akdeniz havzası ülkelerinde dikkat çekmektedir. Bu yönüyle geleceğin tarım fabrikaları olma potansiyeli taşımaktadır (1). Bitki tarafından suyun yaklaşık % 95'i kökler tarafından emilir ve yapraklardan buharlaşır. Bir bitki fabrikasında yetiştiricilik söz konusu olduğunda, ışık kaynağı tarafından üretilen ısıyı gidermek için içerisi soğutulduğundan, su buharı, klimanın soğutma ünitesinde yoğunlaştırılır ve bu, bitkilerin sulanması için geri dönüştürülerek kullanılabilir (1).

**Şekil 1.** Kapalı dikey fabrikalarında raflı sistemlerde marul yetiştiriciliği

Açık alanda yetiştirilen sebzeleri, toprak, diğer yabancı maddeler ve mikroorganizmalardan temizlemek için çok fazla su kullanılmaktadır. Dış yapraklar hasatta ya da ambalajlama sırasında bertaraf edilmektedir ve toplam ağırlığın sadece% 60'ı gerçekten tüketilmektedir. Buna karşılık, bitki fabrikalarında yetişen sebzelerinin % 95 veya %100 ayrılmadan olduğu gibi tüketilmektedir (1). Hijyenik koşullarda üretildiği için temizleme amacıyla su sarfiyatı yapılmamaktadır. Açık alanda yetişen sebzelere göre bitki fabrikalarında üretilen sebzelerin raf ömrü tüketim kalitesi (gevreklik ve besin içeriği) düşmeden 4-5 kata kadar uzayabilmektedir. Bitki fabrikalarının verimliliği, iklim koşullarının optimizasyonu ve yüksek bitki yoğunluğu ile artırılabilir. Bitkiler zararlılara, şiddetli yağmurlara veya kuvvetli rüzgâra maruz kalmamaktadır ve bu dış faktörlerle ilişkili kayıp riski bulunmamaktadır. Açık alanda üretime göre 10 kat raflı bir fabrikada yetiştirme alanı ve üretkenlik 10 kat artırılmaktadır. Bu nedenle, metrekaşe başına toplam üretkenlik konvansiyonel üretime göre, potansiyel olarak artmaktadır (1).

Yaşam döngüsü değerlendirmesi açısından, bir bitki fabrikası 10 yıldan fazla süre kullanılırsa geleneksel tarıma göre daha fazla kaynak tasarrufu sağlanmaktadır. Geleneksel tarımda, tarım makineleri işletmek, pestisit, gübre ve su uygulamak için enerji gerekmektedir. Açık alanda yetiştirilen bitkilerin bitki fabrikasında yetiştirilenlerle karşılaştırıldığında gübre miktarının neredeyse iki katına çıktığı bildirilmiştir. Beklenmedik iklimsel olaylarla ilgili kayıplar (aşırı yağışlar sel, kuraklık, ekstrem sıcaklıklar vb) açık alanda sebze yetiştiriciliğinin en büyük riskleridir (1).

Sanayide gün boyunca elektrik kullanımı zirvede iken gece elektrik kullanımı çok azalmaktadır. Elektrik enerjisi şirketleri, pik elektrik talebini azaltmak için çalışmaktadır. Yapay ışık kullanan bitki fabrikalarında, ışıklar sadece geceleri açılmaktadır ve böylece ucuza daha fazla elektrik kullanılabilir. Seralarda bitkiler güneş ışığı kullanılarak yetiştirilmektedir. Seralarda yapay aydınlatma için elektrik maliyeti düşüktür ancak seraları ısıtmak için önemli miktarda yakıt gerekmektedir. Öte yandan, bitki fabrikaları dış koşullara kapalıdır, asgari iklimlendirme maliyetleri ile yalıtılmış alanlardır ve bu nedenle iklimlendirme için enerji kullanımı azalmaktadır ve çevre dostudur (1).

Bitki fabrikaları hijyenik ortamlar olduğu için ve sıfır pestisit ile üretim yapıldığından yetiştirilen ürünler yıkanmadan tüketilebilmektedir. Ayrıca, fabrika bitkileri geleneksel tarla bitkilerinden daha fazla C vitamini, karoten ve polifenol içermektedir. Devam eden araştırmalar yoluyla özellikle LED aydınlatma sistemlerinde ışığın dalga boyları ile düzenlemeler yapılarak insan beslenmesine katkıları gün geçtikçe artmaktadır (1) (Şekil 2). Böbrek hastalarına potasyum içeriği düşük yeşil sebzelerin üretilmesi ya da selenyum biofortifikasyonu sebzeler gibi özel taleplere göre spesifik ürünler yetiştirilebilmektedir.

Dünyada nüfus artışının mevcut hızla devam etmesi durumunda, gıda üretiminin % 60 oranında artması gerektiği bildirilmektedir [2]. Buna karşın, tarımsal alanın sadece % 2 oranında artabileceği tahmin edilmektedir. Mevcut tarım alanları ile artan gıda üretimine cevap vermek mümkün görünmemektedir. 2030 yılında dünya nüfusunun 8,5 milyara, 2050 yılında ise 9,7 milyara çıkacağı tahmin edilmektedir. Nüfus artışına ek olarak, 2050 yılında, kentsel alanlarda yaşayanların sayısının 6 milyar kişiyi geçmesi ve bu nüfusun % 90'ının gelişmekte olan ülkelerde yaşaması beklenmektedir (3).

İklim değişikliğinin tarım üzerindeki olumsuz etkileri, SARS-Covit-19 gibi küresel salgın hastalıklar ve hızlı artan dünya nüfusunun gıda güvenliği üzerindeki baskılarının çözümüne yönelik arayışlar, hem akademiye hem de özel sektörde uzun zamandır yürütülmektedir. Bunların içerisinde ümit var olarak gösterilen çözümlerin başında kontrollü koşullarda topraksız tarım uygulamaları gelmektedir. Topraksız tarım ilk olarak NASA tarafından keşfedilen ve son yıllarda uzay araştırmalarında da çok sık kullanılan bir yöntem olmuştur (4).

**Şekil 2.** Kapalı dikey tarım tesislerinde bitkiler güneş ışığı yerine LED aydınlatmalar ile yetiştirilmektedir.

İklim değişikliğinden bağımsız, zirai ilaç kullanılmayan, gıda güvenlik zinciri koşulları tam olarak sağlanmış, topraksız tarım uygulamaları her geçen gün hayatımıza yeni tarım uygulamaları olarak girmektedir. Bunlardan bazıları İnce Akan Su Kültürü (Nutrient Film Technique), Derin Akan Su Kültürü (Deep Flow Technique), Püskürtmeli Su Kültürü (Aeroponic) ve Med-Cezir (Ebb-flow) uygulamaları olarak göze çarpmaktadır. Bu su kültürü sistemlerinin kapalı bitki fabrikalarında özellikle yeşil yapraklı bitkilerde (marullar, ıspanak, taze baharatlar; fesleğen, tere, roka vb) başarılı bir şekilde ticarileştiği görülmektedir.

## **KAPALI DİKEY TARIM TESİSLERİNDE KULLANILAN SU KÜLTÜRÜ SİSTEMLERİ**

Topraksız tarım uygulamaları iki ana gruba ayrılmaktadır.

- A) Katı Ortam Kültürü ( Substrat Culture)
- B) Sıvı Ortam Su Kültürü (Water Cultures, Hydroponics)
  - a. Durgun Su Kültürü (Floating Culture)

- b. İnce Akan Su Kültürü (NFT, Nutrient Film Technique)
- c. Derin Akan Su Kültürü (DFT, Deep Flow Culture)
- d. Püskürtmeli Su Kültürü (Aeroponic)
- e. Med-Cezir Su Kültürü (Ebb-Flow)

Kapalı dikey tarım tesislerinde kullanılan su kültürleri topraksız tarım sistemlerinin kullanımının sayısız faydaları mevcuttur (3). Bu faydalar aşağıdaki gibi sıralanmaktadır:

1. Bitkiler toprakta olduğundan % 50 daha hızlı büyürler çünkü besin ve suya daha kolay ulaşırlar,
2. Tüm yıl boyunca kapalı bir yerde güneş ışığı olmadan yapay ışıklandırma ile ürün yetiştirmek mümkündür,
3. İklim ve coğrafyadan bağımsız yapılar oluşturularak, her yerde ve her koşulda yetiştirme yapılabilir,
4. Besinler bitkilerin direkt ulaşacağı şekilde mevcuttur ve yetiştirme ortamına ait değildirler,
5. Pestisit kullanılmaz. Bitkiler hastalıklardan arınmış bir ortamda yetiştirmeye başlarlar,
6. Yetiştiricilik için daha küçük kök hacmi veya kaplar kullanılabilir,
7. Bitki yetiştiriciliğinin mümkün olmadığı yerlerde/mekarlarda yetiştiricilik yapmak mümkündür, örneğin toprağın fakir olduğu yerler, kayalık alanlar, elektrik ve suyun sağlanabildiği her koşulda üretim yapılabilir,
8. Toprakta yapılan yetiştiriciliğe oranla daha az iş gücüne gerek vardır. Toprak hazırlığı, çapalama veya yabancı ot mücadelesine gerek yoktur,
9. Bitkilerin büyüme koşullarının kontrol altında olması bitkiler için mümkün olan en iyi ortamın sağlanmasını kolaylaştırır ve kaliteli ürün ve yüksek gelir elde edilmesini sağlar,
10. Zararlı ve hastalık saldırısına maruz kalmadan hijyenik ortamlarda üretildiğinden kontamine olmayan bitkilerin raf ömrü uzun olmaktadır,
11. Sağlık açısından daha yüksek besin öğeleri içerirler; düşük nitrat, yüksek vitaminler, mineraller, antioksidanlar,
12. Bu yöntemler ile yetiştirilen bitkilerin, insan sağlığına olumsuz yan etkisi bulunmamaktadır. Bu ürünlerin vitamin, mineral ve antioksidan içerikleri toprakta yetiştirilen ürünlerden daha yüksek olabilmektedir.

## **SONUÇ**

İklim deęişikliğinden bağımsız, dikey katlar şeklinde, alanın ve suyun en ekonomik kullanıldığı “Bitki fabrikaları” gıda üretiminin teminatı rolü ile popüler üretim modeli olarak karşımıza çıkmaktadır. Ülkemizin sahip olduęu ekolojik zenginlik ve su kaynakları iklim deęişikliğinden payını almaktadır. Ülke olarak gelecek yıllarda gıda güvenliği konusunda tedbir almak adına, kapalı mekânlarda kontrollü dikey tarım yetiştiriciliğinin bitkisel, endüstriyel ve ekonomik açılardan her yönüyle incelenmesi gerekmektedir.

**MONITORING THE QUALITY OF EDUCATION.**

**Nuraiym ZHANIBEKOVA (Orcid ID: 0000-0002-3024-8061)**

L.N. Gumilyov Eurasian National University

Faculty of Information Technology, Pedagogical dimensions, Astana, Kazakhstan.

**ABSTRACT**

The purpose of the study is to evaluate the effectiveness of school-based monitoring of the educational process. To monitor the educational process at primary schools, we looked at a variety of approaches and methodologies, including continuous observation, test circumstances, explication, surveys, analysis of learner educational activity results, and student testing. Two viewpoints are taken into consideration while examining the monitoring of the educational process during school-based practical training: that of the university personnel and that of the development of student's skills in carrying out such monitoring. The submissions can help improve educational content, assess the efficacy of educational technologies being measured, identify issues with the educational process, and proposing solutions.

**Keywords:** monitoring, educational process, primary school, monitoring practices, feedback.

## **INTRODUCTION**

A crucial part of providing students with a high-quality education, according to the body of educational research literature known as effective schooling research, is the practice of monitoring student learning. One of the key distinctions between effective schools and teachers and those who are not has been demonstrated in the literature to be the rigorous monitoring of students' progress. Monitoring student progress is a powerful predictor of student accomplishment in studies that aimed to quantify the relative effect sizes of various educational strategies. What does it entail to "monitor student learning"? Monitoring is defined as KEEPING WATCH OVER; SUPERVISING in the American Heritage dictionary, but it also has another, more precise definition: TO SCRUTINIZE OR CHECK SYSTEMATICALLY WITH A VIEW TO COLLECTING CERTAIN SPECIFIED CATEGORIES OF DATA.

For our purposes, we will define monitoring as TEACHERS' ACTIVITIES TO KEEP TRACK OF STUDENT LEARNING to make INSTRUCTIONAL DECISIONS AND provide FEEDBACK TO STUDENTS ON THEIR PROGRESS. When educators talk about classroom monitoring, they usually mean one of the following teacher behaviors:

- Questioning students during classroom discussions to check their understanding of the material being taught;
- Circulating around the classroom during seatwork and engaging in one-to-one contacts with students about their work
- Assigning, collecting, and correcting homework; recording completion and grades
- Conducting periodic reviews with students to confirm their grasp of learning material and identify gaps in their knowledge and understanding
- Administering and correcting tests; recording scores
- Reviewing student performance data collected and recorded and using these data to make needed adjustments in instruction

## **WHAT OUGHT TO BE MONITORED BY THE FRAMEWORK?**

Both the individual and the system should be under constant observation. Information regarding their school is necessary for instructors, parents, and head teachers. Officials from the ministry of education need data compiled at several administrative levels. To support their cost-effectiveness estimations, ministries of finance need information on the system resource inputs, consumption, and cost.

The monitoring of quality of education in terms of inputs, processes, and outputs can be classified in a three-part typology:

- Compliance monitoring, intended to ensure educational institutions comply with standards and norms, focuses on educational inputs such as teachers, textbooks, classrooms, and equipment.
  - Diagnostic monitoring focusing on instructional processes and whether students are learning. It provides information on the quality of education provided by schools.
  - Performance monitoring focusing on monitoring academic achievement of students through testing. This provides information on the results of investments made in education.
- (Adapted from Richards, 1988)

The preparation for this report involved reviewing a sizable number of papers. Of these, 23 are studies or evaluations that unmistakably show a connection between one or more ways to track students' progress in learning and their final results, which are typically achievements. There are fifteen reviews and eight studies. Three feature secondary kids, five elementary pupils, and fifteen are inclusive of grades K–12. The dependent variable for fourteen of these is a general achievement. Language arts is the outcome emphasis of three documents. Other ones are student attitudes — 5, science — 2, social studies — 1, and mathematics — 3. Multiple outcome areas were the focus of certain studies. In 19 of the research, normal education pupils of varied racial and socioeconomic backgrounds and academic levels are the subjects. Three of them deal with special education, while one is devoted to Chapter 1 participants.

### **Monitoring seatwork**

The necessity of keeping an eye on the class during seatwork periods has been well demonstrated by research contrasting the conduct of excellent teachers (i.e., those whose students achieve high or better than would be predicted given background variables) with that of less effective teachers. This kind of observation entails teachers moving about the classroom, keeping track of how well or poorly students are doing on their assignments, and working one-on-one with students as necessary. The most successful instructors:

- Have systematic procedures for supervising and encouraging students while they work.
- Initiate more interactions with students during seatwork periods, rather than waiting for students to ask for help
- Have more substantive interactions with students during seatwork monitoring, stay task-oriented, and work through problems with students

-Give extra time and attention to students they believe need extra help

-Stress careful and consistent checking of assignments and require that these be turned in

Monitoring as a part of classroom reviews

According to research, including monitoring techniques in routine classroom evaluations is associated with improved student accomplishment in the future. Daily, weekly, and monthly reviews can all help students learn new content more effectively. If they include questions and other learning probes, they can also highlight any areas that require additional training.

Research on the effects of teacher training demonstrates the efficacy of using review sessions to monitor student learning: students of teachers trained in methods for conducting periodic classroom reviews that include the use of learning probes had achievement levels that were higher than before the teachers had been trained and higher than the achievement levels of students of untrained teachers.

How do you monitor students' comprehension and work during a lesson?

Teachers say they monitor students by:

Asking them to interpret or summarize material presented to them in the lesson

Thinking about the questions that students are asking and noting what parts of the lesson don't seem to be understood

Asking questions from various levels of Bloom's taxonomy of learning objectives

Asking students to act things out or draw them

Walking around the class and checking worksheets, calling attention to errors and noting good work being done

having students do quick problems on individual chalkboards

encouraging children to listen to each other by summarizing comments of others and calling on children who don't seem to be listening

Effective monitoring practices

Effective English and math teachers used efficient monitoring techniques on a consistent basis. During seatwork periods, they did more than just circulate among students. These teachers were meticulous in noting individual students as they moved or looked around the classroom, and they addressed individuals frequently, usually privately, to keep students accountable and on-task. These teachers were concerned that students work steadily on both classwork and tests, and their careful monitoring allowed them to address students who were not working as expected right away. The nature and process of effective monitoring—both of behavior and

academic work—appeared to be extremely important in both math and English classes for keeping students on task and accountable for their work.

More effective math and English teachers were extremely consistent in checking assignments regularly. Homework was assigned virtually every day, and a daily routine in most teachers' classes involved students' exchanging papers and checking them in class as directed by the teacher. Usually the more effective teachers had students sign papers they graded, and at least one effective math teacher cautioned her students to grade papers with care.

When checking daily assignments in class, more effective math and English teachers provided feedback to students as to content as well as a review or further explanation of concepts and processes. By explaining how to figure grades and having grades announced for recording purposes, teachers enabled students to hear how they stood in relation to the rest of the class and gave evidence of the fact that the teachers took seriously the work they assigned. By taking up, checking, and returning papers, teachers provided additional feedback by means of written comments and possible modification on student grading. The advisability of using these effective monitoring practices is further underscored in the following guidelines concerning seat work and homework. (Excerpted from "Teacher behavior and Student Achievement," by Jere E. Brophy and Thomas L. Good. In *Handbook of Research on Teaching* (Third Ed.), edited by Merlin C. Wittrock. New York: Macmillan Publishing Co., 1985)

## **CONCLUSION**

There are several ways and techniques to monitor the progress of education in different fields. It is found that this monitoring system helps to optimize the quality of education in primary schools. The teachers noted that by participating in the project, they upgraded their professional skills, improved their pedagogical and self-study skills, and increased their self-esteem and motivation. Teachers' perception of critics and recommendations is often a disincentive for educators. The results of the study are preliminary due to several limitations, which include a small number of participants, potential bias in school choice and limited opportunities for observation. In my opinion, further research on training primary school teachers on the basics of monitoring makes sense.

**ÖZET**

Şirket değerlemesi finans alanında 1980’li yıllardan sonra önemi hızla artmıştır. Özellikle sermayenin serbest dolaşımı, varlık ve hisse senedi alımları, şirket birleşmeleri, bölünmeleri, şirketlerin halka arzı şirket değerlemesinin önemini daha da arttırmıştır. Rekabet ortamında şirket değerinin artırılmasına ilişkin alternatif yolların belirlenmesi ve şirket değerinin stratejik yönetimi de günümüzde önem kazanmıştır. Şirket değerlendirme yaklaşımları finans alanında yapılan yeni çalışmalar ile birlikte değerlendirme yaklaşımlarının sayısı göreceli olarak artmış olsa bile özünde şirket değerlendirme yöntemlerini dört gruba ayırmak mümkündür. Bu yöntemler; Aktif Bazlı Değerleme Yöntemleri (Maliyet yaklaşımı), Gelir Bazlı Değerleme Yöntemleri, Piyasa Bazlı Değerleme Yöntemleri ve Diğer Değerleme yöntemleridir. Bu çalışmada değerlendirme yöntemleri genel hatları ile açıklandıktan sonra Piyasa bazlı değerlendirme yöntemlerinden biri olan Fiyat/Kazanç oranı yöntemi ile halka açık olmayan ve bilişim sektöründe yer alan bir firmanın değeri hesaplanacaktır. İlgili firmanın değerlemesi yapılarak benzer firmalara bu yöntem ile değerlendirme çalışmasının nasıl olması gerektiği hususunda katkı sağlanacaktır.

**PRICE/EARNING METHOD IN COMPANY EVALUATION: A CASE STUDY IN  
THE SOFTWARE INDUSTRY****ABSTRACT**

The importance of company valuation in finance has increased rapidly after the 1980s. Especially the free movement of capital, asset and stock purchases, company mergers, divisions, public offering of companies have increased the importance of company valuation. Determining alternative ways to increase company value in a competitive environment and strategic management of company value have also gained importance today. Company valuation approaches Although the number of valuation approaches has increased relatively with the new studies in the field of finance, it is possible to divide the company valuation methods into four groups. These methods are; Asset Based Valuation Methods (Cost Approach), Income Based Valuation Methods, Market Based Valuation Methods and Other Valuation Methods. In this study, after the valuation methods are explained in general terms, the value of a company that is not open to the public and is in the software sector will be calculated with the Price / Earnings ratio method, which is one of the market-based valuation methods. By making a valuation of the relevant company, a contribution will be made to similar companies in terms of how the valuation should be done with this method.

**Key Words:** Valuation, Company Valuation, Company Valuation Methods, Price / Earnings Ratio Method,

## 1.GİRİŞ

Şirket değerlendirme çalışmaları, 1980’li yılların başından itibaren hızla uygulamaya konulmuştur. Rekabetin kaçınılmaz olduğu günümüz dünyasında işletme yönetiminin şirket değerini maksimize edecek uygun yönetim yaklaşımı geliştirmesi kaçınılmaz hale gelmiştir. Buna paralel olarak artık işletme yönetiminin amacı sadece değeri maksimize etmek değil bu değerini sürekli artırılmasına yöneliktir (Gündoğmuş ve Öztanır, 2021:309).

Finans bilimi değerlemeyi bugün açısından değil geleceği düşünerek ele almaktadır. Şirket değerlemesinin anlamı varlıklarının gerçek değerini ortaya koymak ya da varlıkların elde edeceği gelirleri değerlemektir. Ancak şirket değerlemesinde genel olarak tek bir hesaplama yöntemi bulunmayıp birden fazla hesaplama yöntemi bulunmaktadır. Birden fazla hesaplama yöntemi ile elde edilen sonuçlar karşılaştırılmakta ve şirket değeri hakkında fikir sahibi olunmaktadır (Gündoğmuş ve Öztanır, 2021:309).

Geçmişten günümüze firmalar kar rakamlarını maksimize etmeye odaklanmışken artık bu anlayış yerini şirket değerini maksimize etmeye bırakmıştır. Son yıllarda yaşanan gelişmelere paralel olarak şirketlerin başarısı bir anlamda şirket değerinin ne kadar arttırıldığı ile ölçülmektedir. Buna paralel olarak şirket değerinin doğru hesaplanması kritik bir önem arz etmektedir (Ede, 2016:3).

Şirket değerinin artışı şirket başarısının bir parçası olduğu günümüzde değerlemenin doğru hesaplanması yatırımcıların doğru karar vermesi açısından çok büyük önem arz etmektedir. Yatırımcılar şirketin değerine bakarak yatırım kararlarını yönlendirir ve şirketin değer potansiyeline göre getiri beklentisine girerler. Bu nedenlerle şirket değerinin doğru belirlenmesi yatırım kararlarına doğrudan etki yapmakta olup kritik rol oynamaktadır. Ayrıca şirket değerlendirme yöntemleri şirketin performansını ve yatırım kararlarını doğrudan etkiledi gibi şirket devirleri, birleşmeleri gibi konularda da önemli rol oynamaktadır (Ede, 2016:3).

Şirket değerlendirme çalışmaları; yatırımcılara verecekleri kararlarda ışık tutarak kendilerine yatırım yapmayı düşündükleri varlıkların olması gerektiği fiyatları hakkında bilgi vermektedir. Halka arz, şirket birleşmeleri, bölünmeleri, satın alma, gayrimenkullerin fiyatlarının belirlenmesinde ihtiyaç duyulan bilgi ihtiyacının giderilmesinde değerlendirme çalışmalarının önemi büyüktür.(Hatipoğlu ve Yener, 2013:8).

Değerleme kavramı ile ifade edilmek istenen söz konusu ekonomik değere sahip varlığın fiyatını tespit etmektir. Finans biliminde birçok değer tanımı olmakla beraber yatırım kararı

alınırken önemli olan ilgili varlıkların olması gereken fiyatlarını referans almaktır (Hatipoğlu ve Yener, 2013:8).

Varlıkların değerinin tespit edilmesi insanoğlunun en çok ilgilendiği konulardan biri olmuştur. Değer kavramı farklı toplumlarda, farklı kültürlerde ve farklı zamanlarda insanoğlu için farklı anlamlar ifade etmiştir. Zaman içerisinde geçmişten günümüze buğdayla, gümüşle, altınla ifade edilen değer kavramı artık para ile ifade edilmektedir. Değerin tanımı bilim disiplinlerine göre farklılık arz etse de çatı itibari ile birbirine benzemektedir (Güler, 2010:3).

## **2.DEĞER KAVRAMI**

Geçmişten günümüze varlık değerlemesi finans biliminin karmaşık konularından biri olmuştur. Ekonomik değere sahip olan varlıkların gerek finansal gerekse reel olarak bir değeri bulunmaktadır. Değerlemeye konu olan varlıklara yatırım yaparken bu varlıkların gerçek değerinin bilinmesi oldukça önemlidir. Herhangi bir varlık için gerek finansal gerekse reel değerlendirme yapılabilir fakat bazı varlıkların değerlendirilmesi diğerlerine göre oldukça karmaşıktır (Öztürk,2008:3).

Değerleme; Herhangi bir varlığın değerinin tahmin edilmesi, belirlenme süreci ve varlığın parasal olarak karşılığını ifade etmektedir. Değerlemeyi yapan analistlerin önyargılı ve de taraflı davranışlarından dolayı değerlendirme sonucunun her zaman objektif sonuçlar verdiği düşüncesi yanlış olabilir. Bu taraflı ve de önyargılı davranışları minimum seviyeye indirmek varlıkların gerçek değerinin belirlenmesi için oldukça önemlidir.(Öztürk,2008:3).

Literatürde değerlendirme ile ilgili değişik tanımlar görmek mümkündür. Değer, herhangi bir varlığın sağladığı toplam fayda, kullanım değeri veya başka birine satıldığında alınacak tutarı ifade etmektedir (Ünlü,2008:3).

Değerin kelime karşılığı bir şeyin önemini belirlemeye yarayan ölçü veya bir varlığın karşılığı ya da kıymeti olarak ifade edilmektedir. Finans biliminde değer kavramı farklı ekonomi düşüncelerine göre farklı tanımlarla ifade edilmektedir. Noklasik ekonomi düşüncesine göre bir varlığın değeri serbest piyasa ekonomisinde getireceği fiyattır. Bu düşünce yaklaşımda pazarın fiyatı ile değeri eşit kabul etmektedir. Klasik ekonomi düşüncesine göre ise bir varlığın değeri kullanım/tüketimden sağladığı faydaya göre değişir (Unvan,2019:931).

Değer ve fiyat kavramları birbirinden farklı kavramlar olup karıştırılmaması gerekir. Değer bir varlığın özellikleri ve özellikler sonucu sahibine sağlayacağı yararlardan oluşmak olup objektif

ve sübjektif yönü bulunmaktadır. Fiyat ise piyasa koşullarından alıcı ve satıcı tarafından kabul edilen tutardır. Her zaman varlığın değeri piyasa fiyatı ile aynı olmayabilir. Bunun başlıca nedenleri; piyasanın etkin ve rekabetçi olmaması, piyasadaki belirsizlikler ve dalgalanmalardır(Öztürk,2008:4).

Değer kavramı farklı yaklaşımlar ve şekillerde değerlendirilmektedir. Çeşitli kavramlarına aşağıda yer verilmiştir (Çetiner vd. 2018:347).

- İşleyen Teşebbüs Değeri: Bir firmanın faal durumdayken satılması durumundaki değerdir. Bu değerinde firmanın maddi ve maddi olmayan tüm varlıkları yer almaktadır.
- Tasfiye Değeri: Şirketin varlıklarının açık artıma ile satılması durumunda elde edilen toplam değerden yükümlülüklerin düştükten sonraki kalan değerdir (Google).
- Nominal Değer: Bir varlığın üzerindeki yazılı olan değerdir. Her çeşit senet, tahvil, hisse senedi üzerindeki değerdir (Ekici, 2019:6).
- Makul Değer: Serbest piyasada baskı altında olmadan ilgili kurumlar ya da bilgili kişiler arasında bir varlığın el değiştirdiği değerdir.(Çetiner vd. 2018:347).
- Defter Değeri: Şirketin toplam varlıklarından toplam borçların çıkarılması durumunda elde kalan değerdir. Bir diğer ifade ile şirketin elindeki varlıkların tamamı ile borçların ödenmesi durumunda geriye kalan öz sermaye değeridir(Google).
- Gerçek Değer: Piyasadaki mevcut bilgilere göre bir varlığın olması gereken değerdir.
- Piyasa Değeri: Varlığın piyasa koşullarından arz ve talebine göre oluşan değeridir.

Şirket değerlemesi; şirketin geçmiş ve cari dönem bilgilerinden faydalanılarak gelecekte oluşturacağı değer en uygun tahminlerle belirlenmesidir. Şirket değerlemesindeki amaç şirketin makul ve uygun piyasa değerinin belirlenmesidir. Piyasa değeri ise piyasadaki şirketlerin değeri konusunda bilgi sahibi olan alıcı ve satıcıların söz konusu şirket için takdir ettikleri alım-satım değeridir (Ekici, 2019:20).

### **3.ŞİRKET DEĞERLEME YÖNTEMLERİ**

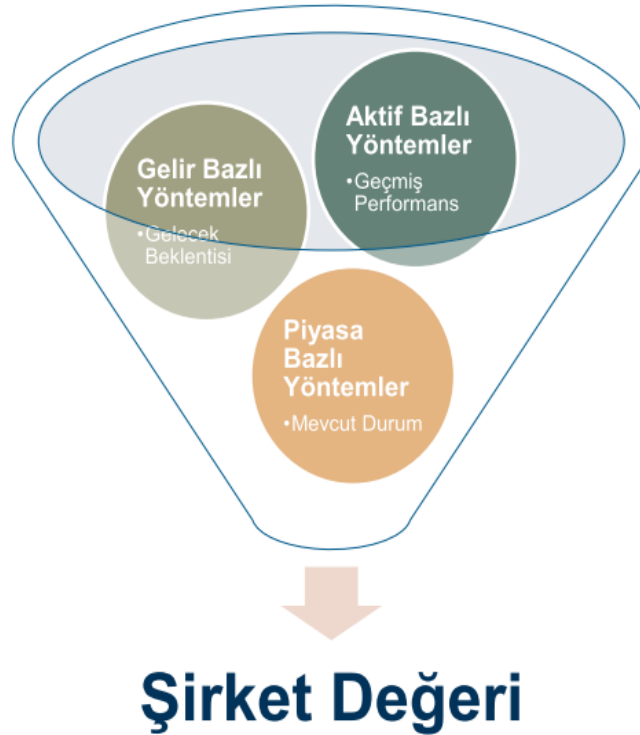

Şirket değerlemesi finans biliminin en önemli ve de uygulaması en zor konularından biridir. Şirket değerinin belirlenmesi ve de bu değer yönetimi oldukça önemlidir. Dünya’da ve de Türkiye’de son yıllarda yaşanan şirket birleşmeleri, bölünmeler, satın almalar, şirketlerin halka arzı ve özelleştirilmesi gibi durumlar şirket değerlemesinin önemini her geçen gün arttırmaktadır (Masun,2017:215).

Şirket değerlemesinin amacı, şirketin uygun ve makul bir piyasa değerinin belirlenmesidir. Alıcı bakış açısındaki amaç şirkete ödenebilecek en düşük değeri belirlemek iken satıcı bakış amacındaki amaç ise şirketi en yüksek değerden satmaktır (Ekici, 2019:20).

Şirket değerlemesinde genellikle alıcı ve satıcılar arasında makul bir değerde anlaşma sağlanmaktadır. Şirketin alıcıları yatırımlarını genel olarak şirketin geçmiş dönemde göstermiş olduğu performansa göre değil daha çok gelecek dönemlerde göstereceği performansa bakarak yapmaktadırlar. Bir diğer ifade ile gelecekte elde edeceği nakit girişlerini bugüne indirgeyerek değerlendirir. Bu nedenle temelde şirket değeri ağırlıklı olarak firmanın gelecekte sağlayacağı nakit girişi ile bu gelir akışının elde edilmesindeki risk derecesine bağlı olarak değişmektedir (Ekici, 2019:20).

Şirket değerinin belirlenmesine yönelik olarak geliştirilen yöntemler, aşağıdaki şekilde gösterilmiştir (Gorbon,2012:4).

**Şekil 1.** Şirket Değerleme Yöntemleri (Gorbon,2012:4).

**Aktif Bazlı Yöntemler;** Bir şirketin değerini muhasebe kayıtlardaki elde etme maliyeti ile dikkate alır. Söz konusu elde etme maliyet değerine eklemeler yapılarak şirketin değeri belirlenir. Bu şirket değerlendirme yöntemi kapsamında şirketin maddi ve de maddi olmayan varlıkları da değerlemeye dahil edilir. Geleneksel bir yaklaşım olarak varsayılan bu yöntemde

şirketin değeri muhasebe kayıtlarında gözükten değer olarak kabul edilir ve kişiye sabit bir tablo sunar. Yöntemin dezavantajı paranın zaman değerini ve de gelecekteki nakit akışlarını dikkate almamasıdır. Aktif bazlı yaklaşımlara aşağıdaki değerlendirme yöntemleri örnek verilebilir. (Gündoğmuş ve Öztanır, 2021:316; Ede, 2016:11).

- Defter Değeri,
- Piyasa Değeri,
- İşleyen Teşebbüs Değeri,
- Tasfiye Değeri,
- Yeniden Yapma Değeri,
- Gerçek Değer,
- Nominal Değer.

**Gelir Bazlı Yöntemler;** Bu şirket değerlendirme yöntemlerinde firmanın gelecek yıllarda elde edeceği gelirler dikkate almaktadır. Bu yöntemin temelini şirket faaliyetleri sonucu oluşan ve gelecek yıllarda elde etmesi beklenen serbest nakit akımları ile bu nakit akımlarını bugüne indirgemede kullanılan iskonto faktörü belirlemektedir. Şirketin yaratacağı gelirler şirketin büyüme ve riskine bağlı olarak değişmektedir. Şirketin varlık değerinden çok gelir getirici faaliyetlerinden ilgilenilmesinden dolayı bu yöntem yatırımcılar açısından önemlidir (Güler,2010:34). Gelir bazlı şirket değerlendirme yöntemleri;

- İndirgenmiş Kar Payları Yöntemi
- İndirgenmiş Nakit Akışları Yöntemi.

**Piyasa Bazlı Yöntemler;** Göreceli değerlendirme yaklaşımı olarak da bilinen piyasa bazlı yöntemler genel olarak piyasa tarafından önceden fiyatlandırılmış benzer varlık ya da firmaların değerleri ile karşılaştırma yaparak şirketin değerlemesini belirlemeye yönelik yaklaşımdır. Bir diğer ifade ile bu değerlendirme yönteminde, bir varlığın veya şirketin değeri benzer varlık, şirketlerin fiyatlandırılmasına bakılarak tahmin edilir. Bunun yapılabilmesi için fiyatların standart verilere dönüştürülmesi gerekmektedir. Bu yaklaşımın uygulama kolaylığı bulunmakla beraber eleştirilen yönleri de bulunmaktadır (Ekici,2019:38). Piyasa bazlı yaklaşımlar; (Ede, 2016:19).

- Fiyat Kazanç Oranı,
- FK/Büyüme Oranı,
- Piyasa Değeri/Defter Değeri Oranı,
- Piyasa Değeri/Satışlar Oranı,

- Firma Değeri/FOVÖK Oranı,
- Fiyat/Nakit Akım Oranı.

Çalışmamızda halka açık olmayan yazılım firmasının değeri Fiyat/Kazanç oranı yöntemine göre yapılacağından bu değerlendirme yöntemlerinden sadece Fiyat/Kazanç oranı yöntemi uygulama kısmında açıklanacaktır.

#### **4. ŞİRKET DEĞERLEMESİNDE FİYAT/KAZANÇ YÖNTEMİ: YAZILIM SEKTÖRÜNDE BİR UYGULAMA**

Göreceli değerlendirme yaklaşımları olarak bilinen piyasa bazlı şirket değerlendirme yöntemleri arasında Fiyat/Kazanç en çok kullanılan şirket değerlendirme yöntemidir. F/K çarpanı şirketin vergi sonrası 1 TL'lik hisse başına karına karşılık yatırımcıların kaç TL ödemeye razı olduklarını gösteren çarpanıdır. F/K hissenin piyasa değerinin toplam net kara bölünmesi ile bulunmaktadır. Bir diğer ifade ile bir hisse senedinin piyasa fiyatının hisse başına kara bölünmesi ile bulunur (Öztürk, 90:2017).

Fiyat/Kazanç oranı bir şirketin net karı ile hisse senetleri arasındaki toplam ilişkiyi kurmakta olup aşağıdaki formülle gösterilmektedir (Sezer vd, 2018:503).

$$\text{Fiyat/Kazanç Oranı} = \frac{\text{Hisse Senetlerinin Toplam Değeri}}{\text{Net Kar}}$$

veya,

$$\text{Fiyat/Kazanç Oranı} = \frac{\text{Hisse Senedi Fiyatı}}{\text{Hisse Başına Düşen Net Kar}}$$

Fiyat/Kazanç oranının mevcut ortaklar açısından yüksek, potansiyel yatırımcılar açısından ise düşük olması beklenir. Potansiyel yatırımcılar mevcut şirkete duyduğu güvene karşılık pay senedine ödeyeceği fiyatı yükseltebilir. F/K oranının yüksek olması hisse senetlerinin değerinin aşırı yükseldiğini ya da düşük bir oran ise hisse senetlerinin piyasada düşük değerlendirildiğini gösterebilmektedir. Bu nedenle söz konusu F/K oranının aynı sektörde yer alan diğer şirketlerin F/K oranları ile kıyaslanarak değerlendirilmesi gerekmektedir (Karadeniz ve Koşan, 2021:251). F/K oranı halka açık olmayan şirketlere uygulanabilmesinden dolayı şirket değerlemesinde kullanılabilen bir yöntemdir. Eğer şirketin hisse senetlerinin fiyatı belli değilse, şirketin

faaliyette bulunduğu sektörün F/K oranından yararlanılarak şirketin hisselerinin değeri tespit edilebilmektedir (Alkan ve Demireli, 2007:32).

Çalışmamızın uygulama kısmında halka açık olmayan bilişim firmasının değeri aynı sektörde faaliyet gösteren bilişim firmalarının ortalama F/K oranı çarpanından yararlanılarak tespit edilmiştir. Halka açık bilişim firmaları tabloda gösterilmiştir. Çalışmadaki bilişim firmalarının isimleri işyatırım.com adresinde sektörde yer alan firmaların F/K oranları ise halk yatırım web sayfasından alınmıştır.

**Tablo 1:** Halka Açık Bilişim Firmaları

NO	KOD	HİSSE ADI	SEKTÖR
1	LOGO	Logo Yazılım	Bilişim
2	ARDYZ	ARD Grup Bilişim	Bilişim
3	ATATP	ATP Bilgisayar	Bilişim
4	EDATA	E-Data Teknoloji	Bilişim
5	FONET	Fonet Bilgi Teknolojileri	Bilişim
6	KFEIN	Kafein Yazılım	Bilişim
7	LINK	Link Bilgisayar	Bilişim
8	MIATK	Mia Teknoloji	Bilişim
9	MTRKS	Matriks Bilgi Dağıtım	Bilişim
10	OBASE	Obase Bilgisayar Danışmanlık	Bilişim
11	PAPIL	Papilon Savunma	Bilişim
12	PKART	Plastikkart A.Ş	Bilişim
13	SMART	Smartiks Yazılım	Bilişim
14	VBTYZ	VBT Yazılım	Bilişim

Halka açık bilişim firmalarının 2021/12 ayına ait F/K oranları tabloda gösterilmiştir.

**Tablo 2: Halka Açık Bilişim Firmalarının F/K Oranları ve Ortalama Değeri**

YILLAR	KOD	HİSSE ADI	SEKTÖR	F/K ORANI	FD/FAVOK
2021	LOGO	Logo Yazılım	Bilişim	15,73	13,96
2021	ARDYZ	ARD Grup Bilişim	Bilişim	8,24	7,36
2021	ATATP	ATP Bilgisayar	Bilişim	34,46	53,96
2021	EDATA	E-Data Teknoloji	Bilişim	16,88	37,88
2021	FONET	Fonet Bilgi Teknolojileri	Bilişim	13,74	12,44
2021	KFEIN	Kafein Yazılım	Bilişim	50,83	5,27
2021	LINK	Link Bilgisayar	Bilişim	11,64	21,36
2021	MIATK	Mia Teknoloji	Bilişim	24,19	20,77
2021	MTRKS	Matriks Bilgi Dağıtım	Bilişim	21,11	14,7
2021	OBASE	Obase Bilgisayar Danışmanlık	Bilişim	0	0
2021	PAPIL	Papilon Savunma	Bilişim	21,19	0
2021	PKART	Plastikkart A.Ş.	Bilişim	24,04	12,05
2021	SMART	Smartiks Yazılım	Bilişim	46,7	8,58
2021	VBTYZ	VBT Yazılım	Bilişim	16,05	16,75
<b>ORTALAMA</b>				<b>21,77</b>	<b>16,08</b>

Halka açık bilişim firmalarının ortalama F/K oranı 21,77 olup halka açık olmayan bilişim firmasının ise 2021 yılına ait dönem net karı 43.167.250 TL'dir. Halka açık olmayan bilişim firmasının değeri F/K oranı çarpanına göre  $21,77 \times 43.167.250 = 939.751.032$  TL'dir.

## 5. SONUÇ

Şirketlerin değerlendirme tespitlerinde kullanılan birçok yöntem bulunmakta olup piyasa çarpanları içerisinde yer alan F/K oranı çarpanı ise bunlardan bir tanesidir. Piyasa çarpanları yöntemi hesaplamalarda tarihi verileri ele alması nedeniyle değerlendirme yapan kişilere ya da kurumlara büyük kolaylık sağlamaktadır. Uygulamasının diğer yöntemlere göre nispeten kolay olmasından dolayı Türkiye'de en çok kullanılan yöntemlerden birisidir.

Mevcut literatür ve uygulamalar ışığında şirketlerin değerlemesinde tek bir yöntem kullanılmamakta olup şirket değerinin doğru hesaplanmasında ve hatanın minimum seviye indirilmesi için bir çok yöntem karşılaştırmalı olarak kullanılmaktadır.

Bu çalışma kapsamında halka açık olmayan bilişim firmasının değeri F/K oranı çarpanı ile tespit edilmeye çalışılmıştır. Çalışmada halka açık olan bilişim firmalarının ortalama F/K oranı elde edilerek ilgili firmanın değeri yaklaşık olarak bulunmuştur. Çalışmada sadece piyasa çarpanları yöntemlerinden biri olan sadece F/K oranı çarpanı kullanılmıştır.

Mevcut yapılan çalışmadaki bulunan değer diğer piyasa çarpanları yöntemleri de kullanılarak karşılaştırma yapılabilir ya da diğer değerlendirme yöntemleri (gelir bazlı, aktif bazlı) yöntemler kullanılarak sonuçlar karşılaştırılabilir.

**ABSTRACT**

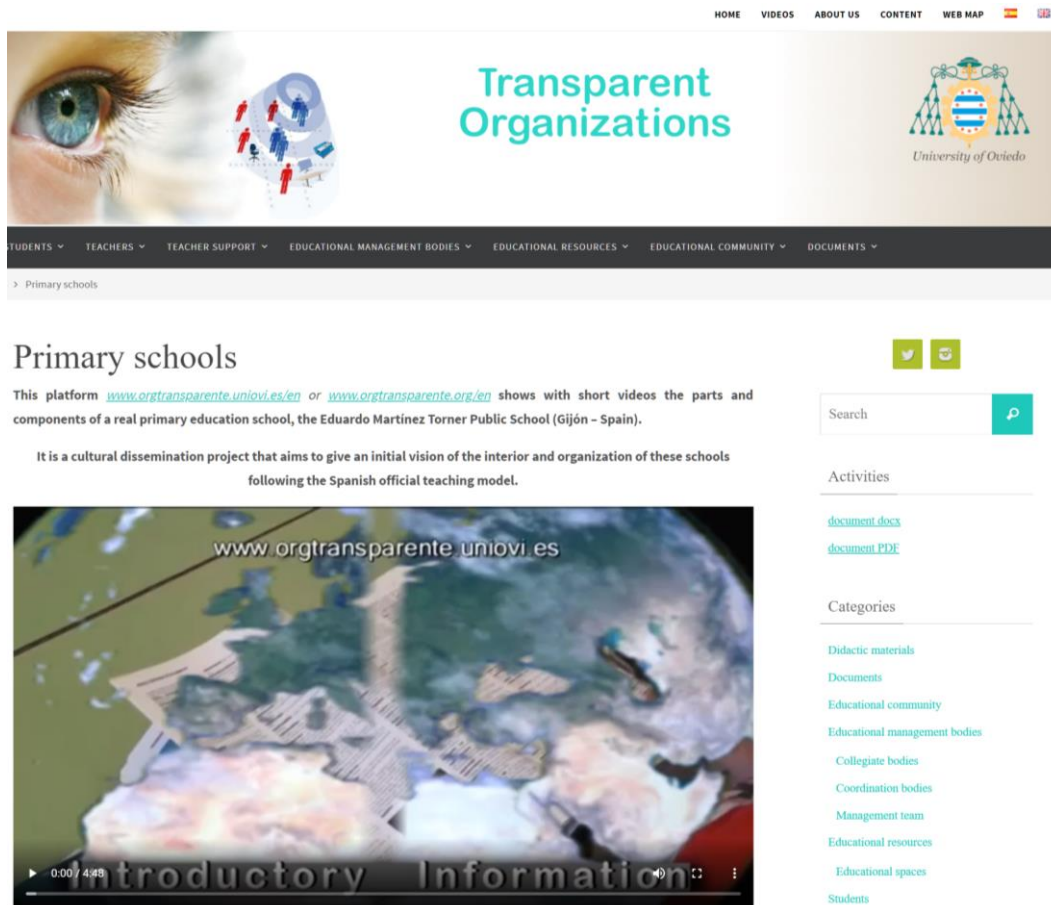

The world is in a special situation, war, migrations, a global pandemic... We are all obliged to collaborate in resolving these conflicts. More research is needed to open avenues for such international collaboration. Thus, from the University of Oviedo (Spain), we present a project to show our educational system to foreign students, and to any other person interested in learning about Spanish primary schools. This is the free platform <https://www.orgtransparente.uniovi.es/en> or [www.orgtransparente.org/en](http://www.orgtransparente.org/en). The platform helps people and students who come from outside of Spain, and who are unaware of our educational system. It is an open window, a transparent organization. In there we show the case of an elementary school through forty short videos. This project has been one of the 2 best educational innovation proposals of the University of Oviedo in the 2021 edition. This website is freely accessible and has no commercial or economic interests. There, in each interaction, users analyze the differences between the information in the videos and what is happening in their previous experience. That is, they comment on the similarities between their educational life in their country and the Spanish educational system. We want to contribute to social and educational progress through trust in institutions. Our strategy shows the operation of schools using visual communication techniques. We have followed the Web Content Accessibility Guidelines (WCAG) to make this platform as accessible as possible for people with disabilities. For example, the platform is accessible to people with hearing disabilities, since the contents are mainly visual. It is also accessible for blind people since the full written transcript availability of videos, and all graphics contents have their corresponding alternative textual descriptions. Although these guidelines cover a wide range of issues, they cannot address the needs of people with all types, degrees, and combinations of disabilities.

**Keywords:** primary school, Spanish education, educational website.

## INTRODUCTION

The project consists of offering a platform to publicize each of the parts of primary schools in Spain. This innovation project is based on four pillars: the specific training of the members, previous scientific research, professional experience in communication and training in international relations.

The free platform <https://www.orgtransparente.uniovi.es/en> or [www.orgtransparente.org/en](http://www.orgtransparente.org/en) (Figure 1) describes the Spanish educational system through forty short videos that analyze primary schools, showing the components, the parts, and the interior of a specific school. This project has been one of the 2 best educational innovation proposals of the University of Oviedo (Spain). The platform wants to support students who come from outside of Spain.

**Figure 1.** Screenshot of <https://www.orgtransparente.uniovi.es/en> or [www.orgtransparente.org/en](http://www.orgtransparente.org/en)

## **MATERIAL AND METHODS**

### **Objective**

The objective is to satisfy the need and absence of educational materials elaborated with the necessary rigor and prepared not only for the Spanish context, but also aimed at foreign users and from the English language support. Thus, international students who attend our Faculty, and Oviedo university in general, will have resources that "kindly" introduce them" to these contents, getting to know how a real school works through small videos that show each of its parts. Therefore, the purpose of the project is to launch a platform with video documents that illustrate the operation of a primary school in Spain open to everyone through the Internet and in English. This will mean changes in strategy: the transition from traditional classes and the written texts used until now, to the use of audiovisual materials and telematic support.

### **Method**

This is an educational innovation project. One of the main strengths is the profile of the work team, due to the interdisciplinary and balanced composition of its members, offering complementary and necessary characteristics for the project:

- Balance in the gender perspective.
- Proportionality of necessary profiles: professionals from the teaching field, IT managers and English language experts.
- Connection with professors outside the university, bringing this institution closer to other external experiences and people.
- The members have command of the English language, which is necessary in this job.
- Teachers who are experts in innovation and research projects together with recent graduated teachers in this field.
- The ages range from 30 to 50years. This indicator gives an idea of how experience with novelty can be shared and how innovation findings can be systematically implemented over many years.
- The group has a varied experience in innovation projects, trying to complement extensive training in innovation management with the first experiences of other participants.
- Members with outstanding activity in scientific dissemination and publication, together with other members who are starting out in this field.
- An attempt has been made to involve the people who coordinate Erasmus mobility, and this facilitates the incorporation of foreign students into the project.

- In addition to teachers, this project also includes technical staff, remembering that this community shares efforts from many perspectives.
- Finally, we wanted to incorporate the presence of students.

The materials were elaborated based on the visual narrative; this supposes a specific language in which things are seen in addition to being told verbally. The resources are necessary for specific foreign students, for bilingual students and for teachers who need to complement their traditional written resources, and society in general, which needs rigorous tools to validate the knowledge of the information. Let's not forget that Erasmus students are inserted in classrooms that are not specific for incoming students. The design of the videos shows basic contents of the educational system: what the management team does, what is done in a meeting of the faculty, or by the Pedagogical Coordination Commission, or how a didactic unit is made.

Fundamental and rigorous ideas are shown, seeking with this format the introduction to the operation of each of the components of a school, and seeking to reach people who are unfamiliar with this subject, who are approaching it for the first time, or who from different contexts want to have those references.

The project is open to collaboration and interaction with students and teachers from all over the world. Thus, we have written some questions to get user feedback (Figure 2).

We are teachers from de Univ. of Oviedo (Spain), we want to be useful especially for foreign students, and want to show the Spanish educational system, through a website with short videos about the components of a primary school [www.orgtransparente.uniovi.es/en](http://www.orgtransparente.uniovi.es/en) or [www.orgtransparente.org/en](http://www.orgtransparente.org/en)

It is very important for us. Please, we would like you to watch some of these 40 videos and answer the 3 questions below those videos. You can write in any language.

## Questions

Please answer the following questions in the space below. You can answer in any language and the questions you want.

## **LITERATURE REVIEW**

The project is part of a new scenario (Post-Pandemic, Tele-training, Globalization and internationalization) where change, improvement and innovation must be a response from the teaching staff and the university to the new demands of society (Corral and Fernández, 2021). These are some of the characteristics and the scenario in which the university and the teaching and learning processes must evolve, and not only from the field of the teachings of Education, but from all its fields.

Why do we use the name ORGTRANSPARENT? This denomination derives from a previous work where it was seen that it was necessary to transparently show the interior of public institutions, opening a window to the operation of schools, and other organizations such as hospitals, etc. This is a path towards the democratization of these organizations, and knowledge of them. Thus, it was shown that people ignore what happens inside many public organizations (Fombona, Pascual, Iribarren, Pando, 2011). On other cases, what is shown, and how it is shown, is loaded with commercial, ideological or other interests.

On the other hand, it is essential to highlight the impact of the Pandemic on human interactions. Technology was already setting the standard for new effective and efficient educational actions through the Internet. Now, the overwhelming and multidisciplinary irruption of telematics has established a new way of transmitting information and converting it into knowledge (Fombona, Pascual, Listopadzk, 2022).

The Faculty of Teacher Training and Education at the University of Oviedo is the educational context. It needed to use this platform [www.orgtransparente.uniovi.es/es](http://www.orgtransparente.uniovi.es/es) as a substitute resource given the impossibility of students going to their internship centers due to confinement. From the Dean of Practices and the Dean of the Faculty they recommended the use of this WEB. And so, it was used during the 2020-21 academic year.

The approach of using purely audiovisual tools has proven effective as complementary material to the traditional written text (Riccio-Anstacio, Molestina-Malta, Veliz-Ozaeta, 2017).

Specifically, this platform demonstrated its effectiveness as an open, rigorous and necessary educational resource. There, the operation of the schools in Spain-Asturias was shown through short videos.

Finally, it is necessary to indicate that there is a lack of educational resources on the subject of this project (Díaz, Caballero, 2014). And to a greater extent there is a need to offer materials that may have an interdisciplinary utility on education in Spain, and specifically on the

functioning of primary schools. On the other hand, there are hardly any materials of this type aimed at foreign students, nor at Spanish students in bilingual courses. Thus, Erasmus students have to assimilate the documents in Spanish used by the rest of the students (Fombona, Pascual, Iglesias, 2015).

In the analysis of the state of the question we detect:

- The need to create resources that respond to this new stage of telematic educational interaction.
- The scenario is global, and it is necessary to offer educational materials open to all of society, and not just Asturian and Spanish. English is the commonly accepted support, both for foreign students and users of this platform, as well as for those Spanish speakers who want to approach that language (Chand-Chávez, 2017).
- Increase in the international dimension of universities and this innovation contributes to creating a welcoming educational space.

## **DISCUSSION**

The pandemic prompted tele-training and the need to create rigorous materials that could, to a certain extent, replace face-to-face teaching in the classroom. In this scenario, students obtain information by means other than the traditional ones, that is, they follow the strategies of social networks. For this reason, this platform follows the approaches of YouTube, showing with short videos how a school works. The use of audiovisual strategies moves away from the speeches of the master classes. Purely audiovisual tools have proven their effectiveness as complementary material to traditional ones (Sangermán Jiménez, Ponce, Vázquez-Cano, 2021). Thus, the videos show real situations in a school, and can be useful for Internship subjects in which foreign students have to go to a Spanish school for the first time. However, the platform is open to all those who want to enter our educational system. Erasmus students are expected to use this resource, but also teaching teams to incorporate these resources as a complementary tool to their lessons. In addition to the academic impact on students and teachers, with this material we intend to get closer to society, with which we have a responsibility, opening ourselves up to experts, educators, families, educational administrations, and others interested in these contents and in what this University does.

The project, coordinated by professors Javier Fombona and Jorge Puente, has an interdisciplinary and complementary approach in profiles, ages, experience, etc. This is how professors from different faculties, but the administrative staff of the university, other regions

and international experts also wanted to open up. This sense of support for students goes beyond the use of a visual methodology and the use of the English language (García, Fombona, 2015), thus following integration and accessibility standards, so that everyone can both receive information (understand, navigate and interact with the Web site) and contribute to the Web with their comments in the forums (Figure 2). This accessibility benefits both people with and without disabilities, for example: people of different ages and knowledge on the subject; people with limitations due to their location; use of mobile phones, smart watches, smart TVs and others; using devices with small screens, different input modes, etc. In short, it is an innovation project framed in a new scenario of Post-Pandemic, Teletraining, Globalization and internationalization, where teachers face the challenges of change, improvement and innovation as a response and satisfaction to the new demands of the society.

## **CONCLUSION**

The use of Internet resources, and especially, the use of correctly prepared audiovisual media is very effective in the educational field (Del Valle-Ramón, García-Valcárcel, Gómez-Pablos, 2020.), in languages (Caja, 2009; Kurniawati, 2013), and other subjects (Mahasneh, Shoqirat, Singh, Hawks, 2021; Sangermán Jiménez, Ponce, Vázquez-Cano, 2021).

The research and actions of universities must have an international, collaborative and positive dimension for humanity. In this sense, we have to create tools, like this web site <https://www.orgtransparente.uniovi.es/en> or [www.orgtransparente.org/en](http://www.orgtransparente.org/en), that makes the mobility of students and teachers welcoming. In this case, this platform offers a friendly showcase of what is happening in the Spanish educational system.

**ABSTRACT**

***Introduction:*** Despite the advances in medical care, still there is no medication accessible that offers protection against hepatic cell damage. Therefore, it is a need of time to find out new drugs from natural sources for liver protection. The utilization of restorative plants has gained prime importance in developing countries due to their safety, cost-effectiveness and efficacy. The purpose of this study is to assess *Dicliptera bupleuroides* Nees' safety profile, hepatoprotective, and in-vivo antioxidant properties.

***Methodology*** Standard techniques were used to conduct toxicity tests on human RBCs and DNA. Albino rats were given all six fractions/extracts of *D. bupleuroides* 350 mg/kg/day for an acute hepatoprotective study. The hepatotoxicity was determined through blood tests including Alanine transaminase (ALT), Aspartate transaminase (AST), Alkaline phosphatase (ALP), and total bilirubin (TB). The n-hexane fraction (200 mg/kg/day) was found to have enough hepatoprotective effect and thus selected to be administered for further dosing and investigation (14 days). Hepatotoxicity was induced by paracetamol (350 mg/kg) and silymarin (50 mg/kg) was set to be the reference drug. After the procedure, liver function tests, liver peroxidation tests, and a histological examination were performed.

***Results*** In comparison with standard medicine, the hexane fraction exhibited a substantial drop in the levels of ALT (88.17.8), AST (93.87.6), ALP (136.38.4), and TB (0.60.03) ( $p > 0.05$ ). In comparison to the toxic group (paracetamol induced), the Malondialdehyde (MDA) and Glutathione (GSH) levels were 51.32.9 nmol/g and 73.64.0  $\mu$ mol/g respectively while the rats treated with ethyl acetate fraction demonstrated a decrease in MDA (42.80.7 nmol/g) and an increase in GSH levels (107.71.8  $\mu$ mol/g). All of the medication extracts reduced oxidative stress and helped to protect DNA from hydroxyl radicals.

**Conclusion** The phytochemicals found in the extracts are responsible for the DNA damage prevention activities in the Albino rats used for this study. Therefore, it is concluded that all drug fractions could be used to protect liver cells damage with higher safety. However, n-hexane drug fraction possessed enhanced antioxidant activity to inhibit paracetamol-induced liver damage.

**Keywords:** Dicliptera bupleuroides Nees, DNA protection assay, hepatoprotective, hemolysis, histopathology, in-vivo antioxidant.

**1. PROBLEM TO BE SOLVED:**

Medicinal plants are the rich wellspring of therapeutic components from natural origin with helpful availability and fewer aftereffects with frequent and adequate availability. The remedial aspects of restorative plants credit to phytochemicals like tannins, alkaloids, flavonoids, and phenolic compounds. These bioactive parts might have protective action against DNA damage. Therefore, to treat hepatotoxicity we used *Dicliptera bupleuroides* Nees a naturally available medicinal plant in our study.

**2. THE IDEA:**

Utilization of restorative plants has gained prime importance in developing countries due to their safety, cost effectiveness and efficacy. It is one of the earliest varieties of medical care for people that have ever been identified. More than half of the drugs now being tested in clinical trials are derived from medicinal plants. In the past two decades, around 40% of newly approved pharmaceuticals have come from natural sources. Not only do they contribute significantly to the development of drugs for the treatment of cancer and other infectious diseases, but they also help many nations, especially those with weak economies, generate income. The business in restorative plants in the United States is developing at a pace of 10% every year, and that's just the beginning as more individuals are becoming keen on utilizing herbal medicines. Restorative plant markets are at present overwhelmed by the United States, China, France, Japan, the United Kingdom, and Italy. Subsequently, the worldwide market for herbal and plant-determined drugs is anticipated to ascend at an 11.0 % yearly speed from \$19.5 billion in 2008 to \$32.9 billion in 2013. The yearly business in restorative plants is supposed to reach \$5 trillion by 2050 because of current extension. Luckily, Pakistan has huge and plentiful greenery with around 5700 species, with around 2000 of them being therapeutically important. Similarly, in this study *Dicliptera bupleuroides* Nees plant concentrates will be investigated for hepatoprotective and antioxidant action (Ali et al., 2019; Almazroo et al., 2017; Riaz et al., 2019).

**3. TARGET MARKET:**

Around 2 million people every year die from chronic liver disease. Chronic liver disease is caused by a variety of reasons, including viral infections, drug addiction, alcohol intake, autoimmune illnesses, and other conditions that cause hepatotoxicity. In chronic liver disease, Pakistan is also battling one of the highest HCV rates (13.5), according to the WHO. There are

several allopathic drugs in the market for treating conditions like fatty liver caused by alcoholism and as chemotherapy agents, such as Metadoxine (which has adverse effects including agitation, hair loss, abdominal discomfort, diarrhoea, etc.), and Ondansetron (which has side effects such as hallucination, agitation, hives, pain, constipation, weakness, etc.). They have a number of undesirable effects in addition to their therapeutic effectiveness, but *Dicliptera bupleuroides* has negligible side effects and can be employed as a hepatoprotective drug as a sole and/or adjuvant therapy (Xu et al., 2017; Del Rio et al., 2005).

#### **4. ADDITIONAL INFORMATION:**

Lipid peroxidation is a destructive, auto catalytic and free radical mediated process in cellular membrane that converts polyunsaturated fatty acids into lipid hydro peroxides (Pund et al., 2012). During this unsaturation process free radical are produced, responsible for formation of malondialdehyde. It is a reactive aldehyde capable of oxidative stress in different tissues and referred as advanced lipoxidation end product (Vurmaz et al., 2019). Production of this aldehyde is used as a biomarker level for oxidative stress in experimental animal (Del Rio et al., 2005). *Dicliptera* had strong antioxidant activity in *Chinensis* spp (Xu et al., 2017). While *D. bupleuroides* showed significant therapeutic values due to polyphenols (Riaz et al., 2019). Decrease level of MDA controls the oxidative stress and hepatic damage resulting in tissue health. Glutathione is one of the major tripeptides found in the liver tissue, its main function is to remove free radicals such as hydrogen peroxide, superoxide radical and maintenance of membrane protein thiols. It is a substrate for glutathione peroxidase, increase in level of GSH caused to decrease cellular stress and maintains the membranous health (Pawar and Abhang, 2017).

**ÖZET**

Bu çalışma, Endonezya'da demokrasinin hayati bir yönü olan Genel Seçimlere Siyasi Katılımdaki (PEMILU) yolsuzluğu analiz etmektedir. Seçimler, vatandaşların seçimlerde oy kullanmalarını sağlayan ve günlük hayatlarını yönlendiren kararları etkilemelerini sağlayan bir araçtır. Ancak Endonezya'da uygulama tersine dönmüş, seçilme ve oy kullanma hakları gasp edilmiş ve bu katılım hem Medeni ve Siyasi Haklar Sözleşmesi'nde hem de Genel Seçimler Yasası'nda düzenlenen asgari insan hakları standartlarını uygulamamaktadır. Yazar, güvenilir kaynaklardan elde edilen ikincil verileri kullanır ve verileri analiz ederken içerik yaklaşımı kullanır. Yazar, eşitlik ve insan hakları yasalarının seçim döneminde uygulanması ve işleme gerektğini söylüyor.

**Anahtar Kelimeler:** siyasi haklar; katılım; oy hakları.

**POLITICAL FRAUD OF ELECTION IN INDONESIA: A HUMAN RIGHTS  
PERSPECTIVE****ABSTRACT**

This study analyzes fraud in Political Participation in General Elections (PEMILU), which is a vital aspect of democracy in Indonesia. Elections are a means that enable citizens to cast their votes in elections and influence the decisions that govern their daily lives. However, the implementation is reversed in Indonesia, the rights to be elected and to vote are hijacked and frauded. Participation does not apply the minimum standards of human rights regulated both in the Convention on Civil and Political Rights and the Law on General Elections. The author uses secondary data from reliable sources, and uses a content approach in analyzing the data. The author says that equality and human rights laws must apply and operate during the election period.

**Keywords:** political rights; participation; voting rights

## **BACKGROUND**

The inclusion of national election in the basic Law crafted Indonesia, alongside the India and the United States among the most representative democracy nations in the world. This has already been indicated in each and every national election throughout Indonesia. Numerous independent oversight groups and foreign experts wish to see how Indonesia's national election, from the actors and procedures which may intensify democratic values, continues to unfold witnessed first hand. The Unitarist State of the Republic of Indonesia is indeed a nation with such a democratically elected government wherein "by people and for the people" is indeed a symbolic representation of Indonesia's democratic government. It is an universal right that protects people as well as other civic groups from marginalization and discrimination (Lee & Sun, 2018; United Nations High Commissioner for Human Rights, 2022).

In a democratic governance, general electoral fraud (PEMILU) has always been outlawed. This is due to its possibilities to denude citizens' right to vote and then provide misleading information in election results. Citizens do not participate in the democratic process by not voting in the election or by replacing voters with ghost voters.

Even though Indonesia claims among the largest democratic nations and made impressive democratic gain (Freedom House, 2022 ), such an accomplishment seems to be subject to debate since buying votes persists to tarnish its election system (Virananda, Dartarto & Wijaya, 2021; Al-Hamdi et al., 2021; Jaffrey, 2020; Muhtadi, 2019; Aspinall et al, 2017). Money politics and political fraud are still prevalent in Indonesian politics (Al-Hamdi, 2022; Kramer, 2022; Jannah et al., 2020; Berenschot, 2018). Political parties continue to rely on political donations to win an election (Hidayaturrahman, Ngarawula & Sadhana, 2022; Dinarto & Ng, 2021; Jannah et al., 2020).

Identity politics, populism, as well as polarization are also employed to undermine political opponents in order to gain votes in elections (Habibi, 2022; Prasetyawan, 2022; Kansong, Sunarwinadi & Triputra, 2022; Rakhmani & Saraswati, 2021; Afrimadona, 2021; Fossati, 2019; Hofmann et al., 2021). Another popular method for improving voting rolls in Indonesian election campaigns would be "ghost voter" politics (LIPI, 2013; Mildaniati, 2022). The ghost politics of casting a vote has been practiced by utilizing the identity of the dead person in the voting rolls to boost the voting rolls of particular candidates.

Based on the information provided above, this research focused on such new issue. Researchers are attempting to respond to two fundamental questions. Are Indonesian voting truly

democratic? Second, how does political scam affect voters' political representation as component of their civil rights? To the first issue, the writer states no, but that it is a pseudo-democracy. The second claim is that vote buying, populism, and ghost voters damage voters' democratic freedom since they are not conducted in accordance with the principle of direct, general, free, as well as confidential elections.. Despite this, Indonesia is a democratic country with limited legal access to the voting process, the use of a ghost ballot, and low levels of civic engagement. Indonesia's electoral system was either magnificent or tarnished by fraud.

## **LITERATURE REVIEW**

### ***Electoral system***

The electoral system is the representation of democratic governance, and it is crucial for the stability of a nation 's development (OCHCR, 2022). According to Huntington (1995), the Electorate must have 5 elements within the successful execution:

1. The embodiment of folk's autonomy is put into practice.
2. Serving as a way of creating as well as formulating representation in government.
3. To serve as a means for lawfully instituting a leadership change.
4. To function as a system that permits elected elites to gain credibility. Voting in an election gives the elected leaders a mandate from the people to run the "wheels of government.
5. To serve as a system of general civic engagement which vigorously defines general populace guideline.

Election process in Indonesia are ruled by Law Number 7 of 2017. The meaning of Voting is found in Article 1 number 1 of the Law. General Elections, also known as elections, are indeed a mechanism of exercising people's sovereign power by electing members of the People's Representative Council, members of the Regional Representatives Council, the President and Vice President, and members of the Regional People's Representative Council in the Unitary State of the Republic of Indonesia based on Pancasila and the 1945 Constitution.

### ***Political fraud***

Political fraud has long been a source of contention among academics (Virananda, Dartarto & Wijaya, 2021; Al-Hamdi et al., 2021; Jaffrey, 2020; Al-Hamdi, 2022; Kramer, 2022; Jannah et al., 2020; Berenschot, 2018; Muhtadi, 2019; Aspinall et al, 2017). Meanwhile, the characteristics of an ideal election cycle include that the voting process must be transparent, non-partisan, and free from political fraud from before the election to after the election results..

According to the Human Rights Office of the High Commissioner (2022), real polling places must meet certain criteria, such as openness, voting chance, full participation, informed comprehension, or schedule regulation. The above representative democracy pattern suggests widespread equality and equal and fair rights for any and all people in the voting sphere. Stokes (1999), the democratic process is characterized by a 'one person, one vote' scheme wherein people have the chance to choose any of the political elites trying to compete for ballots. Even though social networking may be an effective political device, it has the potential to raid liberty as well as decapitate democratic values.

According to Lee (2018), the era of technology (information) puts us within extremely distinct contexts, and people live in a time which is influenced by forgery instead of open mindedness. Lee (2018), tricksters propagandize as well as diminish major parties' or pols' legitimacy with in political sphere. Subterfuge promotions as well as foreign meddling mechanisms infrequently depend entirely on online advertisement; some who have employed deceiving front clusters, frauds social media platform records, internet search techniques, and automated tools to deceive conversations online, among numerous other techniques. Many roadblocks to a global network global ecosystem have been strongly intertwined, and lawmakers must respond to issues throughout a variety of actions. Those who had already created digital marketing devices to easily available functionality. Even before political operatives delegitimize promotional innovation, the few who employ it to identify weaknesses in which both individuals and organizations are the most susceptible to uses a specially will gain. Individual citizens' data is employed against eachother in these kind of situations, and it is employed to aid ideological advertising companies in positively influencing one's targets. Such democratic deception is a human rights infringement.

Political forgery in election process affects the degree of political turmoil because of practice of 'political unrest' is one of government's basic ideas. Political fraud is a form of electoral violence which includes attempting to alter the outcome and process of an electoral cycle, normally shortly before the election. For political analysts, the idea that politicians experience unpredictability as a result of data trickery is intriguing since attempting to manipulate dynamic generation its electoral discourse.

According to Reynolds (2002), voting processes seem to be institutional arrangements for political decisions wherein individuals have the prerogative to choose through a competition for people's voter base. The rise of perceived risks linked to significant political unrest can also

have two implications for investment plan. First, political uncertainty tends to raise the potential risk of foreign funds, resulting in a greater equity expense. Second, electoral unpredictable nature tends to increase management's impression of a fund's operating cash risk, because individual firms' cash flow seems to be vulnerable both to perplexing and aggregation mysteries. As a consequence, all through periods of intense political strife, there is an proclivity to perceive financial inadequacies and to push an outside market share, causing a higher equity cost..

### **Methodology**

This research employed a descriptive qualitative method to investigate interpersonal interactions, mechanisms, as well as activities whilst also used over data on the issue at hand. This article evaluates how well the Indonesian electoral system utilizes social media to control information. This research aims to collect further data and paint a more complex image of political fraud throughout Indonesia's polls. The author performed empirical research is based on vote data using a sequence of series of documentaries bibliography as well as appropriate documents. The writer eviscerated the problems using the other electoral deception through data processing and civil rights theories. In regards to theoretical as well as intellectually rigorous significant contribution, the said article offers a valuable comprehension of analysis of political fraud and also its implications both on contestants' as well as voters' casting a ballot liberties.

### **Analyses**

A powerful democratic clientelism connection between voting organizing committee, nominees, as well as constituents thru the cast a ballot choices becomes a form of electoral fraud in Indonesian voting. Clientelism is a special provision from accomplishment for self gratification or mutual assistance of power and sharing of relationships, as well as unfairness should be considered acceptable.

### ***Pork Barrel and Money Politics***

In the Indonesia electoral practice, cast a ballot tactics including such donating cash to constituents (money politics) and misappropriating government funds to purchase votes (Pork Barrel) seem to be prevalent (LIPI, 2010; Jati, 2013; Saragintan & Hidayat, 2016; Aspinall & Sukmajati, 2016; Broto et al., 2021; Tjahjoko, 2022). Vote buying and favoritism are two factors which commonly appear in Indonesian election process as they can impact voting choices to advantage candidates who use this strategy winning elections. Vote buying is one of

the greatest opponents of each and every democratic establishment in Indonesia, either national and local. Vote buying refers to the act of buying electors votes by election attendees as well as by the winning squad, regardless of whether representative or otherwise, typically before the vote. Voters forfeit his\her independency when this relates to selecting nominees for elected figures based on reasonable considerations including proven record, achievement, initiatives, and manifesto pledges when it relates to money politics. This form of vote buying has always been typically regulated by legislation, such as the Pilkada Law (Electoral Law).

Before the national election, propagandists, functionaries, and even political apparatchiks buy influence. This promotes the practice of vote buying through distributing cash, basic necessities, grains, oil, and sugar to the general populace in order to garner general support for the politicians of party concerned. Vote buying emerged as a consequence of fear and mistrust with in capacity of contestants as well as successful teams to win in a honest fashion. Troubles arise as a consequence of difficulties with in new recruits of elected figures. The said hiring process, which really is agnostic to ability and past record, generates incredibly quick nominees who are incapable of arouse electorate compassion or empathy.

A further method for influencing its voting process thru the transaction - oriented elections is to employ the corporation fund to purchase people to vote. According to figures released by the Corruption Eradication Commission (KPK), as cited by Widayati (2019), the KPK seized 400 thousand packets in 84 cartons totaling IDR 8 billion. Something allegedly planned to use the funds for election day attacks. 'BSP (initial) is suspected of accepting a bribe from A.W. (accused), Marketing Director of P.T. Humpuss Transportation Kimia (HTK company). The accused has been supposed to help P.T. HTK in negotiating a deal to utilize its ships for fertilizer allocation from P.T. Indonesian Logistics Fertiliser. Other money politics cases captured by the police during the 2019 electoral campaign include IDR 1,075 billion. in cash and property from one political group in Lamongan, East Java.

Regardless of the fact that purchasing and selling votes is widespread in Indonesia, its impact on electoral results seems to be negligible. That technique of purchasing and selling franchises tends to affect only around 11% of all total votes. Three of culprits, for example, conceded to distributing a cash to 2,400 people. The amount of cash to be dispersed is IDR 20,000 (US\$ 1 36) per individual. According to Kefer (2007), electors of IDR 20.000 have such a connection to poverty and their financial circumstance. Constituents of low-income practice cronyism and corruption as well as manipulate people to vote from these connections.

### ***Populism in Indonesian Politics***

Populism have been prevalent in recent Indonesian elections, both locally and nationally. Since the 2014 to 2019 election, the algorithmic campaign has indeed been uncommon in comparison to certain other centralized democratic nations. On voting days, populism is employed in order rally large numbers of potential voters. Moreover, populism regularly perpetuates religious doctrine strain through associating an electoral opposing player with such a minority. In addition, religious as well as ethnic background are commonly used as a cast a ballot generator for nominees. As a result, cross-cutting cleavages based on religion and place of origin can be very political. Furthermore, identities associated to religious divergences motivate and inspire larger groups into sensible coalitions with political figures. Such midriff trends influence the way individuals cast a ballot. The above polarizability could correspond to a corruption and nepotism platform, and yet identity coincides it (Habibi, 2022).

Populism is a concern in a state as diversified as Indonesia for three main reasons listed below. First, populism does have the potential to reduce or perhaps even completely remove those certain personas throughout societal structure (Jannah, Ikhwan & Maritza, 2020). Identities are much more complex and diverse in a collective of individuals within a community, a neighborhood, or even a nation. Politicians intentionally display an individuality which those who genuinely think would then convince people to vote for them during the election in order to advance his/her political goals. It guarantees to favor all who arrive from such an individuality in in addition to highlighting that individuality. People of multiple identities would not gain from such a strategy when he is voted into power and keeps his commitment.. Second, populism underscores the quality of the work plan debate. Voting is a platform for different factions to start competing for social influences through offering the best work strategy to help sectors of society that are still suffering from a lack. Third, populism splits instead of integrates civilization. People believe that about there individuality has been characterized by choice of a "greatest" masterpieces which will resolve issues in there own area. Finally, Populism seems to be widely misunderstood as a subset of real politics, or even an outlet of state politics. Undoubtedly, a members of the group become much more able to unite once those who have a common identity. Nevertheless, in the sense of a multiculturalism Indonesian national identity, trying to emphasize this same identity of such a dominant group could really represent a threat to the country's integrity and harmony. This illustrates the dividing line among racial politics and politics in general: it only aims to achieve an exclusive objectives of its particular group,

while the other aims to achieve encompassing targets for shared life whilst also trying to destroy those certain identities.

### ***The emergence of ghost voters***

The 'ghost voter' strategy is a means of vastly increased ballots by utilizing the identities of dead person as electors. Because of number of registered voters have to be massive, as well as because utilizing the deceased's identity in any name is illegal, political pilots are really not frightened to use the identity. Those who used data from Provincial and district to publicize the names of the deceased as voters. Given that there is a list of the names of people who died as voters and were not likely to vote in elections, this politics is also known as 'ghost voter' politics. The Indonesian Institute of Sciences "LIPI" (2013) published reliable data on ghost voters in Indonesia. According to the LIPI study, there is a significant rise with in Population Data of Potential Election Voters (DP4) as well as the Data of Permanent Voters (DPT), which is main reason for the large non - attendance rate. It thus implies that ghost voters are very much likely to contribute to the massive amount of crossbenchers. For example, as in West Java vote, the census inhabitants of West Java is 43 million, whilst statistics from General Election Commission (KPU) using data from the Population Aggregate List per District (DAK2) in West Java is 49 million. As a result, the population information stored by the Central Statistics Agency differs by approximately 6 million. Comparable disparities emerged in North Sumatra, at which DAK2 and BPS vary by 3 million people, and Central Java, where the difference is seven million. Ghost voters are predicted to rise in the general election in 2024 as inhabitants in certain regions have been preoccupied with death certificates (Mildaniati, 2022).

Utilizing dead people's information in elections is a serious crime of misrepresenting population information as well as population records. Falsification of residential documents, for instance, can indeed be punished by:

1. Article 93: Any resident who intentionally falsifies letters and/or documents to the Implementing Agency in reporting Population Events and Important Events faces up to 6 (six) years in prison and/or a fine of IDR. 50 million.
2. Article 94: Anyone who orders, facilitates, or manipulates Population Data and/or Population Data Elements as defined in Article 77 is subject to a maximum prison sentence of 6 (six) years and/or a maximum fine of IDR. 75,000,000. 00. (seventy five million rupiah).
3. Article 96A: Any person or legal entity who does not have the right to print, publish, and/or distribute the Population Documents referred to in Article 8 paragraph (1) letter c shall

be sentenced to ten (ten) years in prison and a fine of IDR. 1,000,000.000,00. (one billion rupiah).

Despite the framework which regulates the legal settlement of general election infringements, the police and prosecutor's office for criminal violations, and the General Election Supervisory Body (BAWASLU) for election disputes, there are numerous barriers in law enforcement. For example, the reporting deadline for a violation is indeed very short, 7 (seven) days after it was discovered. Furthermore, Bawaslu was granted so little time to act on the report, where it made collecting proof complicated.

Even though settlement time in Law 7 to cope with infringements of 7+7 is not in line with the settlement time in the Pilkada Law (Election of Regents, Mayors, and Governors), a further issue is the absence of General Election Supervisory Body (BAWASLU) authority to resurrect parties suspected of having committed crimes. If the matter desires to flee while in an investigation, there is nothing that could be done to halt the case since time runs out in the process of dealing with it, as well as other obstacles that keep recurring in its implementation. Law enforcement should indeed achieve a legal advancement in settling both criminal and administrative instances.

### **Political fraud and violations of human rights**

The voting rights has been institutionalized in many statutory provisions, including Convention On human Rights (UDHR), the International Covenant on Civil and Political Rights, the 1945 Basic law, and Human Rights Law No. 39 of 1999. The above four documents rule the country national elections in Indonesia, each of which authorize inclusion of political freedoms, fairness in electoral engagement, as well as cast a ballot confidentiality assurances.

Among the pillars of contemporary democratic governance is indeed the fundamental premise of global and equitable voting rights for any and all eligible voters. The significance of inclusion and diversity, pluralism, and inclusivity has been stressed through Article 25(b) of the International Covenant on Civil and Political Rights, that acknowledges every citizen's right to vote and be elected at genuine periodic elections by universal and equal suffrage.

Cronyism of Pork Barrels or money politics, ghost voters, and demagoguery make the election a breeding place for violations of human rights. The voices of the people is suppressed, and it becomes a bargaining chip. Since they have freely subverted one's rights for particular political desires, these strategies would then make it more difficult for electors should choose. The concept of holding direct, public, accessible, and confidential election process (LUBER) can

also be managed to negotiate, whether it's with cash or even other conditions that affect voting' freedom to choose his\her political choice.

Although Indonesia does have representative government, there have been a few downfalls in regards to basic freedoms. The country of participatory democracy and also the accomplishment of right to vote in Indonesia appears to somehow be catastrophic. Its political and legal battlegrounds' accessibility to discourse on human rights has had no genuine influence on community fundamental freedoms. Instead of actually implementing civil rights, all of this finally accepted them as a political tactic.

### **CONCLUSION**

Electoral forgery in Indonesian elections was indeed divided into three categories identity politics, pork barrel, as well as ghost voters. The three kinds of fraud have become an acts to influence individual potentials in elections as well as accomplish political motivation there next to election participation, which results in an infringement of political freedoms. Any such political platform increases the level of political turmoil and violates people's voting privileges. Acts of forgery have all been deemed infringements of political and civil rights since there are constraints on casting ballots for candidates or going to vote directly, publicly, freely, and confidentially, as endorsed by Indonesia's electoral doctrine. Political groups play a distinct role through achieving the nation's targets than nation's public positions. With their legitimate interests, instinctual preferences are employed to keep moving the tires of authorities. Particular preferences are indeed the main and quite often overlooked aspirations of people.

**THE FOUNDATION NECESSITY OF BAKU BRANCH OF IMPERIAL RUSSIAN  
TECHNICAL SOCIETY**

**Hajiyeva Mahbuba CAMAL (Orcid ID: 0000-0002-2009-790X)**

The Chair of History of Azerbaijan and Eastern European countries, History and Geography  
Faculty, Sumgait State University (Azerbaijan)

**ABSTRACT**

There are periods in the history of the Caucasus, as well as Azerbaijan, which are still in great need of extensive and comprehensive study. The end of the XIX and the beginning of the XX century is one of such periods. The article deals with the establishment, activities and goals of Baku Branch of Imperial Russian Technical Society, which operated in 1879-1929. It is stated that the activity of the Baku Branch was not only related to the oil industry. The activity of the department employees is remembered for the high efficiency of various discoveries and proposals in different areas of production. The leading role of well-known professors and scientists, engineers and technicians of the time in the activity of the Baku Branch also attracted attention. This was the main aspect of the activity of the department. Information, proposals and appeals of industrialists and entrepreneurs as L.Nobel, H.Z.Taghiyev, M.Naghiyev, S.Asadullayev, V.Ragozin, I.Hajinski on oil issues were the most common forms of this cooperation. Despite the serious inertia of all structures of the imperial government, the conservatism of officials who feared scientific innovations, the scientific discoveries and achievements of scientists, albeit slow but overcame obstacles and proved their effectiveness in practice. Thus, examining the main activities of the Baku Branch and the main results of its work, we can conclude that its activity, of course, primarily aimed at the formation of the oil industry, finding effective ways to produce oil products and improving forms and methods.

## **RUSYA İMPARATORLUĞU TEKNİK DERNEĞİ BAKÜ ŞUBESİNİN KURULUŞU İHTİYACI**

### **ÖZET**

Kafkasya'nın ve Azerbaycan'ın tarihinde hala kapsamlı çalışmalara büyük ihtiyaç duyulan dönemler vardır. XIX'in sonu ve XX yüzyılın başlangıcı bu dönemlerden biridir. Makale, 1879-1929 yıllarında faaliyet gösteren Rus İmparatorluk Teknik Cemiyeti Bakü Şubesinin kuruluşu, faaliyetleri ve amaçlarını ele almaktadır. Bakü Şubesinin faaliyetinin sadece petrol sektörüyle ilgili olmadığı belirtildi. Departman çalışanlarının etkinliği, farklı üretim alanlarında çeşitli keşiflerin ve önerilerin yüksek verimliliği ile hatırlanır. Bakü Şubesi'nin faaliyetlerinde dönemin tanınmış profesör ve bilim adamları, mühendis ve teknisyenlerinin öncü rolü de dikkat çekti. Bu, bölümün faaliyetinin ana yönüydü. L. Nobel, H.Z. Taghiyev, M. Naghiyev, S. Asadullayev, V. Ragozin, I. Hajinski gibi sanayici ve girişimcilerin petrol konularındaki bilgi, öneri ve çağruları bu işbirliğinin en yaygın biçimleriydi. Emperyal hükümetin tüm yapılarının ciddi ataletine rağmen, bilimsel yeniliklerden, bilim adamlarının bilimsel keşiflerinden ve başarılarından korkan yetkililerin muhafazakarlığı, yavaş da olsa engelleri aştı ve pratikte etkinliğini kanıtladı. Bu nedenle Bakü Şubesinin ana faaliyetlerini ve çalışmalarının ana sonuçlarını inceleyerek, faaliyetlerinin elbette öncelikle petrol endüstrisinin oluşumunu, petrol ürünleri üretmenin etkili yollarını bulmayı ve form ve yöntemleri iyileştirmeyi amaçladığı sonucuna varabiliriz. .

**Anahtar Kelimeler:** Bakü, Rusya, teknik, şübe, dernek, sanayi

## INTRODUCTION

**Main part:** Over the centuries, the obvious decline in the political, economic and cultural development of the Russian Empire as compared with the leading European countries, in connection with this the growing anxiety and panic of the ruling circles and even the emperor were intensified after the tragic defeat of the country in the Crimea war (1853-1856). At the same time there were the growing calls and tendencies in the society and among various segments of population about the need for the most ordinary reforms. In this respect, the foundation of Imperial Russian Technical Society on May 24, 1866, meant that the imperial government, though late but in any case was obliged to change his attitude towards science and culture.

In our research, by studying the reasons that led to the foundation of the Baku branch of IRTS, it is possible to see that the work done by the branch had really yielded significant economic benefits. The effective results of the society's activity had been repeatedly admitted in governmental circles.

As a result of an adequate assessment of the short-term activities of the society, the honorary title of "Imperial Society" given to it in 1874, confirms this idea (5).

Russian Imperial Technical Society had many branches in the major industrial cities of the empire. Baku Branch of Imperial Russian Technical Society was established on March 13, 1879 (1, p.6). From the first point of view, this may seem like an ordinary event or the foundation of a new institution, in fact, it could be seen as the next step in the colonial economic policy of Russian imperial government, or as another concession to the supreme governing bodies of the region, which were interested in maintaining the economic and cultural backwardness of the national outlying areas. In fact, on the one hand the establishment of this organization was not only a novelty in the course of all the reforms that the imperial government was forced to implement since the mid-nineteenth century, but also one of the real results of a pre-planned policy campaign. On the other hand, the emergence and development of new capitalist relations in the economy of the empire at that time made it necessary, among other things, to change the attitude to the achievements of technical sciences and to the best practices in the efficient use of the natural resources of the national outlying areas. Thus, the foundation of Baku Branch was not a coincidence, but served to bring the rich natural resources of Azerbaijan, especially the oil and other resources of the Absheron Peninsula, known as the land of oil fields, to a qualitatively new level.

The members of Baku Branch had different forms of activity. From the first days of its activity, the department carried out activities covering various directions and areas of production (5). It was widespread to hold various meetings and discussions, to organize exhibitions on various technical problems and issues, to give lectures by leading scientists at enterprises, and to establish incentive prizes. One of the highlights of Baku Branch's activities was its cooperation with industry representatives in obtaining the necessary financial support for the organization of scientific research and development, as well as the development of ready-made discoveries and proposals with high profit prospects. There is a lot of information about the work of Baku Branch in organizing exhibitions held in Baku in different years in order to promote scientific discoveries and technical innovations. It is concluded that the activities of the department, along with the development of industry, also had a significant impact on the development of the general cultural level of society. One of the multifaceted activities of the Technical Society and its local branches and divisions was the organization of journal and other publications under various names. Among the publications of Baku Branch, we should mention the most persistent issues of the journal "Works of Baku Branch of Russian Imperial Technical Society". The journal is considered to be the first example of a press conference on oil issues in Russia. It should be noted that the department plays a supporting role in the economy of Baku and other cities of Azerbaijan, including the city water supply, street lighting and the solution of many domestic problems. In general, in just a few decades, Baku Branch was able to do important work in various regions of the empire - in Azerbaijan, in the North Caucasus and in other areas - to study the economic and natural resources and use them effectively in the development of the imperial economy.

It was in the middle of the nineteenth century and especially in the second half, when bourgeois reforms began to be implemented in Russia, that the level of cultural development increased slightly, as well as the increase and dissemination of scientific knowledge, characterized by an increase in scientific discoveries and technical achievements that have found a direct path to various areas of newly formed and strengthened industrial production.

Thus, the establishment of Baku Branch of the IRTS was, first of all, a very important event in the economic and, to some extent, cultural life of the region. During its existence, Baku Branch has become a place for the implementation of discoveries and innovations that are both important and new for its time, as well as created conditions for the application of scientific and technical discoveries in Azerbaijan in various sectors of the economy. The principles of

operation of the various structures of Baku Branch were clearly stated in its charter. The department is governed by a general meeting held once a month, and in between meetings, the council meets at least twice a month to deal with day-to-day matters. The council consisted of a chairman, his deputy, a secretary and department heads. The working principles of the departments operating within the department were also clearly defined. They had to identify new books published in the country and abroad, and ensure that the museums and libraries within the department were enriched with new visual aids, objects and publications.

The departments held open meetings to listen and discuss reports and speeches on innovations related to the problems of oil, chemical, mining and other industries. Such technical conversations, as well as listening to reports on trips of employees of the department abroad, were considered to be important information on many discoveries and innovations of direct practical importance at that time, as well as innovations in petro chemistry, other sciences and technology.

The participation of entrepreneurs from oil and other industries in these meetings, on the one hand, allows them to get advice and recommendations that will help them to improve the production process and make significant investments, on the other hand, they also received practical advice on how to deal with harmful conditions in the workplace, sometimes leading to accidents and deaths.

Besides the monthly general meetings held in the department, technical talks were also organized between the departments in accordance with the rules of rotation. It was very common to hold these talks even with the participation of well-known businessmen and industrialists of the time **(2, p.56)**.

It should be noted that the organization of Baku Branch had not previously faced such serious difficulties due to the opening of several branches of society and experience in various regions of the empire. One of the founders of the society, professor of the Russian Forestry Institute E.Andreyev, who spoke at the first meeting of the society with the participation of representatives of Russian universities and scientific organizations, spoke in detail about the goals and principles of the society **(3, p.4)**.

At its first meeting, Baku Branch defined its immediate tasks and stated that the proper organization and development of the oil industry and oil production, as well as the search for other natural resources in Baku province and adjacent areas will be the main direction of its activities **(4, p.112)**.

The activity of Baku Branch consisted of full, honorary and corresponding members with different levels of participation in its work. In the first year of its activity, Baku Branch brought together 20 scientists and engineers. However, in a very short period of time, the first successful results of the department's staff ensured the expansion of its ranks and increase its sphere of influence. In just 3-5 years, the department has become one of the largest scientific organizations in the Russian Empire. In 1914, the number of members of the department was 140. From the very first days of the department's activity, the society carried out activities covering various directions and areas of production (5). Holding various meetings and discussions, organizing exhibitions on various technical problems and issues, giving lectures by leading scientists at enterprises, establishing and presenting incentive prizes were also widespread.

## **CONCLUSION**

Thus, the foundation of Baku Branch of Imperial Russian Technical Society (IRTS) was primarily due to the need to develop the backward imperial provinces from a social, economic, scientific and technical point of view. The main purpose of Baku Branch was to accelerate the development of the local oil industry. Admittedly, one of the main results of the department's activities in this direction was the reconstruction of the oil industry in Azerbaijan, the significant expansion and development of this sector. In the oil industry, the use of technical innovations and discoveries proposed and prepared by the employees of the department played a great role in achieving the results we have discussed. During its existence, Baku Branch was both a place of realization of discoveries and innovations that were important and new for its time, as well as created conditions for the application of scientific and technical discoveries in Azerbaijan in various sectors of the economy. However, the activities of the department are not limited to this, from opening schools and courses providing technical knowledge at low and medium levels, to providing effective practical and financial support for effective work in Baku city economy, city water supply, city lighting and other utilities has been extensive.

**ABSTRACT**

An existing gas turbine from Afam power plant in Nigeria, powered with natural gas fuel was thermodynamically analyzed to identify the baseline practice in terms of environmental sustainability and efficient utilization of fossil power. Three (3) turbine air cooling methods (spray cooler and wetted media, fogging system technology and mechanical chiller system), energy and exergy models as well as exergy-economic models were employed for the system sustainability. Energy analysis was carried out for two gas turbine units (existing and modelled). With a developed program source code, results obtained indicated that the extent of sustainability depends directly on the amount of turbine inlet cooling system reduction according to the design requirements. The refrigeration method of cooling which achieved relatively lower inlet condition (15°C) had a sustainability index (SI) of 2.243 followed by spray cooling technique (2.17 SI), then fogging method (2.165 SI). The least was the base turbine system which had an SI value of 2.057. The SI decreased with increasing ambient temperatures. This was attributable to higher total exergetic destruction in the plant at comparatively high ambient temperatures. Accordingly, both the Enthalpy-Entropy Compensation (EEF) and Waste Exergy Ratio (WER) showed increasing trend in tandem with the ambient temperature since they are both functions of total exergetic destruction. Sensitivity analysis performed to check the effect of basic operating variables on the variation of ambient temperature for both energetic and exergetic efficiency of the plant demonstrated an overall decline in both efficiencies at increasing ambient temperatures which is attributable to higher compressor work requirements at increasing ambient temperatures. Based on the results, refrigeration cooling method which achieved relatively lower inlet conditions and SI of 2.243 is recommendation due to its least overall exergy destruction.

## 1. INTRODUCTION

Globally, gas turbines are used for power generation with varying performance according to a large spectrum of climatic conditions. During very hot periods, as it is the case in dry season, problems are experienced with the gas turbines because of increased demand for electric power. However, at such periods, the turbine performance decreases due to the effect of ambient temperature on the compression process of air. In fact, the gas turbines output are significantly affected by the ambient air temperature, and the output drops by 0.54% to about 0.90% for every degree rise in the ambient temperature (Perez *et al.*, 2007). Additionally, the increase in ambient air temperature causes significant corresponding increase in the gas turbine transfer heat rate with resultant operating cost rate (Chaker *et al.*; 2004). Thus, power reduction is expected in turbine operation when prolonged dry weather conditions are prevalent, and that is the case in Nigeria. An effective approach to overcome the loss of gas turbine power output during hot periods, and in areas with high ambient temperatures, is to cool the compressor inlet air.

Although, there are several inlet air cooling technologies available, high pressure inlet fogging has become increasingly popular over the past decade mainly due to its relatively lower cost and its effective power augmentation (Chaker *et al.*, 2006; Cataldi *et al.*, 2006). Fogging is defined as the cooling of the compressor inlet air by injection of de-materialized water at high pressure through atomizing nozzles. This method results in an increase in relative humidity of about 95% to 100% and a decrease in gas turbine inlet air temperature to very low temperatures without refrigeration systems. Several techniques and technologies for gas turbine power augmentation via inlet air cooling exist in the literature. The application of a particular technique may depend on location, economy and intensive properties of the environment. Fog inlet air cooling system can be directly used to cool down the air inlet temperature entering the compressor. Performance specifications of gas turbines show that reduction of inlet air temperature increases the capacity and reduces the heat rate. A decrease in compressor inlet air temperature leads to an increase in air density at constant pressure (Ikpe *et al.*, 2020). Therefore, the higher the mass flow rate, the higher the gas turbine output power. Increasing turbine capacity will result in smaller heat rates as the turbine power output increases without a corresponding increase in fuel input. Usually, fogging system increases air density and mass flow rate by adding water to dry air, and increase in specific heat ratio due to change in gas-

phase composition and it changes compressor process from adiabatic and liken it to the isothermal process.

In addition to catering for reduced power generation due to high ambient temperatures, the environmental sustainability and ecological efficiencies of energy generation systems is imperative. Large exergy destruction contributes to environmental degradation when not properly matched with the power output from such systems. To augment power production which will be environmentally friendly, the technologies of turbine inlet air cooling on sustainability and ecological efficiencies must be considered. In literature, several turbine air cooling systems have been studied extensively with concerted effort on application, evaluation of droplet size, and optimization (Kim *et al.*, 2012; Pascale *et al.*, 2014; Athari *et al.*, 2015). For instance, Kim *et al.* (2012) analyzed the inlet fogging process in a gas turbine system for different water injection ratios, where special attention was paid to modeling for evaporation of injected water droplets. Using carefully assumed conditions, a model was formulated where the time for complete or partial evaporation of the droplet phase was computed. Athari *et al.* (2015) proposed and analyzed a gas turbine cycle with fog cooling and steam injection, and integrated with biomass gasification using energy, exergy and exergoeconomic analyses. However, the sustainability and environmental impact of steam injection cooling was not considered.

In the absence of nuclear, magnetic, electrical, and surface tension effects, the exergy of a steady stream of fluid can be separated into four main components (Kotas, 1995). These include: Kinetic exergy ( $E_k$ ). The kinetic energy is related with the bulk velocity of a fluid. Under ideal situations, it is converted into mechanical work. The physical exergy is the maximum work obtained by taking the system by means of reversible physical processes, from its initial state to the state of restricted equilibrium with the environment, i.e.  $P_0, T_0$ . A restricted equilibrium is defined as a state in which the system is in thermal and mechanical equilibrium with the environment. Under these conditions, the temperature and the pressure of the system are the same with those of the environment.

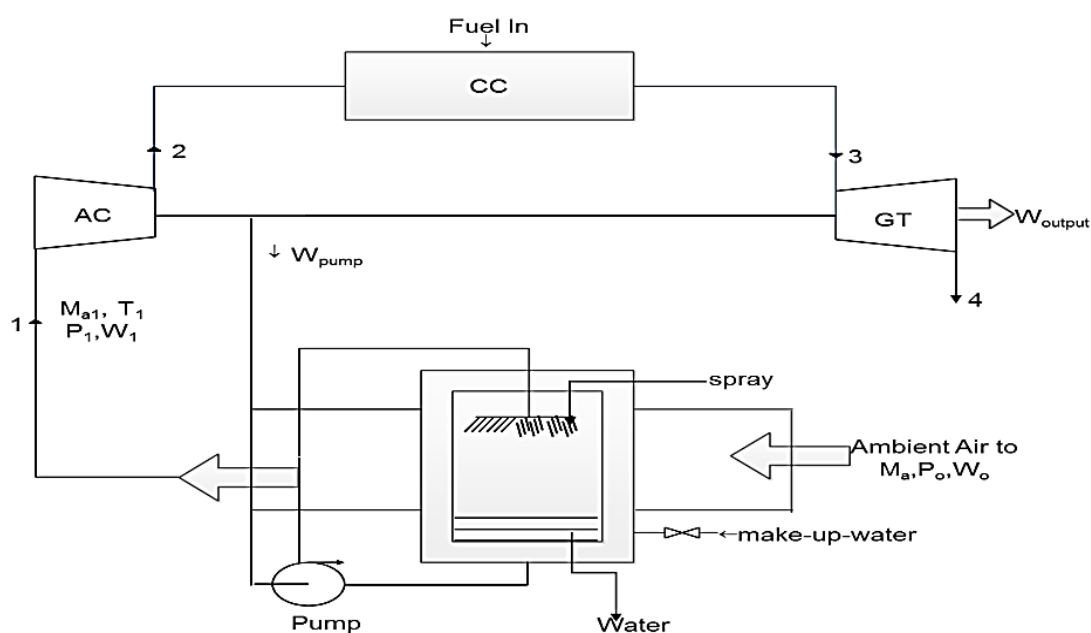

The system of a restricted equilibrium is kept separate from the environment by a physical boundary to avoid mixing and chemical interaction with the environment. With this, the composition of the environment is immaterial and the state of the environment is completely defined by its pressure and temperature. Hence, in a restricted equilibrium the environment can be regarded as an infinitely large reservoir of thermal energy of zero grade, since its value of exergy is zero. The analysis of different turbines air inlet cooling media to strike a balance

between environmental sustainability as well as the traditional power augmentation forms the problem statement for this research work. Hence, investigating the influence of parametric variations on environmental sustainability of different gas turbine inlet cooling systems

## 2. MATERIALS AND METHODS

The basic form of the schematic diagram of a simple gas turbine with an inlet fogging system is presented in the schematic of Figure 1, simple open type gas turbine configuration is shown in Figure 2 while the T-s diagram is shown in Figure 3. The temperature inlet condition to the compressor is reduced due to the fogging arrangement. The system comprises an air-compressor, 1-2 (AC), combustion chamber 2-3 (CC) and the turbine 3-4 (GT). Exergy stream from the ambient conditions in state 1  $T_0$  and  $P_0$  enters the GT system through the compressor. Exergy in the form of mechanical work is delivered to the compressor through the turbine shaft. Some of the exergy is lost in the compressor due to irreversibilities while part of the exergy in the AC is utilized during the compression process. The compressed air enters the CC at elevated pressure delivery exergy. The fuel and air mixed under high turbulence in the combustion chamber resulting to combustion and flow of exergy stream of hot gas at high pressure and temperature into the turbine. Part of the exergy is destroyed in the turbine due to irreversibilities and part is utilized in driving the compressor, while the rest becomes available as the network produced by the turbine (Bejan and Tsatsaronis, 1995):

**Figure 1:** A simple gas turbine with an inlet fogging system

**Figure 2:** Simple open type gas turbine configuration

### 2.1. Gas Turbine with Fogged Cooling System

Figure 1 shows the gas turbine with the fogging system. Fresh water is drawn into the demineralized water plant where certain mineral deposits are removed, maintaining the pH of the water at 7.5 maximum. The demineralized water enters the storage facility and exits, from where the water is pumped to the position nozzles. The nozzles atomize the demineralized water into tiny water droplets (fog). Each droplet, by the nozzles design, is recommended to be less than 50 micron in size. Critical parameters of the fogger include droplets mean size, their distribution pattern and their extent of penetration into the air duct from the points of their production.

**Figure 3:** T-s diagram of a simple open type gas turbine configuration

## 2.2. ISO Operating Data for Gas Turbine Plant

The operating data used for this study was obtained from Afam gas turbine plant. The design data for the based load is depicted in Table 4.1. The plant uses natural gas as fuel with the composition: 88 % methane, 5 % ethane, 2 % propane, 0.6 % butane and 4.4 % carbon dioxide.

## 2.3. Thermodynamic Assumptions

- i. The following assumptions were made in the analysis of the gas turbine system
- ii. The ambient pressure and temperature were kept at 1.013 bars and 25<sup>0</sup>C respectively.
- iii. The gas turbine plant operates at steady state condition.
- iv. The pressure drop in the combustion chamber was considered negligible.
- v. The air after fogging at entry to the compressor is completely saturated adiabatically. That is, the relative humidity of the air is 100%.
- vi. All components have adiabatic boundaries.
- vii. Air and combustion gases are regarded as ideal gases possessing constant specific heats at prescribed temperatures.

## 2.4. Energy Analysis of the Gas Turbine Unit

### 2.4.1. Gas Turbine Energy Balance

Energy balance for the schematic diagrams of Figure 1 and 3 are earlier presented in this study. The difference between these two systems only lies in the alteration of compressor inlet temperature. The pressure values for the base turbine and that of the fogged system still have the same ambient values. In the model analysis, the effect of fogging is incorporated by virtue of the increase of fluid mass which in turn is a function of the specific humidity of the fogged air. The exergy at point 3 for the fogged system is obtained per kilogram of fluid in Equation 1 and 2. For the turbine, in consideration of the T-s diagram of Figure 3 and the general expression of Equation 3, the exergy balance in the gas turbine is:

$$E_{x3} = (C_{pa} + wC_{pv})T_0 \left[ \frac{T_3}{T_0} - 1 - \ln \left( \frac{T_3}{T_0} \right) \right] + (1 + 1.607w)R_a T_0 \ln \left( \frac{p_3}{p_0} \right) \quad (1)$$

$$E_{x3} = m_a(1 + w + f) \left\{ (C_{pa} + wC_{pv})T_0 \left[ \frac{T_3}{T_0} - 1 - \ln \left( \frac{T_3}{T_0} \right) \right] + (1 + 1.607w)R_a T_0 \ln \left( \frac{p_3}{p_0} \right) \right\} \quad (2)$$

$$E_{x3} = E_{x4} + E_w + E_D \quad (3)$$

The exergy at point 4 is computed with the relationship in Equation 4, using the temperature and pressure values of this point as well as its mass flow rate as:

$$E_{x4} = C_{pg}(T_4 - T_0) - T_0 \left\{ C_{pg} \ln \left( \frac{T_4}{T_0} \right) - R \ln \left( \frac{p_4}{p_0} \right) \right\} \quad (4)$$

The expression for the exergy of the fogged system is presented per kg of gas is given by Equation 5.

$$E_{x4} = (C_{pg} + C_{pv}w)T_0 \left( \frac{T_4}{T_0} - 1 - \ln \frac{T_4}{T_0} \right) + (1 + 1.607w)R_a T_0 \ln \left( \frac{P_4}{P_0} \right) \quad (5)$$

For the mass stream, Equation 5 is written as:

$$E_{x4} = \dot{m}_a(1 + w + f) \left\{ (C_{pg} + C_{pv}w)T_0 \left( \frac{T_4}{T_0} - 1 - \ln \frac{T_4}{T_0} \right) \right\} + (1 + 1.607w)R_a T_0 \ln \left( \frac{P_4}{P_0} \right) \quad (6)$$

The exergy of turbine work is same as the turbine work output. The exergetic efficiency for the gas turbine  $\psi_{GT}$  is expressed as (Bejan and Tsatsaronis, 1995; Kotas, 1995):

$$\Psi_{GT} = \frac{E_w}{E_{x3} - E_{x4}} \quad (7)$$

#### 2.4.2. The Air Compressor

The work input to the compressor increases the enthalpy and temperature of air from the ambient conditions to values which vary according to the compression rate. From Figures 1 and 3, the energy balance in the compressor is expressed by (Bassily, 2001) as:

$$C_{pair}T_1 + wac = C_{pair}T_{2a} \quad (8)$$

The actual compressor work is:

$$wac = C_{pair}(T_{2a} - T_1) \quad (9)$$

While the ideal specific compressor work is obtained as:

$$wac' = C_{pair}(T_2 - T_1) \quad (10)$$

By introducing isentropic relation in the compressor, the exit temperature of the compressor is obtained as (Ondrajs *et al.*, 1991):

$$\frac{T_2}{T_1} = \left( \frac{P_2}{P_1} \right)^{\frac{\alpha-1}{\alpha}} \quad (11)$$

$$T_2 = T_1 \left( \frac{P_2}{P_1} \right)^{\frac{\alpha-1}{\alpha}} \quad (12)$$

In the real case, the actual temperature,  $T_{2a}$ , after compression, is obtained using the relationship with isentropic efficiency. Thus:

$$\eta_{comp.} = \frac{Ideal\ work}{Actual\ work} \quad (13)$$

Equation (13) can be expressed as:

$$\eta_{comp.} = \frac{T_2 - T_1}{T_{2a} - T_1} \quad (14)$$

From where  $T_2$  is obtainable as:

$$T_2 = \eta_{comp.} (T_{2a} - T_1) + T_1 \quad (15)$$

Substituting  $T_2$  Equations (15) into (12):

$$\eta_{comp.} (T_{2a} - T_1) + T_1 = T_1 \left( \frac{P_2}{P_1} \right)^{\frac{\alpha-1}{\alpha}} \quad (16)$$

From Equation (16) the actual temperature after compression is obtained as:

$$T_{2a} = T_1 \left[ 1 + \frac{1}{\eta_{comp.}} \left( \left[ \frac{P_2}{P_1} \right]^{\frac{\alpha-1}{\alpha}} - 1 \right) \right] \quad (17)$$

The actual specific compressor work is given by Equation 18;

$$w_{AC} = C_{pair} \left\{ T_1 \left[ 1 + \frac{1}{\eta_{comp.}} \left( \left[ \frac{P_2}{P_1} \right]^{\frac{\alpha-1}{\alpha}} - 1 \right) \right] \right\} \quad (18)$$

Or

$$w_{AC} = C_{pair} \frac{T_1}{\eta_{comp.}} \left( \left[ \frac{P_2}{P_1} \right]^{\frac{\alpha-1}{\alpha}} - 1 \right) \quad (19)$$

Consequently for a given mass flow rate  $\dot{m}_a$ , the actual compressor work can be gotten from Equation (19),

$$w_{AC} = \frac{\dot{m}_a C_{pair}}{\eta_{comp.}} T_1 \left( \left[ \frac{P_2}{P_1} \right]^{\frac{\alpha-1}{\alpha}} - 1 \right) \quad (20)$$

Equation (20) is further simplified as:

$$w_{AC} = \dot{m}_a C_{pair} (T_{2a} - T_1) + \dot{m}_v (ig_2 - ig_1) \quad (21)$$

The mass of vapour,  $\dot{m}_v$  is related to the specific humidity (W) (Rajput, 2009),

$$W = \frac{\dot{m}_v}{\dot{m}_a} \quad (22)$$

Or

$$\dot{m}_v = W * \dot{m}_a \quad (23)$$

Substituting Equation (23) into Equation (21), the compressor work for the fogged system is obtained as:

$$w_{AC} = \dot{m}_a C_{pa} (T_{2a} - T_1) + W * \dot{m}_a (ig_2 - ig_1) \quad (24)$$

Or

$$w_{AC} = \dot{m} [ C_{pai} (T_{2a} - T_1) + W (ig_2 - ig_1) ] \quad (25)$$

Or

$$w_{AC} = \dot{m}_a \left\{ \frac{C_{pair} T_1}{\eta_{comp.}} \left( \left[ \frac{p_2}{p_1} \right]^{\frac{\alpha-1}{\alpha}} - 1 \right) + W (ig_2 - ig_1) \right\} \quad (26)$$

where  $i_{g2}$  and  $i_{g1}$  are the enthalpies of saturated water vapour at compressor exit and inlet respectively.

### 2.4.3. The Combustion Chamber

The energy balance for the combustion chamber for the base case is expressed in (Rajput, 2009) as:

$$\dot{m}_f C_{v,\eta comb.} + \dot{m}_a C_{p,air} T_{2a} = (m_a + m_f) g \cdot T_3 \quad (27)$$

Rearranging Equation (27) and substituting  $Q_{in} = \dot{m}_f C_{v,\eta comb.}$  into Equation (27) the following is obtained as:

$$Q_{in} = (m_a + m_f) C_{p,g} T_3 - \dot{m}_a C_{p,air} \left\{ T_1 \left[ 1 + \frac{1}{\eta_{comp.}} \left( \left[ \frac{p_2}{p_1} \right]^{\frac{\alpha-1}{\alpha}} - 1 \right) \right] \right\} \quad (28)$$

Hence, the energy balance for the combustion chamber for the fogged system is expressed as:

$$\dot{m}_f C_{v,\eta comb.} + \dot{m}_a C_{p,air} T_{2a} + \dot{m}_v h v_2 = (\dot{m}_a + \dot{m}_f) g \cdot T_3 + \dot{m}_v h v_3 \quad (29)$$

Or

$$Q_{in} = (\dot{m}_a + \dot{m}_f) C_{p,g} T_3 - \dot{m}_a C_{p,air} T_{2a} + \dot{m}_v (h v_3 - h v_2) \quad (30)$$

The term  $f$  is the ratio of air mass and fuel approximated according to the relationship in (Alhazmy *et al.*, 2006).

$$f = \frac{\dot{m}_f}{\dot{m}_a} = \frac{C_{p,g}(T_3-298) - C_{p,air}(T_2-298) + w(hv_3-hv_2)}{C_{v,\eta comb.} - C_{p,g}(T_3-298)} \quad (31)$$

### 2.4.4. The Turbine Unit

Energy balance for the turbine is presented in line with the schematic diagram and T-s diagram of Figures 1 and 3 respectively (Dossat, 1997).

$$C_{p,g} \cdot m_t T_3 = W_T + C_{p,g} m_t \cdot T_{4a} \quad (32)$$

where

$$m_t = \dot{m}_a + \dot{m}_v + \dot{m}_f = (1 + w + f) \quad (33)$$

Employing the isentropic expansion in the turbine, the exit temperature is related to the isentropic efficiency (Dossat, 1997).

$$T_{4a} = T_3 \left( 1 - \eta_T \left[ 1 - \frac{1}{(r_p)^{\frac{\alpha-1}{\alpha}}} \right] \right) \quad (34)$$

The turbine work can further be presented according to (Alhazmy *et al.*, 2006) as:

$$W_T = \dot{m}_a (1 + w + f) C_{p,g} \eta_t \cdot T_3 \left( 1 - \frac{1}{(r_p)^{\frac{\alpha-1}{\alpha}}} \right) \quad (35)$$

## 2.5. Exergetic Sustainability

Environmental sustainability indicators are exergy based indices which comparatively assesses the performance of energy conversion systems based on exergy efficiency, useful system output, and the environmental impact of such systems which must result due to large thermodynamic irreversibilities. These environmental sustainability indicators are expressed as follows:

### 2.5.1. Waste Exergy Ratio

The waste exergy ratio quantifies the degree of cumulative thermodynamic irreversibilities in a plant with respect to the available external exergy input to the system. For thermal power plants and boilers, the available external exergy input is the chemical exergy of the fuel used. The waste exergy ratio is obtained mathematically as the overall exergy waste (or destruction) for the system on the total exergy input. This is expressed as (Aydın *et al.*, 2013):

$$\dot{e}_{WR} = \frac{\dot{D}_{Total}}{\left[1 - \frac{T_0}{T_{CC}}\right] * \dot{m}_{Fuel\ oil} * LHV_{Fuel\ oil}} \quad (36)$$

### 2.5.2. Environmental Effect Factor

The environmental effect factor quantifies the degree of cumulative thermodynamic irreversibilities in a plant with respect to the plants net exergy efficiency. It also comparatively relates the extent to which a plants useful output is severely affected due to relatively high thermodynamic irreversibilities resulting in environmental concerns. The EEF is obtained as the ratio of the waste exergy ratio upon the exergy efficiency. This is expressed as (Aydın *et al.*, 2013):

$$EEF = \frac{\dot{e}_{WR}}{\psi} = \frac{\dot{D}_{Total}}{\sum_i x_i E_{xi}^{CH} + RT_0 \sum_i x_i \ln x_i} \quad (37)$$

### 2.5.3. Exergy efficiency

This is the general performance index of a plant based on the concept of availability. The exergy efficiency is the ratio of the exergy in product to the total exergy of fuel. This is expressed as (Cengel and Boles, 2007; Rajput, 2009):

$$\psi = \frac{\text{exergy in product}}{\sum_i x_i E_{xi}^{CH} + RT_0 \sum_i x_i \ln x_i} \quad (38)$$

### 2.5.4. Exergetic sustainability index

A system with exergy output far larger than the total destruction rate will have ‘sustainabilities’ greater than unity while systems with comparatively large destruction at par with the plant output are not sustainable. Appropriately, the reciprocal of the environmental effect factor is

termed the exergetic sustainability index given by Equation 39, and provides a platform for comparison between the environmental degradation due to exergetic output from each system (Aydin *et al.*, 2013):

$$SI = \frac{\text{Exergy of product}}{\text{Grand exergy destruction}} \quad (39)$$

### 3. RESULTS AND DISCUSSIONS

The simulation requires investigation of the effect of various turbine inlet cooling systems with respect to environmental sustainability indicators, the net power output, exergetic and energetic efficiencies as well as the effect of various operating parameters on the system. To effect these conditions on a dynamic level, the basic operating data of an existing power plant have been considered. Models have been written with respect to each component of the system, while program source code has been developed in engineering equation solver (EES) to assist in the simulation. The program is appended for evaluation of similar plant configuration using any combination of operating data. The operating data is summarized in Table 1.

**Table 1:** Gas turbine plant parameters

Component	Parameter	Unit	Value
Air Compressor	Inlet temp. ( $T_{in}$ )	K	298
	Outlet temp. ( $T_{out}$ )	K	644.7
	Inlet pressure ( $P_{in}$ )	Bar	1.013
	Outlet pressure ( $P_{out}$ )	Bar	10.47
	Air flow ( $\dot{m}_a$ )	kg/s	427
	Isent. Effi. ( $\eta_{Comp.}$ )	%	80
Combustion Chamber	Inlet temperature ( $T_{in}$ )	K	644.7
	Inlet gas flow ( $\dot{m}_f$ )	kg/s	7.039
	Inlet air flow ( $\dot{m}_a$ )	kg/s	427
	Outlet temp. ( $T_{out}$ )	K	1324
	Inlet pressure ( $P_{in}$ )	Bar	10.47
	Outlet pressure ( $P_{out}$ )	Bar	10.47
	Outlet mass flow ( $\dot{m}_{out}$ )	kg/s	434.04
Gas Turbine	Inlet mass flow	kg/s	434.04
	Outlet mass flow	kg/s	434.04
	Inlet temp.	K	1324
	Outlet temp.	K	834
	Inlet pressure	Bar	10.47
	Outlet pressure	Bar	1.013
	Isentropic effci.	%	85

The data presented in Table 1 is utilized to perform all the analysis which follows. This presentation is made possible after the utilization of all performance criteria of the gas turbine plant in consideration. These include: the isentropic efficiencies for the compressor and turbine, and the index of compression and expansion of air and burnt gasses respectively. However, the mass flow rates for the air and fuel have remained as they appear in Table 1. A compendium of the performance indices for the plant is shown in Table 2:

**Table 2:** Performance indices for the gas turbine plant at base condition

Parameter	Value	Unit
Compressor Work	148.775	MW
Turbine Work	244.474	MW
Net Turbine Output	95.7	MW
Energy Efficiency	28.69	%
Exergy Efficiency	27.58	%
Waste Exergy Ratio	0.3425	Dimensionless
Environmental Effect Factor	0.486	Dimensionless
Sustainability Index	2.057	Dimensionless

Performance evaluation of the system is shown in Table 2. As much as 95.7 MW of power is generated in the system, although 4.3 MW short of the rated 100 MW in the plant. The sustainability index which relates the ratio of useful output to the total exergetic destruction is shown to be 2.057 indicating that the turbine output exceeds the total destruction by up to 2.1 times. The compressor work is obtained as 148.775 MW, conspicuously larger due to the high compression ratio, while the turbine output is obtained as 244.474 MW.

### 3.1. Parametric Variation of Basic Operating Parameters

The influence of parametric variation of basic operating parameters was considered under the following: Parametric variation of ambient temperature on sustainability indicators of the plant is shown in Table 2. With an increase in the ambient temperature from 290 K to 230 K, the system performance was significantly affected. For instance, the sustainability index decreases for increasing ambient temperatures. This is attributable to higher total exergetic destruction in the plant at comparatively high ambient temperatures. Accordingly, both the EEF and WER recorded increasing trend in tandem with the ambient temperature since they both are functions of total exergetic destruction. The results points to significant increase in the sustainability of the system by employing different turbine inlet cooling as shown in Figure 4.

**Figure 4:** Effect of ambient temperature on exergetic sustainability indices

The compressor work is grossly affected by the magnitude of the ambient temperature. The results of Figure 5 showed that an increase in the ambient temperature results in larger compressor work requirements which results in reduced net output and reduced exergetic sustainability. At higher ambient temperatures entering the compressor, the mass flow of air is significantly improved. However, increasing the air temperature reduces the air density causing an increase in pressure drop. Consequently, the compressor work improves accordingly, resulting in relatively high compressor work requirements which severely cause exergetic destruction in the system.

**Figure 5:** Effect of ambient temperature on compressor work

Figure 6 shows the variation of ambient temperature on both energetic and exergetic efficiency in the plant. The results demonstrate an overall decline in both energetic and exergetic efficiencies at increased ambient temperatures. This is attributable to higher compressor work requirements at increasing ambient temperatures. Performance analysis of the system with respect to turbine inlet temperature on exergetic sustainability indicators is shown in Figure 7. This variation is performed at constant ambient temperature of 25 °C. The turbine inlet was varied between 1200 and 1400 K. The results indicate an increasing trend in values of the exergetic sustainability index along increasing turbine inlet temperatures. Fittingly, there is less environmental degradation from the results as the TIT values increase. Therefore, high values of WER and EEF decreased from 0.4936 to 0.2472, and 0.7728 to 0.3318 respectively. Within the same range, the sustainability index increased significantly from 1.294 to 3.014. The increase in SI results from increasing work output at constant values of other operating parameters, especially before the turbine.

**Figure 6:** Effect of ambient temperature on energetic and exergetic efficiency

**Figure 7:** Effect of ambient temperature on exergetic sustainability indicators

Ambient temperature effect was also investigated on the system regarding exergetic destruction. The results of this evaluation are shown in Figure 8. It indicated an increasing exergetic destruction in the entire system, especially in the combustion chamber where large variation in temperature between the compressed air and natural gas. This variation results in large temperature gradient between the two fluids resulting in large exergetic destruction in this component. Effect of turbine inlet temperature (TIT) on exergy destruction is shown in Figure 9.

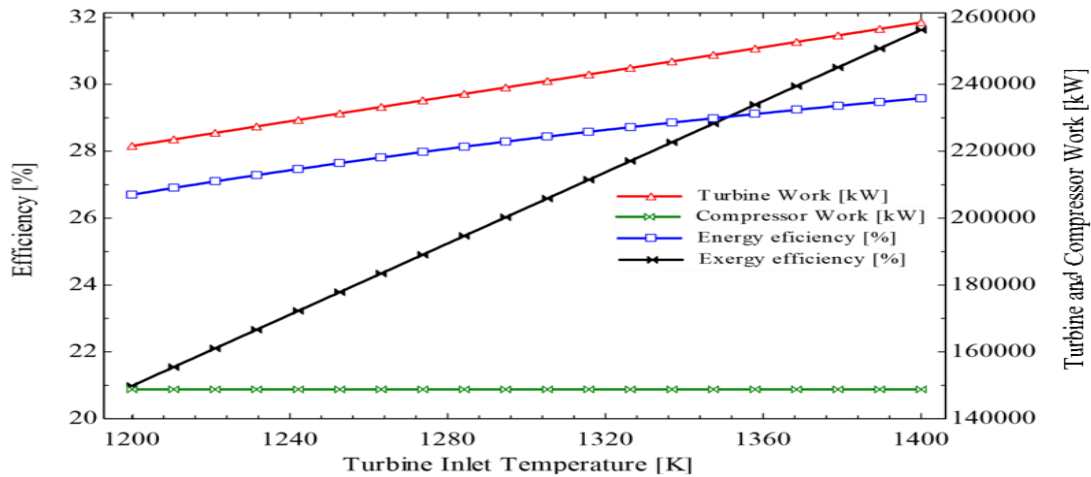

**Figure 8:** Effect of ambient temperature on exergy destruction

**Figure 9:** Effect of turbine inlet temperature (TIT) on exergy destruction

In Figure 9, turbine inlet temperature variation on component as well as total exergy destruction is shown. The TIT values were varied between 1200 and 1400 K at constant ambient temperature of 298 K. Within this TIT range, exergetic destruction within the compressor is constant at 772 kW. However, exergetic variation was observed in the turbine and combustion chamber. In the combustion chamber, there was a sharp fall in exergetic destruction at increasing TIT as expected. The combustion chamber product results as fuel to the turbine. Therefore, at higher turbine inlet temperatures, there is relatively high performance of the combustion chamber using constant supply of fuel at ambient parameters. Accordingly, exergetic destruction drops from 119576 to 25577 kW. The turbine recorded comparatively increased exergetic destruction at increased TIT since the expansion ratio was kept constant resulting in fixed turbine back pressure. Interestingly, in totality, the exergy destruction reduces as TIT values increased. The turbine inlet temperature variation on both energetic and exergetic effect as well as turbine and compressor work is shown in Figure 10.

**Figure 10:** Effect of turbine inlet temperature on energy/exergy efficiency and turbine/compressor work

When the TIT was varied between 1200 and 1400 K, an increase in both energy and exergy efficiency was noticed since higher TIT resulted in higher turbine output as shown in Figure 10. Within this range, the turbine output increased from 221578 to 258507 kW accounting for about 16.67 % increase. The compressor work remained constant for this variation since this component is independent of the turbine inlet temperatures.

#### 4. CONCLUSION AND RECOMMENDATIONS

Turbine inlet air cooling is an effective method for reducing the decrease in gas turbine performance during hot and humid summer periods when electrical power demands are peaked. To augment power production which is environmentally friendly, the technologies of turbine inlet air cooling on sustainability and ecological efficiencies must be considered. In literature, several turbine air cooling systems have been studied extensively with concerted effort on application, evaluation of sustainability index. Accordingly, this study investigated the influence of parametric variations on environmental sustainability of different gas turbine inlet cooling systems. The following conclusions and recommendations were made:

- i. The simple gas turbine plant is generally sustainable to a certain degree since its value is more than unity. However, the results suggest much improved sustainability values by employing turbine inlet cooling.

- ii. The extent of sustainability depends directly on the amount of turbine inlet reduction achievable in consonance with the design requirements. For instance, the refrigerative method of cooling which achieves relatively lower inlet conditions (15 °C) has 2.243 SI followed by sprayed cooling technique (2.17 SI) and fogging (2.165). The least is the base turbine system which has an SI value of 2.057.
- iii. Ambient temperature effects was also investigated on the system regarding exergetic destruction. It indicated an increasing exergetic destruction in the entire system, especially in the combustion chamber where large variation in temperature between the compressed air and natural gas. This variation results in large temperature gradient between the two fluids resulting in large exergetic destruction in this component.
- iv. The variation of ambient temperature on both energetic and exergetic efficiency in the plant demonstrates an overall decline in both energetic and exergetic efficiencies at increased ambient temperatures which is attributable to higher compressor work requirements at increasing ambient temperatures.
- v. The sustainability index decreases for increasing ambient temperatures. This is attributable to higher total exergetic destruction in the plant at comparatively high ambient temperatures. Accordingly, both the EEF and WER recorded increasing trend in tandem with the ambient temperature since they both are functions of total exergetic destruction. The results points to significant increase in the sustainability of the system by employing different turbine inlet cooling as shown in the following results.

It is recommended that different turbine inlet technologies are cost effective. A comparative cost evaluation which employs specific exergy costing including the equipment for cooling and the turbine as one unit will present broader front for determination of the best cooling methods that will be exergetically sustainable and cost effective.

**ABSTRACT**

This study aimed to examine the factors affecting the decision to participate in life insurance of people in the emerging market based on the evidences from Soc Trang provincial city. The study conducted a survey of people in Soc Trang city in May 2021 by applying a random sampling method. Out of 180 survey questionnaires, there were 165 valid responses that can be used for data analysis. The binary logistic regression method was employed to analyze the influence of factors on the decision to buy life insurance. Research results showed that demographic determinants (age and gender), socioeconomic determinants (homeownership and peer group effects), and psychological determinants (risk attitude) affect life insurance purchase decisions. Based on the empirical findings, two managerial implications are suggested in the article: (1) Improving the post-purchase customer care system; (2) Building and developing an official customer data system to provide “personalized” products.

**Keywords:** decision to participate; life insurance; risk attitude; binary logistic regression; Soc Trang province, Vietnam

## **1. INTRODUCTION**

The occurrences of risks and uncertainty conditions have resulted of the damages in finance and livelihoods on individuals and their families. Life insurance plays as a tool to help the individuals for the sharing and transfer the risks through the products provided by insurance companies. Life insurance companies, thus, play as the financial institutions to call for the long-term capital flows from the private sector, and utilize them to invest in the public and private sectors (Catalan et al., 2000).

In 2019, the total revenue of life insurance companies in the world reached 2,916,267 million USD, contributing 3.35% to global GDP. In Asia, life insurance premiums reached 39,598 million USD, contributing 2.15% to the GDP of this area. Even the COVID-19 pandemic occurred and also negatively affected to the insurance market, including the life insurance companies in Asia. The life insurance premiums in emerging Asian markets (excluding China) averagely increased by 3.4% in 2020 and 2021. The demands for life insurance are estimated to continuously because the awareness of uncertainty and risks conditions increased, and the benefits of the participation to the life insurance are considered (Daniel et al., 2020).

Vietnam is a country with a population of 96.2 million in 2019 (Vietnam General Statistics Office, 2020). From 2015 to 2018, the total premium of life insurance averagely increased 31.2%. The development of distribution channel of the life insurance companies also increase the accesability of the insurance products. On the other hand, the Vietnamese Government has issued tax incentives for the participants of life insurance such as interest of life insurance contract and compensation of life insurance are incomes exempt from personal income tax. The potential of the life insurance market has attracted many foreign investors. Between 2015-2018, the number of life insurance companies increased from 7 to 18 (of which, 17 are joint ventures and 100% foreign owned insurance companies). The participation of foreign investors has contributed to the development and diversification of insurance products; promoting the development of traditional and modern distribution channels including insurance distribution channels via banks (bancassurance) and e-commerce.

However, it is fact that the growth rate in operation scale is not proportional to the potential advantages of the life insurance market in Vietnam. For details, the participation rate to the life insurance of Vietnamese people is still lower than that of other countries in the Asia region. In 2018, the density of life insurance market reached 39.7 USD, lower than Thailand's 278.6 USD, and Malaysia's 266.0 USD. The life insurance market in Vietnam has a better growth rate than

1.56% of GDP but still has a lower penetration density - Indonesia 44.2 USD and the Philippines 40.7 USD, compared to Indonesia (1.31% of GDP) and the Philippines (1.14% of GDP) (World Bank, 2020). Therefore, the reasons why the penetration rate of life insurance market in Vietnam is low while the life insurance market has many favorable conditions, and the life insurance companies have introduced various distribution channels are questioned. The aims of this study are to investigate the factors affecting the decision to participate in life insurance of customers based on the evidences from Soc Trang city, Vietnam. The research results are expected to provide a scientific basis to develop the life insurance market for the Vietnamese market and other markets in the world.

## **2.METHODOLOGY**

### **2.1. Research model**

#### 2.1.1 Theoretical conceptual

##### ***2.1.1.1 Asymmetric Information Theory***

Asymmetric information is a situation in which one party has more information than the other in a transaction, and thereby gains more from “information supremacy”. In the insurance market, the individual is the person who knows his or her own risk best. This implies that risk-loving individuals and well aware of the loss they have to bear will tend to participate in life insurance to prevent risks (Ben, 2017).

Under the condition of information asymmetry, Cooper and Rege (2008) have shown that individual decisions, especially decisions about saving and investment, are more influenced by information from familiar groups. Individuals are influenced by social interactions and tend to act because others have acted. In the context that Vietnam is a country that values a collectivist culture - where individual freedom may be restricted and individuals must integrate into groups and the wider community. Therefore, individual decisions will be influenced by reference groups (relatives, friends, ...). Therefore, the influences of the peer-groups, such as friends, relatives, etc. is included in the model, and is expected to have a positive effect on the decision to participate in life insurance.

##### ***2.1.1.2. Social Selection Theory***

The theory of social selection suggests that as people get older and perceive themselves as having less time, they will prioritize maximizing emotional experiences. This leads them to appreciate the benefits that life insurance brings – financial security when there are risks and

mental safety during the time of participating in the insurance policy. On the other hand, when prioritizing the goal of optimizing emotional experience for a complex decision, older adults tended to focus more on positive information and/or less attention on information. negative news (Carstensen et al., 2003). From there, they appreciate the value of protection that the insurance policy brings compared to the cost of insurance. Indeed, many studies such as Loke and Goh's (2012); Dash (2018) has shown that age has a positive impact on the need to participate in life insurance. Therefore, the age variable should be included in the research model and is expected to have a positive correlation with the need for life insurance.

### ***2.1.1.3. Theory of Demand for Life Insurance of Lewis***

Lewis (1989) developed a life insurance demand model based on the assumption that individuals purchase life insurance to maximize the beneficiary's expected utility. Assuming that all family members have a level of risk aversion, the total ownership of life insurance is expressed as follows:

$$(1-Lp)F = \max \left\{ \left[ \frac{1-Lp}{L(1-p)} \right]^{1/\delta} TC - W, 0 \right\} \text{ (Equation 1)}$$

where:

*L*: initial premium of life insurance contract

*p*: probability death of the breadwinner

*F*: total sum insured of the contract

$\delta$ : level of risk tolerance of the insured person

*TC*: present value of total household's expenditures

*W*: net value of household's assets

Lewis's (1989) model also shows that the present value of total household expenditure when the breadwinner is still alive has a positive impact on the need to participate in life insurance. This implies that disposable income, number of dependents and education level positively influence the demand for life insurance. On the other hand, the demand for life insurance will increase when the beneficiary's risk aversion ( $\delta$ ) is low.

Lewis (1989) also showed that the premiums are inversely related to the probability of taking up life insurance. Specifically, women tend to participate more in life insurance than men because women participate in life insurance at lower costs thanks to a longer life expectancy, and less risk of disease than men. Age is also a factor that increases the surcharge. In the same vein, Daniel (2021) has shown that older individuals are expected to be less likely to participate in life insurance than younger individuals due to higher surcharges for older adults.

Lewis (1989) model also implies that family net worth will negatively affect the demand for life insurance. However, the reality is that home owners, who have more net assets than renters (Di et al., 2007), tend to participate in life insurance more (Baek and Devaney, 2005; Li, 2008). The reason is that, when owning a house, households will begin to save more resources to develop family finances such as building a financial reserve for loss of income, preparing for future plans, etc (Lersch and Dewilde, 2018). In addition, home ownership often comes with a loan, thus increasing the need for life insurance to pay off part of the loan and protect the family's finances in the event of a mishap (Li, 2008). The marital status variable that affects the decision to participate in life insurance because it is correlated with the number of dependents should also be included in the model as a control variable (Baek and Devaney, 2005).

#### 2.1.2. Literature review

##### *a) Demography characteristics*

The previous study of Baek and Devaney (2005); Li (2008) showed a nonlinear relationship between needs and age. As age increases, individuals are better aware of the role of life insurance, and have more financial capacity and number of dependents. Therefore, individuals tends to participate to life insurance. However, the need for life insurance of an individual decreased when their children have matured and are less dependent on their sponsorship. In the case of Vietnam, Ta Thi Mai Trang (2012) have indicated that the demand for life insurance of the respondents decreased since the age increases because the younger respondents tends to pay less attentions for the risks. However, the elder respondents have a higher responsibility to protect family finances, prepare for retirement, etc., so they have a higher ability to buy life insurance.

Gender has an influence on the cost of joining life insurance, so it will have an impact on the decision to buy life insurance. Vo Thi Thanh Loan (2005); He (2020) shows that women tend to participate in life insurance more than men because they can participate in life insurance at a lower cost than men. At the same time, women often show interest in the future life through savings rather than risky investments. One of the most important reasons to buy life insurance is to protect your dependents against financial hardship when something goes wrong with the breadwinner of the family. Therefore, marital status and number of dependents are believed to have a positive impact on the need to participate in life insurance. Baek and Devaney (2005); Li (2008); Loke and Goh (2012) both said that married individuals tend to participate in life insurance more than individuals in other cases.

Similarly, the desire to protect dependents against financial difficulties at times of risk is the driving force behind demand for life insurance. Therefore, the number of dependents is expected to have a positive impact on the decision to participate in life insurance. Research by Beck and Webb (2003); Li et al. (2007) showed that the proportion of dependents by age (measured as the ratio of dependents under 15 years old and over 64 years old to the total number of people of working age between 15 and 64 years old) has a positive effect. positive impact on life insurance demand. Research by He (2020) in China also shows a similar trend - the proportion of young dependents (the proportion of children aged 14 and under) has a positive influence on the demand for life insurance. The reason is that parents are worried about their children's life and schooling if an accident happens, so they will buy life insurance as a backup for risky situations.

A high level of education can increase risk aversion and awareness of the need for products. Therefore, education level is said to be positively correlated with the decision to participate in life insurance. This positive correlation has been demonstrated in the study of Beck and Webb (2003); Li et al (2007); Li (2008); Shiferaw (2017). However, research by Loke and Goh (2012) in Malaysia shows that people with high education are less likely to participate in life insurance products. The author explains in the context that the Malaysian financial market is developing with many attractive products, highly educated individuals will choose asset management and highly profitable assets for financial management and create an inheritance for beneficiaries instead of life insurance. In the context of Vietnam's financial market, investment products, asset management, etc. are not diversified and popular, highly educated people are expected to participate more in life insurance than those with less education.

***b) Determinants of social economics***

Many empirical studies by Browne and Kim (1993); Beck and Webb (2003); Li et al (2007) have shown a strong correlation between income and demand for life insurance. Higher-income helps increase access to and purchase of life insurance products. At the same time, when the individual has a high income, the opportunity cost of that person's risk is also greater. Therefore, in order to maintain the living standard of dependents, individuals with higher incomes will participate more in life insurance. Research in developing countries such as Langat et al (2017) in Kenya; Ta Thi Mai Trang (2012) and Vuong Quoc Duy (2016) in Vietnam also show a positive correlation between income and demand for life insurance.

Homeownership is expected to have a positive impact on the decision to participate in life insurance. Once home ownership, individuals will tend to be more concerned with other financial goals including savings and hedging. On the other hand, home ownership often comes with a loan, which increases the need for a financial reserve to cover the loan in the event of a disaster (Baek and Devaney, 2005; Li, 2008). Although this is an important factor that positively affects the demand for life insurance, very few studies consider the effect of this factor in the Vietnam life insurance market.

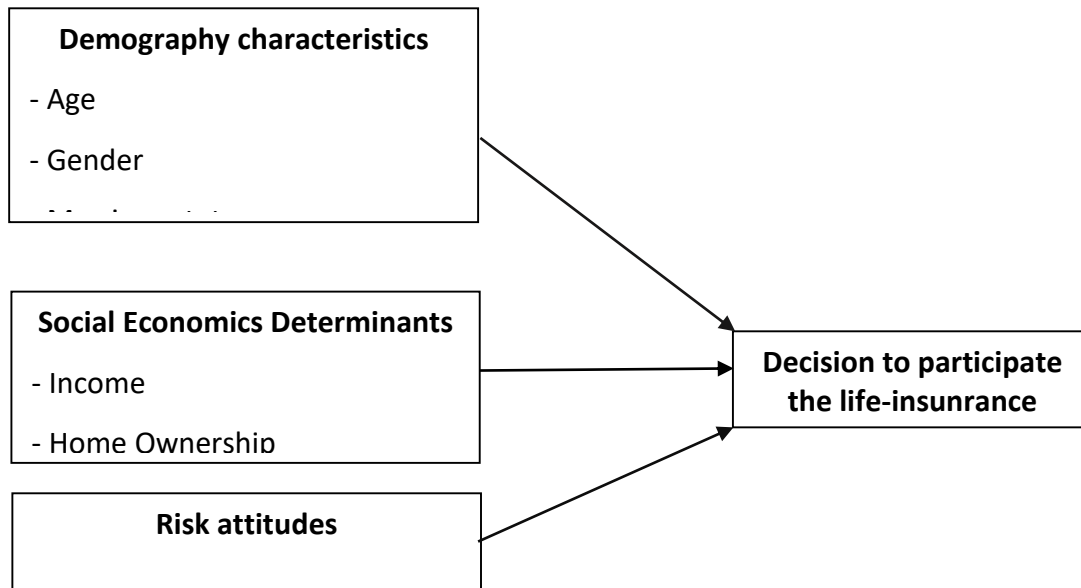

Vuong Quoc Duy (2016); Huynh Truong Huy et al. (2020) show that in the life insurance market in Vietnam, the information of relatives has a positive impact on the decision to buy life insurance. The recommendation of relatives and friends will help individuals feel confident in life insurance products. At the same time, individuals, influenced by collective culture, tend to participate in life insurance because relatives and friends have participated.

***c) Risk attitudes***

Attitude towards risk is a factor that strongly influences the decision to participate in life insurance. However, this factor acts in different directions. Loke and Goh (2012); Tran Thi My Han (2017) have shown that individuals with an aversion to risks are more likely to participate in life insurance as a way to ensure financial security for themselves and their families when risks occur. However, research by He (2020) in China shows that risk aversion will reduce the demand for life insurance. The author explains that when families have a risk-averse lifestyle, they will feel more secure when they keep a lot of cash in the family, thereby reducing the need to buy life insurance.

On the basis of theory, previous empirical studies on the factors affecting the decision to participate in life insurance, and the current situation of the life insurance market in Vietnam, the author proposes a research model on the relationship between the decision to participate in life insurance decision to buy life insurance with related factors are presented in Figure 1.

**Figure 1.** Factor affecting decision to participate the life-insurance of customers  
*(Source: summarized from the theoretical conceptual and literature reviews)*

## 2.2. Data collection

An interview survey has been conducted in Soc Trang city from May to September 2021. Total of 180 respondents, who are living in Soc Trang province, participated to the survey. Each respondent was asked to answer the structured questionnaire, including four parts: (1) demographic information; (2) socio-economic information; (3) attitude towards risk; (4) needs and attitudes towards life insurance.

There was 165/180 questionnaires have fully filled the necessary information, and therefore, the sample size is explored to analyze in the next parts will be included 165 observations. Of which, there was 77 respondents have participated to the life insurance contracts and 88 respondents did not participate.

## 2.3. Data analysis

Binary logistic regression model is applied to examine the factors influencing the decision to participate life insurance (Hoang Trong and Chu Nguyen Mong Ngoc, 2008). The basic function is presented as follows:

$$\text{Logit}(p) = \log_e \left[ \frac{P_i}{1-P_i} \right] = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_k X_k + \varepsilon_i \quad (\text{Equation 2})$$

where:

$P_i$ : probability to participate life-insurance of the respondents

$X_{1...k}$ : independent variables, represent the factors influencing decision to participate the life-insurance of respondents.

$\beta_{1...k}$ : coefficients

$\beta_0$ : intercept

The details of independent variables are presented in Table 1.

**Table 1.** Description of variabes included in the binary logistic regression model

Code	Description	Mean	S.D	Source
<b>Dependent variable</b>				
Y	<b>Decision to participate the life-insurance</b> 1= Participated the life-insurance contract; 0 = otherwise	0.47	0.5	
<b>Independent variables</b>				
X <sub>1</sub>	Age of the respondents	34.55	8.68	Baek & Devaney (2005); Lewis (1989); Ta Thi Mai Trang (2012)
X <sub>2</sub>	Gender (1 = male; 0 = female)	0.52	0.50	Vo Thi Thanh Loan (2005); He (2020)
X <sub>3</sub>	Marriage status 1 = married; 0 = otherwise	0.61	0.49	Li (2008); Loke & Goh (2012)
X <sub>4</sub>	Number of dependents	1.01	1.04	Beck & Webb (2003); He (2020)
X <sub>5</sub>	Education 1 = had tertiary education and above; 0 = otherwise	0.73	0.45	Beck & Webb (2003); Li et al. (2007); Shiferaw (2017)
X <sub>6</sub>	Average income per capita month (million dong)	9.12	8.02	Beck & Webb (2003); Vuong Quoc Duy (2016)
X <sub>7</sub>	Home ownership 1 = owned a house ; 0 = otherwise	0.56	0.50	Baek & Devaney (2005); Li (2008)
X <sub>8</sub>	Peer-group affected: 1 = affected by peer group ; 0 = otherwise	0.62	0.49	Vuong Quoc Duy (2016); Tran Thi My Han (2017); Huynh Truong Huy et al. (2020)
X <sub>9</sub>	Risk attitudes 1 = Risk lovers; 0 = Risk averses	0.36	0.48	Loke & Goh (2012); Tran Thi My Han (2017); He (2020)

### 3. RESULTS AND DISCUSSION

#### 3.1. Results

As can be seen in Table 2, the estimated results of the binary logistic regression model showed a significant level at 1%. This means the independent variables included in the model can be explained for the changes of probability to participate the life insurance ( $P < 0.01$ ).

**Table 2.** The estimated results of Binary logistic regression

Variables	Coefficients	P-value
X <sub>1</sub>	0,091	0,012
X <sub>2</sub>	-0,688	0,087
X <sub>3</sub>	0,319	0,577
X <sub>4</sub>	0,339	0,122
X <sub>5</sub>	-0,074	0,509
X <sub>6</sub>	-0,013	0,554
X <sub>7</sub>	0,904	0,045
X <sub>8</sub>	0,964	0,023
X <sub>9</sub>	0,837	0,048
Intercept	-3,849	0,056
Number of observation		154
-2 Log likelihood		164,119
P-value		0,000
Classification		70,1

The estimated results in Table 2 show that the group of demographic factors including age and sex have an influence on the decision to buy life insurance ( $P < 0.05$ ). Age has a positive effect on the decision to buy life insurance, which implies that the older an individual is, the more likely they are to participate in life insurance. Meanwhile, gender has a negative effect at the significance level of 10%, which implies that women will tend to participate in life insurance more than men.

Social economics determinants also played an important role in the decision to participate in life insurance ( $P < 0.05$ ). In which, the factor of home ownership and the influence of relatives have a positive impact on the decision to buy life insurance.

On the other hand, the attitude towards risk has a positive impact on the decision to buy life insurance at the 5% significance level. Accordingly, the individuals are risk lovers tended to buy life insurance more than risk-averse individuals ( $P < 0.05$ ). This result is similar to the study of He (2020) in China, risk-averse individuals prefer to save cash or participate in high-liquidity assets instead of participating in the life insurance.

### 3.2. Discussion

Demographic factors including gender and age affect the decision to buy life insurance. Accordingly, gender has a negative effect, implying that women will participate in life insurance more than men. This is because women can participate in life insurance at a lower

cost than men thanks to lower morbidity rates and higher life expectancy. This result is similar to the study of Vo Thi Thanh Loan (2005); He (2020).

The older the age, the higher the membership fee for life insurance, and therefore age is expected to have a negative impact on the decision to participate in life insurance (Lewis, 1989). However, the results of this study showed that with increasing age, individuals will tend to participate in life insurance more. This is consistent with the theory of social selection. From a behavioral perspective, as people get older and realize they have less time, they will prioritize maximizing emotional experiences. This leads them to appreciate the benefits that life insurance brings – financial security in the event of risks and mental safety during the policy period. Therefore, older people tend to participate in life insurance more than young people. On the other hand, from a financial perspective, young people are often unmarried and have no dependents, so there is little need for financial backup against risks. Conversely, people tend to demand a higher financial provision when they are elder to ensure financial stability for themselves and their families. In addition, life insurance is also a tool to help individuals accumulate assets to prepare for retirement. Therefore, individuals might prefer to participate the life insurance eventhough the cost of participation might be higher. This suggests that life insurance companies should contribute the new products to meet the needs of the elderly population, such as comprehensive health care by-products.

However, the results of this study could not find the effects of marital status and number of dependents on the decision to buy life insurance ( $P < 0.1$ ). This might be because an individual has married and has children, household spending might be increase faster than increases in income. Therefore, individuals might skip the participants to life insurance. This correspondents with the results from interview survey since 48.3% of respondents indicated that income is the most barrier of decision to participate the life insurance. This implies that life insurers need to develop some products with lower participation fees with flexible payment terms and some support programs if customers encounter unexpected financial difficulties (e.g. financial difficulties).

Education is expected to positively affect the decision to buy life insurance. However, the study did not find the effect of this variable at the 10% significance level. Life insurance is a complex financial product and is tailored to individual needs. Therefore, to understand life insurance well, individuals need to have specific knowledge and this knowledge is not compulsorily

taught in universities. Therefore, high education does not affect the decision to buy life insurance.

Regarding the group of socio-economic factors, owning a house plays an important role in an individual's decision to buy life insurance. Individuals who own their own houses will tend to participate in life insurance more than individuals who rent houses or other circumstances (such as living at home with family, relatives, ...). The reason is that when owning a home, individuals will begin to save more resources to develop family finances such as building a financial backup in case of loss of income, saving for future plans, etc. (Lersch and Dewilde, 2018). In addition, home ownership often comes with home mortgage debt, which increases the need for financial insurance over the life of the mortgage. Therefore, homeowners will tend to participate in life insurance more than tenants or people living with their families, etc. as a way to protect family finances when there is a risk to themselves. The results of this analysis are quite similar to those of Li (2008) in the US. Homeowners, on the other hand, will want to diversify their portfolios so that they can offset potential losses in the housing market (Lersch and Dewilde, 2018). Therefore, they will have a greater need to participate in life insurance than renters who do not face the same risks.

The influence of relatives and friends has a positive impact on the decision to buy life insurance. As can be seen in Table 2, individuals who have known life insurance through relatives and friends will tend to participate in life insurance more than individuals who do not access life insurance through this reference channel. This result is similar to the study of Huynh Truong Huy et al. (2020). Life insurance is a product to prevent risks in uncertain conditions, so the experience of the familiar group will have a strong impact on the decision to participate in life insurance. On the other hand, life insurance is an intangible product with a relatively long participation time, so the opinion of the familiar group will positively affect the individual's belief in the product, promoting the purchase decision. This implies that it is necessary to improve and develop the post-purchase customer care system, to increase customer loyalty, and to encourage existing customers to share their experiences with potential customers.

Risk attitude has a positive impact on the decision to participate in life insurance, that is, risk-loving people have a higher probability of participating in life insurance than risk-averse people. This result is similar to the study He (2020) in China because risk-averse individuals will tend to choose highly liquid assets (such as cash) as a backup for unfortunate situations. since then there is less need to buy life insurance. Conversely, risk-loving individuals will tend to

participate in higher-risk assets with better returns. These assets are often illiquid and are rarely used as a hedge against unexpected financial losses. Therefore, risk-loving individuals will tend to participate in life insurance as a financial backup tool than risk-averse individuals. On the other hand, information asymmetry theory has shown that individuals are the ones who best understand their own risk. Therefore, individuals who love risks and are well aware of their own losses when risks occur will have a higher demand for life insurance than risk-averse individuals. The survey results conducted in this study also show that the most common reason for participating in life insurance of the respondents (69.2%) was to protect family finances in a risky situation. Meanwhile, in addition to income barriers, the reason for not participating in life insurance is not understanding the benefits and not having confidence in life insurance (40.2%). This result implies that life insurers need to invest in developing customer databases to ensure the insurance products are suitable for customers' risk tolerance. At the same time, the data system and forecasting tools will help make information more transparent about insurance products to ensure the rights and interests of customers when participating in insurance.

#### **4. CONCLUSION**

The binary logistic regression model was explored to identify the factors influencing to decision to participate the life insurance based on the sample size of 165 respondents in Soc Trang city, Vietnam. It was concluded that age, owning a home, influence from relatives and risk preference attitude is positively correlated with the probability of participating in life insurance. Respondents are that women are more likely to buy life insurance than men.

Research results suggest that life insurance companies need to improve their post-purchase customer care systems to increase customer loyalty and encourage existing customer groups to share their experiences with potential customers. Customer opinions will help build trust and positively influence a potential customer group's decision to join. In addition, building and developing a formal customer data system to provide personalized products based on customer characteristics. In addition, the data system will help transparent information about insurance products to ensure the rights and interests of the parties involved in the insurance contract.

**OVERALL EQUIPMENT EFFECTIVENESS (OEE) ANALYSIS WITH TOTAL PRODUCTIVE MAINTENANCE. A CASE STUDY OF A BREWERY****Akpan, Immaculata SYLVESTA**

Department of Civil Engineering, Akwa Ibom State Polytechnic, Ikot Osurua, PMB 1200

**Wilson, Emmanuel OKON**

Department of Mechanical Engineering, Akwa Ibom State Polytechnic, Ikot Osurua, PMB 1200

**ABSTRACT**

The problem of waste and losses has been identified as contributing to poor performance of local industries in Nigeria. It is asserted that industries have sought to improve their performance by using some modern manufacturing concepts and methods. Total Productive Maintenance (TPM) is one such concept being used by both small and medium-scale enterprises to identify and reduce waste both on the shop floor and at the enterprise level. The measure of effectiveness of TPM implementation is the Overall Equipment Effectiveness (OEE). OEE is a function of Performance Efficiency (PE), Plant Availability (A) and Quality Rate (Qr). This study uses Champion Breweries where TPM is being implemented as a case study. It is known that the success of TPM implementation is determined by the implementation strategies adopted by individual firms, which takes into account variables such as the firm's size measured in terms of the number and the quality of its employees. Results show that in order to overcome the problem of limited resources, TPM can be implemented using the Hybrid Pillar model being adopted by Champion Breweries. The analysis of OEE of the beer packaging line for a 3-month performance period showed improvement in OEE; it increased from 56.4% to 71.7%. This value shows that there is still room for improvement which can be achieved by a number of action plans stated in the recommendation section of this paper. This is as a result of the existing focused monitoring and improvement measures being adopted.

**Keywords:** Keywords: Overall Equipment Effectiveness, Performance, Losses

## **INTRODUCTION**

### **1.1 Background of Study**

With the huge population of Nigeria estimated at 190 million people, there is the potential for the country to become an industrial hub in view of ready market for goods and services as well as ample availability of labour. Ironically these favourable factors are hardly exploited to the nation's advantage as over 80% of consumer goods as well as construction materials are imported either from European countries or fellow African countries, as reported by the immediate past Director General of Standards Organization of Nigeria, SON, Dr. Joseph Odumudu, (dailypostngr, October 31<sup>st</sup>).

The potential profits of going into manufacturing by indigenous companies have been appreciated and several have ventured into it but the result most often is a backlog of debts to workers and suppliers and finally going into bankruptcy. The latest of such cases is the Honeywell Group; their bankers, Eco Bank Plc, declared the company bankrupt on 16<sup>th</sup> December, 2013 on account of a debt base of ₦4.1 billion owed as at August 6, 2015, (The Nations News October 6<sup>th</sup>, 2013).

This poor industrial performance is attributable to the huge losses/wastes which occur in the manufacturing shop floor and others, (Wilson, 2020). These losses occur in the areas of operations, maintenance, personnel, and process. Examples include tooling problems and non-availability of components in time. Other forms of waste include idle machines, idle manpower, breakdown of machines, and rejected parts, (Oga, 2022).

TPM creates a corporate culture which constantly strives to eliminate losses through overlapping small group activities within the site, (McQueen, 1999). When properly implemented it creates the environment to achieve the three Zs of TPM namely Zero Defects, Zero Breakdown, and Zero Accident, (Nakajima, 1988).

The process industries in Nigeria such as brewing industry contribute significantly to the Gross Domestic Product of the country. Therefore, any performance improvement in this sector will impact positively on the economy of the country. The author is not aware of any study on TPM implementation in the brewery industry and this study is therefore intended to fill this gap.

### **1.2 Statement of the Research Problem**

The purpose of this research is to study the implementation of TPM at the brewery plant with the aim to understand how its benefits are being achieved, how it could possibly be enhanced

and how the gains made by the brewing company could be replicated in similar companies in the industry in order to reduce losses and improve productivity.

The main objective of this research is to study and assess the method of implementing Total Productive Maintenance (TPM) at a local brewery. The specific objectives include to:

- i. Assess the effectiveness of TPM implementation at the local brewery. With respect to some performance matrices and to make recommendations for improvement.

### **2.1 Total Productive Maintenance**

The concept of TPM originated in Japan's manufacturing industries, initially with the aim of eliminating production losses due to limitations in the Just in time (JIT) process for production operations, (Lee, 2002). Seichi Nakajima is credited with defining the fundamental concepts of TPM and seeing the procedure implemented in hundreds of plants in Japan; the key concept being autonomous plant maintenance, (Shingo, 1991).

TPM is a major departure from the "you operate, I maintain" philosophy. It is the implementation of productive maintenance by all associated personnel (whether machine operators or members of the management team), based on the involvement of all in the continual improvement of performance, (Tsang, 2000). TPM endeavours to eliminate the root causes of problems, through team-based decisions and their implementation, (Ljungberg, 1998).

A means of assessing the effectiveness of TPM implantation is the determination of the production lines Overall Equipment Effectiveness, OEE.

## **METHODOLOGY**

The procedures for this study have been chosen to meet each of the project objectives. Although there are 8 pillars of TPM, the pillar which is more related directly to production, quality and maintenance are the AM and PM pillar, (Shirose, 1989). This is because these pillars deals with equipment maintenance which is solely responsible for equipment uptime, production volume and quality. Hence, this research has focused on the AM and PM pillars of TPM at the brewery.

### **3.1 Methods**

The methods used in the research were:

- i. Studying and/ application of relevant theories and models.
- ii. Data collection from maintenance and production log books at the local brewery.
- iii. Data analysis and results.

### **3.2 Studying and Application of Relevant Theories and Models**

The literature search was made in order to understand the philosophy behind TPM, including the underlying theories and models used in TPM. The results obtained here assisted in gaining some basic understanding in order to carry out further enquiries.

### **3.4 Collection of Data from Maintenance and Production Log Books at the Brewery**

Data regarding equipment maintenance, production at the local brewery were consulted. These included charts and templates as follows:

- Loss deployment Charts.
- Equipment evaluation and ranking template.
- Quality output.
- Maintenance calendar.
- Planned Maintenance Calendars.
- PM Day audit sheets.
- Maintenance Check lists and Task lists.

### **3.5 Data analysis and results.**

The data collected from charts, tables and interviews were summarized and analysed in line with the study objectives.

#### **3.5.1 Performance Measurement in TPM**

Performance measures in TPM are used in determining the effectiveness of the implementation of the programme, (Levitt, 1996). Below is a breakdown of these measures.

#### **3.5.2 Overall Equipment Efficiency (OEE)**

Overall Equipment Effectiveness (OEE) is one of the key measures of TPM which indicates how effectively the machinery and equipment is being run. It combines measures of machine Availability, Performance and Quality. The simplest way to calculate OEE is as the ratio of Fully Productive Time to Planned Production Time, (Kaplan, 2002). Fully Productive Time is just another way of saying manufacturing only Good Parts as fast as possible (Ideal Cycle Time) with no Stop Time. Hence the calculation is:

$$\text{OEE} = (\text{Good Count} \times \text{Ideal Cycle Time}) / \text{Planned Production Time} \quad (2.1)$$

Although this is an entirely valid calculation of OEE, it does not provide information about the three loss-related factors: Availability, Performance, and Quality. For that we use the preferred calculation.

The preferred OEE calculation is based on the three OEE Factors: Availability, Performance, and Quality, defined as follows:

### 3.5.3 Availability

Availability takes into account all events that stop planned production long enough where it makes sense to track a reason for being down (typically several minutes), (Bekkers, 2002).

Availability is calculated as the ratio of Run Time to Planned Production Time:

$$\text{Availability (A)} = \frac{(\text{Total Time} - \text{Total downtime}) \times 100}{\text{Total time}} \quad (2.2)$$

Where Total Time refers to planned production time and total down time refers to summation of all losses incurred during production. They include breakdown time, planned stoppages, break time and planned maintenance time.

### 3.5.4 Performance Efficiency (PE)

Performance takes into account anything that causes the manufacturing process to run at less than the maximum possible speed when it is running, (Robert, 2002).

It is calculated as:

$$\text{Performance Efficiency (PE)} = \frac{(\text{Target Production} - \text{Actual Production}) * 100}{\text{Target Production}} \quad (2.3)$$

Target production refers to the projected production output for a period of time and actual production is the production volume produced for a particular period of time. Performance should never be greater than 100%. If it is, that usually indicates that Ideal Cycle Time is set incorrectly (it is too high).

### 3.5.5 Quality Rate (Qr)

Quality takes into account manufactured parts that do not meet quality standards, including parts that need rework. Remember, OEE Quality is similar to First Pass Yield, in that it defines Good Parts as parts that successfully pass through the manufacturing process the first time without needing any rework, (Robert, 2002).

Quality is calculated as:

$$\text{Quality Rate (Qr)} = \frac{(\text{Processed Quality} - \text{Defective Quality}) * 100}{\text{Processed Quality}} \quad (2.4)$$

Where, the quality defects mean the amount of products which are below the quality standards that is, the rejected items after the production process. This formula is very helpful to calculate the quality problem in the production process (Ahuja, 2008).

### **3.5.6 Preferred Calculation of (OEE)**

OEE takes into account all losses, resulting in a measure of truly productive manufacturing time, [2]. It is calculated as:

$$\text{OEE} = \text{Availability} \times \text{Performance} \times \text{Quality} \quad (2.5)$$

### **4.2 Overview of TPM Implementation at the local brewery.**

Champion Breweries implements the TPM Alternative Roadmap Master plan from Heineken who own about 70% equity in the establishment.

The method of TPM implementation at the brewery is unique as it uses hybrid pillar teams which are tasked to implement more than one pillar. This is as a result of the following constraints:

- (i) It is a brewery producing a volume lower than 420,000hl per annum
- (ii) It has a relatively low amount of full time staff (FTS)
- (iii) It has a highly complex production system
- (iv) The relatively low level of educated man power in the establishment

The implementation process is carried out by the TPM Coordinator (TPMC) and overseen by the Brewery Manager (B.Mgr.). The Alternative TPM roadmap is given below.

### **4.11 Analysis of OEE at the packaging line of the brewery via maintenance and production Data**

For every maintenance task, data is captured which is used in positioning the plant in terms of productivity and efficiency. Analysis was done specifically at the packaging line of the brewery where calculations were made to know the true state of the line in terms of plant availability (A), performance efficiency (PE), quality rate (Qr) and overall equipment effectiveness (OEE).

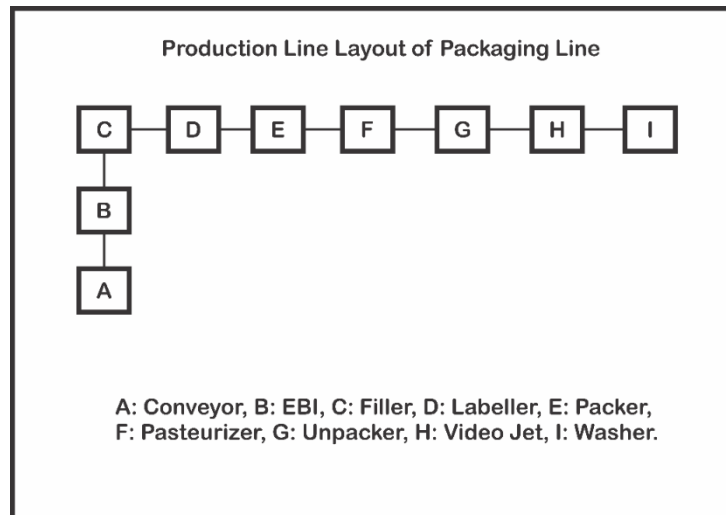

In assessing the packaging line of the brewery the following maintenance as well as production data were consulted.

- (i) The Production Line Layout of the Packaging Line.
- (ii) Loss deployment data.
- (iii) Production data.
- (iv) Quality output data.

In calculating the OEE, the packaging line was seen as a machine. This is because, all equipment on the line are linked together as the breakdown of one will cause a halt in the lines functionality.

Analysis was done on production data over a period of three (3) months.

The production line layout which is the distribution of equipment on the job floor is shown below.

**Figure 4.10 :** Production line layout

**(i) Production data**

This shows the amount of brew produced in terms of hectolitres for a given time frame. It also gives the target output for the given time frame. This is used in evaluating the performance efficiency (PE) of a production run.

**(ii) Quality Output data**

This shows the amount of output which conformed to specification and the amount that was within the boundary of conformance. This is used in evaluating the quality rate (Qr) of a production run.

**(iii) Loss Deployment data**

This shows the number in hour's equipment spends in down time before they are put back into service. Loss deployment is done daily and is used in calculating the Availability (A) of equipment in the plant. Considering the loss deployment data for August, September and October 2016, we see the following:

**Table 4.5:** Analysis of time losses for August, September and October, 2016

	AUGUST	35000	1200	$Qr = \frac{35000-1200}{35000} \times 100$	97.0%
	SEPTEMBER	35000	900	$Qr = \frac{35000-900}{35000} \times 100$	97.4%

**Table 4.7:** Analysis of OEE for 3 months.

MONTH	PARAMETER			OEE	OEE VALUE (%)
	AVAILABILITY (A) (%)	PEFORMANCE EFFICIENCY (PE) (%)	QUALITY RATE (Qr) (%)	$OEE = A \times PE \times Qr$	
AUGUST	74.7	80.0	97.0	$OEE = 74.7 \times 77.5 \times 97.0$	<b>56.4 %</b>
SEPTEMBER	77.5	77.5	97.4	$OEE = 77.5 \times 77.5 \times 97.4$	<b>57.5 %</b>
OCTOBER	87.6	82.5	98.6	$OEE = 87.6 \times 82.5 \times 98.6$	<b>71.2 %</b>

Summary of OEE data generated for the 3 months is given in the table below.

Table 4.14: Comparison of OEE Factors for 3 months.

**Table 4.8:** OEE Comparison for 3 months.

#### 4.12 DISCURSION OF RESULTS

From the analysis done and by inspecting the trends generated in the charts we see that for the month of August, plant availability was 74.7%, performance efficiency was 80%, quality rate was 97% and OEE was 56.4%.

For the month of September, plant availability increased to 76.2%, performance efficiency reduced to 77.5%, Quality rate increased to 97.4% and OEE increased to 57.4%.

For the month of October, plant availability increased to 87.6%, performance efficiency increased to 82.5%, quality rate increased to 98.6% and OEE increased to 71.2%.

It is seen that OEE is increasing from August to October and after proper study of the loss deployment chats, the reasons for this increment are due to the use of the following AM/PM tools.

**(i) The use of loss deployment chat**

This chat assists in identifying equipment responsible for the generation of losses in the production line. The deployment chats also show reasons for the failure of equipment and this makes it very easy for maintenance personnel to spot and thoroughly eliminate the cause of failure. This act prevents the fault from reoccurring.

**(ii) The use of Root Cause of Failure Analysis (RCFA)**

Whenever problems occur on equipment, a generalised approach is followed in solving the issue. This process is already discussed in chapter 4 of this research.

**(iii) The use of Focused Improvement (FI)**

FI involves setting up a dedicated maintenance team to tackle a specific issue that has reoccurred over a period of time.

From the loss deployment charts for the packaging line it is seen that the bottleneck equipment for the first month, August was the Labeller. It had a breakdown time totalling 30.4 hours. But for the next month September, its breakdown time was reduced to 4.3 hours and finally it reduced to 2.7 hours in October. Here we see the effect of FI teams in reducing the breakdown frequency.

In the second month, the filler had the highest breakdown time of 28.3 hours, this was reduced to 12.2 hours in the next month.

In general, it is almost impossible to know when equipment will malfunction but what we have learnt from the study of the loss deployment chats is that whenever an equipment resulted in high breakdown, the fault was identified and thoroughly dealt with by the maintenance team and its breakdown time greatly reduced in the month that followed its failure.

**(iv) The Use of effective Cleaning Lubricating Inspection and Tightening (CLIT) standards**

These activities are done mainly by machine operators on equipment before production begins. The thorough application of these processes greatly reduces equipment failure and cut down planned maintenance time.

**(v) The use of Maintenance schedules and task lists**

As discussed above in this write up, PM Days are pre planned maintenance days set aside for carrying out pre-planned maintenance of all equipment in a functional area. On this day, maintenance task lists which contain detailed tasks which each maintenance staff is mandated to perform on specific equipment is used. Hence every part of an equipment is addressed

properly ensuring a good maintenance activity. It is also the use of these practices that have led to increment in OEE at the line.

**(vi) Training and retraining of Machine operators**

Maintenance staff and machine operators are trained within the company and some sent to other breweries also owned by Heineken for training. This has contributed in capacity building of staff which has affected the production process positively.

**CONCLUSION**

From the research we see that overall equipment effectiveness (OEE) at the packaging line of Champion Brewery Plc increased from 56.40% in August, 2016 to 57.5 % in September, 2016 and to 71.2 % in October, 2016. We also see from data analysis that equipment availability at the packaging line of the Brewery increased from 74.7 % in August to 76.2 % in September and then to 87.6 % in October. This goes to show that the AM/PM hybrid team maintenance management technique has been effective but room for improvement still exists.

The paper shows that OEE determination serves as a monitoring parameter for assessing a facilities present state of effectiveness and can be used as an indices for futuristic planning.

**PREDICTION THE WELDABILITY OF JOINING MATERIALS BY SHIELD  
METAL ARC WELDING USING ARTIFICIAL NEURAL NETWORK****Ziad Shakeeb Al SARRAF**Department of Mechanical Engineering, Faculty of Engineering,  
University of Mosul, Mosul, IRAQ**ABSTRACT**

The need for welding are incessantly required in many fields and different sectors, such as in industries and manufacturing. Based on high quality and reliability, one of the most efficient methods for joining metals is Shielded metal arc welding (SMAW). In this presented work, an attempt has been successfully taken to develop a model to predict the effect of input parameters on weld bead geometry of submerged arc welding process with the help of neural network technique and analysis of various process control variables and important of weld bead parameters in submerged arc welding. The complexity non-linear relationships of input / output variables for any computational models can be addressed by using artificial neural networks (ANN). Today, ANN represents a powerful modeling techniques, that depend on statistical approach, presently practiced in many fields of engineering for modeling complex relationships that other physical models can not be explained it easily. A welding process with automatic or semiautomatic is required to complete the weld through using tubular electrode with consumable flux. Parameters such as welding current, welding speed and voltage are influenced on the quality of the joints. The work conducts many experiments; these are basically depends on many factors and levels. A selection of 2205 duplex stainless steel is carried out in this study to conduct three factors and five levels of central composite design. Neural network model structure having number of neurons layers such as (3 input layers, 1 hidden layers and 3 output layers) with back propagation algorithm has been successfully applied to extract weld bead geometry from predicting the effect of input parameters. Good agreement was obtained between predicted and experiment results, however process parameters such as speed shows opposite effect on all weld parameters. It was seen that weld height and width are proportional to the amount of input current. The prediction of the neural network model showed excellent agreement with the actual results, which indicate that the neural network is viable means for predicting of not only weld bead geometry, but also other parameters such as polarity, current type and flux geometry. This recommends setting the neural network to be applicable for real time work.

## 1. INTRODUCTION

One of the most important processes that are always considered to be a main demand in manufacturing industries is welding. Therefore, selection of welding process such as Submerged Arc Welding (SAW), gas tungsten arc welding (GTAW), gas metal arc welding (GMAW), and flux cored arc welding (FCAW) ...etc is depended practically on the suitable environment of doing process. In industry for example, a fusions welding process, Flux cored arc welding developed from gas metal arc welding process to improve arc effect, metal transfer deposition and both properties and appearance of weld metal. FCAW has been specified as popular process due to good consistency and high quality weld deposition, metal deposition can be controlled accurately, ability to weld in all position due to smooth characteristics, low spatters and minimum cost for shielding gas, high deposition rate which lead to maximize productivity [1]. Selection of appropriate welding technique is very important to obtain good quality of weld bead [2]. For many applications of welding processes, a flux-cored wire performs better and faster. FCAW is suitable for low, mild and high alloy steels as well as stainless steels [3]. In industry, submerged arc welding is considered to be one of the most joining processes that are used to obtain weld quality, due to its ability to predict and monitoring of weld parameters in order to produce weld consistency. Many researches have been focused on SAW technique, first to establish the process and second to study the effect of welding variables on joint area (weld bead weld width and weld size) [Apps, et al., 1963]. Start in 1986, (Gupta and Parmar) predict the weld bead dimension of SAW by using fractional factorial technique. After that a mathematical models are presented by (Revaandra & Parmar, 1987) to reveal the geometry of flux cored weld process. A study on weld bead width in GMAW processes were studied by (Kim, et al., 1996) to examine the effect of input parameters on weld process. Later many studies on weld bead were carried out through using different analyses such as multiple regression analysis (Tarng, et al., 1998; Lee & Rhee 2000; Lee & Um 2000; Jeongick & Kiwoan, 2000) to predict the influence of process parameters on weld for the GMAW. Artificial Neural Networks (Nagesh & Datta, 2002; Kim, et al., 2002) were used to predict the weld bead geometry and penetration in shielded metal-arc welding. The extraction data of multiple regression technique are used in artificial neural network to determine shear wave velocity of carbonate reservoir (Eskandari, et al., 2004). In industry, stainless steels are commonly used as a selection material due to its corrosion resistance. Classification of stainless steel types are varied between ferritic, austenitic, martensitic, precipitation-hardening and duplex stainless steels. These steels are identified based on their micro structure and major

crystal phase. It possesses potential properties such as high mechanical properties, high fatigue strength, good weld ability, low coefficient of thermal expansion and withstand corrosion [4]. These properties allow steel to be applied in different areas such as cargo tanks, pipe systems in chemical tankers, bridges, pressure vessels and heat exchangers. Generally, welding parameters can be chosen according to the previous experience or by trial and error method decided by welders. After conducting trial the welds, the welds are inspected whether it meets the joint requirement or not. The above constraints have been overcome by design of experiment technique. It develops correlation between input process variables and output. Optimization of welding process is essential to achieve desired bead quality [5]. A stainless steel clad quality is used by (Kannan and Murugan) [6] to study the effect of flux cored arc welding process on weld bead quality, through analyzing the input parameters. Among the input weld parameters such as current, speed and voltage were considered as significant parameters in SMAW and the parameters of weld geometry such as width, height and total area were taken as output values.

## 2. Welding Parameters

The welding process variables are totally affected on weld quality [7]. Therefore, obtaining weld bead geometry of high strength and good quality will depend on how to match between input parameters [8]. Arc welding as many welding processes, uses most of these common variables such as AC or DC current, speed, voltage, electrode dimensions, type and dimension of flux layer and polarity as input variables. The extent of base metal fusion is directly influenced by welding current, while both shape depth of penetration are affected by the type of electrode diameter. As shown in Figure 1, the diameter of the weld bead consisting of bead width ( $W$ ) and reinforcement height ( $H$ ). The weld exhibits more brittleness compared with the parent materials, so it is necessary that the weld bead be large enough so that a distance which is measured from the root to outside weld is shortest through the parent materials not through the weld bead. However, minimum bead width is recommended due to reducing wastage of the weld electrode and thereby consuming more time.

**Figure 1** Weld bead (width and Height)

### **3. The Technique of Artificial Neural Network**

Nowadays, artificial neural network (ANN) is considered to be one of the most adaptable intelligent techniques consisting of simple elements operating in parallel, which are specifically adapted by human nervous systems trained to perform a sub particular function by adjusting the values of the weights to be connected between elements and then create a complex input/output relationship. In addition to linearity, this technique has ability to create nonlinear mapping and then performing continuous nonlinear functions, which can be used to model welding process. Traditional linear models are simply inadequate when it comes to modeling data that contains non-linear characteristics. In artificial neural network, several techniques can be performed to model welding process such as multilayer perception (MLP), radial basis function (RBF), and self-organizing map (SOM), however the most common is the multilayer perception (MLP) [9]. The last technique of ANN requires proper output values in order to learn, which allow this technique to be a supervised network. With back propagation algorithm, MPL is widely used because of its simplicity and great forecast ability in the weld modeling [10]. The goal for this type of network is to create a model based on historical data to continuously correct maps and to produce the desired unknown values. The final adjustments of weight parameters can be identified by ANN through iterative training of theses parameters. Many artificial intelligence methods can be efficiently performed as a key technique for monitoring and controlling of welding process, such as ANN, fuzzy logic ...etc. Examining weld strength due to pulsed metal inert gas welding have carried out by Sukhomay Pal et al. [10], which the process parameters with the root mean square (RMS) measurements of welding current and voltage, were used as input variables of the model and the ultimate tensile strength of the weldment plate was considered as the output value. A multilayer neural network was developed to estimate the ultimate tensile strength in weld plates. They compared the output obtained from multiple regression analysis with the developed artificial neural networks models and concluded the powerful of ANN model against multiple regression analysis. Another work to study the weld bead geometry and penetration through considering current, voltage, speed and electrode dimensions as process parameters was done by using ANN model in order to study the influence factors for electric arc welding [11].

Finally, solving complex and difficulty issues can be overcome by the capability of ANN, as this approach apply successfully to investigate the weld geometry of titanium alloy [12]. A

study which adopted multiple regression analysis with back propagation was done through modeling of bead height for metal arc welding process. The result indicate that the back propagation neural network considerable more accurate than multiple regression [13]. On the other hand, most of studies are reported that artificial networks are efficient technique which can be performed for analysis and modeling of weld bead geometry, penetration in arc welding [14], [15]. In present work, ANN models have been used by many researchers to understand and predict their targeted information [14, 15]. In the presented work, artificial neural network (ANN) was selected to develop and predict of the weld bead geometry in Shielded metal arc welding (SMAW) for welding of 2205 duplex stainless steel. A neural network algorithm linked with back propagation has been preformed effectively to associate the input parameters with the weld bead geometry.

#### 4. Preparation and Set-up of Weld Process

First, the samples were prepared to be conducted for experiments, which are selected from 2205 duplex stainless steel and were cut by means of electrical wire cut machine, which it shapes and dimensions should match the general standardization of preparing pieces. The dimensions are 150 mm length and 50 mm width, while thickness of piece is 6 mm. The cutting process of the desired length is obtained with the help of oxy-acetylene flame. After proper cut, the pieces were leaved to cool for a couple of hours, then the pieces were put in the position to be weld in pairs so that they remain together during the experiment. By the end of arc weld, the joint parts were welded have V- groove form. The actual range of weld parameters were proposed based on focus external observation of the weld bead. This was carried out by using visual inspection to observe bead smoothness, absence of porosity, undercut, HAZ, penetration etc. The upper and lower limits (1.68 and -1.68) of variables were specified by coding their values, while the intermediate values were determined based on selected suitable equation  $X_i = 1.68 [2X - (X_{max} + X_{min})] / (X_{max} - X_{min})$ , where  $X_i$  is the coded value of the variable of X, which X is considered as a mid value between maximum and minimum values of X [13]. Table 1 shows levels of process parameters.

**Table 1** Selected process parameters in SAW

Factor Levels	Welding Process Parameters (units)		
	Welding Current (I) (Amp)	Welding Speed (S) (cm/min)	Voltage (V) (Volts)
-1.68	170	25	28
-1	182	27	30
0	200	31	32
1	218	35	34
1.68	230	37	36

In the present work, 2205 duplex stainless steel plates were joined successfully by SAW process, through using filler wire. The experiments were conducted by set three factors with five levels central composite rotatable design. The data of weld were recorded in the form of a design matrix as shown in Table 2. A full replication of factorial design was applied with six centre and starting points at a distance of 1.68 units measured from the centre point. This result indicates that 10 rows were match up the factorial portion, while 11-18 rows were matched to the axial portion, and the remaining 12 rows corresponds to the central portion. Hence, the experimental design consists of 30 successful trials however few numbers were repeated or neglected. In order to develop mathematical models, many attempts were conducted relating to the relationship between process parameters and weld bead geometry. Response surface method was also conducted to design five levels of experiments, which the effect of process (input) parameters on weld bead geometry was clearly identified. Also, a 30 number of experiments allow to study and explore the effect of butt weld process on weld bead geometry, and permit the values to be used as an input command to the artificial network model of weld process. This paper presents a neural network model in order to predict weld bead geometry for input process parameters in 2205 duplex stainless steel butt weld deposited by SMAW. The selected input parameters were welding current, welding speed and circuit voltage. The chosen output parameters were weld bead width, reinforcement and total area. The design simulation of weld was done after developed of forward neural network trained by back propagation algorithm.

## **5. Experiment Work**

As shown in Figure 2, the experimental part was setup which consists of a power source of MEMCO 600 MMR semiautomatic welding equipment with constant voltage rectifier, filler wire feeding unit with shielding gas flow control, welding gun and a manipulator which guides to deposit the filler metal on the selected area. The work table which is equipped by two independent controllers of two axes is connected in order to help for locating the right position of welding region.

**Figure 2** Sketch of welding machine and their equipments

A total of 30 experimental trials follow with 5 factors, 3 levels, 1 center point design of experiments were performed in order to establish the effects of arc welding parameters on weld bead geometries. The size of each plate was  $150 \times 50 \times 6 \text{ mm}^3$ , which these plates were joined using butt weld with a root gap of 2 mm using flux cored 2205 duplex stainless steel wire of 1.2 mm diameter. Shielding gas containing 75 % Argon, 2 % Oxygen plus 23 %  $\text{CO}_2$  with a gas flow rate of 20 per minute was maintained. Plates were welded on both sides keeping electrode-to-work angle as  $90^\circ$ . The temperature at inside weld was maintained at  $150^\circ \text{C}$  and it was measured by infrared non contact digital thermometer. To reduce systematic error that can be expected to set up into the system, a random welding trial was conducted relating to the design matrix. All experiments (30 trials) were cross-section cut at their mid-point and specimen of size  $10 \times 10 \times 6 \text{ mm}^3$  was obtained from each welded plate. A typical cross sectional view of a weld bead is shown in Figure 3. During tests, the process parameters of weld were seen regularly to avoid any change could be happened during test. After end of weld process and prior to cool state, the slag was removed to leave weld in pure condition. Weld width and reinforcement height were measured using accurate caliper of least count 0.02 mm, then total area of designed matrix was calculated by using a stop watch and weighting machine, the metal deposition rate was also calculated.

**Figure 3** Weld bead cross-sections

## **6. Proposed Artificial Neural Network Model**

As mentioned before, a neural network model is used to build a map and set of input patterns to a corresponding set of output patterns by the concept of learn, based on previous input/output data examples related to each other. In industrial and manufacturing fields, traditional linear models are found to be inadequate when it performed modeling data contains non linear characteristics. Therefore, using neural network is a key solution to have ability to represents both linear and non linear relationships, also has capability to learn these relationships directly from data being modeled. This gives advantage to the ANN technique to be simple, low cost effective and high ability to learn from many industrial applications. In general purpose, the developed model by ANN should includes a collection of database, pre-process and post process of input/output data, simulation and train of neural system for prediction demand [16]. One of the issues faced by neural network model is how to choose optimum network architecture. This can be overcome by makes proper arrangement of neurons into layer and connect pattern between these layers, as the network structure consist of input, hidden and output layers. Input layers receive weld process parameters and the output layers obtaining and providing the values of bead geometry, while hidden layers between the input and output is considered as block box [17]. Designing an architecture structure with a no of hidden layers having neurons inside these layers will reflect the performance of the neural network. Hence, optimal design structure can be confirmed due to many attempts that carried out based on the number of hidden layers. To accommodate the convergence error, trial and error method was used to conduct the required hidden layers and neurons of the design model and then to get an appropriate structure of the weld bead geometry [13, 22]. The feed forward neural network structure was modelled, which include three neurons in the input layer, one hidden layer and three neurons in output layer using

MATLAB Neural network toolbox [18, 19, and 23]. With the aid of back propagation (BP) algorithm, the model was trained to represent an approximation of regression non linearity. It is important to know here, that most researches are implemented their models by using (BP) in order to predict weld parameters of neural network processes. It was trained with help of back propagation (BP) algorithm. BP is essentially stochastic approximation to nonlinear regression. Several researchers were used BP to model welding processes and to predict welding parameters using neural network (NN). Based on MATLAB simulation, the developing models and training of networks were successfully completed. The train is essential to obtain balancing for process parameters to become more feasible neurons and then to reach normalized condition. Under pre processing and to get more feasible, the parameters were normalized and transformed within a specified range varied from 0 to 1 [20, 21]. Since, the normalized value for each raw input/output data set were converted using the following equation as follows:

$$X_n = \frac{[X - X_{\min}]}{[X_{\max} - X_{\min}]} \quad (1)$$

Where  $X_n$  is denoted by normalize value and  $X$  is referred to input/output value, while  $X_{\min}$  and  $X_{\max}$  are minimum and maximum values of input and output respectively. The design model of neural networks structure was addressed to compose of 3 neurons input layer, 5 neurons in hidden layer and 3 neurons output layer. Figure 4 shows a proposed feed forward architecture model that was simulated by neural network. The difficulty prediction for operating process parameters of a non-linear model has some obstacle and may not be able to indicate the reality in determining values, while the use of neural network technique will help to predict the non-linear models due to its high efficient tool [20]. With learning rate of 0.6, the developed models of neural network were trained based on back propagation algorithm that successfully applied to set 25 data, and with up to 10000 iterations. The trained network was necessary in order to reduce the percentage error. The network is trained for 10000 iterations and the developed was tested out of testing dataset. As listed in Table 2; the percentage error was also calculated between the experimental and predicted value. The results indicate that the percentage error is ranging between  $\pm 2.62$ . At the end of this training process, it was concludes that the developed neural network model, have high accuracy and more reliability for predicting of weld bead geometry.

**Figure 4** Predicting of weld bead geometry by proposed neural network architecture

## 7. RESULTS AND DISCUSSION

Study the effect of parameters on weld bead geometry was investigated experimentally and plotted on the following figures. Figure 6, 7 and 8 shows the measured weld bead width, reinforcement and total area from the experiment and then predicted output values using ANN in the form of feed forward neural network model with back propagation algorithm. The results were predicted from the best architecture of neural network, so the predicted values were very close to experimental values. It can be observed from the convergence between predict and experiment values that the percentage errors determined between them are low and within acceptable condition as listed in Table 2, hence the ANN was able to predict the weld bead geometry with good accuracy.

**Figure 6** Comparison between predicted and experimental weld bead width versus the number of trials network model

**Figure 7** Comparison between predicted and experimental weld bead reinforcement versus the number of trials network model

**Figure 8** Comparison between predicted and experimental weld bead areas versus the number of trials network model

## 8. CONCLUSION

The simulation model of the welding process of Shielded metal arc welding (SMAW) was carried out based on feed forward artificial neural network structure (3-5-3) to extract weld bead geometry from predicting the effect of input parameters. A multiple sets of data were used to train the network in order to predict the geometry of weld, minimize the percentage error that can be initiated during tests and to benefit from artificial neural network to predict the quality of weld. In general, the predicted results and the results from experiments are compared, which show good agreement. However, process parameters such as speed have opposite effect on all weld parameters. In experiments, increasing speed substantially reduce heat, lower burn off rate

and minimum the deposition at weld joint so affect weld bead parameters. It was seen that weld height and width are proportional to the amount of input current, which means that input high current leads to increase in height but decrease in width. Also, it was observed that the weld bead become wider as received high amount of voltage. At end this work shows that it is possible to use neural network in order to predict the weld bead geometry. The proposed neural network has the modeling competence with average accordance ratio of 93.5 %, which allow the ANN to have powerful and alternate technique to predict weld bead geometry, and hence permit it to include other parameters such as polarity, type of current and flux geometry. Furthermore, it was recommended to set the neural network as a technique used for real time work.

**DIAGNOSIS OF RADIOTRACER PROCESSES****Çiçek ABBASOVA**

ANAS Institute of Radiation Problems Baku Azerbaijan

**INTRODUCTION**

A tracer is any substance whose atomic or nuclear, physical, chemical, or biological properties provide for the identification, observation and following of the behavior of various physical, chemical or biological processes (dispersion, mixing, kinetics and dynamics), which occur either instantaneously or in a given lapse of time (Fig. 1). There are many kinds of tracers. The radioactive tracers are mostly used for online diagnosis of industrial reactors. For conducting a radiotracer investigation, various requirements need to be met before starting the actual test. The most important of all the requirements is the “*Radiotracer*” itself. It is of fundamental importance that the radiotracer compound should behave in the same way as the material to be traced. Therefore, the selection of an appropriate tracer is crucial to success of a tracer study. For reliable and meaningful results, an industrial radiotracer must meet the basic requirements such as suitable half-life and energy of radiation, physical and chemical stability, easy and unambiguous detection. It is often difficult to meet all the requirements of an ideal tracer and certain compromises have to be made. Even if a radiotracer meets the required criteria, it may not be available to tracer groups in developing countries.

**FIG. 1.** Tracer principle

The behavior of tracer under conditions of the system (physical & chemical conditions) is very important. One must know, before injecting a tracer, how it will behave in the system. In certain circumstances, the tracer injected into a system may undergo decomposition, phase change, undesirable absorption and adsorption, chemical interaction with system constituents leading to incorrect results. For example, para-dibromobenzene when used at high temperature is adsorbed on the surfaces or packing inside the reactor vessel and does not follow, faithfully, the organic liquid phase.

While tracing fluid movement in oilfield (inter-well tracing), the reservoir physical and geochemical conditions pose constraints and an undesirable tracer-loss or delay occurs. Sometimes, tracers found to behave properly in one reservoir, may not behave satisfactorily in another reservoir. While tracing aqueous phase (in a liquid/solid phase system like, waste water treatment plant, oil reservoirs, etc), cationic tracers, with certain exceptions, may lead to problem of sorption and ion exchange with host material. Leaching and flotation are main processes for enrichment of ore minerals, in particular for gold and copper ores. They are hydrodynamic processes and their efficiencies are directly related to the time raw materials spend in the processing vessels (leaching tanks or flotation machines). To fully diagnose these processes the distribution of the time it takes for the material to process from the inlet to the outlet has to be known. RTD function provides the necessary parameters to diagnose the process or to design a proper unit. The comparison of the measured MRT with the expected MRT, as

well as the RTD model obtained from the RTD experimental curve, give the most useful and valid information about the mixing properties and process efficiency.

RTD method was applied in a gold enrichment plant. The most important part of the gold processing plant is the leaching process, which is being carried out in eight processing tanks of the leaching line (Fig.2). The gold slurry (after grinding process) is overflowing from cyclone to the first tank and after it is going through all tanks where gold ore leaching taken place. The overall flow rate through tanks was 100 m<sup>3</sup>/h. Taking into account the importance of the leaching process in final gold recovery the RTD method was applied to diagnose the process functioning throughout the processing tanks. The main objectives of the radiotracer investigation were:

- to measure the slurry retention time of tanks 1 (volume 500 m<sup>3</sup>), 7 and 8 (volume 250 m<sup>3</sup> eachone), as the most important tanks in leaching process,
- to judge about macromixing of slurry within these tanks,
- to locate possible malfunctions inside the processing tanks.

Potassium bromide K<sup>82</sup>Br liquid radiotracer was used to investigate the leaching tanks in the plant. The radiotracer was prepared at the nuclear reactor. The activity of radiotracer injected in the tank 1 was 100 mCi at the injection time, while the activity of radiotracer injected to the inlet of tank 7 to diagnose both tanks 7 and 8 was 130 mCi.

**FIG.2.** Tracer experiment in gold leaching tanks

<sup>82</sup>Br as potassium bromide is a good tracer of water phase. In fact the tracer is following the water phase, but it is quite representative of slurry flow as well because it is already proofed that fine solid grains of less than 100  $\mu\text{m}$  are moving in the same way like water. <sup>82</sup>Br has a lifetime of 36 hours, so the samples should be measured along the experiment run.

Immediately after injection the sampling process started collecting 2L of slurry and taking water phase for off-line radiotracer activity measurement with a portable NaI(Tl) detection system installed near by (Fig.2).

### ***Results of radiotracer tests***

The sampling interval was selected according to the expected mean residence time distributions in these tanks. Just after radiotracer injection, the sampling interval was 1 minute for 10 minutes; after that an interval of 10 minutes was kept for around 850 minutes that lasted the test 1 (tank1), and for around 600 minutes during the next day test in tanks 7+8. All the count rates were corrected for radioactive decay and background, and were presented in counts per minutes(cpm).

The experimental curves obtained in tanks 1, 7 and 8 are presented below (Fig.3). The experimental curves for tank 1 and tank 7 represent the RTD curves for these tanks respectively, while the third experimental curve shown in fig. 70 is the response of both tanks 7 and 8. The mean residence time for tank 8 was calculated as difference of MRTs of two last curves.

**FIG. 3.** Experimental RTD curves obtained in tanks 1, 7 and 8.

## DISCUSSION OF RESULTS

The higher narrow peak at the beginning of the experimental RTD curves, just few minutes after the radiotracer was injected, shows the by-pass or short-circuit that happen in the tank 1 and 7, that means reflect transport of slurry from entry to exit very quickly by surface flow mechanism without any mixing inside tanks. This surface flow is more evident in tank 1.

The general common characteristics of two first experimental curves (for tanks 1 and 7, fig.2) are the exponential decreasing of the main part of the curve with a relatively long tailing, which does not follow the main exponential decreasing. The main exponential curve represents the main flow of slurry inside the tanks and shows a perfect mixing process that occurs only in one part of them. In tank 1 the mixing is perfect in 87 % of the total volume, in tank 7 in only 70 %, and in tank 8 in 73 % of the total volume. The long tail of experimental curves shows clearly the stagnant volume where radiotracer (and slurry) is staying longer being released at a lower rate than the bulk slurry from the tank. This is an anomaly of the tank performance, which is more problematic in tanks 7 and 8 (nearly 30% of total volume is almost dead, and might be blocked by the solidified material (slag) as well).

Modeling of complex flow in leaching tank 1 was performed using a combined model of perfect mixer with exchange and surface flow (by-pass). RTD software was applied and the result of modeling is shown in figure 4. It seems that the model fits well with the experimental RTD curve.

**FIG. 4.** RTD model for tank 1: perfect mixer + exchange with stagnant zone + surface flow

From the model it was estimated that the surface flow consists of 3-5 percent of total flow rate in tank 1. The modeling of tank 7 gave the surface flow rate of and 1-2 % of the main flow.

## CONCLUSIONS

Radiotracer provided all parameters needed to diagnose the functioning of leaching process. Tanks were mixing the slurry well but not in all their designed physical space, some dead zones were found, which were estimated to around 13 % for tank 1, and 27-30 % for each tank 7 and 8. A surface flow transporting overflow slurry from inlet directly to outlet without mixing and processing it within the tank was observed. This surface flow rate is relatively small and more evident in the first tank (3-5%), in tanks 7 and 8 the surface flow rate was smaller 1-2 % of the main flow. The dead volume and surface flow are influencing negatively in gold recovery rate, keeping it lower than designed. These anomalies can be eliminated or at least reduced modifying the mechanical design of tanks to mix better slurry in all physical volume; extension of stirrers down towards tank bottom was recommended. From observations and results it is evident that the downcomer pipe (150 mm in diameter and 20 cm below surface of material) is not sufficient. It is recommended that downcomer diameter be increased to at least 250 mm and extent to approximately 2-3 m from the bottom of the tank. This will reduce also the by pass flow. Another additional way to reduce by pass is construction of baffle between inlet and outlet.

**DRIVING FORCES AND BARRIERS IN THE IMPLEMENTATION OF GREEN  
ADAPTION STRATEGIES OF ACCOMMODATIONS: THE CASE OF CAN THO,  
VIET NAM****NGUYEN TRI NAM KHANG**

Can Tho University, Vietnam

**HUYNH TRUONG HUY**

Can Tho University, Vietnam

**TRAN THANH LIEM**

Can Tho College, Vietnam

**ABSTRACT**

The objective of the article is to evaluate driving forces and barriers in the application of environmental friendly policies and the implementation of green adaptation strategies of accommodations in Can Tho City. Based on data collected from a survey of 134 senior managers of accommodations in Can Tho, the research results show that: (1) There is a huge difference in the number of green adaptation strategies in the group of small and large-size accommodations; (2) Accommodations are most concerned about investment costs when implementing green adaptation strategies, but according to practical assessment, low-cost strategies have not been focused.

**Keywords:** Green adaptation strategy, driving force, barriers, size of accommodation facilities, senior management.

## **1. INTRODUCTION**

Many experts acknowledge that implementing a formal environmental policy or environmental management system (EMS) is an effective green adaptation strategy. EMS is a management system that aims to encourage an organization to control its environmental impacts and reduce them on an ongoing basis. Research shows that some of the main reasons for hotels to adopt EMS include environmental concerns, economic reasons and to gain a positive image (Chan, 2008). Brown (2010) also argues that hotels with formal environmental policies or EMS tend to achieve better environmental performance.

Several subsequent studies continue to support the urgent need to adopt greener practices in the hospitality industry (Han, 2015). This is because more and more consumers accept the idea of using environmentally friendly products and services in the context of hotel operations (Kim & Han, 2010). This up-and-coming market has encouraged leading hotels to adopt greener approaches to gain a competitive advantage.

However, to be successful, an accommodation may need to consider barriers to green practices before committing to green practices. Chan (2008) highlighted a number of pressing issues including lack of skills or knowledge to go green, lack of facilities, increasing costs and unstable outcomes.

The study was conducted with the aim of assessing the driving forces and barriers in the adoption of eco-friendly policies and the implementation of green adaptation strategies of accommodation establishments in Vietnam. Can Tho, Vietnam

## **2. DEFINITION OF GREEN ADAPTATION STRATEGY**

With increasing awareness of the environmental burden created by hotels, green adaptation strategies in the hotel industry have begun to receive much research attention. There are different definitions of the term “green adaptation strategy” or “environmental strategy”. Carmona-Moreno et al. (2004) view green adaptation strategy as the strategic direction that a company gives to environmental questions and how they use them as a competitive tool. Latan et al. (2018) consider a green adaptation strategy as a set of initiatives that can reduce the impact of activities on the natural environment through corporate products, processes and policies such as reduce energy consumption and waste, use green resources sustainably and implement an environmental management system. Based on these definitions, this study defines a green adaptation strategy as a strategy adopted by an organization to reduce or minimize the environmental impacts of its activities on the natural environment. Course

### 3. RESEARCH METHODS

By method of expert interview, senior managers of high-ranking hotels in Can Tho were asked to assess the relevance of the set of criteria on green adaptation strategy. The criteria after being approved on the suitability for the study area will be continued to be used to conduct a survey of 134 managers belonging to 134 different accommodation establishments in Can Tho. The subjects interviewed for the study were the hotel managers/owners. Sample was collected mainly in Ninh Kieu district, some participants came from Cai Rang, Binh Thuy and Phong Dien. The survey was conducted in November 2021.

Descriptive statistics method is applied in this paper to summarize data on driving forces, barriers in adopting environmentally friendly policies and implementation of adaptation strategies. green of accommodation establishments in Can Tho

### 4. RESEARCH RESULTS AND DISCUSSION

#### 4.1 Reasons to motivate accommodations to adopt eco-friendly policies

Driving forces can be divided into external and internal forces. External forces include those generated outside the company; such as from the macro environment: political, economic, social, technological, legal and environmental (PESTLE analysis) (Kew & Stredwick, 2005) as well as from the microenvironment: suppliers, competitors, customers, marketing intermediaries and the public. Internal forces refers to the forces inside the company. Some potential drivers are discussed below.

**Table 1.** Statistics of driving forces for accommodations to apply environmental friendly policies

N <sup>o</sup>	Reason	Frequency	%
1	Law regulations	80	59.7
2	Promotion of the accommodation's green image	101	75.4
3	The hotel's governance system promotes the hotel's CSR implementation	45	33.6
4	Attitudes and perceptions of leaders on environmental issues	96	71.6
5	Environmental pressure from customers and business partners	35	26.1

Source: Survey 2021

From the results of Table 1, it can be seen that the reason "Promotion of the hotel's green image" is the most chosen reason, consistent with the study of Chan (2013) indicating that some hotel companies consider compliance with environmental laws is simply an opportunity to promote their green certification.

Next is the reason "Leadership's attitude and awareness on environmental issues" is recognized as an important motivation to apply an environmentally friendly policy, ranked second with 96/134 votes. Therefore, top management's attitude and the importance of environmental strategy will significantly influence their strategic priorities.

Next is the reason "Regulation of the law" with 80 choices. The lowest is 2 reasons: "The hotel's management system promotes the implementation of CSR of the hotel" and "Environmental pressure from customers and partners" with 45 and 35 choices respectively.

#### **4.2 Barriers in implementing eco-friendly accommodation policies**

However, to be successful, a hotel may need to consider barriers to green practices before committing to green practices. Chan (2008) highlighted a number of pressing issues including lack of skills or knowledge to go green, lack of facilities, increasing costs and unstable outcomes.

**Table 2.** Statistics of barriers in implementing eco-friendly accommodation policies

<b>N<sup>o</sup></b>	<b>Barriers</b>	<b>Frequency</b>	<b>%</b>
1	Initial investment costs for systems and equipment	103	76.9
2	Cost of operating and maintaining systems and equipment	63	47.0
3	Lack of advice from experts and management organizations	72	53.7
4	Lack of knowledge and skills on system operation	57	42.5
5	Lack of resources to operate systems and equipment	48	35.8
6	High cost of certification	43	32.1
7	Uncertainty of outcome, efficiency	34	25.4

**Source:** Survey 2021

The biggest barrier in the implementation of environmentally friendly policies of accommodation establishments, which is easily seen from the analysis results of Table 27, is the element "Initial investment costs for systems and equipment". " accounting for 76.9%, this is especially evident with accommodation establishments with small size and low classification rank.

Next is the factor "Lack of expert advice, management organization" accounting for 47%. It shows that in order for accommodation businesses to implement favorable environment-friendly policies, it is necessary to receive support from relevant state agencies and environmental organizations.

Besides, internal barriers such as: "Operation and maintenance costs"; "Knowledge, skills" and "resources" account for the death rate 35.8% - 47%. This suggests that these factors play an

important role in hindering progress when considering the formal EMS. The factors "High cost of certification" and "Uncertainty of results, effectiveness" have the lowest frequency of selection.

#### **4.3 Current status of green adaptation strategy**

In Can Tho, accommodation facilities are currently applying 5 environmental standards. In which, two standards TCVN 4391:2015 are required requirements for star hotels and Decree 40/2019/ND-CP (29/2011/ND-CP, 35/2014/ND-CP, 18/2015/ND-CP) for accommodation establishments with 50 rooms or more. The remaining 3 standards: Asean green label certification, Green Lotus certification and ISO 14000 standard system are the standards that are recommended to apply but not required for accommodation facilities.

Although different certification systems focus on different environmental issues, there are some basic criteria that are addressed by most certification systems. A total of 21 green adaptation strategies are synthesized from a review of previous research papers and from 5 applicable environmental standards. These strategies are further categorized into 14 key areas: water, energy, transport, waste, amenities, hazardous substances, living room, design and building materials, shopping, food service drinks, outdoor environment, corporate social responsibility, guest information, management and employees.

Then, using the expert interview method, 5 experts who are senior managers from high-ranking hotels in Can Tho were asked to assess the relevance of the set of strategic criteria. green adaptation. As a result, 3 criteria were excluded because they were deemed unsuitable for evaluation of accommodation facilities in Can Tho. These are: (1) Using indoor thermostat control system; (2) Use electric boats and (3) Introduce "eco-friendly room packages" (e.g. special room rates for rooms without disposable items). The remaining 45 criteria continued to be used to interview 134 managers from 134 different accommodation establishments in Can Tho. The statistical results on the number of strategies implemented by accommodation facility size are shown in the following table:

**Table 3.** Green Adaptation Strategy by Accommodation Size

Size of accommodations	Green adaptation strategy		
	Frequency	Mean	Standard deviation
Small size (Below 50 rooms)	113	6.63	3.694
Large size (From 50 rooms or more)	21	18.86	10.664
Total	134	8.54	6.965

Source: Survey 2021

Thus, on average, each accommodation implements about 8 green adaptation strategies. For medium-sized accommodations, about 6 green strategies are implemented, and for large-scale accommodations, this number is about 18 green strategies. At the same time, there is a very high standard deviation in the group of large-scale accommodation establishments (10,664). The reason for these differences is that large-scale accommodation establishments (equivalent to 3-star standards) will be subject to more stringent environmental regulatory pressures that require specialized departments to monitor. hotel activities are related to the environment and require the use of environmentally friendly products. Particularly for 5-star hotels, it is required to have a staff specialized in environmental protection management

## 5. CONCLUSION

It can be seen that "Initial investment cost" is the biggest concern hindering the green practice of accommodation establishments. However, the survey results on the implementation of green adaptation strategies indicate that low-cost environmental tactics have received little attention, as evidenced by the frequency of these tactics. accommodation facilities are very low. Thus, it can be seen that if managers realize and take advantage of these activities, it will not cost too much but can increase efficiency in the implementation of green strategies of the accommodation.

**ABSTRACT**

Irregular migrants (they) have been present in Serbia for more than a decade. They have appeared in groups and communicated in languages unknown to the local population (we). They have consisted of Asian and African peoples. They have leaved the homeland because of wars, economic reasons and search better quality of life. In common is that they are in "passing through Serbia". Their target destinations have located in Western or Northern Europe. In Serbia, they were detained by the COVID-19 pandemic and changes in the European Union's attitude towards migrants. The significance of the paper is for historical geography because it provides information about irregular migrants, which are almost non-existent in the scientific literature of Serbia. Irregular migrants are almost invisible in all statistics, because they refuse to be classified as asylum seekers. They have arrived in irregular ways, therefore it is impossible to state their exact number. The work was created on the basis of facts collected since 2018. Information about irregular migrants was obtained in communication with the population that is in close contact with them or from electronic and written media. Volunteers who have engaged to communicate with irregular migrants have also given precious information. The work showed that the attitudes of the local population differ greatly depending on whether they had direct contact with irregular migrants or not. The local population has both positive and unpleasant experiences. Those who have not had direct contact base their views on prejudice. Therefore, there is a need to devote part of the media space of the public service to these ethnic groups.

**Keywords:** Serbia, irregular migrants, local population, historical geography

## **INTRODUCTION**

Many works deal with refugees, asylum seekers and migrants who have passed through the territory of Serbia during the previous decades. However, there are almost no papers that talk only about irregular migrants and their impact on the population of the Republic of Serbia. This is one of the reasons why it is important to leave evidence of their presence in the historical geography of Serbia. Irregular migrants have been walking around Serbia for more than a decade.

Serbia, like other countries in the Balkan region, is a transit country and a temporary destination, or unplanned waiting room (Bobić, Šantić, 2019). Irregular migration is any movement of the population from one state to another, which is not in accordance with the applicable legislation of the country of origin and the country of destination, as well as residence in a particular country contrary to applicable laws of that country. An irregular migrant is a person who has entered the country illegally without citizenship (Government 2018). As irregular migrants are a special category of the population on the territory of Serbia that "found itself in transit" there, so there are no data on them in any official statistics. There have been sporadic traces of their presence for more than a decade. AS (2012b) states that in 2011, the Ministry of the Interior of Serbia discovered about 10,000 immigrants on the Serbian-Macedonian border. They tried to enter and enter Serbia by train, highway or through the "green" border zone. Some of the immigrants discovered at the border crossing, in an attempt to enter illegally, were returned to Macedonia. Some of them asked for asylum, and with the appropriate certificates, they were sent to asylum centers (in the settlements of Banja Koviljača and Bogovađa). As some did not show up, it means that they abused their right to asylum and continued their illegal journey to rich EU countries. In 2011, about 1,100 illegal migrants were returned to Serbia from Hungary. The turning point happened in March 2016, when the borders and passages to the European Union were suspended for these people. Everyone was offered asylum. Some accepted it and some did not because they hoped to open the borders.

The presence of irregular migrants affects life in Serbia both directly and indirectly. Irregular migrants are mostly talked about by those who have been in contact with them, followed by the media, and are less frequently sporadically mentioned in scientific papers. The population in whose local environment the reception centers are located had the most contacts with them. Some information can be obtained from those who are in direct contact with them, such as volunteers, government officials, members of non-governmental

organizations, security guards, soldiers, doctors and others. That is why this paper seeks to leave a testimony of their presence.

It is not possible to say with certainty how long they will be on the territory of Serbia. The only thing that can be understood is how their presence affects the local environments in which they live. The Covid 19 pandemic has attracted so much media attention that monitoring the presence of this population group in Serbia has been minimized. The idea of the work came from the stories of the population living near the border or the reception centers where irregular migrants are accommodated. Their presence affects the quality of life of the domicile population. Time will tell what consequences it can cause. It is indisputable that leaving a written trace about this group of people can gain significance in the future.

## **METHODS**

Generally known facts about irregular migrants were taken from the Office for Migrants and literature sources. Part of the research refers to the facts found in the media, obtained from the volunteers of the Center for Protection and Assistance to Asylum Seekers, and part consists of those obtained in communication with the population living near the reception centers. It was noticed that the population is reluctant to talk about migrants, but also about the reasons why this is so. The answer was most easily obtained from people who were in some way damaged by their presence.

Several direct semi structured interviews were done. The facts were collected between 2018 and 2022. Some respondents spoke from memory about events that happened even 5 years ago. All participants are inhabited in Serbia. Participants are divided in two groups. Respondents from the first group had contact with migrants, while the second group of respondents had those who had no contact with migrants. Respondents' profiles are given in brackets, so that the first data are gender (male or female f), age, location where the respondent lives, last two digits of the year when the statement was taken, contact (c - had contact or w - no contact).

### **Who are irregular migrants?**

AS (2012b) writes that it all started in 2009 when there was a big conflict between immigrants, police and the local population in the Greek port of Patras. Through Patras, immigrants illegally entered trucks that were transported by ferry to Italy, traveling to the West. There were no border controls because both countries are members of the Schengen

Agreement. Tighter controls when boarding ships have resulted in illegal migration changing to a route from Greece via Serbia to the West. ‘Arab spring’ (Bayat, 2013; Ribas Mateos, 2016; Bani Salameh 2019) has certainly significantly contributed to the mass migration of people from Southwest Asia and North Africa to Europe.

Back in April 2009, it was stated that the largest number of illegal migrants and asylum seekers enter the Republic of Serbia on the border with Macedonia and through the administrative border with Kosovo and Metohija. They have been observed at legal as well as illegal border crossings (AS, 2010). Irregular migrants are young men, often minors, or men in their thirties, and rarely people over the age of sixty. Among them is a family with small children and pregnant women. According to Mijatović, Nedeljković (2013), juvenile irregular migrants were also ordered. Drašković et al. (2019) talking about the position of particularly vulnerable categories in transit, testifying to the presence of unaccompanied minors, girls and women, and psychiatric users among irregular migrants. AS (2012) states that some of them seek asylum, while the vast majority only transit through the Republic of Serbia. They reside in the suburbs of settlements, abandoned hangars, and closed buildings or near abandoned factories and landfills. Some have money and rent apartments or small rooms to shelter from harsh weather conditions and people. For that reason, it was said for a whole decade (2009-2019) that the number of this group of people was constantly changing.

Lukić (2016) called all migrants on the Balkan route irregular, referring primarily to those who stopped to rest or renew contacts. According to Šelo Šabić (2017), 800,000 migrants passed through the territory of Serbia in 2015 and 2016. They used different means of transportation. According to Denda (2014), they are grouped into three categories: economic reasons (the Maghreb countries), fleeing from war, oppression, disagreements with the political regime (Syria, Eritrea, Afghanistan, Sudan) and combined reasons that are seen through danger from armed conflicts and the need for a better life, education (Somalia, Nigeria). During the research, in addition to the mentioned countries, the respondents stated that they also met with people from Iran and Pakistan. According to Beta (2013), immigrants from Algeria and other North African countries were also noticed, and the APC (2015) also mentions those from Morocco, Sri Lanka and Bangladesh. In the 2018 Strategy, the government states the structure of identified irregular migrants in 2016. That year, the majority were Afghans (38%), followed by Iraqis (32%), Syrians (11%) and Pakistanis (6%).

Solarević & Božić (2018) wrote that residents feel some fear and discomfort due to the arrival of migrants and refugees, which can be associated with a strong perception of their behavior, as well as religion, language, culture and hygiene, that is, cultural and behavioral patterns that are unknown to many people and are very different from those in Serbia. Laloš (2012) writes that cameras have been set up on the border between Hungary and Serbia. They catch even the slightest movement for miles around, and patrol helicopters and patrol boats stand ready at the ready if anyone just tries to get through the European ramparts. Until the construction of the "wall" on the Hungarian border (Székely & Kotosz, 2018), in September 2015 (Silaški & Đurović, 2019), there were illegal crossings. However, the "wall" kept some in Serbia. Fence along the border is 174 km long (Šantić et al, 2017). This closure caused redirecting the refugees towards Croatia and Slovenia. In November, the first joint restrictive measures were adopted by Croatia, FYR Macedonia, and Serbia as a result of Slovenia's request to redirect migrants from non-war torn countries back to Croatia (Šelo-Šabić & Borić, 2016). On March 2016, most of the countries on the Balkan Route have announced that their borders were definitely closed to irregular migrants (Commissariat for Refugees and Migration, 2016). However, irregular migrants, especially families with children, were released in small numbers every day until 2019, ie until the outbreak of the Kovid 19 pandemic (Babić & Majer, 2020). During 2020, a fence was erected between Serbia and Northern Macedonia (Đukić Pejić, 2021), and it is noticed that in 2021, irregular migrants from Afghanistan and Syria arrive from the territory of Kosovo and Metohija, the Kosovska Mitrovica - Raška railway, across the administrative border at Jarinje.

If irregular migrants are mentioned somewhere (in statistical reports), their number also refers to refugees, asylum seekers, and migrants. Irregular migrants are not visible in the legal system. They did not express their intention to seek asylum, and it is believed that they will migrate further. Serbia offers them asylum, with which they get an identity and certain rights, for example, to manage the money they have in their bank accounts. But, according to the Executive Director of the Center for Protection and Assistance to Asylum Seekers (2019), they refuse.

According Galijaš (2019) even if a report is filed, those responsible for the violence go unpunished, precisely because they have no legal status. If individuals are charged with a criminal offence or are caught at an illegal border crossing, the law stipulates that they should be deported from the country. But this measure is futile both in Serbia and in the

rest of Europe, because there is nowhere the refugees can be deported to: it is impossible to send anyone back to Syria or to parts of Iraq. So, those who break the law continue to live in Serbia, and keep trying to enter the EU.

Todorović (2011) mentions that irregular migrants seek asylum only to avoid penalties for illegal border crossing. The asylum procedure consists of two phases and lasts about five months. With the submitted request, an ID card was obtained with which one can move freely and free medical assistance was provided. Economic refugees cannot get asylum. This is best illustrated by the data received by the BBC (2021) from the Ministry of the Interior, UNHCR and the Belgrade Center for Human Rights, according to which a total of 647,512 irregular migrants expressed their intention to seek asylum by entering Serbia from 2008 to the end of March 2020. (Which does not necessarily mean that they really did), and in the same period only 173 of them were approved.

### **Reception Centers**

According to the Commissariat for Refugees (2021), there are asylum centers at six locations. There are people in them who have expressed their intention to stay in Serbia. In that way, they entered the appropriate procedure at the State Asylum Office. Unlike them, there are irregular migrants in the reception centers. Reception centers are considered transit centers.

At the beginning of the migrant crisis in Serbia, there was one pre-reception center for migrants and three reception centers. The pre-reception was located in the village of Miratovac on the border between Serbia and Macedonia. The first reception centers were organized in Preševo on the border with Macedonia, Kanjiža on the border of Serbia with Hungary and Principovac on the border with Croatia near Šid. As their capacities were not sufficient, others were established.

The Government (2018) announced that in February 2017, there were 12 reception rooms with a total capacity of 6,900 beds. Of that, 5,600 seats are in solid buildings and 1,300 in slave halls. The installation of slave halls in locations closer to the northern borders was a response to the increased needs in the conditions of mass influx of migrants in order to urgently accept and take care of them. After the formal closure of the Western Balkan route (March 2016), between 200 and 400 migrants stayed in the centers. In May 2017, there were 13 operational reception centers) with 6,165 people accommodated. These numbers include irregular migrants, but also asylum seekers.

The latest data that could be obtained show that there are fourteen reception centers in Serbia (Figure). Capacities, depending on the data source, range between 4758-5050 bearings (Table). Data from the beginning of 2019 show that for most, eight out of fourteen, reception centers are not available. The available data at the time numbered 2,338 irregular migrants, which accounted for about half of the projected capacity.

According to research, some reception centers will be closed if there are fewer irregular migrants due to rationalization. Irregular migrants are transferred to other reception centers. In the reception centers, irregular migrants have the right to temporary accommodation, food and water, medical and any other assistance.

**Table** Receptions centers of Serbia

Location	Region	Founded	Capacity	Number of migrants (January 2019) <sup>2</sup>
Subotica	Vojvodina	2015	150	No data

<sup>3</sup>E and SE Serbia means East and Southeast Serbia

Galijaš (2019) writes that in practical terms, building refugee centres in Sjenica and Tutin was not an economical solution for the state, as the centres are at about 1,000 and 760 metres above sea level, with snowfall between October and March, making them expensive locations to keep heated. Their physical distance from Belgrade also complicates efficient management. The only excuse for this is that ‘Muslims have it easier in Muslim environments.’

According to Đurović (2019), the conditions in Serbia are different. Conditions in asylum centers are far more decent than those in transit centers. For example, in the transit center in

Adasevci, there are no conditions for a normal life, there is no drinking water. That place is isolated and far from the city center. Single men and orphans are most often accommodated in Obrenovac near Belgrade. Many of them do not have a bed. Migrants and refugees complain about the terrible conditions in which they live, the violence that reigns there, and often the behavior of officials from the Commissariat for Refugees.

Tanjug (2019) writes that the Center for Protection and Assistance to Asylum Seekers (CZA) believes that the existing centers for the accommodation of minors are not adequate and appeals for the opening of a special center for the reception of these children. In July 2019, 300 to 600 migrant children stayed in Serbia without their parents. They were assigned a guardian, provided accommodation, psychosocial support. The most numerous are teenagers between the ages of 14 and 17, and the growth of younger children is also noticeable. Marinković (2020) writes that in April 2020, about 8,800 people were accommodated in 20 reception and asylum centers, of which more than 1,100 were children.

## RESULTS AND DISCUSSION

There are few scientific papers on irregular migrants in Serbia. The inspiring research of Petrović and Pešić (2017) deserves the greatest attention, but even after it, irregular migrants

continued to move through Serbia. Irregular migrants who are not in the reception centers are known from the media or from the stories of the population. For example, Jevtović and Bajić (2018) analyzed the image of migrants provided by the daily press. Laloš (2012) writes that irregular migrants were visited by some political parties and the Red Cross. The non-governmental organization Eastern European Mission provides great assistance.

Volunteers are the most in contact with irregular migrants. People who apply to volunteer are of different profiles. There are many young people among the volunteers, but there are also older citizens. Volunteers work in different professions and have acquired different levels of education. They are of different property and other status. The motives for their engagement are always a strong need and awareness to help people in need. By their actions, volunteers awaken solidarity. They trigger a wave of change in interpersonal relationships. Volunteers say it would be best for local communities and society as a whole to be based on the principles of solidarity, humanity and respect for human rights. In addition to domestic volunteers, some of the volunteers are young foreign students who are doing professional student internships at the Center for Protection and Assistance to Asylum Seekers (APC / CZA). Pavlović (2016) found that most citizens are compassionate and respectful to migrants, as long as it remains implicit that they will continue their journey.

Krasić et al testify about the integration of people found on the territory of Serbia (2017). They write that around 400 teachers in nine school catchment areas near the asylum and reception centres had received specific training and thorough instruction on how to put the Ministry's 'Guideline' into practice. Special IT-based applications have helped children learn the Serbian language in a separate group, while they have widened their knowledge of all other school subjects through an integrated curriculum which they share with the Serbian children.

According Galijaš (2019) irregular migrants relate how the Hungarian police and military pushed them back to Serbia. She found that there is no prevention of human trafficking or smuggling. Refugees often choose the route through Serbia because they believe it is a safe passage posing little risk to life, and without extensive pushbacks or serious and systematic police maltreatment, they nevertheless have to survive without any institutional or legal protection.

According to the Center for Protection and Assistance to Asylum Seekers, more than 16,000 migrants and refugees entered Serbia in the first half of 2019. More than 37% of them were women and children. At any given time, there are more than 5,000 migrants in Serbia, of which

about 3,000 are housed in state centers. The rest are housed in alternative accommodation, in the open along the borders, in urban cores. In the period from January 1, 2019 to August 31, 2019, 7,396 people expressed their intention to seek asylum, and 14 refugee protections and 15 subsidiary protections were granted. Every day, hundreds of migrants enter Serbia from the direction of Northern Macedonia, Kosovo, Montenegro, while hundreds of them try to leave Serbia every day in the direction of Croatia, Bosnia, Hungary, and even Romania (KzZPiPPM, 2019). According to Galijaš (2019), following the closure of the Balkan route, Serbia began receiving financial support from the EU to cover the migrants' basic needs at the collective centres: health services, clothing, food, water, child-friendly spaces, and informal education in things like sewing or learning the language, and so on. Indeed, between the beginning of the refugee crisis and July 2018, the EU allocated more than 25 million euros in humanitarian aid to Serbia specifically to assist refugees and migrants.

The Government (2018) adopted the Strategy for Combating Irregular Migration in the Republic of Serbia for the period from 2018 to 2020. Savanović (2021) quotes the words of the President of Serbia, who says that 38,226 illegal border crossings were prevented in 2020, which is an increase of 89% compared to 2019. In June 2021, there were 3,977 migrants from Syria, Afghanistan, Bangladesh and Pakistan. That is why Serbia signed an agreement with the EU worth 11 million euros for the needs of migration management. Irregular migrants do not want to stay in Serbia, but they are there until further notice. According to Đurić et al. (2014), based on the 2011 Census and the size of ethnic groups in Serbia, it can be said that there are more irregular migrants than Egyptians, Jews, Armenians, Russians, Turks, Cincars, Czechs and others. People in Serbia know how much the mentioned ethnic groups have left their mark in the cultural, scientific, etc. life of Serbia. The obtained research results will be divided into those found in various media and those obtained by interviewing the population.

Selected facts about irregular migrants taken from the Serbian media

Irregular migrants are most often mentioned in the electronic media. The Center for Protection and Assistance to Asylum Seekers has existed since the end of 2007. The first mention of migrants who did not seek asylum dates back to the beginning of 2012, when they were given help due to frostbite. At that time, due to snow and strong wind in the north of Serbia, in Subotica, about a hundred people were taken care of. A fifth had health problems and frostbite (APC, 2012). The media wrote about the locations of irregular migrants. Laloš (2012) stated that some managed to settle in private houses, while most, while waiting for the opportunity to

cross the well-guarded Schengen border, found temporary accommodation in the city dump. Thus, AS (2012) states that since mid-2011 there has been a ‘Jungle’. She was just one of the stops for hungry, tired and scared irregular migrants. It is located under cardboard and plastic roofs near Subotica, in the north of Serbia. Migrants from Pakistan, Afghanistan, India and Somalia gather and temporarily stay in it. They went to the settlements to buy food and medicine. They were afraid of being arrested by the police or harassed. Places such as ‘Jungle’ were visited by members of the Center for Protection and Assistance to Asylum Seekers and the Eastern European Mission, a local humanitarian organization. They helped irregular migrants to survive, to realize their legal position and existing legal alternatives in the Republic of Serbia. According to the AS (2012a), Pakistanis and Afghans clashed in the illegal settlement of Jungla. One person lost his life. Illegal migrants from Somalia were among them at the time. Rujević (2015) wrote about thousands of irregular migrants waiting at the border between Serbia and Croatia to board a train to Zagreb. Politika (2015) wrote about irregular migrants at the beginning of the most massive crossings through Serbia. She stated that migrants gathered in parks in residential areas, landfills or cemeteries. The media also write about conflicts among migrants. According Sovilj (2017) Serbia showed that negative attitudes towards migrants arose due to security concerns. While many Serbian citizens donated food and equipment, they showed a lower level of readiness to initiate any closer interaction. Beta (2019) quoted the representatives of the Center for Protection and Assistance to Asylum Seekers, according to which irregular migrants from the territory of Croatia return to Serbia every day. Irregular migrants who crossed the border in 2016 were returning from the territory of Hungary. Đurović (2019a) said that it was estimated that migrants who legally wanted to move to Hungary waited for about three years, and during that time lived in Serbia. They were employed in deficient occupations in Serbia and were not in competition with the domestic labor force. Maričić (2020) wrote that migrants from Syria and Iran, by making masks, contributed to the fight against the Covid 19 pandemic. In addition, they assisted the local population in other matters. They were accommodated in the reception center in Bujanovac. Marinković (2020) noted that migrants from Principovac (western Serbia) did not respect the measures of distance and gathering in groups during the Covid 19 pandemic. The Telegraph (2020) pointed out that migrants, in the absence of money, engage in robberies, divide into clans, and clash. According to the portal Subotica.com (2020), problems were registered in Kelebija, Ljutov, Čikerija, Bački Vinogradi. But, according to Lalic (2020), migrants were also

‘targets of attacks’ by the local population. RTV (2021) broadcasts the news of Tanjug that the residents of Gornji and Donji Tavankut and Ljutovo (northern Serbia) received greater security protection from the state. They submitted a petition with 2,000 signatures due to the large number of migrants in their settlements. Subotica police have increased the number of patrols. They include members of the traffic, border police and other police departments. The BBC (2021) reports that 1.5 million migrants have been smuggled along the Balkan route since 2015. It divides smugglers, based on the work they have, into three types. Then, it reveals the prices of movement across the territory of the Balkans, but also across international borders. Đukić Pejić (2021) states that there are traces (food waste produced outside the territory of the Republic of Serbia) of the presence of irregular migrants at the administrative crossing Jarinje. During 2021, more than 68,000 people passed through reception centers in Serbia (RSE, 2022). Islam (2022) writes that officials in Serbia say that in the last few months, more and more migrants from India have joined migrants from other South Asian countries in order to arrive in the European Union on an irregular basis. According to (Mitrović, Maričić, 2021, DW, 2022), citizens of Tunisia and India do not need a visa to enter Serbia, Albania and Bosna and Herzegovina. About 100 Indian migrants live in the Kikinda reception center (northern Serbia) after they were denied entry into the European Union. As RSE (2022) learned from the Commissariat, 4,350 people are staying in 13 active camps in Serbia. Most refugees and migrants in the camps are from Afghanistan (about 35%) and Syria (about 22%). Đurović (2022) also mentions migrants who came from the Maghreb, Somalia, Pakistan, Bangladesh and others. The increased number of people coming to Serbia from Burundi, where they are fleeing due to ethnic and political persecution, is also mentioned. So migrants are present. The latest news tells about their conflicts (Pavkov, 2022), about their self-initiated camps near the border (Ostojić, 2022) and about how concerned the local population is for their own safety. Smugglers are armed (ENS, 2022). Knives, machetes, sabers and boxers, as well as 182 pieces of ammunition of different calibers, were found with irregular migrants (Pavkov, 2022a). Irregular migrants are no longer in the focus of the media. They are mentioned sporadically. However, the population of Serbia, which is not in a position to be in direct contact with them, can only find out through the media that they still exist in Serbia. Residents who were in contact provide their perspective on the story.

### **Survey**

Between answers there are found difference. Generally, more positive responses are obtained from people who had no contact with migrants. The main findings are:

1) What are your experiences with irregular migrants?

Different answers were received to this question. Some are negative (further negative attitudes), such as: 'They rob cottages, steal crops, kill cattle, cause fires' (m, 65, Bogovođa, 18, c); 'My field was in their way, so a trace of their passage was seen in the form of trampled plants' (m, 35, Subotica, 18, c); 'They picked my orchard' (f, 65, Subotica, 18, c); 'The neighbors' laundry disappeared from the dryer that was standing in the yard.' (f, 57, Šid, 18, c); 'There are irregular migrants who are not in reception centers, but are located in settlements that are very close to the borders with Hungary and Croatia' (m, 44, Kelebija, 19, c); 'I heard that they are located in weekend houses near the Majdan water reservoir. They are mostly abandoned during the colder part of the year' (f, 62, Horgoš, 20, c);

Some of the respondents also mentioned positive attitudes (further positive attitudes). 'Back in 2012, we collected clothes, shoes and medicines for these people' (f, 51, Subotica, 20, c); 'I taught asylum seekers to sew and weave. We agreed with our hands and feet' (f, 70, Bogovođa, 19, c); 'They came to help after the flood. I remember they said they came from Algeria, Syria, Senegal, Tunisia, Niger, Congo and Afghanistan. I heard that they also helped in Obrenovac' (m, 68, Krupanj, 18, c); 'A Syrian told me that there is no going back and there will never be again and that with this knowledge he continues to go through life' (m, 28, Presevo, 18, c); 'I will never forget their stories about the war, suffering and fear in the cities they come from, about the torments and problems they faced until they reached Serbia and about the uncertainty in which they live, trying to continue their journey as soon as possible' (m, 28, Adasevci, 19, c); 'I remember when in March 2016, the changed rules border crossing caused so much despair, fear, uncertainty, problems to those who found themselves in Serbia, and their final destination was far northwest of it' (m, 41, Belgrade, 18, c); 'I remember counting about a hundred irregular migrants in the parks around the bus station in April. I heard that they are from Afghanistan, Iraq and Somalia and that they arrived on foot, and that some of them have injuries from the hard road' (m, 29, Belgrade, 19, c); 'I heard that there are about 100 Pakistanis in the forest, including many children. They have problems with food, warm clothes and are exhausted' (m, 52, Sombor, 18, c); 'Irregular migrants are staying in Grafosrem (which is an abandoned factory) trying to cross the border with Croatia. Others come here to get food from an organization that provides them with humanitarian aid every day. It is estimated that there

are about 100 of them around the border, originally from Afghanistan, Algeria and Tunisia' (m, 33, Sid, 18, c); 'I saw them being brought back from Hungary barefoot. Maybe it's up to the authorities, and maybe for some reason they took off their shoes' (f, 24, Subotica, 19, c); 'Even after the blizzard, they tried to cross. I am sorry to hear that they survived the violence before returning to Serbia' (m, 25, Subotica, 2022, c).

This question was not asked to respondents who did not have direct contact with irregular migrants. This may be an explanation for why no answers were identified that could be classified as indifferent.

2) How do you look at migrants?

Negative attitudes - 'I see them as a workforce, with which we are very deficient in some activities.' (m, 55, Belgrade, 18, c) 'When I hear them fighting, killing and dying, they make me angry.' (f, 48, Subotica, 20, c); 'He could be a good neighbor, but not a son-in-law.' (f, 69, Kikinda, 20, c); 'I'm intimidated. One day, about 500 of them crossed the railway (Photo). They went in groups of 10-15 people' (m, 54, Raška, 21, c) 'Ever since I heard about the shootings and read about them being armed, I'm afraid' (f, 70, Subotica, 22, w)

Positive attitude - 'I think that, as Tanja Fajon says, it is inappropriate to raise barriers in the Schengen era and restrict their movement.' (f, 35, Novi Sad, 18, c); 'Human rights and freedoms of movement are endangered, which is one of the basic principles of the European Union' (f, 33, Novi Sad, 18, c); 'I took them food on the route of the road they were passing through and wished them a happy journey. They did not want to stay. We need to help people get where they are going'. (m, 42, Sombor, 18, c); 'I look at people who are willing to do anything to get to their desired destination. Women take off hijabs, children give European names...' (f, 39, Sid, 20, c) 'Irregular migrants have different life circumstances. As they pass through Serbia, some give birth, lose and find family members...' (f, 42, Sid, 18, c); 'Life happens to these people in its positive and negative manifestations' (m, 48, Novi Sad, 22, c)

Indifferent - 'I watch them pass through the city every day, in small or large groups. They don't mind. They act exotic and attract my attention personally' (f, 45, Novi Sad, 21, c); 'I never saw them. I have no opinion.' (m, 31, Negotin, 19, w). They set off on their own. I read somewhere that they got paid for it. It is not clear to me, why didn't they fly over, but walk and pay the smugglers? (m, 26, Belgrade, 18, w).

Photo Migrants in Vladičin Han, Serbia (Dejanović, 2019; photo: Flickr, Freedom House)

3) Do you feel xenophobic?

Positive attitudes - 'I didn't. I see in migrants a new ethnic group in our Vojvodina that can enrich it with its experience, culture, diversity'. (f, 38, Novi Sad, 20, w)

Negative attitudes - 'Yes. I don't like when someone doesn't speak the language I understand. (f, 70, Subotica, 18, c); "Yes, especially when I hear something bad about their behavior." (f, 56, Subotica, 22, w); 'Yes, I do. I doubt that he will leave Serbia. Not because it's their will, but because they fail (m, 34, Horgoš, 20, c). We have few children and they have many. To put it mildly, we will disappear in an instant '(m, 66, Kraljevo, 18, w)

Indifferent - 'Why would I be? I have not met any migrants. I'm not interested in them. (m, 50, Novi Sad area, 22, w)

4) Do you think that migrants have changed something in the life of Serbia?

From the part of the answers received, it can be concluded that the respondents saw some good aspects in the presence of irregular migrants.

Positive attitudes - 'Yes, as one of the volunteers, I had the opportunity to listen to different life stories, to observe difficult and uncertain moments in their lives and thus realize how happy I am to be able to provide them with psychological support and to live in a country where peace

reigns.’ (m, 24, Preševo, 18, c); ‘I know that it changed the life of my friend who is an artist who was strongly inspired by the migrant crisis.’ (f, 29, Belgrade, 19, w); ‘For now, a little, but we could build a museum for them in Vojvodina, an ethno house, and tourism could take on another dimension because of them’ (f, 36, Kikinda, 19, w). ‘Migrants can help with labor shortages’. (m, 72, Preševo, 18, c) ‘They can affect greater road controls. As a taxi driver, I had offers to help migrants, but I refused due to frequent police checks’ (m, 33, Belgrade, 18, c)

Negative attitudes - In 2015, the migrant crisis has closed the Subotica-Szeged railway’. (f, 30, Subotica, 19, w); My neighbors are scared of stories of bad behavior towards the domicile population (m, 38, Šid, 20, w); ‘I think that workers and investors are most afraid of migrants’. (m, 54, Belgrade, 18, c)

Indifferent - ‘Yes. The feeling of their presence. I saw them for the first time in 2015. They pass. They are different. This year there are more of them again. The border is obviously not impermeable.’ (m, 46, Subotica, 22, c) ‘They are not in mine, but I am sure that there are people in their lives who live in settlements where there are reception centers’ (f, 35, Novi Sad, 18, w); ‘I read in the newspapers that some migrant children will go to Serbian schools, and I know that this will change the lives of the children in whose classes they find themselves.’ (f, 32, Loznica, 20, w) ‘It depends on their number, the behavior of the authorities, but also their way of life’. (f, 24, Preševo, 18, w) ‘They certainly bring a new experience to anyone who has any verbal contact with them’. (f, 49, Subotica, 20, c)

5) What do you think, how much the attitude towards immigrants depends on the origin of the inhabitants?

Positive attitudes – ‘I also fled the war and I understand people who simply do not want to live in conflicts in the affected areas’ (f, 67, Bačka Palanka, 21, w) ‘It depends very much, according to the popular one ‘The full does not trust the hungry’’ (m, 69, Šid, 21, c)

Negative attitudes on this issue were not recognized.

Indifferent - ‘It depends. People in Vojvodina who came from somewhere better understand newcomers.’ (f, 54, Subotica, 22, c)

6) Do you expect that the next census will show the presence of migrants on the territory of Serbia?

Positive attitudes – ‘You never know in Serbia’ (m, 36, Belgrade, 19, w) ‘Probably not, because I don't have the impression that there are a lot of them’. (f, 24, Smederevo, 18, w)

Negative attitudes - 'I notice that young and reproductive people are migrating. I would not be surprised if there are as many as are needed to be seen as a separate ethnic group in the census.' (m, 49, Belgrade, 22, c) 'I don't know, only those who organize them know that' (f, 44, Loznica, 18, c)

Indifferent - 'I don't think anyone now knows how the story of these "stuck" people in the passage will end.' (m, 40, Šid, 18, c) 'No, they just want to leave. They are fleeing from one misery and they do not need another'. (m, 30, Subotica, 18, c) 'It depends on who it is. In 2017, we saw them as one group, and they are made up of dozens of different groups.' (f, 45, Novi Sad, 18, c)

Irregular migrants are usually unwilling to communicate. They often do not want to communicate with women researchers. They like to talk to volunteers. They like the presence of a psychologist, because it means the understanding, advice and kindness they receive from people in the profession. That is why the opinion of irregular migrants was obtained through volunteers.

1) Your perception of life in Serbia?

'They don't beat us, they don't break our phones and they don't let dogs on us like in Hungary.' (m, 22, Kelebija, 20); 'Thank you Serbia, may Allah help you.' (m, 30, Preševo, 19); 'Serbia is trying to take care of us. I received the vaccine.' (m, 24, Belgrade, 21); 'We meet basic needs, but our spiritual life is unfulfilled' (m, 19, Šid, 18); 'It is peaceful in Serbia, but rarely does anyone care about us' (m, 32, Subotica, 18); 'I would like to help, to work, just so that there is no war' (m, 26, Loznica, 19)

2) Are you planning to seek asylum?

'No, I don't want to stay here' (m, 23, Sombor, 19); 'No, I want to go to the Netherlands, Germany, France... because I have relatives, friends, compatriots there'. (m, 44, Krnjača, 19); 'Yes, just to make life easier until I move on' (f, 35, Bogovađa, 20); 'I've been looking for it and I've been waiting for it for a month' (f, 22, Tutin, 20).

## **CONCLUSION**

Irregular migrants have been passing through Serbia for more than a decade. They are satisfied with the hospitality, but they do not want to seek asylum. Their desired destinations are further north and west of Serbia. Since 2019, with the onset of the pandemic, the borders of the European Union, which they aspire to, have been closed for them. If they manage to cross

them, they must be returned to Serbia. Their intentions to continue the journey are clear, but the chances of that happening are minimal for now. Every new irregular migrant starts waiting for his luck or chance. Some decide to ask for asylum because it makes their life easier (it provides accommodation, food, medical and psychological protection), but there are also optimists who believe that one day they will reach their desired destination. With a volume of almost 4,000, according to the latest data found, it can be said that they are more numerous than some ethnic groups that have existed on the territory of Serbia for centuries and influence the characteristics of life in it.

It was easier to find interlocutors on this topic in the border areas than anywhere else. The conducted research on the perception of irregular migrants among the population of Serbia gave great differences in the answers. They are most influenced by the experiences the interviewees had with irregular migrants. A large part of the population of Serbia had no contact with migrants and was informed about them exclusively through the media. This part is full of compassion, understanding or completely indifferent. A smaller part of Serbian residents, who were in contact with them, have positive and negative emotions. The positive ones arose as a result of the help that migrants provided to the local population in different ways. Volunteers who help irregular migrants find their way have a positive attitude. These are the most knowledgeable residents of Serbia who understand that all life situations happen to migrants 'in transit'. The offenses of irregular migrants are interpreted as an effort to survive. Negative emotions were observed only among those residents of Serbia who had or still have material damages from irregular migrants or are afraid of them due to various prejudices.

Considering that irregular migrants pass through Serbia and exist more illegally than legally and that they are members of numerous African and Asian countries, this work represents an important testimony for the historical geography of Serbia. At the same time, this paper is a note about the space, time and conditions in which irregular migrants moved through Serbia. De facto, these people leave different traces (cultural, demographic, economic and etc) in different segments of the life of the local population. Differences among irregular migrants were also observed, considering the country of origin. One day, when everyone will be able to move freely again, it will be possible to make a detailed analysis of how many of these people remain on the territory of the Republic of Serbia and how they will demographically affect its future.

**ABSTRACT**

The goal of this application is to help people, working in teams to collaborate over things like a product idea, event planning, designing, development, etc. Users can come up with creative solutions or ideas and add them to an existing node of ideas or sub-ideas. The users are viewed as nodes contributing to the main objective or idea. The ideas/notes of the users are viewed as sub-nodes with different branches and sub-branches consisting of text, images, and links. The ideas/notes are drag able and can be placed anywhere and can be linked to other ideas/notes. The notes/ideas can be linked and unlinked with other notes/ideas according to the user's wish.

## 1. INTRODUCTION

Craft Dash provides an online platform for the people working in teams to collaborate in real-time with interactive drag and drop idea nodes with emojis, with video and text chatting functionalities. The main objective of this project is to provide a mind-mapping platform where users can collaborate with their team members in real-time. The project will be in the form of a web application.

## 2 EXISTING SYSTEM

Mind mapping software (also called concept mapping software) is a brainstorming tool that enables you to create visual diagrams of your ideas. Using a mind map maker, you can create an idea map, a conceptual map that illustrates the hierarchy and connections between different ideas.

- **MindMeister** is a beautifully designed, cloud-based mind mapping tool that lets you visually capture, develop, and share ideas. Used alone or with a team, MindMeister allows you to easily collaborate, share, and present from anywhere in the world.
- **Milanote** is an easy-to-use concept map maker to organize your ideas and projects into visual boards. Far from a basic mind map maker, Milanote allows you to add rich media to your boards when you create a conceptual map (images, videos, links), and create as many levels of hierarchy as you wish to go deeper into topics.
- **Microsoft Visio** is a visual diagramming tool that works well for mind mapping as well as creating many other graphical representations.

### 2.2 LIMITATIONS OF EXISTING SYSTEMS:

- Many of the existing systems don't have a robust online collaboration feature in them
- They don't have an easy to use interface. Basically, the learning curve is quite steep.
- Online mind mapping softwares are quite expensive.
- They lack features like user feedback and online polling of ideas e.g. upvotes and downvotes

### 2.3 PROPOSED SYSTEM:

Craft Dash is a web application which allows the user to create sessions and host meetings so that the users working in a team of four, can share their ideas about the project. Craft Dash is made to mind map and brainstorm about the ideas for the user's project. Note creation, polling

and task planning are some task performed by the application. Real time group chat and video call is provided so that the users can communicate while working.

#### **2.4 BENEFITS OF THE PROPOSED SYSTEM:**

Craft Dash provides features that emphasize and promote user friendliness. Some of the advantages of our proposed system are:

- Provides real-time chat for communication
- Provides mind mapping platform
- Allows multiple users to work simultaneously
- Video chatting between users
- Free of cost

Craft Dash is an online web application that helps the users working in a team, collaborate seamlessly with each other, helping them with instant feedback and real-time interaction with ideas focusing on the main topic/agenda. The users are viewed as nodes contributing to the main objective or idea. The ideas/notes of the users are viewed as sub-nodes with different branches and sub-branches consisting of text, images, and links. The ideas/notes are draggable and can be placed anywhere and can be linked to other ideas/notes.

**ABSTRACT**

Compliance is a growing area increasingly recognized as a key component of all business activities. This analysis introduces the key elements of effective organizational compliance by reviewing concepts, considerations, and strategies for assessing risk and managing the compliance function. Learn the basic principles of effective compliance, what constitutes an effective compliance program, and their application. It also explores his two compliance areas of greatest importance in today's business environment: data protection compliance and anti-corruption. The insights in this article can be applied to many types of organizations, from private companies to non-profit organizations. This article will help develop a strategy for implementing technology, policies, monitoring, and training to build an effective privacy compliance program.

**Keywords:** Compliance – Compliance programs – Privacy – Corruption

**JEL:** G18 – G20 – G28

## **1.INTRODUCTION**

This article introduces the key elements of effective organizational compliance by reviewing concepts, considerations, and strategies for assessing risk and managing the compliance function. Compliance is more than just preventing problems and making sure everyone is complying with laws, rules, and regulations. It also mentions the positive impact a robust and ethical compliance program can have on a company or organization. This article focuses on human psychology, a key factor in building a positive compliance culture. Identify drivers, attention grabbers, distractions, and how all these factors contribute to building a strong belief in a corporate culture of compliance. Formal compliance programs are reviewed and the nuances of practical application are addressed. Technologies, workflows, policies, monitoring, and training are explored to create a toolkit for designing effective compliance programs. It explains the complex landscape of data protection requirements. A better understanding of data protection laws and data protection will protect the organization and its members who rely on it for the protection of their personal information.

First, this article examines the historical background of laws, best practices, and other standards for protecting personal data. Where in the United States are there privacy laws and which areas are not regulated? Various models are being considered to promote the security of personal data. Describe strategies for improving overall data protection. Second, it examines the unique and important role of international law, state law, and the Federal Trade Commission in protecting privacy. Finally, define what actual corruption is. Where does corruption exist, how does it exist, its impact and the emergence of today's anti-corruption laws? Practical strategies are presented for creating compliance policies and procedures to combat and prevent corruption. Various laws have been put forward, such as the US Foreign Corrupt Practices Act, the UK Bribery Act, and many other anti-corruption laws. Practical ways to prevent corruption within an organization and warning signals and other mechanisms for detecting corruption are presented.

## **2.COMPLIANCE DEFINITIONS**

### **2.1 Defining compliance**

Compliance, at its simplest level, means the following; Compliance generally refers to laws, rules, regulations, or other standards that tell you what to do or what to do. It describes programs within an organization or company that identify specific rules that apply. The

International Compliance Association defines compliance as the ability to act by orders, rules, or demands. For financial services firms, compliance takes place on two levels. Level 1 compliance refers to external rules imposed on the entire organization. At level 2, compliance describes the system of internal controls imposed to achieve compliance with externally imposed regulations. (please refer to the 2022 definition by the International compliance association). Sometimes it is helpful to understand compliance through a simple example.

### ***EXAMPLE***

Take the transportation of dangerous goods as an example. First and foremost, you need to know the proper packaging for materials that meet the definition of dangerous goods, proper documentation, and where to ship the materials. You must obtain proper packaging, obtain proper documentation, obtain proper documentation, and provide your employees with a list of prohibited destination countries. Employees need to know when the rule is triggered and when the rule is not. What have you done to mitigate the additional risk you are currently taking? How do you show them your plans and successes? You can show them your policies and systems for storing shipping documents. But can you prove to them and yourself that they used it? What kind of monitoring and reporting, and what kind of testing, if any, is in place? These are essential tools for the modern compliance professional.

### **2.2 Literature overview of the most recent compliance literature**

In this short overview, a comprehensive introduction to the most recent literature on compliance is given. In their article Sutinen and Kuperan (1999) describe how the basic deterrence model is extended above to allow an individual's behavior to be driven by both intrinsic and extrinsic motivations. Their model integrates economic theory with theories from psychology and sociology to account for moral obligation and social influence.

The English literature is very detailed. According to Chayes (1993) "On compliance", compliance problems often do not reflect a deliberate decision to violate an international undertaking based on a calculation of interests. A variety of other reasons are proposed why states may deviate from treaty obligations and why these reasons are accepted by the parties as justifying such departures. In conferences all over the world best practices and strategies for success are discussed (Compliance and ethics institute 2008). Biegelman (2008) provides clear guidance for those charged with protecting their companies from financial and reputational

risk. Risk in compliance is a worldwide phenomenon. Even the *Shariah* mentions compliance risk (Delorenzo 2006). Bamberger (2010) evaluates risk and regulation in the digital age.

Good insights in privacy can be found in the article of Huberman, Adar, and Fine (2005), in which they describe the valuation of privacy. The analysis of their results shows that a trait's desirability with the group played a key role in the amount people demanded to publicize private information. Kokolakis (2015) gives a review of current research on the privacy paradox phenomenon. A very good article on reforming the US approach to data protection is also available on the web by the council on foreign relations.

Nissim and Wood (2018) in their paper "Is privacy privacy?" describe different technical and normative conceptions of privacy that have evolved in parallel and describe the practical challenges that these divergent approaches pose. German Stirnimann (2021) "Der Mensch als Risikofaktor bei Wirtschaftskriminalität" concludes that the topics of non-compliance, white-collar crime, and in particular Cybercrime continue to be significant in the international economy's role-play. The world is not necessarily becoming more criminal, but the possibilities and patterns have changed and will change due to new technologies continuing to change. Criminal Compliance, according to Rosch (2012), is further proof that we must say goodbye to the idea that there is a unitary and homogeneous criminal law capable of solving each and every one of the problems of modern societies. Nagin and Telep (2017) show that citizen perceptions of procedurally just treatment are closely tied to perceptions of police legitimacy.

Very nicely Losiewicz-Dniestrzanskaa (2015) remembers one effect of passing through the world financial crisis by paying closer attention to compliance with the regulations of business by banks and other financial institutions. Martin and Murphy (2017) capture the current state of privacy scholarship in marketing and related disciplines. In their working paper Racz, Weippl, and Seufert (2010) design a process model for integrated IT governance, risk, and compliance management. They exemplarily explained how the processes of the separate disciplines of IT governance, IT risk management, and IT compliance relate and how they can be integrated. In their working paper Al-Karablieh, Koumanakos, and Stantcheva (2021) "Clearing the bar: Improving tax compliance for small firms through target setting" study a voluntary tax compliance program for small firms. Here they found that the firms that take up the program report significantly larger taxable profits than non-eligible firms.

Also, the German literature on compliance has interesting findings. Some detailed books are presented by lawyers. E.g. in their book “Corporate compliance” Hauschka, Moosmayer, and Lösler (2010) give an excellent overview of the German law which determines compliance issues. Möhrle and Weinen (2021) describe different methods to communicate compliance within an enterprise. Berwanger and Hahn (2020) evaluate how internal audit and compliance interact. Bethke and Bach (2020) describe in detail how to implement compliance and to communicate it. In his book, Vollmann (2029) “Compliance in der öffentlichen Verwaltung” prove that compliance management systems offer advantages since they allow an external view of the measures taken and their assessment creates and, if necessary, indicates a need for improvement. Zenke, Schäfer and Brocke (2020) in their book “Corporate governance” state that compliance is a management expression in a holistic governance and risk management organization. Modern corporate governance requires comprehensively adapted areas, in which the derivations of corporate governance are implemented. Möhrle and Weinen (2021) “Professionelle Compliance-Kommunikation” require that for compliance communication all participating actors, areas and those responsible for a consistent and coordinated procedure are prepared. Such forward-looking, active compliance communication has long been part of any risk management that deserves its name.

Lutzenberger (2022) “The Future of Europe Subnational Authorities and the European Union Compliance in a Multilevel Implementation System” concludes compliance depends to a large extent on the goodwill and expertise of local politicians and administrations in the municipalities. Baer (2009) finds out that “policymakers should consider New Governance’s administrative stance instead of the more punitive, “war-driven” approach that adjudication usually encourages. Holm (1993) argues “that we should perhaps not talk so much about the non-compliant patient, but instead shift the focus towards the noncompliant doctor.”

### **2.3 The different theories of compliance**

How can you get people on board? Get some idea of these 10 theories. Also, you may be able to come up with other theories and variations that are more appropriate for your particular organization.

**Table 1:** The different theories of compliance (adapted from Andrew Kandel (2022))

<b>Nudge theory</b>	Ensuring employee compliance can be a very effective and important tool for compliance officers. Part of this theory is to keep the topic on people's minds in any way possible. That includes all kinds of indirect encouragement and gentle nudges in the right direction. An effective compliance program includes a large amount of subliminal messages. It takes skill to communicate subliminally and convey a message of conformity.
<b>The punishment or scare them theory of compliance</b>	Actual penalties for violations of compliance policies and procedures by these individuals Including Ethics and Code of Conduct. a punishment system in which someone gets what a reprimand or censure and a fine. Very effective. In general, people who have paid fines for non-compliance are unlikely to repeat non-compliance. Use examples of government or criminal behavior to scare people. The main deterrent is to show people the consequences of non-compliance at other companies.
<b>Rules theory</b>	Some want to be clear about what they can and cannot do. You can be inspired by many things. Someone who has a very large contract of employment and does not want to give anyone a reason to be fired for good reason. When giving people rules and guidelines, you want to avoid loopholes. It can be difficult to define all the rules people have to follow.
<b>Ubiquity theory of compliance</b>	Create a program where employees believe that compliance is everywhere
<b>Reward Me Theory of compliance</b>	Employees who want to be known as being compliant. The reward comes with a nice prize like tickets to something, and it might be well-received at the firm.
<b>Quid pro quo theory</b>	Compliance should be part of the company's normal operations. You can tell them that they will get a gift for completing a compliance survey.
<b>the habit theory</b>	People will comply if they are accustomed to comply and are comfortable with a particular compliance policy or procedure. Continue this behaviour. It's easier to prevent bad habits than to stop them.
<b>Broken windows theory of compliance</b>	People are forced to be compliant by directing attention to even minor compliance violations and not letting them build up. It contributes to creating the proper compliance culture. If people believe that small, inconsequential compliance breaches are okay, then it might lead to slightly bigger violations, until you have a real problem
<b>Target theory</b>	Target individuals who are more vulnerable to violations of compliance policies and procedures and attempt to prevent recurrence. A list of employees who can demonstrate that they have not filed a complaint is created. This group will be monitored more closely than the others until it no longer needs to be included in this target group.
<b>One size does not fit all theory</b>	Compliance officers know when to scare people by talking about recent law enforcement actions against other companies and reward them for compliance. But incorporating all of these techniques into her compliance arsenal can take your compliance program to a new dynamic and robust level.

***EXAMPLES OF THESE THEORIES*****Example 1 The Lack of Recognition Theory**

“Some call it gratuities, some call them questionable payments, some call it extortion . . . I looked at these payments as necessary to sell a product.”

**Example 2 The Lack of Self-Control Theory**

“I really should not be doing this,” but he did it anyway.

**Example 3 The Psychological Aberration or Deviation Theory**

“Mr. Madoff’s crimes were extraordinarily evil.” –Judge Denny Chin

**3.COMPLIANCE LAW**

The public compliance clarification was a response to federal sentencing guidelines for foreign official bribery and corporate misconduct. These guidelines describe the elements of an organization's compliance and ethics program required to receive reduced penalties. There should be accountability. No delegation to known bad employees. All organizations must investigate who is breaking the rules. We must take action against those who break the law and remove them from the workplace.

In the United States, the NCAA has numerous rules and regulations that must be followed. Federal law requires certain disclosures to appear in all advertisements for loans. The SEC says compliance policies and procedures should consider each advisor's practices and risks. The SEC regularly issues risk alerts discussing compliance issues. The Dodd-Frank Wall Street Reform and Consumer Protection Act certainly implies the importance of relationships in many of its 16 sections. From a compliance perspective, the key is getting everyone in your organization to think differently about risk and compliance. If your company conducts background checks in the United States, it must comply with Fair Credit Reporting Act requirements. When it comes to salaries, companies must pay their employees a minimum wage, comply with overtime and child labor standards and comply with the Fair Labor Standards Act. The Equal Pay Act stipulates that male and female employees of the same function must receive equal pay. The IRS federal tax code requires companies to pay a portion of their employees' wages to the federal government. In addition, it is necessary to comply with the Disabled Persons Act and the Age Discrimination Act. The Occupational Safety and Health Act requires a safe working environment. Employers must provide family and medical leave

under the Family Medical Leave Act and health insurance options under the Affordable Medical Care Act. Unemployment insurance must be paid per employee. A company must comply with applicable fee requirements and applicable FCC electronic safety standards. In summary, there are 12 different laws that may apply to your company. The FDIC and the Federal Reserve Board and other financial regulators in the United States conduct audits of the safety and soundness of financial institutions and their compliance activities. In healthcare, the Joint Commission, a regulatory oversight program, announces general timeframes that may arrive to conduct assessments of various compliance standards at hospitals.

#### **4.COMPLIANCE PROGRAMS**

A compliance program needs to establish what the rules of conduct are, whether in policies, a code of conduct or guidelines. There must be an individual who is responsible: Every compliance program must have a component that looks for inappropriate behaviour. (please refer to Epifanio and Fiorenzano (2022)).

For violent behavior, you can use monitoring or auditing tools. A hotline should be established that individuals can contact if they believe there is something wrong that needs investigation. Standards must be enforced through discipline. Finding violations is not enough. Steps should be taken to deal with individuals involved in this fraudulent activity. Organizations must learn from their mistakes.

A compliance program must address essential fundamentals. A compliance program requires recognition, acceptance, empowerment, and independence. Trust must always evolve. A compliance program establishes a framework or strategy to ensure that an organization complies with applicable regulations. Every company has to deal with compliance. Each employer's specific regulations may include tax requirements, fair labor standards for workers, etc. Requirements are often industry-specific and may come from industry standards rather than specific rules. Doctors, nurses, accountants, soccer players, astronauts, fashion managers, and many other professions all need to know and follow some rules. A good compliance program can give you a competitive edge in the market. If your compliance program addresses privacy, data protection, business continuity, and cybersecurity, you're more attractive than those that don't. If your compliance program regularly reviews and updates its policies and procedures to comply with new or proposed banking regulations, more customers will be willing to lend you money than otherwise. .

#### **4.1 Integration of compliance throughout the organisation**

A modern and effective compliance program must be agile and opportunistic. It should include industry best practices and a proven foundation. New compliance challenges that exist in a rapidly changing world must be considered and addressed. From Bitcoin and cryptocurrencies (see Scharfman 2021), social media and deep learning (including the use of big data and artificial intelligence) to self-driving cars, drones, ESG, environmental, social and governance topics (and ESG compliance). Good explanation found at Moro Visconti 2022)

#### **4.2 Organisation of compliance**

Compliance departments must ensure that new systems do not violate the law. As part of the industry and corporate best practices, we are beginning to consider including compliance in all aspects of our business. Corporate governance, culture, and compliance have been integrated. See Griffith's excellent 2016 review, *Corporate Governance in the Age of Compliance*. A strong compliance program can be seen as an indicator of a truly mature organization. Compliance means knowing the rules that apply and developing a strategy to comply with them.

#### **4.3 Reasons to implement compliance**

There are many reasons why all companies should be aware of the importance of compliance. Today's world operates in a highly regulated environment. There are currently over 400 financial regulators worldwide. Some deal in securities, some in commodities, some in banking, some in insurance. In the United States, each state has a different insurance-focused regulatory agency and another banking-focused regulatory agency. Each state has a securities regulator, in addition to a separate attorney general. The US SEC requires certain companies to have a compliance program and, among other things, a chief compliance officer. SEC Rule 206(4)-7 proposes that a registered investment advisor's failure to implement appropriate compliance policies and procedures constitutes a violation of that rule, regardless of other securities law violations. In healthcare, there are regulatory topics related to billing, personal protection, data protection, infection control, and more.

#### **4.4 Significant monetary policies**

Regulators enforcing compliance rules can be costly. Most regulators have the power to impose fines and penalties. Under the European Union's new General Data Protection Regulation (GDPR), the harshest administrative penalty could amount to up to €20 million, or 4% of a company's global annual turnover. Performance of Settlement Agreement. The actual cost of

non-compliance is not the only driver for improving a company's compliance practices. Many settlement and court-ordered agreements not only include civil penalty clauses, but also many other requirements with accountability for onerous activities and implementation costs. and other stressful activities.

### ***EXAMPLE***

#### **Google's 2011 settlement with the FTC**

After Google was sued for violating its privacy promises to consumers about the implementation of its social media feature, Google had to comply with many conditions, including setting up and implementing a complete security program. This comprehensive security program has been sensibly designed to address privacy risks and protect the privacy of personal information. Google had to appoint a coordinator for this program and identify the risks and remediate them. Google had to train all of its employees on privacy and manage product design development. Google was required to receive privacy assessments from an independent, qualified third-party expert using generally accepted standards within six months of order. Google had to expand the record-keeping requirements of all the statements it makes about privacy. She has to keep consumer complaints and records showing disobeying orders. All records must be considered during the preparation of the confidentiality assessment.

## **5. C U L T U R E**

### **5.1 Positive Value of Compliance**

Compliance can have real demonstrative positive value. Many regulators recognize this positive value. In implementing Rule 206(4)-7, the SEC said, "We expect our fund investors' advisory clients, funds, and advisors to benefit from the new rule" and promised to reduce costs and provide significant investor protection. Deliver profits and increase efficiency for funds and advisors."

### **5.2 Compliance culture**

The right culture can only be established by the right tone of the top, but it is impossible without it. The top tone represents leadership's belief in an ethical culture and literally says everything about the company. It actually comes from the world of accounting, which is probably not surprising. This includes ethical conduct, identification and management of conflicts of interest, and strong internal controls. This is not just financial management, it's all internal

management. A good compliance culture cannot exist without the right tone at the top, but it's not just about having the right tone at the top. At its core, compliance is about creating an environment where people feel a real sense of responsibility and respect and support compliance. It is necessary to create an environment in which a strong sense of personal responsibility is felt. Employees need to understand their own culture, the culture of the organization and the compliance expectations that come with it. You should understand that violations of the Code of Ethics or violations of laws, rules and regulations must be reported through appropriate channels. When everyone in the organization understands the culture and expectations, and when they really feel and appreciate their personal responsibility. You understand that you must report violations of the Code of Ethics or any law, rule, or regulation.

### **5.3 Building a compliance culture**

A good compliance culture limits potential liability, whether for intentional or negligent violations. A good compliance program drives good business. Compliance strengthens the discipline and accountability that help bring an organization closer to its goals. Employees feel more comfortable working for a company that is recognized as being compliant. However, empirically, creating such a positive atmosphere can lead to lower employee turnover. As policies are created, reviewed and updated, people are allowed to reconsider. Helps spot inefficiencies and opportunities. Companies with subpar compliance policies and procedures, or subpar overall compliance programs, cannot function well. This impacts the quality, creativity and efficiency of nearly every employee. Achieving corporate goals is becoming increasingly difficult.

## **6. THE COMPLIANCE PROFESSION**

### **6.1 The different layers of the compliance profession**

Over the past 20 years, compliance professionals in the United States have grown to more than 200,000 compliance officers in 2016. A chief compliance officer can be both a generalist and a specialist. By ensuring compliance in specific areas by these professionals, hospitals can, for example: Stay compliant with important state, federal, and industry regulations. However, there is a broader need to foster a compliance-conscious environment and culture. A single person should oversee the organization's overall compliance program and identify the infrastructure needed to support the various areas of regulatory compliance. Generalists work to build the right culture and foundation for a compliant organization. Overall, it helps foster a culture of

compliance that minimizes corporate governance errors. Compliance generalists and specialists are key to helping organizations of all sizes manage compliance. (For “Cultures of compliance” please see Langevoort (2017))

**Table 2:** Comparison of compliance generalist and compliance specialist (own presentation)

<b>Compliance generalist</b>	<b>Compliance specialist</b>
Creation of a compliance hotline and anti-retaliation policies	Creation of best practices manual to be used by hospital staff responsible for disposing of hazardous materials
Allocation of compliance staff/resources to meet hospital privacy, security and hygiene policies.	Procurement of new medical records software to be used throughout the entire hospital by staff and doctors

## 6.2 Compliance Officer

Because compliance concerns arise in all industries, jobs for skilled compliance officers are plentiful, and unemployment in this area tends to be low. The compliance officer must be independent, empowered and provided with adequate resources. The Chief Compliance Officer and the entire compliance department need to be independent of any business unit. There needs to be a reporting structure that ensures this independence which will help empower the compliance team. This means having a reporting line to the board of directors. The Chief Compliance Officer can report to a committee (risk management committee) and you might see a hybrid reporting mechanism where the Chief Compliance Officer has dual reporting lines to the CEO as well as to such a committee. Therefore, the compliance officer should have a position of sufficient seniority and authority within the organization to compel others to adhere to the compliance policies and procedures. The commission needs capable and honest CCOs to help protect investors and the integrity of the capital markets. Part of the independence and empowerment that feeds into the compliance culture of an organization also involves how comfortable employees are in reporting a violation, or reporting even a concern, or a potential conflict or a problem, or a worry.

There must be a direct correlation between comfort and compliance. The more comfortable employees are in reporting issues, the more compliant the workplace becomes. Take potential conflicts of interest. They exist in every organization and every industry. There is more potential conflict of interest in the financial services industry than in many others. The more companies deny that they have conflicts of interest or even minimize or downplay them, the more likely they are to have problems down the road. Companies should embrace the fact that

potential conflicts of interest exist and problems can exist. They need to be de-mystified. Every potential conflict of interest can be managed, every problem and issue can similarly be dealt with. As a result, compliance needs to create a method, a safe method for escalating and addressing them. After all, there's no compliance issue, no potential conflict of interest and no violation that gets better over time if it is not addressed as soon as possible. Chief compliance officers and their staff need to be approachable. There need to be several paths for people at companies to raise issues. Finally, you need to establish an ethics hotline. Lastly, there's a question of resources. A compliance officer must properly define the goals and budget for them so that they could obtain the right number of people, the proper technology. And other support necessary to carry out strategically important compliance initiatives. Compliance works best when the chief compliance officer is part of the senior management of an organization.

The Chief Compliance Officer does not necessarily have to be involved in all decisions. However, they should have a voice and be consulted on important decisions that affect the organization. The more influence the chief compliance officer has, the more likely they are to manage or direct resources. The SEC and CFTC require some registrants to have their CCO, but not all highly regulated companies are required by law. Understaffed compliance programs should be avoided at all costs, but overstaffed compliance programs can pose unique challenges, including B. Resource depletion and workforce dissatisfaction.

### **6.3 Board of directors has a special duty**

Compliance is important due to internal and external requirements. There are many different types of companies, with different types of boards and other governing bodies. The board of directors must guide the organization. They comprehensively monitor both the strategic objectives of the organization and the necessary and necessary policies. The board must ensure proper financial oversight and accountability. Public companies' directors are elected by the company's shareholders, while private companies typically appoint directors. Directors are bound by law as trustees of the shareholders. Directors must always act in the best interests of shareholders. This means that directors must always put the interests of shareholders and the company ahead of their interests, unless there is a conflict. This includes a duty of care, a duty of loyalty, and a duty of good faith. If a director fails to meet these obligations, she will be liable for shareholder lawsuits. How to ensure that an exemplary compliance program is in place.

The Sarbanes-Oxley Act of 2002 expanded the responsibilities of public company boards. Investors needed protection from fraudulent corporate accounting practices. This was a direct response to corporate accounting fraud at Enron, Tyco, WorldCom, and others. There are 11 sections of the Sarbanes-Oxley Act. Establishment of the Public Company Accounting Oversight Board and Auditor Independence it analyses conflicts and improves penalties for white collar crime. Under Sarbanes-Oxley, US corporate boards are required to have audit committees composed entirely of directors independent of management. The Audit Committee, rather than management, is directly responsible for the appointment, compensation and oversight of the work of the external auditors. Sarbanes-Oxley also assigns specific financial and tax reporting responsibilities to certain corporate executives, such as the CFO and CEO. The report must be notarized and signed. There are specific forfeiture penalties and penalties for violations. If you cheat, you go to jail. A non-compliance scandal in the media can seriously damage a company's reputation and economy.

#### ***Example***

After hackers stole personal information from 57 million user accounts in 2016, Uber's chief security officer allegedly paid them \$100,000 in ransom to erase the data and keep it quiet. Fearing it could hurt its \$70 billion business, Uber hasn't made the data breach public for more than a year. Uber faces multiple class-action lawsuits, state investigations and the possibility of FTC enforcement. On the face of it, Uber has indeed placed a heavy price on reputational damage, paying hackers in hopes of avoiding a backlash over its non-compliance. Uber suffered severe damage to its reputation and business. The scandal is a reminder of how much reputational damage non-compliance can cause.

#### **6.4 Compliance training**

Effective training and awareness should be put in place. Individuals and organizations need to know the rules to comply with them. A code of conduct is where an organization announces its values, priorities, and commitment to ethical behaviour. Some companies call it the Code of Ethics and Professional Conduct, or the Code of Ethics and Professional Practice. A code of ethics or conduct should form the basis of any compliance program. The code should be comprehensive, yet concise, easy to understand, and serve as a general guide to everyday life. It should be mentioned regularly in meetings. In the financial services industry, the SEC requires the creation, maintenance and enforcement of a written code of ethics. Rule 204A-(1) describes certain minimum requirements that must be included in the Investment Advisor's

Code of Ethics, and violations must be reported to the Chief Compliance Officer. Under Sarbanes-Oxley, all publicly traded companies are required to disclose their annual reports. Companies must also publish their ethics codes.

### **6.5 How can good training be achieved?**

Each new employee is welcomed as soon as they join the company. At the compliance briefing, the history of the firm, the current state of the firm, and the future of the firm is explained. A regulatory environment and specific policies and procedures are put in place for each new hire. What is the understanding of compliance and what compliance is based on many factors, including previous work experience, previous education? Everyone in the organization must understand compliance like everyone else. In fact, compliance training for new hires is a critical time to get everyone on the same page, set the right tone, and manage compliance expectations. It is also a time to review key policies and procedures and, just as importantly, to answer questions. Organizing departmental compliance trainings to address specific issues and answer specific questions is a great benefit. The Compliance Officer is responsible for initiating strategy and receiving executive support for that strategy. Training and policies and procedures can and should go hand in hand. The best lessons learned from compliance training are when employees learn that policies actually exist to address specific situations and issues.

Employee training is not the only information critical to compliance. Employees should be familiar with the financial health controls in place. It may be helpful to report the completion rate of required training. The board should be aware of the number of compliance concerns that have been reported and investigated. Employees are afraid to report problems because they believe it may lead to retaliation. A strong compliance program wants to be able to hear about incidents and problems, address them, learn from them, and strengthen the organization. Incidents should always be viewed not only as problems, but as warnings, opportunities to delve into the business environment and critical risks, and necessary to minimize the risk of significant harm. Communication with board members and other senior their leaders leads to increased engagement and support to reach a better place.

### **6.6 Compliance and branding**

Companies involved in fraud, ethics violations, cybersecurity breaches, corruption, and other public affairs put their brand at risk. Compliance helps to strengthen the image of the company. If a company's PR strategy can easily promote the company's strengths, culture, corporate governance and credibility, it can pave the way for growth and prosperity. However, branding

and public communications can come with restrictions related to compliance. Special rules apply to advertising in the financial services industry. It prohibits misrepresentation of material facts or otherwise misleading. If you want to run ads that let you know how well you or your business is investing, or if you want to list real-world performance, or if you want to add testimonials, you need to know the regulations and rules. These materials require a compliance mechanism to verify before submitting a request or claim.

The CCO would love to hear about compliance incidents. Doing so will help you address compliance incidents, optimize your organization's compliance program, and avoid them in the future. Senior management should be notified of compliance issues that have a significant impact on people and the business, but should not be reported on an incident-by-incident basis. Companies that deal with compliance violations can, in some cases, come up with more robust compliance programs than this business relationship. Providers must convince companies that they meet strict technical, administrative, and physical security standards. You must convince your company that you comply with state, federal, and international data protection laws. Companies can increase headcount, pay more attention to financial data and other controls, and increase overall accountability. Some companies can effectively communicate their experiences and their overall stronger position as credible companies.

## **7. MONITORING**

There are many areas to monitor. Some are specific to the nature of a company's business and activities. Some may be required under certain rules or regulations. In some industries, such as the financial services industry, email monitoring is a must. You can apply email best practices, catch problems early, and give your compliance team a better overview of what's happening in your organization. Finally, it also prevents potential problems from becoming real problems. Personal transactions by employees should also be monitored. Again, monitoring face-to-face transactions is a regulatory requirement in some industries. SEC Rules 204A-1(a) and 1(a).b specifically require reporting and verification of certain employees' personal securities transactions.

Some kind of expense monitoring should be done in almost every company. At a minimum, this should be done to ensure that expense policies and procedures are followed. Fraud can be monitored. Abusing company travel and expense policies can lead to theft in some

circumstances. Make sure this is consistent with your company's policies and procedures regarding gifts and entertainment. Social media monitoring was just added to this list, but it's becoming more and more important. Monitoring social media is critical for compliance. It helps protect a company's reputation and anticipate unforeseen legal issues. Ensure the safety of the company and its employees. It's an entirely different matter when company names, identities, trademarks and even employee identities are used to perpetuate fraud. There is also brand misuse, appropriation, and misrepresentation of non-existent overseas subsidiaries and affiliates. Lobbying and monitoring political activity. Put in place appropriate policies and procedures and some form of oversight in these areas.

### **7.1 Monitoring and reporting**

Compliance programs must monitor employees and operations to ensure that applicable regulations are being followed. Audits identify standards that are regularly agreed upon by the International Organization for Standardization or ISO and other authoritative bodies. Auditors employ a common benchmarking approach to identify common risks and appropriate responses to them. Audit professionals combined with these evolving standards can provide superior solutions for compliance monitoring. SEC rules require public companies to prepare and file audited financial statements annually in accordance with Rule 205(4)-7. Registered organizations must review the adequacy of the policies and procedures established under this section and the effectiveness of their implementation at least annually. The growth and deployment of artificial intelligence and other data mining and analysis tools are enabling organizations to significantly increase their monitoring efforts. Monitoring using new technologies, audits, and other approaches is powerful and should be considered an important part of your compliance program.

### **7.2 Behavioral monitoring.**

Therefore, some compliance programs may monitor employee behaviour. Monitoring behavioural activity and patterns can help identify and prevent compliance issues. It is convenient to use technical tools such as big data and artificial intelligence. We must monitor for violations, violations of laws, rules or regulations, and violations of internal policies and procedures, including our Code of Ethics. Monitor red flags, anomalies, and outliers. A significant part of oversight and supervision is specifically established by federal sentencing guidelines. Promoting confidentiality is another way to encourage employees and others in the community to report potential compliance issues. Absolute confidentiality promises are always

difficult to keep and should be avoided. Finally, the organization must have a well-publicized and credible non-retaliation policy so that those who work there are aware of it. No dismissals, no promotions, no actions of any kind that adversely affect reporters. A complete compliance program must be more than training, monitoring, auditing, and reporting, as well as the laws, rules, and regulations behind these policies and procedures. The compliance program is really about getting people to follow these policies and procedures and act in an appropriate and ethical manner. It should include aspects of philosophy, criminology, sociology, political science, history, comedy and entertainment, the science of social behavior and impact, and psychology. To understand how people become compliant. The FBI lists 23 common fraud schemes.

The different theories about why people commit financial crimes:

**Table 3:** Theories why people commit financial crime (modified from Andrew Kandel)

Privileged or Entitled	People feel like they fall into a different category than others. They are often wealthy because they owe something in some way, so they engage in illegal activities. In the financial services industry, some highly successful brokers and investment professionals believe that the usual rules don't always apply to them.
Excessive Greed or Excessive Ambition	Excessive greed and ambition can make a person do bad things. There are many examples of people craving fancy cars, apartments, jewelry, yachts, and many other things.
Cost-benefit or Risk Reward	Some people are very adept at this cost-benefit analysis, weighing the potential reward against the risk of getting caught and deciding if the risk is worth it.
Lack of Recognition	Some people are unaware that they are actually breaking laws, rules, or regulations. In such situations, harm is often seen as a side effect of their actions. Damage and casualties are remote or undefined.
Psychological Aberration or Deviation	These criminals disregard other people and societal norms, and commit crimes solely to benefit themselves, without any concern for report cautions.
"I Could Have Done it Another Way"	To some extent, businesses work with numbers to plan budgets and document forecasts. This can be a problem when operations are performed to reach a given result. Lump-sum payments and the use of off-balance sheet statements are not permitted. People who engage in this kind of behavior consider themselves justified in that way just because they could have done it otherwise.
the No Harm theory	People commit white-collar crime because they believe that what they are doing does no harm. This is the basis many insider his traders use in violating securities laws.
Stress and Pressure	Stress and pressure can certainly cause people to do bad things or ignore policies and procedures. According to the theory of stress and pressure, these people believe that if something goes wrong, they cannot share their problems with others at work. This could be due to pride or the work environment.

Lack of Self-control	People with weak self-control find it difficult to resist temptation.
Everyone is Doing it" or the Virus	If you see other people doing the same bad thing, it's probably okay Or at least in your own head. Things usually start small and grow into bigger and bigger frauds and non-compliances.

### 7.3 Dealing with non-compliance

Being prepared for non-compliance situations is just as important as putting controls in place to prevent them. Instead, an effective compliance professional should prepare for non-compliance by implementing strategies to minimize, not necessarily prevent, non-compliance. Designate a point contact: An individual lead may be the point contact. Or that the person responsible for complaints about this regulation at the head office is the point of contact. Once the incident her manager is identified, that manager will define and oversee the deployment of the action plan. A predefined incident response playbook can be used as a starting point.

Here is a step-by-step approach in a somewhat generalized form:

- Identify immediate emergency and/or security needs.
- Investigate the incident.
- Determine what happened based on interviews, system analysis, report reviews, and other information.
- Contain the incident and consult with people, processes and technology savvy people to try to contain the current impact.
- Evaluate the impact of what happened and any necessary or desired next steps.
- Clean up and contain the problem. -People soberly and very thoroughly judge the extent of possible adverse effects of the incident.
- Identify strategies for dealing with them.

## 8. RISK

### 8.1 RISK and Compliance

The concepts of compliance and risk management are intertwined. Those working in either field should be well aware of both important roles. Companies are always in their official risk management office. Poor organization budgeting, forecasting, reporting and control can lead to substantial losses. For publicly traded companies, this can affect profits and share prices. In private companies, this can also affect profits. The business success depends on your bottom line. This is the so-called financial risk. Managers regularly focus on managing financial risks. If machine safety and functionality are not checked or information is not available,

performance can suffer. This creates an operational risk that the organization cannot function properly. If your computer system fails and you don't have a good backup plan, your business can cease to function until the problem is identified and fixed. Reputational risk may be what business leaders fear most. Businesses can survive bad quarters. The reputational risks can last longer and affect your business in invisible ways. This type of risk can reduce a company's stability and credibility and reduce trust in the company. This reduces consumer interest in buying from them and strategic partners willing to work with them. The power of the press is far more effective than financial and operational setbacks. Compliance risks can lead to other problems. Failure to comply will result in fines or more embarrassing surgery. It hurts media coverage. Compliance officers should champion this very line of thinking and ensure that employees at all levels and functions are aware of the critical role of compliance and the overall health of the organization.

- Determine what happened based on interviews, system analysis, report reviews, and other information.
- Contain the incident and consult with people, processes and technology savvy people to try to contain the current impact.
- Evaluate the impact of what happened and any necessary or desired next steps.
- Clean up and contain the problem.
- People soberly and very thoroughly judge the extent of possible adverse effects of the incident.
- Identify strategies for dealing with them.

### **8.2 Risk Assessment**

Organizations should regularly ask questions such as: Should all employees be trained? If not, how high are some and which are the least risky? How should this oversight be done? At what level of detail? Do all rules guarantee the same compliance solution? Which requirements are the riskiest? Which are the most important? Which are the most active contributors to the organization? Which regulators are the most active? Compliance obligations and the extent to which compliance adheres to unintended consequences. Compliance professionals need to consider all the different issues that affect compliance requirements. For risks to be properly addressed, they must be associated with those risks using specific compliance policies and procedures. Compliance should be built into every element, strategy, and function of your organization. The need to create and maintain a safe workplace is one of the key examples of

how HR and compliance must work together. Compliance should become part of the lexicon for all specialists and managers in your organization.

### **8.3 Risk tolerance**

Some organizations are more willing to take risks than others. One of the most difficult aspects of the compliance role is understanding your organization's risk tolerance. Organizations can focus on innovation. When it comes to risk, the role of compliance is simple. Compliance must identify risks. Present the risks to the appropriate parties and ensure they fully understand the risks. Compliance is a risk interpreter and a risk navigator. At the same time, compliance must ensure that laws, rules or regulations are not violated or ethical standards are violated. Compliance is what keeps a company on track.

### **8.4 Outsourcing risk and compliance**

Outsourcing is becoming more and more important. That means hiring another company to improve company's functions. It can be risky as it can also pose a compliance risk if not properly understood and managed. Suppose you hire another company to perform debt collection services for your company. What if the company continues to provide inaccurate information? This is bad for your company. Debt collection agencies are subject to compliance obligations under the Fair Debt Collection Practices Act. Violations of this law by hired debt collectors can be enforced by the Federal Trade Commission. The company can be at risk by using the service without properly checking how it works. However, before outsourcing to manage compliance risk, Organizations should conduct due diligence not only on the company's financial data, but also to determine whether it is sound. They also need to manage the various compliance requirements that exist in this ROI area.

### **8.5 Insurance to manage risk**

Insurers can also address another risk, compliance risk. One of the policies related to corporate governance is directors' liability insurance, often referred to as D and O. Liability insurance for the failure of directors to fulfill their fiduciary duties. They may have misused company assets to enrich themselves at the company's expense. Insurance may not cover fines or penalties, but it may cover legal and related costs. It rarely covers illegal activities such as fraud or theft. Insurance coverage is much broader than in the past, both in terms of the range of actions it protects and when they occur. An insurance policy may include coverage where no formal claim has been filed. This Trading Risk Coverage Insurance also includes representations and warranties. Another type of insurance relates to potential tax liability.

Contingency insurance can cover potential exposure to a variety of risks. There are various risks, such as litigation, environmental risks, and labour disputes. Businesses concerned about privacy and data breaches affecting sensitive customer information can purchase insurance to cover it. Companies that fear sanctions from the Environmental Protection Agency can actually purchase environmental liability insurance. We now have cybersecurity insurance. This type of insurance is designed to cover cyber incidents such as hacks, data breaches, business interruptions, and damage to networks as a result of these incidents. These insurance products protect your business from the costs that non-compliance can impose on your business. It can be insured against almost any potential risk and, of course, it can also be used as a certain kind of compliance tool. Insurance can't always improve bad deals and eliminate compliance risks, but if it can cover unknown events, it can improve bad deals.

### **8.6 Enforcement agencies**

Almost all companies operate in highly regulated environments. After a major scandal, regulatory focus is generally stronger. Regulators may not pay enough attention to whistleblower complaints and allegations, and worse, may overlook fraud in the many investigations they conduct. This increased the number of audits and increased verification during audits.

*As a result of all of that, we've seen increased regulation, increased examinations, increased number of investigations, increased number of enforcement proceedings, and increased number of indictments, arrests, trials and convictions, and record amounts of time that people have spent in prison.*

*Andrew Kandel on compliance and regulation (The Wharton School 2022)*

## **9 DATA BREACH REPOSE**

### **9.1 Senior response team**

Another aspect of aggressive enforcement can be found in the Federal Trade Commission. The FTC, a relatively small independent agency responsible for broad consumer protection, also has a history of aggressive enforcement, in areas such as consumer fraud, fraud, unfair collection practices and disclosure issues, Green Guide, Leather Guide, Textile Rules, and many more. In addition to all these agencies, the FTC receives millions of complaints each year.

### **9.2 Reporting of data breach**

A key role of the senior response team is to direct necessary and desirable communications. As to required notices, you may have an obligation to notify state, local, federal, or international authorities in the event of a non-compliance. Regulators expect low impact incidents to be few, but high impact incidents to be significant. You can expect a detailed explanation of what happened. What is the company's investigation and remediation plan? I want to see details such as changed processes, system personnel, etc. Fellmann and Zasada (2016) provide an overview of state-of-the-art business process compliance approaches in their book. Another source of information on formalizing and applying compliance templates for business process compliance is Elgammal, Turetken, van den Heuvel, and Papazoglou (2016). Compliance culture is typically strengthened, and senior-level commitment can be strengthened. Improving compliance and showing regulators how to improve compliance has all the right benefits. Compliance officers can handle 'minor' compliance incidents themselves, rather than assigning a senior response team to investigate and resolve the issue. The Data Breach Notification Act first appeared in 2003, when the state of California, often a trendsetter on privacy and other issues, required companies inside and outside of California to disclose their computer data to California residents. Violated personal data breaches must be notified to the data subject. There are many and wide variations in security breach reporting laws at the state, federal, and international levels.

### **9.3 Imposing discipline**

Think about absenteeism, tardiness, failure to perform routine duties, unprofessionalism, fraud, and other crimes. It is easy to impose discipline. Those who commit fraud are usually dismissed. People intent on engaging in non-compliant acts that enforce their intentions can cause serious compliance issues. To hold these individuals accountable, compliance must be adequately briefed on the dos and don'ts of her program and ensured that they receive regular training. For critical requirements, periodic refresher training may be required. Better instruction using new educational technology tools, intermittent quizzes, interactive games, real-life scenarios, and role-plays to convey messages about what behaviours to comply with or avoid. Over time, we may be suspended, terminated, or fined based on other significant factors. Companies themselves must actively monitor to detect violations. An increase in the number of requests combined with the need for proactive and regular monitoring can lead to a significant increase in violations. For some organizations, the growing number of rules that

must be followed, combined with the need for proactive monitoring, has led to cultural shifts and inadvertent compliance violations. Taking regulatory reporting seriously has several advantages. It helps you avoid costly enforcement actions in the future and strengthen your organization's culture of compliance. Admins can enforce compliance.

### ***Example***

At Company X, two employees inadvertently violate a minor compliance rule. The company's compliance training program was somewhat effective, but this breach made the CCO aware of the potential for further clarification. CCO is implementing new technology tools to support education. If the compliance program's recommendations and prohibitions are properly communicated to employees, even unintentional violations should have consequences.

### ***Example Root Cause analysis***

We recommend using existing tools to perform root cause analysis. We recommend the following steps: Describe your existing problem and collect the necessary data related to your problem. Identify possible causes. Identify causes that need to be addressed to prevent recurrence Find solutions, implement changes, and observe changes. Who can contribute most to these steps? Are your system settings correct? Are there workflows that are too risky to change? Are there bad actors causing problems that should be removed from the workforce? For serious violations, of course, a causal analysis should be performed.

## **9.4 Learning from compliance failures**

A tabletop exercise is a meeting to discuss simulated emergencies. The obvious goal is to be prepared for different scenarios that may arise. Bring together senior members of IT, HR, Facilities, Legal and Operations. Scenarios should be realistic. Involving feature experts in the discussion can be effective. They identify weaknesses and strengths, develop plans, and design training to address the issues raised.

## **10. CORRUPTION**

Corruption in some form has existed for thousands of years and is found in all societies. This is a generally illegal activity carried out by authorized persons for illegal gains. Police officers, teachers, judges, and other government officials, politicians, and business representatives may be involved. Primarily bribery, but bribery has many nuances. Corruption has many names. It can be called fraud, theft, bribery, kickbacks, and many others. This may include client, which is a form of exchange of goods and services for political support of some kind. Whatever form

corruption takes, it is always bad for the communities, countries and regions where it occurs. It is anti-competitive and, like infrastructure investment, often hinders community growth. Corruption also creates an environment of distrust in which citizens cannot be trusted or may lose trust

Trust in their judicial and political systems and infrastructure. Penalties are severe everywhere. Criminal and civil penalties, disciplinary action, and, of course, reputation are greatly affected. Not only were companies fined hefty, but some company employees, consultants, and other employees themselves paid hefty fines and ended up in jail. Many countries have multiple laws that deal directly with corruption. The United States has a similar number of laws against corruption. An important law that affects all US citizens, residents, and virtually anyone associated with the US or a US company is called the Foreign Corrupt Practices Act, or FCPA (1977). This was the first law applied abroad to criminalize corruption outside the country in which it was enacted. The UK Bribery Act, passed in 2010, is very similar to the FCPA. The UK Bribery Act considers it a crime in itself for a company to have or fail to implement an effective anti-corruption compliance program. The FCPA does not include lack of a compliance program as a violation of law. The UK Bribery Act prohibits bribery payments currently permitted by the FCPA. UN Convention against Corruption with over 140 signatories and 165 Parties

### **10.1 How to protect against corruption - Training**

Clear, complete and thoughtful policies and procedures are essential in all areas of compliance. Policies and procedures will not truly work or provide the value they need unless they are communicated in the right way to the right people. All key elements of an anti-corruption compliance program should include training. Employees must be aware of the corruption-related issues most commonly experienced by individuals working in a particular industry or geography and be provided with the necessary knowledge to effectively address them when they arise. When anti-corruption training is done correctly, employees know they have the power to ask questions and, most importantly, to escalate issues without fear of reprisal. Supervisory staff should be familiar with the rules of what is and should not be approved or approved. You should also know how to respond and what actions to take if you become aware of a violation of the Anti-Corruption Policy the Company. Incidents with really relevant details should be described in concrete, colourful language.

## **10.2 How to protect against corruption - Preventative measures**

Businesses must eliminate incentives to pay bribes. Across the workforce, incentives to pay bribes are against the profit with whom the company does business. The company must have a culture that makes it clear from the outset that the company will not tolerate the involvement of employees or third parties acting on behalf of the company. Illegal or unethical business practices. You must ensure that there are no financial incentives to pay bribes. Precautionary measures should also be included in the actual contract with the third party and should always be stated in the contract or specific third party certification. Third parties must agree and acknowledge compliance with certain laws, rules and regulations, in particular those relating to anti-corruption. It outlines the actual jurisdiction in which the business is conducted. A contract may contain a provision that the contract may be terminated in the event of the negligence of a third party. Proper monitoring and auditing is another way to prevent corruption, or at least catch some problems early. Therefore, regularly review all payments to third parties that pose a higher risk to the Company. Review invoices for third-party payments to ensure they comply with the terms of any agreements you have entered into and are properly paid. Email monitoring is also a very important additional precaution that should be taken. Supervisors should act as a second eye and signal compliance if they see or hear anything.

## **11.PRIVACY LAW AND DATA PROTECTION**

### **11.1 Legal basics**

In the United States, some judges and magistrates have interpreted the right to privacy through constitutional provisions, but the concept of privacy specifically does not exist in the United States Constitution. The right to respect for private and family life is specifically cited in Section 8 of the European Convention on Human Rights. What is your biggest privacy concern? This may include identity theft, online tracking and targeting, government surveillance of phone and internet records, and profiling. Surveillance and profiling in the private sector, misuse of biometric information. Face recognition, location tracking, genetic identification. Privacy issues can arise from cameras and other types of surveillance, and are perhaps examples of other modern privacy issues as well. Privacy is not just a collection of modern issues. It is a value that has been recognized for centuries and has evolved into the legal principles and legal requirements we live by today.

### **11.2 The origins of privacy protection**

Privacy concerns exist as long as information dissemination exists. The law must provide some remedy to individuals when the actions of others interfere with their right to rest. Computers are the new privacy threat! In the 1960s, with the rise of mainframe computers, a different kind of privacy concern emerged. It is the one that leads to the principles and to principled rules that we live by today. Computers can often solve privacy problems through biometrics, security roles and systems, encryption, and more. Computerized records can raise new privacy concerns. First, with the new computerized collection of personal information, unknown databases may contain information about you. Second, computer-assisted editing has made it possible to collect large amounts of information in a cost-effective manner. Third, computers make it easy to give personal information to so many people. Fourth, computers were so cheap that it became easier to collect other kinds of information than before. Fifth, the information collected by computers was used differently than before.

### **11.3 Fast information principles**

The purpose of the Records, Computers, and Civil Rights Report was to analyse the harmful consequences that could result from automated systems of personal data. Develop safeguard recommendations that can protect individuals from potentially harmful consequences and provide compensation for any harm. There should be no system of recording personal data whose existence remains confidential. Second, there must be a way for people to know what information is available about them. It's on record and how it's used. There needs to be a way to prevent information obtained about an individual for a specific purpose from being used or made available for other purposes without their consent. There must be some way for a person to modify or alter records of identifiable information about him or her. Organizations that create, maintain, use, or distribute records of identifiable personal information must take reasonable precautions to ensure the reliability of the data for its intended use and to prevent misuse of the data. .

How we collect, use, share and protect data is a challenge in itself. Second, organizations creating information policy statements should go through a process of self-reflection to gain a deep understanding of how they are actually handling personal data. Third, organizations that make public commitments must comply with the law. This should avoid the liability of companies to make misleading advertisements in order to deliver on their promises. This information has tremendous implications for all of us. False and negative information can make

the difference between getting a job or being rejected (for compliance processes please see Ghose, Aditya, and George Koliadis 2007), enabling people to see information and dispute incorrect information with duties to investigate for the people who supplied and have that data:

- Minimize the amount of information collected, used, and shared
- Downstream assurances, from vendors and other third parties with whom one is sharing personal information
- Mitigate any privacy harm that occurs.

### **11.5 The Statutory Landscape in the U.S. in 2022**

Data protection laws were enacted in the late 1960s. The federal government and credit bureaus had amassed data from millions of people. The Data Protection Act governs personal information collected by federal agencies, and the Fair Credit Reporting Act governs information collected by consumer reporting agencies, commonly known as credit bureaus. FERPA (Family and Educational Rights and Privacy Act) protects the privacy of educational records. Other privacy laws include the Video Privacy Protection Act and the Driver Privacy Protection Act. The Health Insurance Portability and Accountability Act ensures insurance portability and standardizes and facilitates electronic communications in standard formats between providers and payers. The Gramm-Leach-Bliley Act was created to break down barriers, corporate affiliations and proprietary rights and pave the way for commercial banks, investment banks and insurance companies to share information about their customers. Data protection laws have been developed in response to concerns about certain harms.

The Children's Online Privacy Protection Act (COPPA) protects against collecting information online from a child without verifiable parental consent if the child is under the age of 13. The Genetic Information Nondiscrimination Act (GINA) protects against employment and insurance discrimination based on genetic information. While the United States relies on a "patchwork" of privacy laws to protect an individual's personal information, Europe has enacted comprehensive legislation to protect explicit "privacy rights." I'm here. Affiliates must adequately inform patients of their data collection uses and privacy practices. Training as a strategy to ensure all enrollment staff are aware of the changes and requirements of this process. Finally, technology can be added to record in the system that the patient has confirmed receipt. Workflow changes, training, and documentation in proper systems can bring reporting requirements closer to this standard. Disclosure is permitted in emergencies to deal with crime

on the spot, medical examiners and coroners, organ procurement organizations, secret services for protective purposes, and a few other cases specifically described in the regulations.

### **11.5 Training privacy**

Privacy professionals seeking to implement use and disclosure rules may choose to educate everyone on what is generally permitted and briefly discuss specific scenarios. Different compliance policies may apply. One is called bare minimum. Essentially, affected organizations are forced to take steps to limit the scope of potential privacy vulnerabilities. Affected facilities should implement procedures to limit staff access to patient information to that reasonably necessary for their role. Similarly, covered Entities must limit the amount of information they disclose to that which is reasonably necessary for the purpose.

#### **How can make this compliant??**

- Configure role-based access in information systems
- Monitoring proper or improper access.
- Manually review records of who has access, or
- Provide software that can detect instances of system access that appears suspicious.
- Use a gatekeeper for certain kinds of high volume requests.
- Educate people about what sensitive data is or which patients may be in the most sensitive situations.
- Strictly adhere to access and disclosure rules.

### **11.6 Introduction to data security**

There have been privacy issues due to security breaches and vice versa. Security is for privacy. Information security is broadly defined as a program for protecting the confidentiality, integrity and availability of personal or other sensitive data. Making data available to those who should have access is confidentiality. It's privacy. Standards organizations such as the International Organization for Standardization (ISO), the National Institute of Standards and Technology (NIST), and COBIT have developed complementary frameworks that information security professionals rely on on a regular basis. In the field of data protection, the protection of personal data is necessary. We care about security, but we also care about the security of proprietary data. The Security Rules define confidentiality as close to privacy as possible, meaning that ePHI cannot be used or disclosed to unauthorized persons, and also support the Privacy Rules' prohibition against misuse and disclosure of PHI. The second category, physical security measures, includes facility access and controls, and workplace and equipment security. Finally,

there are technical safeguards such as access controls, automation controls, integrity controls and transmission security. In addition, identify reasonably foreseeable internal and external risks to the security, confidentiality and integrity of Customer Information that could lead to unauthorized disclosure, misuse, alteration, destruction or other compromise of information. Risk assessments include employee training and management; information systems, including network and software design; information processing, storage, transmission and disposal; and detection, prevention, and response to attacks, intrusions, or other system failures. This should include risk considerations in specific areas of Information security safeguards are developed and implemented to control the risks identified by the risk assessment and to periodically test or monitor the effectiveness of these safeguards. Compliance or security professionals bring together stakeholders, gather information, and scan internal and external environments. Compliance or security professionals in the field assess risks, raise significant risks, and allocate large budgets to oversight boards.

### **11.7 Information Security and compliance**

Many privacy experts report simply complying with the strictest applicable laws. These laws, despite this challenge, have changed the game. The threat of security breaches being made public quickly underscored the importance of strong security. Security professionals and standards bodies have developed a rigorous and critical framework for creating and maintaining an effective information security program. Therefore, the goal of privacy or compliance professionals working in this field is not only to minimize incidents, but also to respond to those incidents appropriately and appropriately. Building effective information security and being prepared to handle errors responsibly is the cornerstone of this field. Applying the principles of compliance outlined here will help you position yourself most effectively in this dynamic and challenging environment.

## **12. SUMMARY AND ACTION HINTS**

In this article, we have fully understood what compliance means in an industrial environment. In many ways Risk and compliance are related and ways to address or manage risk are considered. It identifies the reasons why industries, companies and organizations should address compliance. Compliance is critical to supporting the financial, reputational, and functional aspects of an industry, business, or organization. Next, the basic components of a compliance program were presented. Various strategies for building a culture of compliance

within an organization were presented, and learned psychological theories were presented to explain compliance management techniques and methods and their effectiveness. Various techniques and methods are employed to apply technology and workflows to support an effective compliance system. Strategies for addressing compliance violations and responding to incidents are being considered. Anti-corruption laws and their impact were reviewed. The relationship between anti-corruption efforts and organizational culture and compliance programs were explained. Various strategies for avoiding corruption problems and strategies for building a comprehensive anti-corruption program that can prevent and/or mitigate corruption within an organization are presented. Certain ways of protecting privacy through the Fair Information Principle can be achieved. In the area of data protection, you learned the laws and regulations regarding data protection. Data protection obligations that may apply to complex organizations were examined. Day-to-day compliance decisions an organization must make in relation to privacy laws and data protection were recognized.

Finally, a company's future action plan is presented.

- Ensure that the policy is circulated and reviewed by various departments before it is formally adopted.
- Ensure the public knows where to report ethics and compliance violations. Comply with pay-to-play laws that prohibit donations to certain campaigns
- Review and report on the personal securities transactions of certain employees.
- A code of conduct should set the tone for employee behavior and form the basis of your compliance program.

**APPLICATION OF MACHINE LEARNING TECHNIQUE FOR PREDICTION OF  
PHISHING ON ANDROID**

**Dr. Ekbal RASHID**

Associate Professor, RTC Institute of Technology, Ranchi, Jharkhand

**ABSTRACT**

Phishing is a proliferating cybercrime in which a target or targets are contacted through emails, spoofed URL or text message by someone posing as a legitimate company to trap individuals into providing sensitive data such as personal information, banking details, credit card details and passwords. As we live in an era of smartphones, this anti-phishing methodology aim is to enlighten a user that whether the website they're visiting is legitimate or not. Phishing techniques are propagating with time, with the help of machine learning (ML) we build an application which is able to determine whether the URL is leading to correct parent website or not, based on certain datasets and patterns.

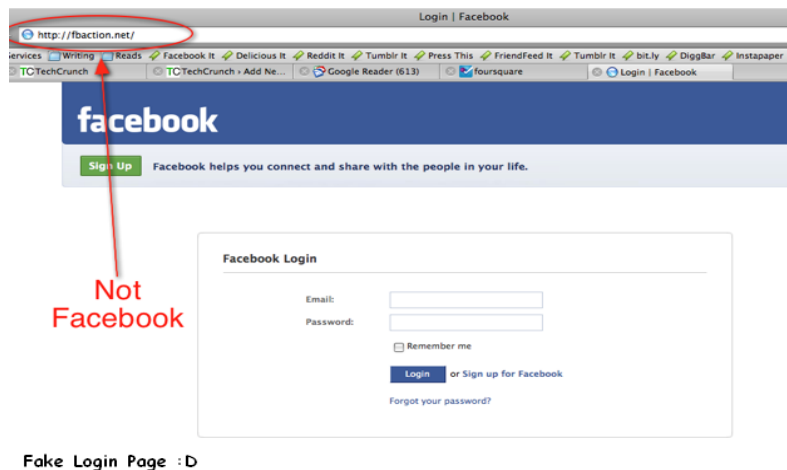

**Keywords:** Phishing emails, Facebook, Malicious, Fraud, Spoofed url

**1. INTRODUCTION**

In this section, I discussed about phishing and non-phishing with some social media example such as facebook in which Phishing is a form of fraud in which an attacker masquerades as a reputable entity or person through e-mails and malicious URL’s. Phishing is a type of social engineering attacks [1] [2] [3]. An attack can have devastating results. For individuals ,this include unauthorised purchases, the stealing of funds , or identities theft [4]. Anti-Phishing software, a computer programs that attempt to identify phishing content contained in websites, e-mail, or other forms used to accessing data and block the content, usually with a warning to the user [5] [6]. It is often integrated with web browsers and email clients as a toolbar that displays the real domain name for the website the viewer is visiting, in an attempt to prevent fraudulent websites from masquerading as other legitimate websites [7]. Most popular web browsers comes with built-in anti-phishing and anti-malware protection services, but almost none of the alternate web browsers have such protections [8] [9]. Password managers can also be used to help defend against phishing, as can some mutual authentication techniques [10].

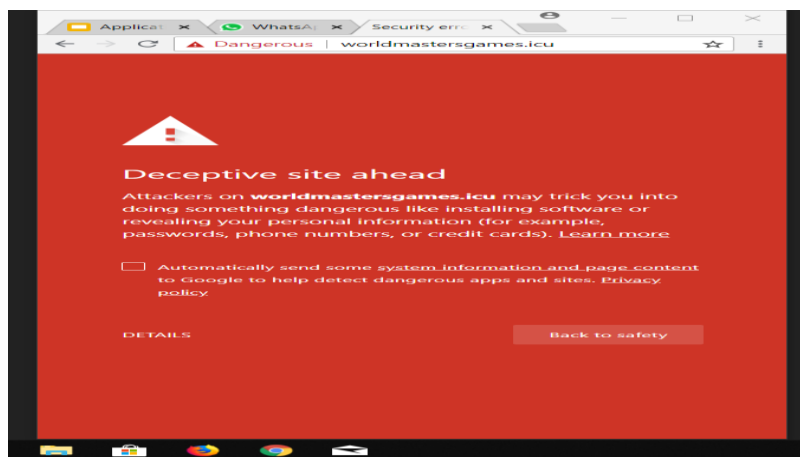

**Figure 1:** Legitimate Website of Facebook i.e., it is an secured website and data can’t be tampered

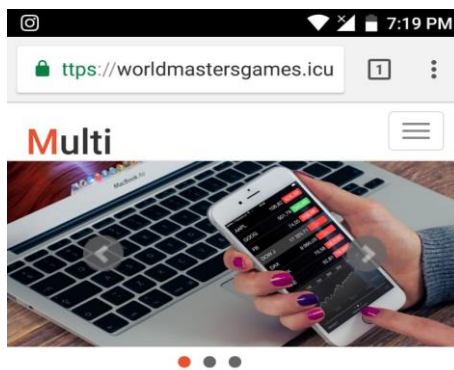

**Figure 2:** A Facebook page with malicious URL, which can steal user’s personal details.

**2. Existing System:**

“There is no single fool-proof way to avoid phishing attacks”. Even in the presence of numerous tools on anti-phishing we still become prey for phished url’s.As technology becomes more advanced, the cybercriminals techniques being used are also advancing. Recently there has been an outrage on ransomware-phishing which locks downs a system just by the click of “URL”.The major drawback in the existing system is that there isn’t a standalone android application which is able to detect phished url through machine learning technique.

**Figure 3:** Web Application: Malicious URL has been detected and access has been denied.

Providing Our Clients  
**Best & Creative  
Solutions**

**Figure 4:** ANDROID: Malicious URL has been opened without any alert.

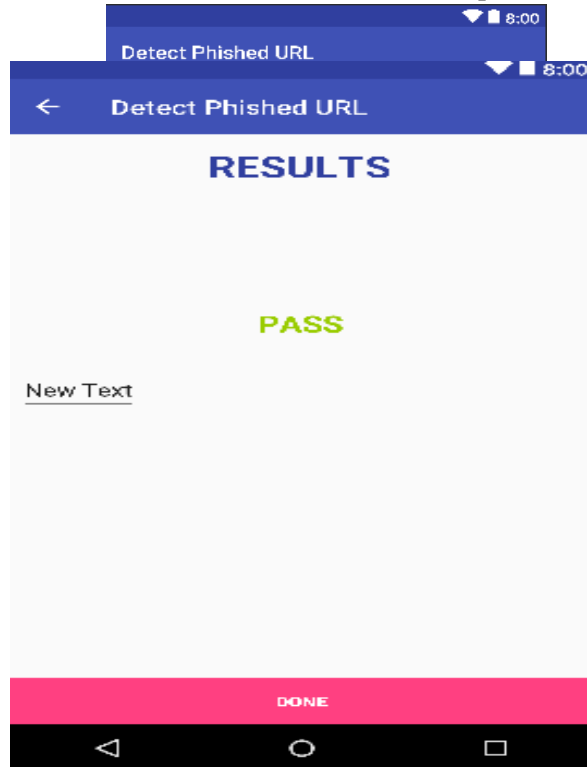

### **3. Proposed System:**

This application is designed in such a way that it is able to detect the legitimacy of the url and avoid users from any repercussions and herald a user regarding phished url's. The approach towards detection of this algorithm is simple, we give the machine(ML-technique) pre-determined datasets of phished websites and with the combination of supervised and unsupervised learning strategies we come with an outcome to determine non-phished and phished url's. We use python as programming language to implement the ML algorithm to verify and detect phished url's. Later this python application is packaged into an android application and deployed on android, where it detects and overlays a message on screen by just copying the url to the clipboard. The whole processing of detection is done in the background for feasible usage.

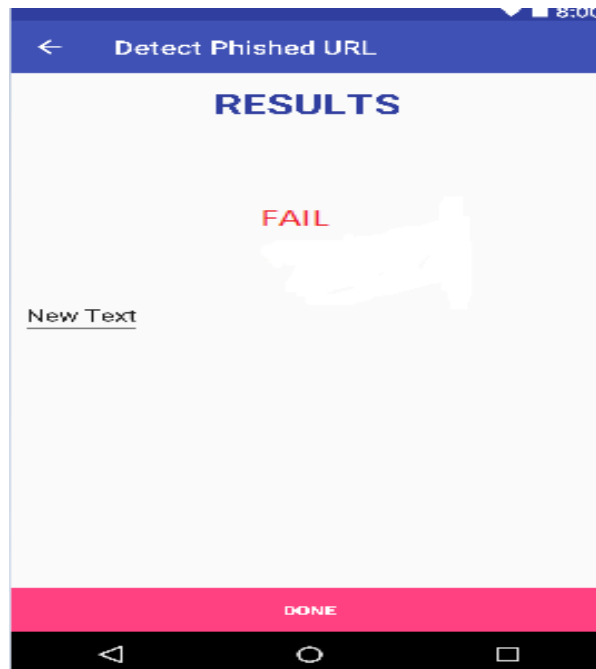

### **4. RESULTS AND DISCUSSIONS:**

In this research as we know malicious website or Malicious URL is a common and very serious threat to information security and cyber security. Malicious URLs host unwanted content such as spam, phishing, drive-by downloads, etc. and trap innocent users to become victims of scams and cause theft of private information, monetary loss. To avoid such threat we have applied the machine learning technique to protect from such fraud and result can be seen in the form of snapshot (see snapshot 5 through 7).

**Figure 5:** URL is entered here to check whether it is a phished or non-phished URL

**Figure 6:** Result is displayed. PASS represents URL is non-phished

**Figure 7:** FAIL represents URL is phished

**Concluding Remarks:**

As we know attackers are using most common technique such as phishing to break security and steal confidential and private information. In this section Malicious URL detection plays a serious role for many cyber security applications. An effective and efficient way to protect against phishing is to use an add-on filter. In the last few years, automated detection of malicious URLs using machine learning becomes a very exciting vulnerable problem. In this paper we have applied the machine learning technique to protect from malicious URL and emails.

**A COMPARATIVE STUDY OF KEY QUALITY PERFORMANCE INDICATORS IN  
ANAESTHESIA AND SURGERY IN OPERATION THEATRE AT A TERTIARY  
CARE HOSPITAL**

**Bhavna GUPTA**

All India Institute of Medical Sciences Rishikesh

**BACKGROUND**

A key performance indicator (KPI) is a measurement that assesses the success of an organisation or a specific activity in which the organisation is involved; success is defined as the repeated periodic achievement of some operational goal or as progress toward strategic goals determined by the organisation. Because perioperative care is both an investment of the hospital budget and a source of revenue, optimizing the utilisation and efficiency of the operation theatres (OT) is clearly in the best interests of the hospital and the populations it caters. As a result, it is critical that all KPIs used to assess OT performance are in sync with national and international accrediting authorities, both medically and financially.

**AIM AND OBJECTIVES**

The current study aimed to assess existing anaesthetic and surgical services at a tertiary level healthcare centre in accordance with the National Accreditation Board for Hospitals and Health Care Providers standards. Retrospective research for key quality indicators (CQI-NABH) relating anaesthesia and surgical services was undertaken at a tertiary care hospital.

## **METHODOLOGY**

The study was carried out at a tertiary care hospital's Department of Anaesthesiology, and data were analysed retrospectively from October 1st, 2019, to November 30th, 2020. During the study period, all patients receiving elective or emergency surgical procedures under supervised anaesthetic care, regional or general anaesthesia, were considered. A retrospective analysis of key quality performance indicators (CQI-NABH) for anaesthesia and surgical services at a tertiary care hospital was carried out. It was in accordance with the NABH 4th edition 2015 standards of COP 13, COP 14, and COP 15. Six quality indicators were studied: OT utilisation rate (hours), percentage of anaesthesia plan modification, percentage of adverse anaesthesia events, percentage of anaesthesia related mortality, percentage of cases where the organization's procedure to prevent adverse events such as wrong site, wrong patient, and wrong surgery was followed, and percentage of cases who received appropriate prophylactic antibiotics within the specified time frame. We also wanted to identify gaps and offer suggestions in Anaesthesia and Surgical Services, as well as to observe any changes in quality indicators throughout the 2020 Corona Virus illness (COVID) pandemic. For exploratory analysis, an Excel spreadsheet was employed.

## **OBSERVATIONS**

The regular caseload in OTs was in the 1000-1500 range, but due to the pandemic situation, there was a drop in cases from March 2020 onwards, compared to a defined benchmark of 1000 cases per month. The benchmark was generated by averaging the number of cases operated in OR over a 6-month period prior to the implementation of COVID 19. The percentage of anaesthetic plan modifications on the day of operation ranged between 0-3.34%, compared to a predefined benchmark of 1%. The number of adverse anaesthetic events ranged from 0 to 2.1 percent, with the most common causes of AAE being cardiovascular, respiratory, and airway-related reasons, compared to a benchmark of 1%. Over the course of a year, there was no documented fatality attributable to the administration of anaesthetic. There has been a considerable improvement in antibiotic and WHO surgical safety check list compliance in the operating room, which is now close to 98 percent -100 percent. In the pre-covid period, the department of Orthopaedics handled the most patients (18.76 percent), followed by Obstetrics and Gynaecology (12.84 percent), and Neurosurgery (12.84 percent). However, during the covid era, the department of Obstetrics performed the greatest number of procedures.

Recommendations, as well as corrective and preventive actions, have been discussed with the relevant key performance indicators.

### **CONCLUDING REMARKS**

To summarise, monitoring, evaluating, and comparing healthcare performance metrics, or KPI, in hospitals is critical for providing the best care while ensuring the best use of available resources. These quality indicators offer one a "bird's-eye view" of the efficiency of hospital's services and assist management in developing key process improvement strategies. These quality indicators aid in the key areas: improving the patient treatment and patients' overall satisfaction, improving healthcare quality, reducing medical costs, and ensuring the best use of available resources. Such audits should be done on yearly basis to maintain proper records and to check effective utilization of Operation theatre.

**INTRODUCTION OF ADDITIONAL NAME-NODE FOR CACHE MECHANISM  
FOR FAST READ OPERATIONS IN HDFS**

**ABSTRACT**

Hadoop applications primarily employ HDFS (Hadoop Distributed File System) as their primary storage solution. The open-source framework functions by sending data quickly between nodes. Companies that need to manage and store large amount of data frequently employ it. Files are divided into blocks by HDFS, and each block is kept on a DataNode. The NameNode, the cluster's master node is connected to numerous DataNodes. Replicas of these data blocks are dispersed throughout the cluster by the master node. Users can designate paths that HDFS should cache using the centralized cache management feature of HDFS. In order to advise DataNodes that have the desired blocks on disc to cache them in off-heap cache, The NameNode will communicate with them. In this proposal, we propose an introduction of additional Name-Node for cache mechanism for fast read operations in HDFS which will store frequent request records for handy access instead of performing lookup across DataNodes. This will drastically reduce the latency in accessing records in HDFS.

**Keywords:** HDFS, NameNode, DataNode, Cache.

## 1. INTRODUCTION:

Big data is a collection of large data sets that cannot be processed using traditional computing techniques. It is not a single technique or a tool. Rather it has become a complete subject, which involves various tools, techniques and frameworks. The primary purpose of NameNode is to manage all the metadata. As we know that data is stored in the framework of blocks in a Hadoop cluster. So, on which data node or on which location that block of the file is stored is in metadata. NameNode is the master node in Apache Hadoop HDFS architecture that maintains and manages the block, very high available server that manages the file system name and controls access to files by clients. In computing, a cache is a high-speed data storage layer which stores a subset of data, typically transience in nature. So future request for that data is secured up faster than is possible by accessing the data primary storage location.

## 2. LITERATURE SURVEY:

As part of literature study, we tried to provide all the latest and their corresponding future trends, following table highlights the contribution, limitations and future enhancements.

Sl.no	Reference paper	Contributions	Limitations	Future Enhancements
01	Debajyothi Mukhopadhyaya Et al.	Presented a way to reduce the NameNode memory consumption thus increasing the capacity of a Hadoop cluster.	This way the Hadoop cluster will not reach the stage where the namenode because irresponsive due to excessive jvm garbage collection as the HDFS will not be heavily loaded.	Namenode will only store relatively more frequently used data the operations carried on the cluster will be faster and more efficient.
02	Eric Newberry	Demonstrated the benefits that in network caching can provide to big data applications running on two of the Hadoop distributed file system by reducing the total amount of traffic sent over cluster networks	This includes the ability to implicitly retrieve data from multiple sources and over multiple paths as well as a stateful forwarding plane that can detect failures and discover alternative paths.	They have conducted their evaluations using the 2Q, ARC, LIRS, LRU, and MQ cache replacement policies. However, this is only a subset of the many replacement policies in existence. This would increase the breadth of the evolution.

03	Dr. Chandrakant Naikodi	Big data analytics examines large and varied data sets. We use advanced analytics techniques against the large data to uncover the hidden patterns unknown correlations market trends, customer preferences and other useful information.	Code is very lengthy and more development efforts are required but the code efficiency is high as compared to live	Describes all advances, methods and techniques, leading research areas, research motivational areas of big data analytics.
04	Rotsnarani sethy	Conducted a survey on Hadoop framework for big data processing. Different features of Hadoop map reduce are discussed to deal with the problems of scalability and complexity for processing big data	Today, data is generated from various different sources and can arrive in the system at various rates. To process these large amounts of data is a big issue today.	Hadoop components which are used to support the processing of large data sets in distributed computing environment in future we can use some clustering techniques and check the performance by implementing it in Hadoop.
05	Revathi veluswamy	Hadoop has emerged as a popular tool for big data to analyse these data using map-reduce to get the desired output with the help of programs the design purpose of it is to perform millions of data in a single executive a server.	There is a huge amount of data lying in the industry, but there is no tool to wield it and Hadoop can implement on low-cost hardware and can be used by a large set of audience large number of datasets.	Many techniques are used to make efficient plan but the map reduce .so, that it can speed up the system data retrieval techniques like Quincy asynchronous processing, job awareness, delay scheduling had made the schedule effective for faster processing.

### **HADOOP ARCHITECTURE:**

The basic Hadoop architecture consists of two primary components viz.

1. Hadoop distributed file system (HDFS) and 2.map reduce

### Hadoop Distributed File System (HDFS Layer)

Hadoop Distributed File System is a fault -tolerant distributed file system designed to run on “off-the-shelf” hardware. It has been optimized for streaming reads on large files whereas I/o throughput is favoured over low latency. In addition, HDFS uses a simple model for data consistency where files can only be return to once. HDFS assumes this failure as an eventuality and uses a concept called black replication to replicate data across nodes in the cluster. HDFS uses a much larger block size when compared to desktop file system.

### METHODOLOGIES

An HDFS cluster as two types of nodes operating in a master-worker pattern:

A NameNode (the master) and a number of DataNodes (workers).

#### A) **Namenode:**

The NameNode manages the file system namespace. It maintains file system tree and the metadata for all the files and directories in the tree. This information is stored persistently on the local disk in the form of two files. The namespace image and the edit log. The NameNode also knows the DataNodes on which all the blocks for a given file are located. However, It does not store block locations persistently, Because this information is reconstructed from data nodes when the system starts. A client accesses the file system on behalf of the user by communicating with name node and DataNode.

#### B) **DataNode:**

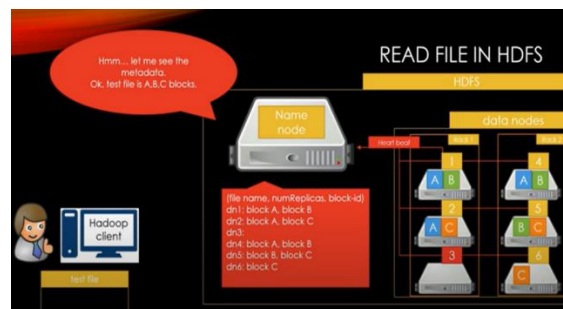

Data nodes are the workers of the file system. DataNode performs creation, deletion and copy of block under the ‘Name Nodes command’. They stored and retrieve blocks when they are told to by clients are the Name Nodes, and they report back to the name node periodically with

lists of blocks that they are storing each block replica on a data node is represented by two files in the local hosts native file system. The first file contains the data itself and the second file is blocks meta data including checksums for the block data and the blocks generation stamps.

### READOPERATION WITH CACHE:

Read operation starts with a lookup operation and has a partial overlap between the lookup and data read operation

- If there is cache it, then cache returns the value to the processor or the higher-level cache.
- If there is a cache miss, then we need to cancel the data. read operation and send a request to the lower-level cache
- The lower-level cache will perform the same sequence of accesses and return the entire cache block.
- The cache controller can then extract the requested data from the data and send it to the processor.
- Simultaneously, the cache controller invokes the insert operation to insert the block into the cache.

### 3. CONCLUSION

The Hadoop distributed file system is a reliable distributed file system to stores large files across big data clusters. The namenode is the centrepiece of a Hadoop distributed file system it keeps the directory tree of all files in the system caching reduces latency in the round-trip time by retrieving the content much faster.

**INVESTIGATING PHASE CHANGE MATERIALS, THEIR PERFORMANCE AND TYPES WITH THE APPROACH OF SUSTAINABILITY AND REDUCING ENERGY CONSUMPTION**

**Mehrdad KARIMIMOSHAVER (Orcid ID: 0000-0001-5536-2138)**

Associate Professor of Architecture, Bu-Ali Sina University, Faculty of Art and Architecture,  
Department of Architecture, Hamedan, Iran

**Alireza GERAMI (Orcid ID: 0000-0003-1317-6534)**

Phd Student of Architecture, Bu-Ali Sina University, Faculty of Art and Architecture,  
Department of Architecture, Hamedan, Iran

**ABSTRACT**

Recently, the increase in population and expansion of construction has caused a significant increase in energy consumption. This issue has caused many concerns about the depletion of energy sources and the increase in pollution caused by its use. For this reason, attention has been paid to new sustainable solutions to supply the energy needed by humans and also to prevent its waste in recent years. Thermal energy storage (TES) refers to the temporary storage of energy in the form of cooling or heating for later use, and is considered a technology in the field of using renewable energy, and can help create balance between energy demand and resources by storing excess energy and returning it when needed. Phase change materials (PCMs) can store thermal energy of the surrounding environment when they reach the phase change temperature (melting or freezing point), based on the latent heat of melting and freezing. The purpose of this article is to study phase change materials, how they work and their types. we try to find the weak and strong points of using these materials by reviewing the studies done in this field, and we can express the areas needed for future research. Different types of PCMs are Organic, Inorganic and Eutectic. methods of PCM incorporation are macro and micro encapsulation as direct ways of installing them in buildings or using them in combination with different heating and cooling systems. Although this material has shown reasonable success in the field of energy consumption reduction in most cases, however, other factors must be considered to determine the cost-effectiveness of using such a system. So Economic and life cycle analysis of phase change materials are of great importance in future studies.

**Keywords:** Phase Change Materials, Thermal Energy Storage, Latent Heat, Sustainable Solutions, Energy Consumption

## 1. INTRODUCTION

The increase in population and the expansion of construction have caused an increase in energy consumption, and this issue has caused many concerns about the depletion of energy resources and the increase in pollution. For this reason, in recent years, there has been a significant increase in attention to new solutions to supply the energy needed by humans and also to prevent its waste. It is predicted that due to growing number of population and economic growth, the amount of demand for energy will double the current amount by 2050 [1]. Nowadays, reducing the amount of fossil energy consumption through finding design potentials and using renewable energy has become one of the main goals of architects. We are currently witnessing a new generation of buildings. Buildings that have completely ecological behavior and are able to react to direct and indirect changes around them and adapt to the conditions by intelligently using appropriate and new materials and using new technology. Thermal energy storage in general, and phase change materials in particular, has been the subject of some researches over the past 20 years. The contents of this field deal with energy saving, efficient and rational use of existing resources and optimal use of renewable energy. Thermal energy storage (TES) refers to the temporary storage of energy in the form of cooling or heating for later use, and is considered a technology in the field of using renewable energy, and can be used by storing excess energy and restoring it when needed. this can provide many solutions to important issues related to energy consumption, such as [2]:

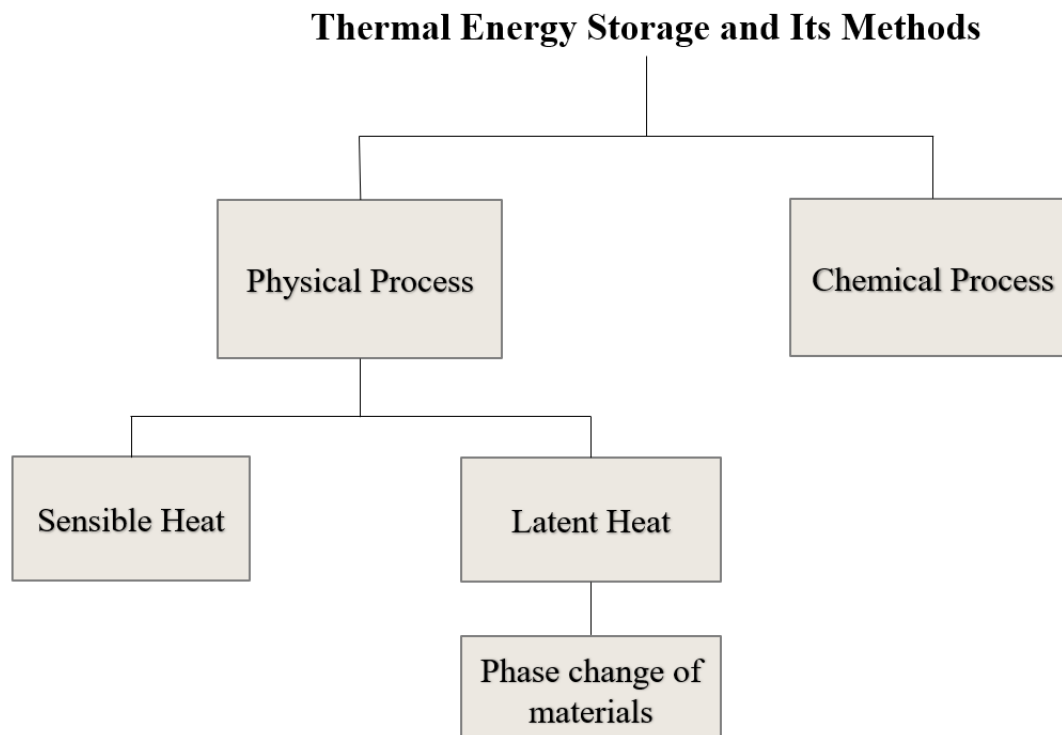

- Time delay and transmission between the production or availability of energy and its consumption in energy receiving systems.
- Providing energy in special places such as hospitals, computer centers, etc.
- Creating thermal inertia

For example, due to the difference in day and night temperature, the energy demand can be balanced during the day and night, by saving energy summer heat can be used for solar collectors in winter, and the cold obtained from winter air can also be used to provide air conditioning systems in summer.

The most common way to store energy is to use the sensible heat of materials. In this method, thermal energy is absorbed by the material and causes its temperature to rise, and for this reason, this storage method is called using sensible temperature. In fact, the material acts like a battery and stores energy, and because of this, its temperature rises. If necessary, the object returns the

absorbed energy to the environment and its temperature reaches its initial temperature again [3].

using sensible heat is suitable for storing a limited amount of energy, and if we need to store more energy, a very large amount of material must be provided. For a better understanding, we can say that in the example of a battery, we need a large number of batteries to store energy, which is usually not possible. A better solution is to use a larger battery that can store the large amount of energy required [3]. This idea has been realized in the method of energy storage using latent heat. The heat transfer that occurs when a substance changes from one phase to another is called latent heat. The amount of energy stored in latent heat is usually much more than sensible heat at a certain temperature, which of course depends on the specific heat of the material. If a suitable material is chosen, the solid-liquid phase change (melting and freezing of materials) can store a large amount of energy. All materials experience phase change, so in fact all materials can be considered phase change materials (PCM). Of course, only a number of materials in which phase change occurs in a certain temperature range (the operational temperature range of building residents) are actually called phase change materials (PCM)[4].

**Figure 1.** Thermal Energy Storage and Its Methods

Figure 2. latent heat storage

An article in 2020 showed that The eutectic mixture of capric acid and palmitic acid had the highest performance score when using in trombe wall, this implies that integrating a Trombe wall with this PCM will yield the optimum performance for the system [5]. An experimental study has been conducted on building wall fragments containing phase change material (PCM) to investigate the impact of PCM on the heat transfer in a building wall and the effectiveness of PCM in improving the indoor thermal comfort of a building. The placement of the PCM layer shows that PCM closer to the heat source gives a low-temperature gain of the cold water bath (indoor state) relative to the PCM near to the heat sink [6]. Another study in 2014 shows the results of the corresponding building energy simulations indicate that the incorporation of 0.9 kg/m<sup>2</sup> floor area of PCM with a melt temperature of 25 °C is capable of reducing the zone hours overheated by about 50%. The simulations indicate that reducing the melt temperature of the PCM below 25 °C may have an adverse effect on thermal comfort. Finally, changing the location of the PCM from behind the drywall to the interior wall surface resulted in a reduction of zone hours overheated by more than 60% compared with a building with no PCM [7]. In another study, The potential of PCM in reducing the building energy consumption at different climate zones of Australia and influence of several factors on the effectiveness of PCM have been investigated using building simulation software EnergyPlus. Five different melting ranges PCM have been used to identify the optimum PCM melting range for each city. Conclusions that have been reached: PCM has the potential to reduce the building energy consumption in Australian cities under cold temperate, mild temperate and warm temperate zones. The

integration of PCM has very minor effect on the energy consumption of houses which are in hot and humid climate zone. Effectiveness of a PCM depends on local climate, thermostat range, PCM layer thickness, surface area and location of application in buildings [8].

The purpose of this article is to research on phase change materials, how they work and their types. Then, we try to find the weak and strong points of using these materials by examining the studies done in this field, so we can express the areas needed for future research.

## **2. RESEARCH AND FINDINGS**

Phase change materials are materials that store the thermal energy of the surrounding environment when they reach the phase change temperature (melting or freezing point), based on the latent heat of melting and freezing, and return it to the environment when needed. By doing this, they force their surrounding environment to remain at a certain temperature. PCMs can store 5 to 14 times more energy per unit volume than sensible storage materials (water, masonry, or rock).

### **2.1 Types of Phase Change Materials**

*2.1.1 Organic Phase change Materials.* They are divided into two categories: paraffins and non-paraffins.

The most important advantages of using paraffins in energy storage systems are: high latent heat of melting, low volume change during melting, low vapor pressure in molten state, non-corrosive and relatively cheap. The disadvantages of this group of materials are: low thermal conductivity, relatively flammable.

Organic non-paraffins, which are better known as fatty acids, are the most abundant phase change materials with very variable properties, and unlike paraffins, which have similar properties, each of these materials has its own unique characteristics. Including: high latent heat of melting, flammability, low thermal conductivity, low flash point, variable toxicity level, imbalance at high temperatures. The main problem of these materials is their cost, which is two to two and a half times that of commercial paraffins. In addition, these acids are relatively corrosive [9].

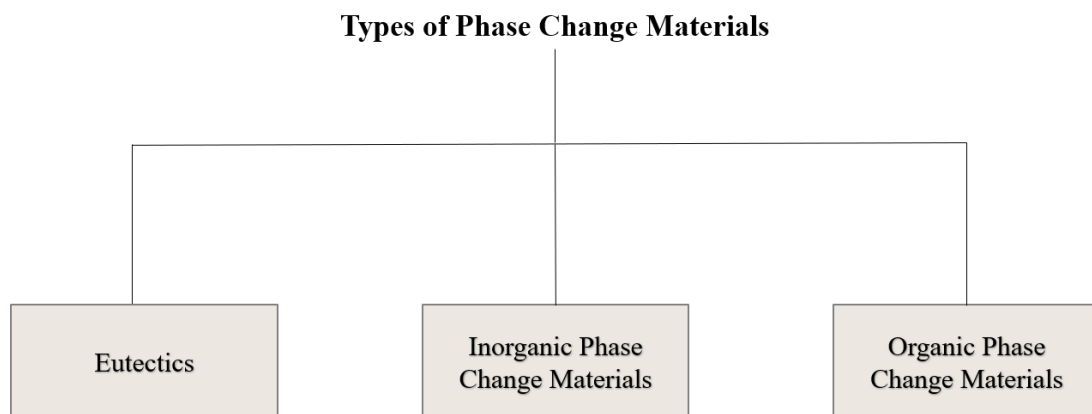

*2.1.2 Inorganic Phase change Materials.* They are classified under two groups of salt hydrates and metals. The most attractive properties of salt hydrates are: high latent heat of melting per unit volume, relatively high thermal conductivity (almost twice that of paraffins), low volume change during melting. These salts are not very corrosive and compatible with plastic. Many hydrate salts are cheap enough to use in storage. The main problems salt hydrates are: non-

uniform melting, the spontaneous reduction of the number of water moles of the hydrate salts during the discharge process and the fact that they are only slightly toxic.

Metal phase change materials include metals and metal alloys with low melting points. Currently, this group of metal materials is not used much as phase change materials due to its heavy weight. However, when volume is involved, these materials are suitable due to their high latent heat per volume unit. Among the properties of metal phase change materials, the following can be mentioned: low heat of melting per unit weight, high heat of melting per unit volume, high thermal conductivity, low specific heat, relatively low vapor pressure [10].

**2.1.3 Eutectics.** Eutectic or alloy materials are a combination of two or more components with a minimum difference in melting point, each of which melts or freezes equally and forms a mixture of crystals related to each component during crystallization. Since alloys freeze as a mixture of very close crystals, their melting and freezing almost always takes place without separation. In other words, during freezing or melting, both components become solid or liquid at the same time. Alloy materials have a higher volume storage density than organic compounds. Eutectics can be a mixture of inorganic and/or inorganic (organic -organic, organic–inorganic, inorganic - inorganic) [10].

**Figure 3.** Types of phase change materials

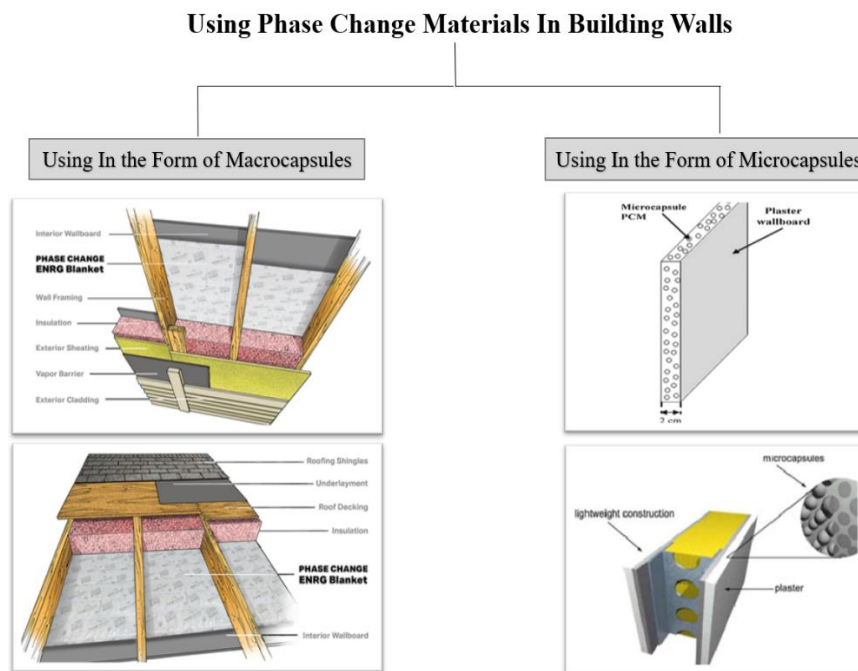

## **2.2 Conditions of Using Phase Change Materials**

Phase change materials must have certain properties in order to achieve the expected performance. For using in buildings, it is necessary to use materials that have a small volume change during the phase change, otherwise the performance of these materials in construction applications will be disturbed and limited. Another feature is that phase change materials, while having a high heat capacity, must also have an acceptable heat transfer coefficient so that they can transfer the stored heat to the desired spaces easily and without disturbance. For the full

performance of these materials, PCMs must be used in which the phase change process is stable and the physical characteristics of them do not change in long cycles. Another thing is that in choosing phase change materials, special attention should be paid to the melting temperature of these materials; For example, when using in the building walls, if the selected material has a melting temperature in the temperature range of the same area around noon, the phase change process occurs during the day, around noon when the ambient temperature reaches its maximum [11].

### 2.3 Methods of using phase change materials

**2.3.1 Using in building directly.** These materials should be placed in containers and used to prevent them from flowing and wasting in the liquid phase. There are three types of phase change materials available in the market for building use: microcapsules containing these materials, plastic macrocapsule envelopes, and hard panels made of high-density polyethylene. The simplest, most practical, and cost-effective method is direct incorporation, in which the PCM is integrated with the construction material. Among the cases of use in this way, we can mention the use in concrete of walls and ceilings or gypsum boards containing these materials [10].

**Figure 4.** Using phase change materials in buildings directly

**2.3.2 Using in building indirectly.** Phase change materials can be used in combination with other components and systems in the building to increase their efficiency. They can be used in: electric heating system, solar heat pump, solar water heaters, refrigeration systems, use as

transparent insulation on windowa, use in solar systems and combination with Trombe wall [11].

### **3. CONCLUSION**

In this article, we introduced phase change materials, their types, how they are used in buildings and their benefits. But efficiency is an important factor that determines whether something is worth using or not. Although PCMs show promising results in most cases, other factors need to be examined to determine the cost-benefit of using such a system. For example, if the system shows a high performance but is costs more than it saves, overall system performance is not acceptable. It is recommended that in future studies, the cost-benefit analysis of using these materials through building life-cycle be considered and also determining how they impact embodied energy and carbon emission is another important issue in the field of sustainability.

## **INTRODUCTION**

The existence of peatlands in Southeast Asia reaches 12% of Southeast Asia's area or around 24 million hectares (Ramadan, 2018). Peatlands in Indonesia are included in the widest ecosystem in Southeast Asia. These peatlands are spread across the three largest islands, namely Papua (8 million Ha), Sumatra (7.2 million Ha) and Kalimantan (5.8 million Ha). (Rais, 2011). The spread of this peatland area is also followed by widespread peat damage. Damage to peatlands disrupts the sustainable function of peatlands as carbon absorption, water buffers, habitat for various flora and fauna and a source of community income. (Ramadan, 2018).

One of the causes of damage to peatlands is land fires. Peatland fires are indeed a very complex matter because they occur with various background issues, one of which is the issue of land ownership related to the management and use of peatlands. (Arifudin et al., 2019). The use of this peatland contributes to the income of farmer households through farming activities of various agricultural commodities.

Agriculture on peatlands cannot be separated from its role in utilizing the land. The use of land by humans for farming can be a turning point for restoration. The success of this recovery depends on the community managing the land. Communities living around the peat area always encounter peat every day. The community can have knowledge about the condition and management of peat. This knowledge is used to manage agricultural land. So the purpose of writing this paper is to find out the perception of public knowledge about peatlands towards the restoration of peat ecosystems.

## **METHOD**

The method used in writing this paper is to use secondary data. Secondary data is used to find information related to the writing of this paper through journals, papers and other literature.

## **RESULT AND DISSCUSION**

Peat ecosystems are included in vulnerable ecosystems (Tamin et al., 2019). The vulnerability of this ecosystem makes the peat ecosystem easily damaged. The existence of peat ecosystems that are damaged and degraded makes peat ecosystems in a state of concern. Peat soils are classified as marginal soils and are prone to disturbance, so that efforts to increase land productivity must be followed by efforts to prevent damage to ecosystems at considerable cost (Erlina et al., 2021). Damage to peatlands is mainly due to tree felling and forest conversion to other uses, fires and reclamation (Wibowo, 2009).

Changes in forest land use are changing the benefits of forest into non-forest land such as settlements, agricultural areas and plantations. the use of forest land to become oil palm plantations, this is because each community party is loaded with their own interests(Acin et al., 2021). The use of peatlands for agriculture has been carried out for a long time and is a source of life for farming families. However, the utilization of peatlands has environmental risks, because peat is very susceptible to degradation(Barlandi, 2020).

Land use is actually a human effort in its interaction with the physical resources of the land in order to meet their needs. Changes in the structure of land use are not merely a physical phenomenon of reducing the area of certain land and increasing land use for other uses, but has a close relationship with changes in the economic, social, cultural and political orientation of society.(Arifudin et al., 2019). Likewise with peatlands, as marginal lands are used because there is a need for plantation development development, both by corporations and the community

Efforts to restore better peatlands are needed to maintain the integrity of the peat ecosystem. The existing perception in the community underlies the attitude and participation of the community towards efforts to prevent peatland fires. The existence of a positive perception from the community can be used as an indicator that the activities carried out to prevent peatland fires have received support from the community in the form of participation or participation from the community in carrying out their activities, because efforts to prevent peatland fires cannot be achieved without community participation(Tampubolon et al., 2018).In this case, the existence of the community is very important in supporting the success of maintaining and improving. Communities living around peat ecosystems will be the first to be affected when they are damaged. The knowledge gained by the community while living around peatlands and the knowledge they have passed down from generation to generation can assist in efforts to restore the function of peatlands.

Communities who have knowledge of how to manage these peatlands can have a positive impact on land restoration activities. Recovery can take place when people understand how important land is and how to manage it. Good management can be done by not burning the land intentionally and massively. Maintenance of canal blockings and maintaining the water level are also commonly carried out by the community because the community has important knowledge regarding how to keep the peat wet.

## **CONCLUSION**

The conclusion of this paper is that people's perceptions about peatland knowledge can be a factor in supporting the successful restoration of damaged peatlands. Damage can be overcome with the knowledge possessed by the community combined with information from outside.

**ON THE NON-EXTENDIBILITY OF D(2) TRIPLES DETERMINED  
WITH THE HELP OF SPECIAL TYPE D(2) PAIRS****Assoc. Prof.Dr. Özen ÖZER**Department of Mathematics, Faculty of Science and Arts, Kırklareli University,  
Kırklareli,, 39100, Türkiye**ÖZET**

Diyofant küme teorisi, bazı koşullara sahip bir tür Diyofant denklemdir. Bu popüler konu, sayılar teorisi/matematikte doğrudan olduğu kadar dolaylı olarak diğer bilimlerdeki etkili uygulamalarda da birçok önemli role sahiptir. Konu antik çağda Diyofantus tarafından keşfedilmiş olsa da günümüzde hala sınıflandırma sorunu bulunmaktadır. Bu çalışmada,  $x'$  in pozitif tamsayılar cinsinden yazıldığı özel D(2) Diyofant çifti  $\{1, x\}$  hakkında birkaç yeni sonuç ve yaklaşım elde edilmiştir. Çalışmanın başında bu tür çiftlerin sayısal olarak iterasyonu belirlenir. Daha sonra düzenli D(2) üçlüsüne genişletilebilirlikleri elde edilmiş ve Diyofant denklemleri teorisi kullanılarak D(2) Diyofant 4-lülerine genişletilemeyecekleri kanıtlanmıştır. Hesaplama sonuçları da elde ettiğimiz sonuçları desteklemekte ve bir sonraki çalışmamızda bu çalışmayı genelleştirmek için genel sonuçlar elde etmemizi sağlamaktadır.

**ON THE NON-EXTENDIBILITY OF D(2) TRIPLES DETERMINED WITH THE  
HELP OF SPECIAL TYPE D(2) PAIRS****ABSTRACT**

Diophantine set theory is a kind of Diophantine equations with some conditions. This popular topic has many significant role in number theory/ mathematics as directly as well as effective applications in other sciences indirectly. Even the topic was found out by Diophantus in the ancient time, it still has classification problem at the present time. In this paper, several new results and approximations on the specific kind of D(2) Diophantine pair  $(1, x)$  such that  $x$  is written in the terms of the positive integers) are obtained. In the beginning of the work, it is determined iteration of the such type of pairs as numerically. Then, it is obtained their extendibility to regular D(2) triple and proved that they can not be extended to D(2) Diophantine 4-tuples by using theory of Diophantine equations. Computational results are also lend countenance to our acquired results and, they give us to get general results to generalize this work in our next work.

**Keywords:** Diophantus' Set Theory, Diophantine Equations, Pell Equations, Positive Integers, Regularity condition for D(n) Diophantine Triples, Repeating, Prime Numbers, indefinite binary quadratic form, equivalence class, fundamental solution

## INTRODUCTION

Diophantus (Father of Algebra) lived in Alexandria, Egypt between 200 AD and 214 to 284 or 298 AD and little is known about the life of him. He knows with his many theories and Diophantine set theory (given in the preliminaries section) is considered in this work.

One of the famous Diophantine sets is Fermat set known as  $\{1, 3, 8, 120\}$  in the set of integers. They can be determined in the terms of rational numbers, Gaussian number so on... They are a kind of Diophantine equations and it is directly related with solutions of the Pell equations. Even some of the properties and definitions are given in the preliminaries section, readers can find more information on the Diophantine set theory and Pell equations in the references.

The aim of this work is to remind some fundamental notations firstly. Then, we deal with a type of Diophantine  $D(2)$  pairs started with number one (1) and ongoing with positive integers such as  $\{1, 2\}$ ,  $\{1, 7\}$ ,  $\{1, 14\}$  ...so on...

it is demonstrated that a special type of Diophantine  $D(2)$  pairs ( $\{1, x\}$  where  $x$  is a suitable positive integer) can extendable to Diophantine  $D(2)$  regular triples but they can not be finding primitive fundamental solutions of the Pell equations.

## PRELIMINARIES AND METHODS OF THE PAPER

### Definition 1. (Dujella's papers)

Assume that  $k$  be an integer.  $P_k$ -set of size  $r$  or  $D(k)$  set (with size  $r$ ) is defined (called as or the Diophantine  $r$ -tuple with property  $D(k)$ ) by a set  $\Gamma = \{t_1, t_2, t_3, \dots, t_r\}$  of distinct positive integers where  $t_i t_j + r$  is the square of an integer for each  $i \neq j$ .  $D(k)$ -set  $\Gamma$  can be extended to a new  $D(k)$ -set for size  $r+1$ , if there exists a positive integer  $u \notin \Gamma$  such that  $\Gamma \cup \{u\}$  is again a  $D(k)$ -set.

### Definition 2. (Dujella's papers, Regularity Condition for Triples and Quadruples)

(i) A Diophantine  $D(k)$  triple  $\Gamma = \{t_1, t_2, t_3\}$  in set of the positive integers is called as regular if  $(t_3 - t_2 - t_1)^2 = 4 \cdot (t_1 t_2 + k)$ .

(ii) A Diophantine  $D(k)$  quadruple  $\Gamma = \{t_1, t_2, t_3, t_4\}$  in set of the positive integers is defined as regular if  $k \cdot (t_4 + t_3 - t_2 - t_1)^2 = 4 \cdot (t_1 t_2 + k)(t_3 t_4 + k)$ .

In order to find the solutions of the Pell equations we obtained in this study by using the theory and methods expressed in Matthew's and Stolt's articles, the following information can be given briefly. (Since the techniques of Stolt's papers and Matthew's papers are different from each others and their effectives are changeable for different methods while finding primitive fundamental solutions):

Matthew paid regard to the integer solutions  $(u, v)$  of the equation/binary quadratic form  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$ , for integers  $\mathcal{A}, \mathcal{B}, \mathcal{C}, \mathcal{N}$  such that  $\mathcal{A} > 0, \mathcal{N} \neq 0$  and  $\mathcal{D} = \mathcal{B}^2 - 4\mathcal{A}\mathcal{C} > 0$  is non-square. He gave following results:

Let us consider  $(r, s)$  be an integer solution of  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$  and also  $(r_1, s_1)$  is defined as follows:

$$r_1 = \frac{r(u - \mathcal{B}v)}{2} - \mathcal{C}sv, \quad s_1 = \frac{s(u + \mathcal{B}v)}{2} - \mathcal{A}rv$$

where  $(u, v)$  holds Pell's equation  $u^2 - \mathcal{D}v^2 = 4$ .

Then,  $(r_1, s_1)$  also becomes an integer solution of  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$ . From the equations  $r_1 = \frac{r(u - \mathcal{B}v)}{2} - \mathcal{C}sv$   $s_1 = \frac{s(u + \mathcal{B}v)}{2} - \mathcal{A}rv$  it is obtained that

$$2\mathcal{A}r_1 + \mathcal{B}s_1 + s_1\sqrt{\mathcal{D}} = \frac{u + v\sqrt{\mathcal{D}}}{2} (2\mathcal{A}r + \mathcal{B}s + s\sqrt{\mathcal{D}})$$

which is an equivalence relation on the set of integer solutions of  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$ .

**Definition 3. (Matthew's papers)**

Assume that  $(u_1, v_1)$  is the solution of the Pell equation (1.3) with least positive  $u$  and  $v$ . Then

$$(R, S) = \begin{cases} \left( \sqrt{\frac{\mathcal{A}\mathcal{N}(u_1 - 2)}{\mathcal{D}}}, \sqrt{\frac{\mathcal{A}\mathcal{N}(u_1 + 2)}{\mathcal{D}}} \right) & \text{if } \mathcal{N} > 0 \\ \left( \sqrt{\frac{\mathcal{A}\mathcal{N}(u_1 + 2)}{\mathcal{D}}}, \sqrt{\frac{\mathcal{A}\mathcal{N}(u_1 - 2)}{\mathcal{D}}} \right) & \text{if } \mathcal{N} < 0 \end{cases}$$

Stolt determined the following needed requirement for  $(r, s)$  to be a fundamental solution.

**Proposition 1. (Stolt's papers)**

Supposing that  $(r, s)$  be a fundamental solution of the Diophantine equation  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$ . Then  $0 \leq s \leq S$ .

This was a generalization of the theorem in Nagell's paper (He tried hard for the solutions of the equation  $r^2 - ds^2 = \mathcal{N}$  by using the classical Pell equation's  $u^2 - dv^2 = 1$  solutions.)

**Theorem 1. (Taken from Matthews' papers to get a refinement of the Stolt bounds which completely characterizes the fundamental solutions.)**

(a) Assuming that  $(u_1, v_1)$  be the least positive solution of Pell's equation  $u^2 - \mathcal{D}v^2 = 4$  and  $\mathcal{N} > 0$ . So, an integer pair  $(r, s)$  satisfying  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$  is a fundamental solution iff one of the following statements are satisfied:

(i)  $0 < s < S$ .

(ii)  $s = 0$  and  $r = \sqrt{\mathcal{N}/\mathcal{A}}$

(iii)  $s = S$  and  $r = (R - \mathcal{B}S)/(2\mathcal{A})$ .

(b) Supposing that  $(u_1, v_1)$  be the least positive solution of Pell's equation  $u^2 - \mathcal{D}v^2 = 4$  and  $\mathcal{N} < 0$ . So, an integer pair  $(r, s)$  satisfying  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$  is a fundamental solution iff one of followings are satisfied:

(i)  $\sqrt{4\mathcal{A}|\mathcal{N}|/\mathcal{D}} \leq s < S$ .

(ii)  $s = S$  and  $r = (R - \mathcal{B}S)/(2\mathcal{A})$ .

So, it is noted that  $R$  becomes an integer if  $S$  is an integer.

**On the equation  $r^2 - \mathcal{d}s^2 = \mathcal{N}$**

Matthew was occupied in doing the special case of equation/binary quadratic form  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$  and considered following Pell equation  $r^2 - \mathcal{d}s^2 = \mathcal{N}$ .

In  $\mathcal{A}r^2 + \mathcal{B}rs + \mathcal{C}s^2 = \mathcal{N}$ , he took into consideration  $\mathcal{A} = 1$ ,  $\mathcal{B} = 0$  and  $\mathcal{C} = -\mathcal{d}$ , where  $\mathcal{d} > 0$  is not a perfect square and  $\mathcal{N}$  is nonzero. Then  $\mathcal{D} = 4\mathcal{d}$ , and the equivalence relation  $r_1 = \frac{r(u-\mathcal{B}v)}{2} - \mathcal{C}sv$ ,  $s_1 = \frac{s(u+\mathcal{B}v)}{2} - \mathcal{A}rv$  between two integer solutions  $(r, s), (r_1, s_1)$  of equation  $r^2 - \mathcal{d}s^2 = \mathcal{N}$  makes modest to  $r_1 + s_1\sqrt{\mathcal{d}} = (r + s\sqrt{\mathcal{d}})(u + v\sqrt{\mathcal{d}})$  where  $(u, v)$  holds Classical Pell's equation  $u^2 - \mathcal{d}v^2 = 1$ .

He simplified to Theorem 1 as follows:

**Theorem 2. (From Matthew's papers)**

(a) Assuming that  $(u_0, v_0)$  be the least positive solution of Pell's equation  $u^2 - \mathcal{d}v^2 = 1$  and  $\mathcal{N} > 1$ . Hence, an integer pair  $(r, s)$  holding  $r^2 - \mathcal{d}s^2 = \mathcal{N}$  is a fundamental solution iff one of the followings is satisfied:

(i)  $0 < s < v_0\sqrt{\mathcal{N}/(2u_0 + 2)}$ .

(ii)  $s = 0$  and  $r = \sqrt{\mathcal{N}}$ .

(iii)  $s = v_0\sqrt{\mathcal{N}/(2u_0 + 2)}$  and  $r = \sqrt{\mathcal{N}(u_0 + 1)/2}$ .

(b) Supposing that  $(u_0, v_0)$  be the least positive solution of Pell's equation  $u^2 - \mathcal{d}v^2 = 1$  and  $\mathcal{N} < 0$ . So, an integer pair  $(r, s)$  holding  $r^2 - \mathcal{d}s^2 = \mathcal{N}$  is a fundamental solution iff the following holds:

(i)  $\sqrt{|\mathcal{N}|/\mathcal{D}} \leq s < v_0\sqrt{\mathcal{N}/(2u_0 + 2)}$ .

(ii)  $s = v_0\sqrt{|\mathcal{N}|/(2u_0 + 2)}$  and  $r = \sqrt{|\mathcal{N}|(u_0 + 1)/2}$

*To see how these results are used in the numerical examples, followings can be given from the references as illustrates.*

**Instance 1. (From Stolt's paper)**

Let us consider binary quadratic form as  $209r^2 + 29rs + s^2 = 31$ . So, it is obtained that  $\mathcal{D} = 5$ ,  $(u_1, v_1) = (3, 1)$ ,  $\sqrt{\mathcal{N}/\mathcal{A}} = \sqrt{31/209} = 0.38 \dots$  and  $S = 35.99 \dots$ . Thus, the fundamental solutions are on the range  $1 \leq s \leq 35$  and solutions are obtained as  $(-2, 23)$  and  $(-2, 35)$ .

**Instance 2. (From Frattini's paper)**

From the Pell equation  $r^2 - 96s^2 = 4$  it is easily seen that  $\mathcal{d} = 96$ ,  $(u_0, v_0) = (49, 5)$ ,  $\sqrt{\mathcal{N}} = 2$ ,  $S_0 = 1$ ,  $R_0 = 10$ , and  $(\sqrt{\mathcal{N}}, 0) = (2, 0)$  and  $(R_0, S_0) = (10, 1)$  are the fundamental solutions.

**Instance 3. (From Matthew's paper)**

Consider Pell equation  $s^2 - 96r^2 = -96$ . Then, it is obtained that  $\mathcal{d} = 96$ ,  $(u_0, v_0) = (49, 5)$ ,  $\sqrt{|\mathcal{N}|/\mathcal{d}} = 1$ ,  $R_0 = 5$ ,  $S_0 = 48$  and  $(0, \sqrt{|\mathcal{N}|/\mathcal{d}}) = (0, 1)$  and  $(S_0, R_0) = (48, 5)$  are the fundamental solutions. No more solutions are on the range  $1 \leq s \leq 4$ .

**3.MAIN RESULTS**

By using method of Matthews et al. work on the fundamental units of binary quadratic forms, following theorems are proved for Diophantine D(2) sets (size three) and demonstrated that they can not be extended to Diophantine D(2) quadruples.

From the paper of ICOM 2022 conference, it has been known that some positive integers such as 3 or any multiple of 3, 4 or any multiple of 4, 5 or any multiple of 5 ... etc can not be in the Diophantine D(2) sets with arbitrary size (Theorem 1).

Now, it is demonstrated that  $\{1, 2\}$ ,  $\{1, 7\}$ ,  $\{1, 14\}$ , ... are Diophantine D(2) pairs. Then, such sets are extended to Diophantine D(2) triples by adding suitable smallest positive integer but they can not be extended to Diophantine D(2) quadruples using method of the Matthews (fundamental unit of the binary quadratic forms).

**Theorem 1.**  $\{1, 7\}$  is a Diophantine D(2) pair and also, it is extendable to a Diophantine D(2) triple by positive integer 14 and more.

**Proof.** In the beginning it has to be proved that  $\{1, 7\}$  is Diophantine D(2) 2-tuple. Using definition of the Diophantine D(2) set from preliminaries section ( Definition 1), then it is

obtained that  $1.7 + 2 = (\pm 3)^2$ . This gives us, the set  $\{1, 7\}$  satisfies Diophantine D(2) pair's definition.

Let us consider  $\alpha$  be a smallest positive integer such that  $\{1, 7, \alpha\}$  Diophantine D(2) triple. Hence, followings are satisfied for some  $X, Y$  integers.

$$\alpha + 2 = X^2 \text{ and } 7\alpha + 2 = Y^2$$

At this stage, it is calculated that  $\alpha = 14$  is the smallest positive integer and also, Diophantine D(2) pair  $\{1, 7\}$  is extended to Diophantine D(2) triple as  $\{1, 7, 14\}$ .

**Theorem 2.**  $\{1, 7, 14\}$  is regular Diophantine D(2) 3-tuple but it is not extended to Diophantine D(2) 4-tuple.

**Proof.** In the Definition 2, it has been defined regularity conditions for Diophantine D(k) triples and Diophantine D(k) quadruples. From the Definition 2,  $\{1, 7, 14\}$  satisfies regularity condition. So,  $\{1, 7, 14\}$  is a Diophantine D(2) regular triple.

Assume that  $\{1, 7, 14\}$  is extended for suitable positive integer  $\theta$  such that  $\{1, 7, 14, \theta\}$  is a Diophantine D(2) 4-tuple. From the definition of Diophantine D(2) quadruple, we have  $u, v, w$  integers such that followings are satisfied;

$$\theta + 2 = u^2$$

$$7\theta + 2 = v^2$$

$$14\theta + 2 = w^2$$

If these equations are simplified, then following Diophantine equations are obtained;

$$7u^2 - v^2 = 12$$

$$14u^2 - w^2 = 26$$

$$2v^2 - w^2 = 2.$$

Using method of the Matthews (given in the prelimineries section with details), we obtain following results:

For  $7u^2 - v^2 = 12$ , we get  $\mathcal{D} = 28$ . Also, Pell equation  $x^2 - 28y^2 = 4$  has the least positive solution as  $(x_0, y_0) = (16, 3)$  and,  $\sqrt{\mathcal{N}/\mathcal{A}} = \sqrt{12/7} = 1.30930$  as well as  $R = 6.48074$  are not integers. Then, any remaining solutions are obtained on the range for  $1 \leq s \leq 6$  as  $(2, 4)$  and  $(-2, 4)$ . So,  $7u^2 - v^2 = 12$  has two fundamental solutions.

Similarly;

For  $14u^2 - w^2 = 26$ , we have  $\mathcal{D} = 56$ . Additionally, Pell equation  $x^2 - 56y^2 = 4$  has the least positive solution as  $(x_0, y_0) = (30, 4)$  but neither  $\sqrt{\mathcal{N}/\mathcal{A}} = \sqrt{26/14} = 1.36276$  nor  $R = 13.49073$  are integers. Hence, any remaining solutions are attained on the range for  $1 \leq s \leq 13$  as  $(3, 10)$  with  $(-3, 10)$  and  $14u^2 - w^2 = 26$  has two fundamental solutions.

For  $2v^2 - w^2 = 2$ , we have obtain  $\mathcal{D} = 8$ . Moreover, Pell equation  $x^2 - 8y^2 = 4$  has the least positive solution as  $(x_0, y_0) = (6, 2)$  and  $\sqrt{\mathcal{N}/\mathcal{A}} = \sqrt{2/2} = 1$  is an integer but  $R = 1.41421$  is not integer. Thus, any remaining solutions are achieved on the range for  $1 \leq s \leq 1$  as  $(1, 0)$  and  $2v^2 - w^2 = 2$  has just one fundamental solution.

If it is considered the above solutions, it is seen that there isn't any common solution that makes  $u, v, w$  be integers at the same time.

So, any positive integer  $\theta$  can not be obtained to makes  $\{1, 7, 14, \theta\}$  as Diophantine  $D(2)$  4-tuple  $\{1, 7, 14, \theta\}$  is not extended to Diophantine  $D(2)$  4-tuple.

**Theorem 3.**  $\{1, 14\}$  is a Diophantine  $D(2)$  pair. Further, it is extended to a Diophantine  $D(2)$  triple by adding positive integer 23.

**Proof.** Firstly, it has to be proven whether or not  $\{1, 14\}$  is a Diophantine  $D(2)$  2-tuple? Using Definition 1 on the  $\{1, 14\}$ , it is obtained  $1 \cdot 14 + 2 = (\pm 4)^2$ . It implies that  $\{1, 14\}$  is a Diophantine  $D(2)$  pair.

It is assumed  $\beta$  be the smallest positive integer such that  $\{1, 14, \beta\}$  be a Diophantine  $D(2)$  triple. So, following equations are satisfied

$$\beta + 2 = M^2 \text{ and } 14\beta + 2 = N^2$$

for some  $M, N$  integers.

It is seen that  $\beta = 23$  is the smallest positive integer makes Diophantine  $\{1, 14\}$  to Diophantine  $D(2)$  triple as  $\{1, 14, 23\}$ .

**Theorem 4.**  $\{1, 14, 23\}$  is a regular Diophantine  $D(2)$  triple although it can not extendable to Diophantine  $D(2)$  quadruple.

**Proof.** Using the regularity condition mentioned in the Definition 2 (previous section), it is easily seen that that  $\{1, 14, 23\}$  is a Diophantine  $D(2)$  regular triple.

Suppose that  $\{1, 14, 23\}$  can be extended for suitable positive integer  $\mu$  so that  $\{1, 14, 23, \mu\}$  is a  $D(2)$  Diophantine 4-tuple. So, following equations are satisfied for  $u_1, v_1, w_1$ ;

$$\mu + 2 = u_1^2$$

$$14\mu + 2 = v_1^2$$

$$23\mu + 2 = w_1^2$$

Followings are obtained by abbreviation  $\mu$ ;

$$14u_1^2 - v_1^2 = 26$$

$$23u_1^2 - w_1^2 = 44$$

$$23v_1^2 - 14w_1^2 = 18$$

In the similar way of the proof of Theorem 2 and Maththews' method, following results are obtained:

We have calculated there are two fundamental solutions as  $(3, 10)$  with  $(-3, 10)$  for  $14u_1^2 - v_1^2 = 26$  from the previous theorem.

For  $23u_1^2 - w_1^2 = 44$ , we have  $\mathcal{D} = 92$  and Pell equation  $x_1^2 - 92y_1^2 = 4$  has the least positive solution as  $(x_0, y_0) = (48, 5)$ . Furthermore, both  $\sqrt{\mathcal{N}/\mathcal{A}} = \sqrt{44/23} = 1.38312$  and  $R_1 = 22.49444$  are not integers. In the present case, any remaining solutions are obtained on the range for  $1 \leq s_1 \leq 22$  as  $(4, 18)$  and  $(-4, 18)$ . So,  $23u_1^2 - w_1^2 = 44$  has two fundamental solutions.

For  $23v_1^2 - 14w_1^2 = 18$ , we obtain  $\mathcal{D} = 1288$  and Pell equation  $x_1^2 - 1288y_1^2 = 4$  has the least positive solution as  $(x_0, y_0) = (646, 18)$ . Addedly,  $\sqrt{\mathcal{N}/\mathcal{A}} = \sqrt{18/23} = 0.88464$  and  $R_1 = 14.38749$  are not integers. In the circumstances, any remaining solutions are got on the range for  $1 \leq s_1 \leq 14$  as  $(4, 5)$  and  $(-4, 5)$ . Thus,  $23v_1^2 - 14w_1^2 = 18$  has two fundamental solutions.

From the solutions calculated as above, it is obtained that there is no common solution for Pell equations. It implies that there is no suitable positive integer  $\mu$  to makes  $\{1, 14, 23, \mu\}$  as Diophantine D(2) four-tuple.

Therefore,  $\{1, 14, 23\}$  can not extendable to Diophantine D(2) quadruple.

**Theorem 5.** The following statements are performed and can be resumed.

- (i) A set  $\{1, 23\}$  is a diophantine D(2) pair and it can be extendable to a Diophantine D(2) triple by  $\{1, 23, 34\}$ .

(ii) A set  $\{1, 34, 47\}$  is a diophantine D(2) pair and it is extended to a Diophantine D(2) triple  
by  $\{1, 23, 34\}$  .

(iii)...

**Proof.** In the same vein of the demonstrations of Theorem 1 or Theorem 3, it can be got result easily. Hence, demonstration is left for readers.

**Theorem 6.** The following executions are provided and can be continued as follows:

(i) The set  $\{1, 23, 34\}$  is a regular Diophantine D(2) triple although it is not extendable to Diophantine D(2) quadruple.

(ii) The set  $\{1, 34, 47\}$  is a regular Diophantine D(2) triple although it is not extendable to Diophantine D(2) quadruple.

(iii)...

**Proof.** From the proofs as mentioned above, demonstration of the Theorem 6 is easily got by readers. Thus, proof is left for readers.

## CONCLUSION

In this study, it is demonstrated that a specific type of Diophantine D(2) pairs ( i.e.  $\{1, x\}$  for  $x$  positive integer) are extendable to Diophantine D(2) regular 3-tuple but they can not extendable Diophantine D(2) 4-tuple. This work and previous one imply that there is an especial iteration for Diophantine D(2) pairs and triples. In the next work, such papers will be generalized in the terms of natural numbers and obtained different relations of them with quadratic fields. So, it will be more useful for readers to apply these works to other topics.

**SOME NUMERICAL RESULTS AND CLASSIFICATIONS ON THE  $P_{\mp 19^2}$   
DIOPHANTINE REGULAR QUADRUPLES****Assoc. Prof. Dr. Özen ÖZER**Department of Mathematics, Faculty of Science and Arts, Kırklareli University,  
Kırklareli,, 39100, Türkiye**ÖZET**

Literatürde “ $r$ -elemanlı Diyofant  $P_k$  kümelerinin pozitif tamsayılar kümesinin bir alt kümesi olduğu ve  $r$ -farklı doğal sayıyı içeren  $\Gamma = \{\zeta_1, \zeta_2, \zeta_3, \dots, \zeta_r\}$  kümesinin elemanlarının  $i, j=1, 2, \dots, r$  ve  $i \neq j$  için  $\zeta_i \cdot \zeta_j + k$  bir tam kare tamsayı olması” şeklinde tanımlanır. Bu çalışmada, Diyofant  $P_{\mp 19^2}$  kümelerini elde etmek için ilk olarak bir elemanlıdan iki elemanlı kümeye geçilecek şekilde başlayarak bazı doğal sayıları ele almaktayız. Daha sonra, bu tür kümeler için (düzenlilik koşullarıyla) üç elemanlı kümeye genişletilebilirliğini araştırmaktayız. Bundan sonra, bu tür kümelerin dördüncü elemanları üzerinde bazı sonuçlar elde edilmekte ve bunlar dört elemanlı Diyofant  $P_{\mp 19^2}$  kümelerine genişletilmektedir. Cebirsel yollarla ilerlenen bu bakış açısıyla bazı karakterizasyon sonuçları gösterilmektedir. Son olarak, özel  $k$  asal sayı değeri için  $P_{\mp k^2}$  'nin genelleştirileceği bir sonraki çalışmamızın temeli olarak (bu çalışmayı dikkate almak için) çalışma hakkında bazı yeni yaklaşımlar ve görüşler verilmektedir.

**Anahtar Kelimeler:** Dört Elemanlı Diyofant  $P_{\mp k}$  Kümeleri,  $P_{\mp k}$  Kümelerinin Karakterizasyonu, Pell Denklemlerinin Tamsayı Çözümleri, İkinci Dereceden Kalıntı Teoremi, Kuadratik Kalıntı Teoremi, Kuadratik Karşılıklık Teoremleri, Legendre Sembolü, Pozitif Tamsayılar, Asal Sayılar, Düzenlilik Koşulu.

**SOME NUMERICAL RESULTS AND CLASSIFICATIONS ON THE  $P_{\mp 19^2}$   
DIOPHANTINE REGULAR QUADRUPLES****ABSTRACT**

In the literature, it is defined that “Diophantine  $P_k$  sets with  $r$ -tuples is a subset of positive integers’ set and includes  $\Gamma = \{\zeta_1, \zeta_2, \zeta_3, \dots, \zeta_r\}$   $r$ -different natural numbers with the condition  $\zeta_i \cdot \zeta_j + k$  perfect square integer for  $i, j = 1, 2, \dots, r$  and  $i \neq j$ .” In the present work, we consider some natural numbers to get Diophantine  $P_{\mp 19^2}$  sets by starting from size one to two firstly. Then, extendibility to size three of them (with regularity conditions) is investigated for such sets. After that, some results on the fourth elements of the such sets are obtained and they are extended to Diophantine  $P_{\mp 19^2}$  sets with size four. Some characterization results are demonstrated on this perspection using algebraic ways. Lastly, some new approximations and opinions are given on the work to consider this work as a base of the our next work which will be generalized of  $P_{\mp k^2}$  for special type of  $k$  prime.

**Keywords:** Diophantine  $P_{\mp k}$  Sets with Size Four, Characterization of  $P_{\mp k}$  Sets, Integral Solutions of Pell Equations, Quadratic Residue Theorem, Quadratic Reciprocity Theorems, Legendre Symbol, Positive Integers, Prime Numbers, Regularity Conditions.

## **INTRODUCTION, PRELIMINARIES AND METHODS OF THE PAPER**

Number theory (which is studied on numbers and their properties) is a queen of mathematics and other sciences. It involves large number of topics such as prime numbers, factorization, Diophantine equations theory, modular arithmetic, congruence, continued fractions, elliptic curves, arithmetic functions, algebraic numbers, quadratic forms, class number, sieve theory, reciprocity theory... so on. Different from mathematics, number theory is also connected with cryptography such as online shopping, mobile phone privacy, secure online banking tools.

For this work, we consider Diophantine set theory and use concepts of the theory which are given in the reference section.

It is known that a lot of examples (such as clock, weeks, ...) of modular arithmetic (includes different types of congruences and their properties) has been in the real life as well as science (probabilistic primality test, cryptography, legendre symbol, quadratic reciprocity law etc. are used in this work).

Diophantus who is the father of algebra lived between 250 and 350 A.D. approximately. He also introduced representations for unknowns with the degree of the variables as Diophantine equations. The equations in two or more variables with integer solutions are named by Diophantine equations. Especially, a general form of Pell like equations (a type of Diophantine equations) is in the form  $ax^2 - by^2 = \mp N$  where  $d$  and  $N$  are integers. Even it has many (finite or infinite) solutions, the fundamental solution is given by the pair  $(a, b)$  where they are positive and minimal.

In this work, we discuss how can we obtain Diophantine  $P_{\mp 19^2}$  pairs and their extensions. Firstly, we introduce some notations as modular arithmetic, quadratic residue, Legendre symbol, quadratic reciprocity laws with their basic properties. Then, characterization of the elements of Diophantine  $P_{\mp 19^2}$  sets is determined. Also, extendibility of Diophantine  $P_{\mp 19^2}$  pairs are demonstrated as Diophantine  $P_{\mp 19^2}$  triples and quadruples for several numerical results using different methods of determination of the solutions of Pell equations. Lastly, some other open problems are mentioned for Diophantine  $P_{\mp 19^2}$  pairs, triples and quadruples.

Following concepts for our work can be given briefly:

**Definition 1. (Quadratic Residue)**

Assume that  $\gamma$  is a positive integer. If  $\gcd(\beta, \gamma) = 1$  i.e.  $\beta, \gamma$  are coprimes) and the quadratic congruence  $z^2 \equiv \beta \pmod{\gamma}$  can be solvable, then an integer  $\beta$  is defined as a quadratic residue of  $\gamma$ .

The other way around,  $\beta$  is a quadratic nonresidue of  $\gamma$  if the congruence  $z^2 \equiv \beta \pmod{\gamma}$  has no solution.

The theorem:

*“If  $q \neq 2$  is a prime number, then there are certainly  $(q-1)/2$  quadratic residues (mod  $q$ ) and  $(q-1)/2$  quadratic nonresidues (mod  $q$ ) in the set of integers from 1 to  $q-1$ .”*

also demonstrated the number of integers how many of them are quadratic residues (mod  $q$ ) for  $q$  an odd prime.

Legendre symbol is associated with quadratic residues and defined rely on it as follows;

**Definition 2. (Legendre Symbol)**

Assume  $q$  is an odd prime and  $m$  is any integer. The Legendre symbol  $(m/q)$  is defined as follows;

- $(m/q) = +1;$             if  $m$  is a quadratic residue (mod  $q$ ),
- $(m/q) = -1;$         if  $m$  is a quadratic non-residue (mod  $q$ ) and,
- $(m/q) = 0;$          if  $q$  divides  $m$

It is also proved as  $(m/q) \equiv m^{(q-1)/2} \pmod{q}$  by Euler.

The law of quadratic reciprocity is related with Legendre symbol and primes. It also defined as follows:

**Definition 3. (The Law of Quadratic Reciprocity)**

Suppose that  $P$  and  $Q$  are odd primes. The multiplying of their Legendre symbols has the following certain formula:

$$\left(\frac{Q}{P}\right)\left(\frac{P}{Q}\right) = (-1)^{\frac{P-1}{2} \cdot \frac{Q-1}{2}}$$

This is named as Quadratic Reciprocity Law.

In especially:

If  $P \equiv Q \equiv 1 \pmod{4}$ , then the congruences  $z^2 \pmod{Q} \equiv P \pmod{Q}$  and  $z^2 \pmod{P} \equiv Q \pmod{P}$  can be either both solvable or both not solvable.

If  $P \equiv Q \equiv 3 \pmod{4}$ , then one of the congruences  $z^2 \pmod{Q} \equiv P \pmod{Q}$  and  $z^2 \pmod{P} \equiv Q \pmod{P}$  can be solvable, the other not solvable.

Generalization of the Legendre symbol is named by Jacobi symbol and defined as follows:

**Definition 4. (Jacobi Symbol)**

Suppose  $n$  and  $m$  are any integers. The Jacobi symbol  $(m/n)$  is defined as follows;

$$\left(\frac{m}{n}\right) = \left(\frac{m}{Q_1}\right) \cdot \left(\frac{m}{Q_2}\right) \cdot \left(\frac{m}{Q_3}\right) \dots \left(\frac{m}{Q_s}\right)$$

where  $\left(\frac{m}{Q_s}\right)$  denote the Legendre symbols (for  $i=1, \dots, s$ ) of a modulo the prime numbers  $Q_i$  (without exponential value) dividing  $n$ .

**Definition 5. (Dujella’s papers and other Diophantine set references)**

Suppose that  $t$  is an integer. A  $P_t$ -set of size  $m$  is determined by a set  $Z = \{k_1, k_2, k_3 \dots k_m\}$  of distinct positive integers where their multiply are increased by  $t$  is the square of an integer for each  $i \neq j$ .

A  $P_t$ -set  $Z$  is extended to a new  $P_t$ -set with size  $m+1$ , if there exists a positive integer  $x \notin Z$  such that  $Z \cup \{x\}$  is once more a  $P_t$ -set. If  $m=3$  then it is named as Diophantine  $P_t$  triple.

**Definition 6. (Regularity Condition for Triples from Dujella’s papers)**

A Diophantine  $P_t$ -triple  $Z = \{k_1, k_2, k_3\}$  in set of the positive integers is named by regular if the condition  $(k_3 - k_2 - k_1)^2 = 4 \cdot (k_1 k_2 + t)$  is satisfied.

**Definition 7. (Regularity Condition for Quadruples from Dujella’s papers)**

A Diophantine  $P_t$ -quadruple  $Z = \{k_1, k_2, k_3, k_4\}$  in set of the positive integers is named by regular if the condition  $t \cdot (k_4 + k_3 - k_2 - k_1)^2 = 4 \cdot (k_1 k_2 + t)(k_3 k_4 + t)$  is proved.

**3.MAIN RESULTS**

Firstly, characterization of the numbers are determined for Diophantine  $P_{361}$  and  $P_{-361}$  sets as follows:

**Theorem 1.** A Diophantine  $P_{-361}$ -set can not include many positive integers such as written by  $3a, 4b, 7c, 11d, 23e, 31f, 43g, 47h$ , ( $a, b, c, d, e, f, g, h$  are positive integers) so on...

**Proof.** In this proof, we just make proof for  $7c$  and  $23e$  ( $c, e$  positive integers) different from other works and the rest can be done by readers similarly.

(i) Assume that  $7c$  ( $c \in \mathbb{Z}^+$ ) is in the Diophantine  $P_{-361}$ -sets. So, following equation has solution for  $x \in P_{-361}$  using the definition of the Diophantine  $P_{-361}$ -set:

$$7c \cdot x - 361 = A^2$$

Applying (mod 7) to such equation we have  $A^2 \equiv +3 \pmod{7}$  quadratic congruence. So, we obtain following result for Legendre symbol by using definitions (quadratic reciprocity law, legendre symbol, residue) of preliminaries section.

$$\left(\frac{3}{7}\right) = -1$$

It implies that  $A^2 \equiv +3 \pmod{7}$  has not got any solution and  $7c \cdot x - 361 = A^2$  can not be solved. This is a contradiction.

Therefore, 7 or  $7c$  ( $c \in \mathbb{Z}^+$ ) can not be in the Diophantine  $P_{-361}$ -sets.

(ii) Suppose that  $23e$  ( $e \in \mathbb{Z}^+$ ) is in the Diophantine  $P_{-361}$ -sets. Then, followings has solution for  $y \in P_{-361}$  using the definition of the Diophantine  $P_{-361}$ -set:

$$23e \cdot y - 361 = B^2$$

Applying (mod 23) to such equation, we obtain  $B^2 \equiv +7 \pmod{23}$  quadratic congruence. So, following result is achieved for Legendre symbol using q definitions of uadratic reciprocity law, legendre symbol, residue in preliminaries section.

$$\left(\frac{7}{23}\right) = -1$$

It implies that  $B^2 \equiv +7 \pmod{23}$  has not got any solution and  $23e \cdot y - 361 = B^2$  can not be solved. This is a contradiction.

Hence, 23 or  $23e$  ( $e \in \mathbb{Z}^+$ ) can not be in the Diophantine  $P_{-361}$ -sets.

**Theorem 2.** A Diophantine  $P_{-361}$ -set can include all types of natural numbers.

**Proof.** As it is seen that  $+361 = 19^2$  is a perfect square and every natural number can belong to a Diophantine  $P_{-361}$ -set from the definition of the legendre symbol and property of  $(m/q) = 1$  unless  $q$  prime divides  $m$ . Thus, it is not need to classified Diophantine  $P_{-361}$ -set s for natural numbers.

After now, it is worked how some special numerical values can be extended to a Diophantine  $P_{-361}$  or  $P_{+361}$  pairs, triples or quadruples as follows:

**Theorem 3.** The set  $\{2\}$  is extended to Diophantine  $P_{+361}$  pairs with positive integers 40, 84, 132, 240, ... so on.

**Proof.** Let us consider that  $\vartheta$  is the second positive integer in the set of  $\{2\}$  as Diophantine  $P_{+361}$  pairs. Then, we have following equation with solutions ( $d$  is an integer) using the definition of Diophantine  $P_{+361}$  pairs ;

$$2\vartheta + 361 = d^2$$

It is easily seen that  $\vartheta = 40$  is the smallest positive such that this smallest integer makes the left-hand side of the equation a perfect square. ( $2 \cdot 40 + 361 = 441 = 21^2$ ). Also, there are other positive  $\vartheta$  integers such as  $\vartheta = 84$  ( $2 \cdot 84 + 361 = 529 = 23^2$ ),  $\vartheta = 132$  ( $2 \cdot 132 + 361 = 625 = 25^2$ ), ... etc make the left-hand side of the equation a perfect square.

So,  $\{2, 40\}$ ,  $\{2, 84\}$ ,  $\{2, 132\}$ , ... are Diophantine  $P_{+361}$  pairs.

**Theorem 4.** The set  $\{2, 132\}$  can be extended to regular Diophantine  $P_{+361}$  triples with positive integers 184, 240, ... etc.

**Proof.** Assume that  $\aleph$  is the third positive integer in the set of  $\{2, 132\}$  as Diophantine  $P_{+361}$  triples. So, followings have solutions ( $e, f$  are integers) from the definition of Diophantine  $P_{+361}$  triples;

$$2\aleph + 361 = e^2 \text{ and } 132\aleph + 361 = f^2$$

Dropping  $\aleph$  from the above equations, we get

$$66e^2 - f^2 = 23465$$

Pell equation. If we search fundamental solutions of this Pell equation, we have 12 (twelve) different fundamental solutions as follows:

$$(19, 19), (-19, 19), (23, 107), (-23, 107), (27, 157), (-27, 157),$$

$$(29, 179), (-29, 179), (57, 437), (-57, 437), (97, 773), (-97, 773).$$

So,  $66e^2 - f^2 = 23465$  has 12 fundamental solutions. If we use them we obtain  $\aleph = 184$  is the smallest positive such that this smallest integer makes the left-hand side of the equation a perfect square. Additionally,  $\aleph = 184$  also makes the left-hand side of the equation a perfect square.

Therefore,  $\{2, 132, 184\}$ ,  $\{2, 132, 240\}$ , ... are Diophantine  $P_{+361}$  pairs.

We should prove whether or not  $\{2, 132, 184\}$ ,  $\{2, 132, 240\}$ , ... are Regular Diophantine  $P_{+361}$  triples?

Using regularity condition (Definition 6 in preliminaries section) for Diophantine  $P_k$  triples, it is seen that they are regular Diophantine  $P_{+361}$  triples ( $(184 - 132 - 2)^2 = 4 \cdot (2 \cdot 132 + 361)$  and  $(240 - 132 - 2)^2 = 4 \cdot (2 \cdot 132 + 361)$ ).

Thus, the proof is complete.

**Theorem 5.** The set  $\{2, 132, 184\}$  can be extended to Diophantine  $P_{+361}$  quadruples with least positive integer 240.

**Proof.** Suppose that  $\theta$  is the fourth positive integer in the set of  $\{2, 132, 184\}$  as Diophantine  $P_{+361}$  quadruples. Then, following equations have solutions ( $m, n, s$  are integers) from the definition of Diophantine  $P_{+361}$  quadruples;

$$2\theta + 361 = m^2, \quad 132\theta + 361 = n^2 \quad \text{and} \quad 184\theta + 361 = s^2$$

Dropping  $\theta$  from the all equations mentioned as above, we obtain following three Pell equations:

$$66m^2 - n^2 = 23465 \quad \text{and} \quad 92m^2 - s^2 = 32851 \quad \text{and} \quad 46n^2 - 33s^2 = 4693$$

If we search fundamental solutions of these Pell equations, we have results as follows:

$66e^2 - f^2 = 23465$  has following fundamental solutions;

(19,19), (-19, 19), (23,107), (-23, 107), (27,157), (-27, 157),  
(29,179), (-29, 179), (57,437), (-57, 437), (97,773), (-97, 773).

$92m^2 - s^2 = 32851$  has following fundamental solutions;

(19,19), (-19, 19), (25,157), (-25, 157), (29,211), (-29, 211)  
(41,349), (-41, 349), (95,893), (-95, 893), (229,2189), (-229, 2189)

$46n^2 - 33s^2 = 4693$  has following fundamental solutions;

(19,19), (-19, 19), (25,27), (-25, 27), (179,211), (-179, 211)

When the solutions are examined, it is seen that there is a common solution that provides all three Pell equations. Therefore, this triple Pell equation system has a common solution. In that case, it can be mentioned that the Diophantine  $P_{+361}$  triple can be extended to the Diophantine  $P_{+361}$  quadruple.

Hence,  $\theta$  is calculated as  $\theta = 240$  and  $\{2, 132, 184\}$  can be extended to Diophantine  $P_{+361}$  quadruples by  $\{2, 132, 184, 240\}$ .

From the Definition 7 (Regularity condition for Diophantine  $P_t$  quadruple), it is easily seen that  $\{2, 132, 184, 240\}$  is not regular Diophantine  $P_{+361}$  quadruple.

So, the proof is completed.

**Remark 1:** it is quite difficult to identify these sets as the numbers in the sets get larger. That is why, there is still open problems to get practical algorithm for such sets.

**Theorem 6.** Following statements are true.

(i) The set  $\{44\}$  is extended to Diophantine  $P_{+361}$  pairs with positive integers 82, 100, 156, 180, 252, 282, 370, etc.

(ii) The set  $\{44, 100\}$  can be extended to regular Diophantine  $P_{+361}$  triples with positive integers 282, 720, ... so on.

(iii) The set  $\{44, 100, 282\}$  can be extended to Diophantine  $P_{+361}$  quadruples with smallest positive integer 720.

(iv) ...

**Proof.** Considering the proof of Theorem3, Theorem4 and Theorem5, readers can easily see the proof the theorem.

Analogously, following theorems are obtained for Diophantine  $P_{-361}$  sets too.

**Theorem 7.**

(a) The set  $\{37\}$  is extended to Diophantine  $P_{-19^2}$  pairs with positive integers 41, 53, 146, 170, 325, 361, etc.

(b) The set  $\{37, 146\}$  is extended to Diophantine  $P_{-19^2}$  triples with positive integers 325, 905 and also, the set  $\{37, 325\}$  is extended to Diophantine  $P_{-19^2}$  triples with positive integers 361, 578, 905, ... so on...

(c) The set  $\{37, 146, 325\}$  is extended to Diophantine  $P_{-19^2}$  quadruple and also, the set  $\{37, 325, 578\}$  can be extended to Diophantine  $P_{-19^2}$  quadruple with same positive integers 905.

**Proof.** The proof of the theorem can be easily seen by using the above-mentioned theorems in a similar way.

**Remark 1:** Each of the following expressions are provided.

The set  $\{5\}$  is extended to;

(i) Diophantine  $P_{-19^2}$  pair as  $\{5, 82\}$  (ii) Diophantine  $P_{-19^2}$  triple as  $\{5, 82, 101\}$   
Diophantine  $P_{-19^2}$  quadruple as  $\{5, 82, 101, 361\}$

**Remark 2:** As an open question if we fix  $\{37, 325\}$  or  $\{37, 905\}$  as Diophantine  $P_{-19^2}$  pairs it may be searched what kind of natural numbers (characterization) can be added to them for making Diophantine  $P_{-19^2}$  triples, quadruples or more.

**CONCLUSION**

In this work, we found out several Diophantine  $P_{\mp 19^2}$  pairs and obtained their extension to Diophantine  $P_{\mp 19^2}$  triple and quadruple. We also determined characterization of the numbers in the Diophantine  $P_{\mp 19^2}$  sets. Moreover, numerical results on Diophantine  $P_{\mp k^2}$  pairs, triples or quadruples can be specified with any k integers by the readers using our work.

## **İNSAN HAKLARINDAN BİRİ OLAN SU HAKKININ METALAŞMASI**

**Erkan KÖSEDAĞ (Orcid ID: 0000-0002-1079-5973)**

Marmara Üniversitesi, Sosyal Bilimler Enstitüsü

### **ÖZET**

Su, insan yaşamının sürdürülebilirliği için hayati bir önem taşımaktadır. Sadece biyolojik ihtiyaç için değil aynı zamanda sağlıklı bir çevre ve sanitasyon için de gereklidir. Buna rağmen Dünya genelinde temiz, sağlıklı ve içilebilir suya ulaşamayan milyonlarca insan bulunmaktadır. Özellikle az gelişmiş ve gelişmekte olan bir çok ülke kuraklıkla mücadele etmekte, bu ülkelerde temiz suya erişim sorunu artarak devam etmektedir. Birleşmiş Milletler raporlarına göre sağlıklı suya ulaşımın zorlaşması sonucunda yüzbinlerce çocuk yaşamını yitirmekte veya ciddi derecede sağlık sorunları yaşamaktadır. Bu sebeple sivil toplum kuruluşları, uluslararası kuruluşlar ve bilim insanları tarafından suyun insani bir hak olarak tanımlanması sıklıkla dile getirilmeye başlanmış, son yıllarda su hakkı, ulusal ve uluslararası bir çok belgeye konu olmuştur. Ancak, yeryüzündeki temiz su kaynağının sınırlı miktarda olması, suyun bir insan hakkı olarak değilde bir meta olarak düşünülmesine neden olmuştur. Birleşmiş Milletler'in 2015 yılında yayınladığı sürdürülebilir kalkınma hedeflerinde herkesin 2030 yılına kadar temiz ve içilebilir suya eşit derecede ve belirli bir bedel ödeyerek ulaşabileceğinden bahsedilmiştir. Suyun bedelinden bahsedilmesi gelecekte suyun daha kıt ve ulaşılması zor bir kaynak olacağını ortaya koymaktadır. Bu bildiri, gelecekte ticari bir ürün olarak algılanacak olan suyun aslında bir insan hakkı olarak değerlendirilmesi gerektiğini ortaya koymayı amaçlamaktadır. Bildirinin literatüre katkısının yanı sıra devletlerin su hakkını diğer insan haklarıyla ilişkilendirmeleri için üretecekleri politikalara sağlayacağı katkı açısından önemli olduğu düşünülmektedir. Bildiride su hakkı kavramının tarihçesine değinilmiş, ulusal ve uluslararası belgelerde su ile ilgili literatüre yer verilmiştir. Nitel araştırma yöntemine dayalı olarak gerçekleştirilen bu çalışmada; literatür taraması ve ulusal kurum ve kuruluşların raporları incelenerek veriler elde edilmiştir. Elde edilen bu veriler, doküman analizi tekniği ile değerlendirilmiş, araştırma sonucunda ülkelerin sosyal devlet gereği su hakkı konusunda neler yapabilecekleri, çalışmaların neler olabileceği konusunda önerilerde bulunulmuştur.

**Anahtar kelimeler:** Su, Su hakkı, insan hakkı, sanitasyon,

**COMMERCIALIZATION OF THE RIGHT TO WATER, ONE OF THE HUMAN RIGHTS**

**ABSTRACT**

Water is vital for the sustainability of human life. It is necessary not only for biological need, but also for a healthy environment and sanitation. Despite this, there are millions of people around the world who do not have access to clean, healthy and potable water. Especially many underdeveloped and developing countries are struggling with drought, and the problem of access to clean water continues to increase in these countries. According to the United Nations reports, hundreds of thousands of children die or experience serious health problems as a result of the difficulty in accessing healthy water. For this reason, the definition of water as a human right has been frequently mentioned by non-governmental organizations, international organizations and scientists, and the right to water has been the subject of many national and international documents in recent years. However, the limited amount of clean water on earth has caused water to be considered a commodity rather than a human right. In the sustainable development goals published by the United Nations in 2015, it is mentioned that everyone can reach clean and potable water equally and at a certain price until 2030. Mentioning the cost of water reveals that water will be a scarce and hard-to-reach resource in the future. This paper aims to reveal that water, which will be perceived as a commercial product in the future, should actually be considered as a human right. In addition to its contribution to the literature, the paper is thought to be important in terms of its contribution to the policies that states will produce in order to associate the right to water with other human rights. In the declaration, the history of the concept of the right to water is mentioned, and the literature on water is included in national and international documents. In this study, which was based on the qualitative research method; The data were obtained by examining the literature review and the reports of national institutions and organizations. These obtained data were evaluated with the document analysis technique, and as a result of the research, suggestions were made about what the countries could do about the right to water as a requirement of the social state.

**Keywords:** Water, right to water, human right, sanitation,

## 1. GİRİŞ

Su, insanođlu için biyolojik ve sürdürülebilir sağlıklı bir çevre oluşturabilmek için vazgeçilmez bir unsurdur. Suyun vazgeçilmez oluşu sebebi ile ilk medeniyetlerin nehir kıyılarında hayat bulduđu ve gelişimlerini bu bölgelerde sağladığı bilinmektedir. Günümüzde gelişmiş ülkelerin tükettikleri su miktarları suyun aynı zamanda ülkelerin gelişmişlik düzeylerine katkıda bulunduđunu da göstermektedir (Kılıç & Karataş, 2018;37)

Hızla artan küreselmeye paralel olarak sanayi sektöründeki gelişmeler, kentsel nüfusun sürekli olarak artması, nüfus artışı sonucunda tarım alanlarının büyümesi gibi faktörler temiz su ihtiyacının artmasına sebep olmaktadır. Buna paralel olarak küresel iklim değışikliđi sebebi ile kuruyan kaynaklar ve su kirliliđi ise temiz su kaynaklarının tükenmesine yol açmaktadır. Su kaynađının sınırlı olması birçok tartışmayı beraberinde getirmektedir. Tartışmalar suyun bir insan hakkı olduđu ile suyun metalaşması üzerine odaklanmaktadır.

Suyun insan hakkı olmasını savunanlar sağlıklı suya herkesin yeterli miktarda erişiminin sağlanması gerektiğinden bahsetmektedirler. Bu anlayışa göre su hakkı, yaşam hakkı talebinden çok da farklı değildir. Su yaşam hakkının unsurudur (Narin, 2016;730). Herkesin sağlıklı suya erişimini sağlayabilmek için uluslararası hukuk devreye girerek birçok bilimsel çalışmalar ve toplantılar yapmış, su hakkının yer aldığı ifadeler bildirilere, anayasalara, yasalara ve mahkeme içtihatlarına girmeye başlamıştır.

Suyun mülkiyeti ve kontrolü, Dünya'nın pek çok yerinde kamu yönetiminin elindedir. Kamu yönetimleri sosyal devlet olmanın bir geređi olarak insan hakkı olan suyu düşük maliyetle, sübvans ederek ve ödeme gücüne bakılmaksızın halka ulaştırmaktadır (Küçükbaşol, 2015:57). Suyun bir meta değeri olduđunu savunanlar ise 1992 yılında düzenlenen Dublin Konferansı'nda ortaya bu düşüncüyü ortaya koymuşlardır. Konferansta suyun ekonomik bir değeri olduđu deklare edilmiştir. Suyun metalaşmasını savunanlar, kamu yönetiminin suyun dağıtımı ve kontrolünü bırakmasını, oluşacak boşluđun küresel şirketler eliyle doldurulmasını savunmaktadırlar. Buradaki amaç suyun belirli bir fiyat ile halka satılmasını sağlamaktır.

Suyun metalaşması, serbestçe bir şekilde alınıp satılabilmesi, dünya genelinde ithalat - ihracat konusu yapılabilmesi ve bunun önündeki her türlü ulusal engelin kaldırılması için uluslararası ticareti düzenleyen GATT (Tarifeler ve Ticaret Genel Anlaşması) ve DTÖ (Dünya Ticaret Örgütü) anlaşmalarına hükümler konulmuştur (Küçükbaşol, 2015:56). Suyun özelleşmesi durumunda piyasada tekelleşme oluşacak, su fiyatları yükselecek ve alt gelir grupları suya erişimde zorlanacaktır. Oysaki devletler herkesin sağlıklı suya erişebilmesi için gereken

ekonomik, sosyal ve siyasal ortamı oluşturacak politika ve stratejileri geliştirmelidir. Bu durumda suyun bir insan hakkı olarak herkese eşit derecede gitmesi mi yoksa su dağıtım hizmetlerinin özel sektörce yapılarak ücretlendirilmesinin mi doğru olup olmadığı tartışılmalıdır.

Bu çalışma su hakkının insan hakları arasında yer almasını gerektiğini açıklayabilmek amacı ile dört bölümden oluşmaktadır. Birinci bölümde Dünya su istatistikleri açıklanarak suyun önemi ortaya konulacaktır. İkinci bölümde “su hakkı” kavramı açıklanarak bu kavramın gündeme gelme süreci ulusal ve uluslararası metinlerde su hakkına dair yer alan bilgilere yer verilecek, su hakkı kavramının diğer insan hakları ile ilişkisi ortaya konulacaktır. Üçüncü bölümde suyun metalaşma süreci ve metalaşmayı savunan fikirler ele alınacaktır. Çalışmanın son bölümünde ise suyun insan hakkı olması üzerinde durulacak, devletlere suyun metalaşması durumunda sosyal devlet anlayışı olarak neler yapabileceklerine dair önerilerde bulunulacaktır.

## **2. DÜNYA SU İSTATİSTİKLERİ**

Dünya yüzeyindeki suyun % 97,5'i tuzludur, % 2,5 oranındaki tatlı suyun % 70 gibi önemli bir oranı Antartika ve Grönland'da buz kütleleri halinde, kalan kısmın büyük bölümü ise derin yeraltı küresinde bulunmaktadır (Yıldız, 2007:15). Geçtiğimiz elli yılda, su kaynaklarının miktarı aynı kalmasına rağmen, su çekimi üç katına çıkmıştır (WWAP, 2012).

Dünya her geçen yıl su konusunda daha fazla stresli bir hale gelmektedir. Birleşmiş Milletler'in 2019 yılında hazırladığı Dünya Su Raporu'na göre 1980 yılından sonra yaşanan teknolojik gelişmeler, kentleşme ve diğer faktörler nedeniyle mevcut su tüketimi her geçen yıl, bir önceki yıla oranla %1 oranında artmaktadır. Su tüketiminin en fazla olduğu yer tarım sektörüdür. Küresel olarak tarım sektörü yıllık su çekiminin %69'unu oluşturmaktadır. Sanayi (elektrik üretimi dahil) %19'unu ve hane halkı ise %12'sini oluşturmaktadır (AQUASTAT, 2022). Küresel su talebinin 2050 yılına kadar benzer bir oranda artmaya devam etmesi, mevcut su kullanım seviyesinin %20 ila %30 üzerinde bir artışa denk gelmesi beklenmektedir (Burek , 2016).

Dünya genelinde 2 milyardan fazla insan güvenli suya erişememektedir. Suya erişim sorunu yaşayanların genel nüfusa oranı yalnızca %11 iken, 31 ülkede bu oran %25'e ile %70 arasında yer almaktadır. 22 ülkede suya erişim sorunu %70'in üzerinde seyretmektedir (UN, 2018). Yetersiz su temini, sanitasyon ve hijyene atfedilen ishaller hastalıklar nedeni ile her yıl 2,4

milyona yakın insan hayatını kaybetmektedir. (UNICEF;2004) Bu durum toplam küresel hastalık yükünün %3,7'sine eşdeğerdir (WHO, 2002).

Küresel iklim değişikliğinin hali hazırda suya erişimde zorluk çeken bölgelerde erişim sorununu arttırması, doğal çevrenin bozulması ve küresel su kaynakları üzerindeki baskıların devam etmesi durumunda, küresel gayri safi yurtiçi hâsılanın (GSYİH) %45'inin, Dünya nüfusunun %52'sinin ve küresel tahıl üretiminin %40'ının risk altında olacağı tahmin edilmektedir. (UN, 2018). Böyle bir durumda yoksul nüfus orantısız bir şekilde etkilenecek ve hâlihazırda artan eşitsizlikler daha da derinleşecektir.

Tüm doğal afetlerin yaklaşık %90'ı su ile ilgilidir. 1995-2015 yılları arasında belgelenmiş sel felaketleri, belgelenen tüm doğal afetlerin %43'ünü oluşturmuş, 2,3 milyar insanı etkilemiş, 157.000 kişinin ölümüne sebep olmuş ve 662 milyar ABD doları hasara neden olmuştur. Kuraklık ise doğal afetlerin %5'ini oluşturmuş, 1,1 milyar insanı etkilemiş, 22.000 kişinin ölümüne sebep olmuş aynı yıllar arasında 100 milyar ABD doları hasara neden olmuştur (Dinavasova, 2019).

İklim değişikliğinin gelecek yıllarda şiddetli hava olaylarının sıklığını ve büyüklüğünü arttırması beklenmektedir. Ekonomik İşbirliği ve Kalkınma Teşkilatı (OECD) bugün 1,2 milyar olan sel riski altındaki insan sayısının 2050'de 1,6 milyara çıkacağını (dünya nüfusunun yaklaşık %20'si) ve risk altındaki varlıkların ekonomik değerinin 2050 yılına kadar 45 trilyon ABD Doları civarında olmasını beklemektedir. (OECD, 2016).

Dünya genelinde her on kişiden üçü (2,1 milyar kişi veya dünya nüfusunun %29'u) güvenli bir şekilde yönetilen içme suyu hizmetinden faydalanamamaktadır. Dünya genelinde güvenli bir şekilde yönetilen içme suyu hizmetlerini kullanan kişi sayısının üçte biri (1,9 milyar) kırsal alanlarda yaşamaktadır. (UNICEF, 2017). Güvenli bir şekilde yönetilen su hizmetlerinin kapsamı, bölgeler arasında önemli ölçüde farklılık göstermektedir. Sahra Altı Afrika'da bu oran %24 iken Avrupa ve Kuzey Amerika'da bu oran %94'tür. Halen doğrudan arıtılmamış yüzeysel su kaynaklarından içme suyunu kullanan 159 milyon insanın %58'i Sahra Altı Afrika'da yaşamaktadır (UNICEF, 2017). Yoksulluk içinde yaşayan insanlar, suya ve sanitasyona, sağlık ve eğitim hizmetlerine ve en temel ihtiyaçlarına ulaşmak için her gün mücadele etmektedir (Castaneda, 2016).

### **3. SU HAKKI, SU HAKKININ İNSAN HAKLARI İLE İLİŞKİSİ**

Bu bölümde su hakkının tarihsel gelişimi ve su hakkı kavramının insan hakları ile olan ilişkisi ortaya konulacaktır. Ayrıca su ile ilgili bölgesel, ulusal ve uluslararası metinler incelenecektir.

#### **3.1. Su Hakkı Kavramı ve Kavramın Tarihsel Gelişimi**

Su hakkı birçok bölgesel, ulusal ve uluslararası metinde doğrudan veya dolaylı olarak yer almıştır. 1949 tarihli Cenevre Sözleşmeleri savaş esirleri ile sivil halkın yeterli miktarda suya erişiminin sağlanması yükümlülüğünü getirmektedir. Bu sözleşmeler uluslararası alanda su hakkına dair önemli metinlerdir. Literatürde su hakkına dair en önemli metin 1977 yılında yayınlanan Mar Del Plata Dünya Su Konferansıdır. Konferansın kapanış bildirgesinde, sosyal ve ekonomik konumu ne olursa olsun suyun tüm insanlar için temel bir ihtiyaç olduğu belirtilmiştir. Bu konferans sonrasında su sorunu uluslararası bir boyutta tartışılmaya başlamıştır.

1979 yılında yayınlanan Kadınlara Karşı Her Türlü Ayrımcılığın Önlenmesine Dair Uluslararası Sözleşmenin 14/2. maddesinde kadın ve erkeğin içme suyundan eşit şekilde yararlanmasına 1989 yılında yayınlanan Çocuk Hakları Sözleşmesinin 24/2/c. maddesinde ise çocukların hem içilebilir suya hem de beslenme, çevre gibi konulara erişiminin sağlanmasına vurgu yapılmıştır. Bir yıl sonrasında ise Afrika Çocuk Hakları ve Esenliği Şartı'nın 14/2. maddesi ile sözleşmeye taraf olan devletlerin her çocuğa yeterli düzeyde beslenme ve güvenilir içme suyu sağlanması gerektiği kararlaştırılmıştır.

1992 yılında Dublin'de yapılan Uluslararası Su ve Çevre Konferansı'nda suyun ekonomik bir mal olduğu belirtilerek su sorunu farklı bir tartışma alanına kaymıştır. Dublin Bildirisi su hakkını açıkça tanımakla birlikte suya ekonomik bir değer atfetmesi nedeniyle sonraki dönemde eleştirilere konu olmuştur (Salihoğlu, 2006). Dublin konferansı sonrasında aynı yıl Rio'da yapılan BM Çevre ve Kalkınma Konferansı'nda Eylem Planı olan Gündem 21'de Mar del Plata Su Konferansının kararları onaylanmış, her bireyin içme suyuna erişim hakkı olduğu ve bu konunun toplumca kabul edilmesi gerekli olan bir ön koşul olduğu ifade edilmiştir.

1994 yılında BM Uluslararası Nüfus ve Kalkınma Konferansı'nda tüm bireylerin kendisi ve ailesi için yeterli su ve sanitasyon hakkının olduğu savunulmuş, Eylül 2002'de ki Dünya Sürdürülebilir Kalkınma Zirvesinde insan onuru, temiz su, sanitasyon gibi konularda hedefler ve planlar açıklanmış, Kasım 2002'de ise BM 15 nolu Genel Yorum'da su hakkının insanlık onuruna yakışan bir hayat için vazgeçilmez olduğu ifade edilmiştir.

BM Ekonomik Sosyal ve Kültürel Haklar Komitesi farklı tarihlerde yaptığı yorumlarda su hakkına değinmiştir. BM sözleşmelerinin genel yorum kısımları devletler için bağlayıcı olmamakla birlikte büyük kabul görmektedirler (Rudolf, 2007: 23). BM yorumlarından 1991 tarihli 4 nolu Genel Yorum konut hakkına değinmiş ve su konusunda erişilebilirliği konu edinmiştir. 1994 tarihli 5 nolu Genel Yorum'da ise engelli hakları içerisinde su ve gıda gibi temel ihtiyaçların karşılanmasının programların temelinin oluşturduğu belirtilmiştir. 1995 tarihli 6 nolu Genel Yorumda yaşlılara yeterli su olanaklarının tanınmasından, 2000 tarihli 14 nolu Genel Yorum'da ise sağlık hakkı ile bağlantılı olarak su hakkından bahsedilmiştir. BM yorumlardan 15 Nolu Genel Yorum, uluslararası alanda su hakkını bağımsız bir insan hakkı olarak ortaya koyması açısından literatürde de önem atfedilmiştir. Bu yorum suyun bir hak olduğunu kabul ederek, “herkesin kişisel ve ev içi kullanımları için yeterli, güvenli, kabul edilebilir, erişilebilir ve bedeli ödenebilir suya sahip olma hakkını” öngörmektedir. (Rudolf, 2007: 23).

BM 15 Nolu Genel Yorum'da su üç ana unsur üzerinde değerlendirilmektedir. Buna göre, su hakkının korunabilmesi için belirli bir miktarda suyun mevcut olması, bu suyun belirli bir nitelikte olması ve suyun erişilebilir olması gerekmektedir. Suyun mevcut olması her birey için kişisel ve sanitasyon için yeterli ve sürekli olmasıdır. Yeterlilik ile ilgili miktarlar Dünya Sağlık Örgütü'nün belirlediği ilkeler ile dikkate alınmaktadır. Bu ilkelere göre bir bireyin günlük 20 litre suya ihtiyacı olduğu belirtilmiştir. Suyun nitelik bakımından güvenli olması, zararlı maddelerden arındırılmış olması ve rengi, kokusu ve tadının kabul edilebilir olması gerekmektedir.

15 Nolu Genel Yorum'da suyun bir diğer unsuru erişilebilir olmasıdır. Suyun erişilebilirlik unsuru da kendi içerisinde dört farklı başlıkta yer almaktadır. Suya fiziksel olarak erişim her bireyin konutunun ya da iş yerinin yakınında su kaynağının olması anlamına gelir. Bu konuda Dünya Sağlık Örgütü 30 dakikalık ulaşım mesafesi ya da 1 km'lik ulaşım mesafesini erişilebilir olarak tanımlamaktadır. Bu rakamlar zaman açısından 5 dakika, mesafe açısından 100 metre düzeyinde ise suya orta düzeyli bir erişimden bahsedilmektedir. Suyun kullanıldığı mekanda doğrudan kaynağa ulaşılabilir ise optimum bir erişimden bahsedilebilir. Ekonomik olarak her bireyin eşit derecede erişiminin sağlanması keyfi kesintilerin olmaması ve su ile ilgili her bilgiye şeffaf bir şekilde erişilebilmesi BM'nin 15 nolu Genel Yorumunda yer almaktadır.

Su hakkı insan haklarına dair metinlerde de geniş bir şekilde yer almıştır. BM İnsan Hakları Yüksek Komisyonu'nu tarafından 2007 yılının Ağustos ayında yayınlanan raporda güvenli bir

içme suyu ve sanitasyonunun artık bir insan hakkı olarak kabul edilmesi gerektiğinin altı çizilerek, yaşam ve sağlığın sürdürülebilirliği için kişisel ve genel kullanımlarda yeterli miktarda güvenli içme suyuna erişimde ayırım gözetilmemesi gerektiği vurgulanmaktadır (Kılıç & Karataş, 2018). Bu kararın dışında 2009 ve 2010 tarihli İnsan Hakları Konseyi kararları su hakkını konu edinmiştir. Su hakkının birçok yerel, bölgesel, ulusal ve uluslararası metinde yer alarak tartışılıyor olması bu hakkı doğuran birçok gerekçenin var olduğunu göstermektedir. Tablo 1 incelendiğinde BM başta olmak üzere pek çok kuruluş suyun bir hak olması için birçok çalışma yürütmüş ve uluslararası alanda sözleşmeler imzalamış, bildiri ve kararlar yayınlamışlardır.

**Tablo 1: Su Hakkına Yönelik Tarihsel Gelişim Süreci**

<b>Tarih</b>	<b>Toplantı, Sözleşme, Karar vb.</b>	<b>Su Hakkı İle İlgili Görüş</b>
Mart 1977	Mar del Plata BM Su Konferansı	Birleşmiş Milletler Eylem Planı, suyu ilk kez bir hak olarak kabul etmiş ve “Gelişme evreleri ve sosyal ve ekonomik koşulları ne olursa olsun tüm halklar, temel ihtiyaçlarına eşit miktarda ve kalitede içme suyuna erişim hakkına sahiptir” denilmiştir.
Aralık 1979	Kadınlara Karşı Her Türlü Ayrımcılığın Önlenmesi Sözleşmesi (CEDAW)	Sözleşme, kadınlara karşı ayrımcılığı sona erdirmek için bir gündem belirlemiş ve metninde hem suya hem de sanitasyona açık bir şekilde atıfta bulunmuştur. Madde 14(2)(h) “Taraflar, kadın ve erkek eşitliği temelinde, katılmalarını ve bundan yararlanmalarını sağlamak için kırsal alanlarda kadınlara karşı ayrımcılığı ortadan kaldırmak için uygun tüm önlemleri alacaklardır. Kırsal kalkınma ve özellikle bu kadınlara aşağıdaki hakları sağlayacaktır: ... (h) Özellikle barınma, sanitasyon, elektrik ve su temini, ulaşım ve iletişim ile ilgili olarak yeterli

		yaşam koşullarından yararlanma”.
Kasım 1989	Çocuk Haklarına Dair Sözleşme	Sözleşme su, çevresel sanitasyon ve hijyen den açıkça bahsetmektedir. Madde 24(2): “Taraflar Devletler bu hakkın tam olarak uygulanmasını takip edecek ve özellikle aşağıdaki uygun önlemleri alacaklardır: ... c) diğerlerinin yanı sıra, çevre kirliliğinin tehlikeleri ve riskleri göz önünde bulundurularak, hazır teknolojinin uygulanması ve yeterli besleyici gıdaların ve temiz içme suyunun sağlanması yoluyla; ... (e) Ebeveynler ve çocuklar başta olmak üzere toplumun tüm kesimlerinin bilgilendirilmesini, eğitime erişimini ve çocuk sağlığı ve beslenmesi ile ilgili temel bilgilerin kullanımı, emzirmenin avantajları, hijyen ve çevre temizliği konularında desteklenmelerini sağlamak ve kazaların önlenmesi”
Ocak 1992	Uluslararası Su ve Sürdürülebilir Kalkınma Konferansı.	Dublin Konferansın 4. ilkesinde “...öncelikle tüm insanların uygun fiyata temiz suya ve saniteasyona erişim temel hakkını tanımak hayati önem taşımaktadır”.

Haziran 1992	Birleşmiş Milletler Çevre ve Kalkınma Konferansı.	Rio Zirvesi , Gündem 21'in 18. Faslı , Mar del Plata Su Konferansı'nın tüm halkların içme suyuna erişim hakkına sahip olduğu Kararını onaylanmış olup buna “ortak kabul edilen öncül” adı verilmiştir.
Eylül 1994	Birleşmiş Milletler Uluslararası Nüfus ve Kalkınma Konferansı	Bu konferansta tüm bireylerin: “Yeterli gıda, giyim, barınma, su ve sanitasyon dahil, kendileri ve aileleri için yeterli bir yaşam standardına sahip olma hakkına sahip olduklarını” tekrar edilmiştir.
Aralık 1999	BM Genel Kurulu Kararı A/Res/54/175	Genel kurul kararının 12. Maddesi , “diğerlerinin yanı sıra kalkınma hakkının tam olarak gerçekleştirilmesinde : (a) Gıda ve temiz su hakları temel insan haklarıdır ve bunların desteklenmesi hem ulusal hükümetler hem de uluslararası toplum için ahlaki bir zorunluluk teşkil eder”.
Eylül 2002	Dünya Sürdürülebilir Kalkınma Zirvesi	Johannesburg Zirvesi'nin insan onurunun bölünmezliğine odaklanmasını memnuniyetle karşılandığı belirtilerek temiz su, sanitasyon, enerji, sağlık hizmetleri, gıda güvenliği ve biyolojik çeşitliliğin korunması gibi temel gereksinimlere erişim hızının artması için planlama ve ortaklıklar konuşulmuştur.

Kasım 2002	Genel Yorum No. 15.	Genel Yorum 15 , su hakkını teyit eden 1966 Uluslararası Ekonomik, Sosyal ve Kültürel Haklar Sözleşmesi'ni (ICESCR) uluslararası hukukta yorumlamıştır. Bu Yorum, su hakkının yorumlanması için kılavuz ilkeler açıklamıştır. Madde 11, yeterli yaşam standardı hakkı ve Madde 12, ulaşılabilir en yüksek sağlık standardı hakkı ile taraf devletlere hak ve yükümlülükler getirmiştir. Ayrıca su ile ilgili hangi eylemlerin ihlal teşkil edeceğini tanımlanmıştır. Suyu erişim, insan onuruna uygun bir yaşam sürmek için vazgeçilmezdir denilerek diğer insan haklarının gerçekleşmesi için su hakkı bir ön koşul olarak belirtilmiştir.
Mart 2003	Dünya Üçüncü Su Forumu ve Bakanlar Konferansı	Kyoto'da düzenlenen konferansta suyun bir hak olduğuna değinilmemiş, temel insan ihtiyacı olduğu ifade edilerek kavram değişikliğine gidilmiştir.
Temmuz 2005	İçme Suyu ve Sanitasyon Hakkının Gerçekleştirilmesine İlişkin Taslak Kılavuz. E/CN.4/Sub.2/2005/25	BM Ekonomik ve Sosyal Konseyi Özel Raportörü El Hadji Guisse'nin raporunda yer alan ve İnsan Haklarının Teşviki ve Korunması Alt Komisyonunda kabul edilen taslak kılavuz ilkeler, hükümetlere, politika yapıcılarına, uluslararası kuruluşlara ve su ve sanitasyon sektöründe çalışan sivil toplum üyelerine içme suyu ve sanitasyon hakkının uygulanmasında yardımcı olmayı amaçlamıştır. Bu kılavuzda yer alan ilkelerde su ve sanitasyon hakkını yasal olarak tanımlanmamış, hakkın

		uygulanması için rehberlik sağlar.
Kasım 2006	İnsan Hakları Konseyi Kararı 2/104	“Birleşmiş Milletler İnsan Hakları Yüksek Komiserliği Ofisi devletlere uluslararası insan hakları belgeleri kapsamında güvenli içme suyuna ve sanitasyona adil erişimle ilgili insan hakları yükümlülüklerinin kapsamı ve içeriği hakkında, ilgili sonuçları ve tavsiyeleri içeren ayrıntılı bir çalışma yürütmüştür.
Aralık 2006	Engellilerin Haklarına İlişkin Sözleşme	28. madde, engellilerin yeterli yaşam standardına sahip olma hakkını tanımlar ve “2. Taraf Devletler, engellilerin sosyal korunma ve engelliliğe dayalı ayrımcılık olmaksızın bu haktan yararlanma hakkını tanırlar ve aşağıdaki önlemler de dahil olmak üzere bu hakkın gerçekleşmesini sağlamak ve teşvik etmek için uygun adımları atar: (a) engellilerin temiz su hizmetlerine eşit erişimi ve engellilikle ilgili ihtiyaçlar için uygun ve uygun fiyatlı hizmetlere, cihazlara ve diğer yardımlara erişiminin sağlanması”.
Mart 2008	İnsan Hakları Konseyi Kararı 7/22	Bu kararlar, İnsan Hakları Konseyi “Üç yıllık bir süre için güvenli içme suyuna ve sanitasyona erişimle ilgili insan hakları yükümlülükleri konusunda bağımsız bir

		uzman atamaya” karar vermiştir.
Ekim 2009	İnsan Hakları Konseyi Kararı	Bu kararda, İnsan Hakları Konseyi, insan hakları yükümlülükleri konusunda bağımsız uzmanlarla istişareyi memnuniyetle karşılamış, güvenli içme suyu ve sanıtasyona erişim, bağımsız uzmanın ilk yıllık raporunu kabul etmiştir. İlk kez, devletlerin sanıtasyona erişimle ilgili ayrımcılığı ele alma ve ortadan kaldırma yükümlülüğü olduğu kabul edilmiş ve devletleri bu alandaki eşitsizlikleri etkin bir şekilde ele almaya teşvik etmiştir.
Temmuz 2010	BM Genel Kurulu Kararı A/RES/64/292	Bu BM Kararı ilk kez su ve sanıtasyon hakkını resmen tanımıştır. Karar temiz içme suyu ve sanıtasyonun tüm insan haklarının gerçekleştirilmesi için esas olduğunu belirtmiştir. Karar, devletleri ve uluslararası kuruluşları, ülkelere, özellikle de gelişmekte olan ülkelere, herkes için güvenli, temiz, erişilebilir ve uygun fiyatlı içme suyu ve sanıtasyon sağlamak için finansal kaynaklar sağlamaya, kapasite geliştirmeye ve teknoloji transferine yardımcı olmaya davet etmektedir.

Eylül 2010	İnsan Hakları Konseyi Kararı A/HRC/RES/15/9	BM Genel Kurulu kararının ardından, BM'nin bu kararı İnsan Hakları Konseyi, su ve sanitasyon haklarının mevcut uluslararası hukukun bir parçası olduğunu teyit etmiş, bu hakların devletler üzerinde yasal olarak bağlayıcı olduğunu belirtmiştir. Ayrıca devletlere, şu anda hizmet verilmeyen ve yetersiz hizmet verilen alanlar da dahil olmak üzere, güvenli içme suyuna ve sanıtasyona erişimle ilgili insan hakları yükümlülüklerinin aşamalı olarak tamamen gerçekleştirilmesini sağlamak için uygun araçlar ve mekanizmalar geliştirmeleri için çağrıda bulunmuştur.
Nisan 2011	İnsan Hakları Konseyi Kararı A/HRC/RES/16/2	Bu kararda, İnsan Hakları Konseyi güvenli içme suyuna ilişkin görevlendirilen özel raportörün görev süresinin uzatılmasına karar vermiş, insan hakkının güvenli içme suyu ve sanıtasyona tam olarak uygulanmasını teşvik etmek için, pratik uygulamaların teşvik edilmesi sağlanmıştır.
2019	Birleşmiş Milletler Dünya Su Kalkınma Raporu	Rapor, herhangi bir şekilde ödeme yapılmaması nedeniyle su hizmetlerinin kesilmesinin insan hakları ihlali teşkil edebileceğini belirtmiştir.

**Kaynak:** (UN, The Human Right to Water and Sanitation Milestones, 2022)

### 3.2 Su Hakkının İnsan Hakları İle İlişkisi

Su sorunu su kaynaklarının kirlenmesi, küresel iklim değişikliği, çatışmalar sonucu su kaynaklarının tahrip edilmesi, düzensiz kentleşme, su israfı gibi insanoğlundan kaynaklanan birçok sebeple her geçen gün büyüyen ve yakın gelecek krize dönüşecek bir olaydır. Herkesin yeterli, güvenli ve kabul edilebilir nitelikteki suya fiziksel ve ekonomik olarak erişebilmesi için su hakkı kavramı ortaya atılmıştır. Bu kavram sağlıklı içme suyuna ve temizlik için kullanılacak

sanitasyona erişmenin insan onurunun ayrılmaz bir parçası olma düşüncesiyle uluslararası bir anlayış ile gelişmeye başlamıştır (McGraw, 2011:132)

Su hakkı tanımının ilk defa yer aldığı metin 1977 yılında BM'nin gerçekleştirdiği Su Konferansı'nda ortaya çıkan Mar Del Plata Eylem Planı'dır. Bu metinde insanların yeterli miktarda ve kalitede erişme hakkı olduğu ifade edilmiştir. Konferansta, ekonomik koşullarına bakılmaksızın, herkesin temel gereksinimleri için eşit miktarda ve kalitede içme suyuna erişim hakkı olduğu vurgusu yapılmış, ancak öncelikle suya erişim sıkıntısı yaşayan savaş ve silahlı çatışma mağdurları, kadınlar, çocuklar ve mahkûmlar için uluslararası alanda güvence yaratılmaya çalışılmıştır (Topçu, 2009). Mar Del Plata Eylem Planı sonrasında yapılan tartışmalarda su hakkının birçok hak ile ilişkili olduğu görülebilmektedir.

İnsanların yaşamlarını sürdürmelerini engelleyen veya imkansız hale getirerek tehdit eden her olay yaşam hakkı ile alakalıdır (Ioanna, 2007:123). İnsanoğlunun doğuştan sahip olduğu en önemli haklarından biri olan yaşam hakkı yasalarla korunmakta ve bu hakkın keyfi olarak bireyin elinden alınamayacağı hukuki metinlerde yer almaktadır. Kavramsal tartışmalar incelendiğinde suyun insan hayatını devam ettirebilmesi için hayati bir öneme sahip olduğu, bu sebeple her insanın yeterli, güvenilir ve erişilebilir içme suyuna ve sanitasyona sahip olması gerektiği konusu tartışmasızdır. Bu durumda susuzluk sebebi ile insan yaşamının son bulacağı düşünülür ise suyun yaşam hakkının bir ön koşulu olduğu söylenebilir.

İnsan Hakları Evrensel Bildirgesinin 3.maddesinde “Herkesin yaşama hakkı ile kişi özgürlüğü ve güvenliğine hakkı vardır.” ifadesine yer verilmiştir. Su yaşamın bir gereksinimi olduğu için suyun bir insan hakkı olduğuna dair yorum yapılabilir. 6 Ekim 2010 tarihli BM İnsan Hakları Komite kararında, temiz içme suyu ve sanitasyona erişimin, yaşam ve sağlık hakkı ile insan onurundan türeyen bir hak olduğu ifade edilmiştir.

Su hakkının bir başka insan hakkı ile ilişkisi ise sağlık hakkıdır. Uluslararası hukuktaki en geniş formuyla düzenlenen sağlık hakkı, Ekonomik, Sosyal ve Kültürel Haklara İlişkin Uluslararası Sözleşmesi'nin 12. maddesinde düzenlenmiştir. Burada Taraf Devletlere, herkesin ulaşılabilecek en yüksek fiziksel ve zihinsel sağlık standartlarını tanıma ve bu hakkın tam anlamıyla kullanılmasını sağlamak için gerekli tedbirleri alma yükümlülüğü verilmiştir. İnsanların güvenilir su kaynaklarına erişememeleri birçok sağlık sorununu beraberinde getireceği düşünülür ise, sağlık hakkı ile su hakkının ilişkisi ortaya koyulmaktadır.

Ekonomik, Sosyal ve Kültürel Haklara İlişkin Uluslararası Sözleşmesi'nde konut hakkına da atıfta bulunulmuştur. Sözleşmenin 11. maddesinde herkesin yeterli beslenme, giyim ve konuta

sahip olması gerektiğini belirtmektedir. Yeterli konut kavramı Birleşmiş Milletler tarafından doğal ve ortak kaynaklara, temiz içme suyuna ulaşabilme v.d. imkânına sahip konutlar olarak ifade edilmektedir. Böylelikle su hakkı konut hakkı ile iç içe geçen bir hak olarak görülebilmektedir.

Sağlıklı bir çevre ile su arasındaki ilişki de çok derin bir şekilde kendini göstermektedir. Çünkü su döngüsü çevrenin ve ekosistemin en önemli unsurlarından biridir. Su kaynakların tahrip edilmesi ve kirletilmesinin su arzına zarar verdiği düşünüldüğünde çevre ile su ilişkisi kaçınılmazdır. 6 Haziran 1972 tarihinde kabul edilen Birleşmiş Milletler İnsan Çevresi Konferansı Stockholm Deklarasyonu ilk maddesinde çevrenin korunması ikinci maddesinde ise gelecek nesiller için su kaynaklarının korunması gerektiğini belirtmiştir.

#### **4. SUYUN METALAŞTIRILMASINA YÖNELİK ÇALIŞMALAR**

Su ile ilgilenen kuruluşların biri olan Birleşmiş Milletler'in yayınladığı göre gelecek yıllarda içilebilir sağlıklı suya erişmekte güçlükler yaşanacağı, başka bir deyişle su kıtlığı yaşanması muhtemel olarak görülmektedir. Suyun metalaşması konusundaki temel yaklaşımlar bu öngörülerden dolayı ortaya atılmaktadır. Bu yaklaşımlar suyun korunabilmesini ilke edinmeye çalışarak su dağıtımının özelleştirilmesi gerektiğini söyler.

Suyun metalaşması ilk defa 1992 yılında Dublin'de ortaya atılmış, sonrasında Dünya Su Forumu'nda Su Komisyonu tarafından yayınlanmış olan bildiriye su yönetiminin önemli bir sorun olduğu ve suyun serbest piyasa ekonomisine açılması gerektiği fikri ileri sürülmüştür (Narin, 2016). Dünya Bankası ve IMF'de suyun özelleştirilmesi fikrini destekleyen kuruluşlardan olmuştur. Bu kuruluşlar, kendilerine kredi için başvuru yapan ülkelere suyu özelleştirmelerini şart koşmuş ve kredi vermeyi bu şarta başlamıştır. Bu iki kuruluştan kredi alan ülkeler su yönetimlerini özelleştirerek kredi almışlardır. 1971 yılında Dünya Bankası tarafından yayınlanan Su Arzı isimli raporda yoksul hanelerin evsel su tüketimlerinin belirli bir miktarının sübvansede edilerek su hizmetlerinin kendi kendini finanse eden bir karakter taşıması gerektiğinden bahsetmiştir. Dünya Bankası kentte yaşayan yoksulların çoğu yerde su ihtiyaçlarını damacaneler ile sağladığını ve şu anki hizmetin onlar için zaten erişilebilir olmadığını söyleyerek yoksulların belirlenecek bedelin üç dört katını bile ödemek için istekli olabileceğini, susuzluktansa parayla dahi olsa suya sahip olmak istediklerini ileri sürmektedir. Suyun ekonomik değeri ile ilgili çalışmalar yürüten BM ise yayınlamış olduğu Sürdürülebilir Kalkınma Hedeflerinden altıncı hedefinde herkesin 2030 yılına kadar güvenli ve uygun bedelli

bir içme suyuna erişiminin sağlanmasından bahsederek suyun metalaşmasına yönelik çalışmaları desteklemiştir. BM'nin geçmişte (1977 Mar del Plata) içilebilir suya erişimin bir insan hakkı olduğu görüşünü yansıtmaya ve daha sonrasında suyun bir bedel ile erişilmesini savunması, hak temelli su yaklaşımından piyasacı bir yaklaşıma kayıldığı yorumlarına neden olmuştur (Kılıç & Karataş, 2018).

New York merkezli Amerikan iş dünyası dergisi olan Fortune, 2010 yılında hazırladığı Dünya'nın en büyük şirketleri listesinde 200 şirkete yer vermiş, bu şirketler arasında Almanya menşeli RWE, ABD menşeli Suez ve Fransa menşeli Vivendi firmaları yer almıştır. Bu üç firma dünya su tekeli elinde bulunduran firmalar olarak bilinmektedir (Kartal, 2009). Su endüstrisinin kar oranları incelendiğinde petrol sanayisinin %40'ına tekabül ettiği görülmektedir. Bu oran Dünya'da ki suyun şu ana kadar %5'inin özelleştirildiği varsayılır ise çok büyük bir kar oranı olarak değerlendirilmektedir. Su piyasasının genişliği, sürekliliği ve kâr payı birlikte değerlendirildiğinde, ticari gaye ile hareket eden su şirketlerinin motivasyonunu anlamak zor olmayacaktır. (Narin, 2016). Tüm bu veriler ile gelecekte su kıtlığı yaşanmasın diye suyun özelleştirilmesine yönelik gösterilen çabaların aynı zamanda devasa boyutlara ulaşması beklenen su endüstrisini büyütme için olduğu da görülebilmektedir.

Suyun metalaşmasına yönelik tartışmaları anlayabilmek için uluslararası kuruluşların almış oldukları kararları ve kamuoyuna deklare ettikleri metinler incelenmelidir. Uluslararası Su Kaynakları Birliği (IWRA, 1971), Su ve Çevre Konferansı (Dublin,1992), Kalkınma ve Çevre Konferansı (Rio,1992), Hizmet Ticareti Genel Anlaşması (GATS,1995), Dünya Su Konseyi (DSK,1996) , Dünya Su Forumu (DSF,1997) suyun metalaşmasına yönelik çalışmalar yürütmüş ve suyun belirli bölgelerde özelleştirilmesini hızlandırılmıştır. Son yıllarda suyun metalaşması yönünde önemli girişimlerde bulunan ulusal ve uluslararası kuruluşlar, kamu-özel işbirliği veya kamu-kamu işbirliği modellerini öne sürerken, tezlerini "kamusal" gerekçelere dayandırmaktadır (Üstün, 2009). Oysaki yapılan araştırmalarda Dünya genelinde su kaynaklarının büyük bölümü halen kamu mülkiyetinde bulunmaktadır ve su hizmetleri ortalama olarak Asya ülkelerinde %99'u, Afrika'da %97'si Orta ve Doğu Avrupa ile Güney Amerika'da %96'sı, Kuzey Amerika'da %95'i, Batı Avrupa Ülkelerinde %80'i kamu kurumları tarafından yönetilmektedir (Sarı & Tuluay, 2011).

Suyun piyasa ürünü olması için çalışmalar yürüten kuruluşlardan birisi de Dünya Su Konseyi'dir. Dünya Su Konseyi, karar vericileri suyun sürdürülebilir ve adil gelişimi için hayati bir siyasi öncelik olduğuna ikna etmek için uluslararası toplumu bir araya getirmeyi

amaçlamaktadır. Bu konsey 1997 yılında kurulmuş olup her üç yılda bir düzenlenen Su Forumlarının finansörlüğünü yapmaktadır. İlk su forumu Fas (1997)'ta yapılmış, sonrasında sırası ile Lahey (2000), Kyoto (2003), Mexico (2006) İstanbul (2009), Marsilya (2012), Gyeongbuk ve Daegu (2015), Brezilya (2018)'de düzenlenmiş, 2022 yılı forumunun ise Dakar'da gerçekleştirileceği duyurulmuştur. Dünya Su Konseyi su ve sanitasyona genel erişimi sağlamak veya iyileştirmek ve BM'nin Sürdürülebilir Kalkınma Hedeflerine ulaşmak için su sektöründe yatırıma ihtiyaç olduğunu belirtmektedir.

Su yönetimi ile ilgili Avrupa Birliği'nde üyeleri arasında bir dizi çalışmalar yürütmüştür. AB'nin en gelişmiş çalışması 2000 yılında benimsenmiş olan Su Çerçeve Direktifi'dir. 22 Kasım 2000 tarihinde kabul edilerek yürürlüğe giren Su Çerçeve Direktifi AB'nin su politikasının anayasası olarak kabul görmektedir (İZKA, 2020). Direktif suyu kirleten faktörlerin olması halinde temizlenme maliyetlerin karşılanması, su kullanımı ile ilgili ücretlerin belirlenmesi gibi ana amaçlara yer vermektedir.

Avrupa Parlamentosu ve Konseyinin 2000/60/EC sayılı Direktifi'nin kilometre taşlarının yazıldığı metnin ilk aşamasında "Su, diğerleri gibi ticari bir ürün değil, aksine korunması, savunulması ve bu şekilde muamele edilmesi gereken bir mirastır." ifadesine yer verilmiştir. Ancak 4. aşamada "Topluluktaki sular, her amaç için yeterli miktarda iyi kaliteli suya olan talebin sürekli artması nedeniyle artan bir baskı altındadır." denilerek su krizinin yaşanabileceğine dair emareler sunmuştur. 38. aşamada ise "Üye Devletler tarafından ekonomik araçların kullanılması, bir eylem programının parçası olarak uygun olabilir." denilerek suyun metalaşmasına doğru atılan ilk adım atılmıştır.

Su Çerçeve Direktifinin 9. maddesi ise su hizmetleri dolayısı ile yapılan harcamaların geri kazanılmasını içermektedir. Üye devletler, çevre ve kaynak maliyetleri de dahil olmak üzere su hizmetlerinin maliyetlerini geri alacak ve sanayi, hane halkı ile tarıma ayrılan farklı su kullanımlarının, su hizmetlerinin maliyetlerinin karşılanmasında sosyal, çevresel ve ekonomik etkiler dikkate alınabilecektir. Görüldüğü üzere AB'nin yayınladığı Su Çerçeve Direktifi, suyun kirlenmesi ve su hizmetinin sağlanması için yapılan altyapı harcamalarının maliyetlerinin karşılanmasında yetkiyi hükümetlere vererek bu konuda ülkelerin vatandaşların ekonomik gelişmişlik düzeyini de dikkate alarak maliyetlendirme yapmaları gerektiğinden bahsetmiştir. Bu direktif ile AB'nin suyun metalaşmasına yönelik ciddi bir adım attığı söylenebilir.

Su kıtlığına dair çözümün metalaşmak olduğu bilim dünyası tarafından da yapılan önemli bir tartışmadır. Shiva (2002:31) Su kıtlığının sebebinin ve su sorununun tek çözüm yolunun suyun

ticarileştirilmesi olduğunu, su hakkını kabul etmenin kendisi ile birlikte birçok sorunu doğuracağını bu sebeple su hakkının tanınmasının doğru olmadığını savunmuştur. Bakker (2007: 438)'de benzer bir şekilde suyun metalaşmasını savunarak suyun insan hakkı olarak kabul edilmesi durumunda devletlerin herkese eşit su dağıtımını yapabilmek için mali kaynaklarını zorlayacağı ve bu durumun su savaşına dönüşebileceğini söylemiştir. Devletlerin mevcut su kaynaklarını herkes için erişilebilir yapması bazı ekonomik politik ve çevresel sorunları beraberinde getirecektir (Sav, 2007: 346).

## **5. SONUÇ VE DEĞERLENDİRME**

İçilebilir, nitelikli ve güvenli içme suyuna ve evsel kullanıma uygun suya erişebilmek, uluslararası kuruluşlarca kabul görmüş bir insan hakkıdır. Bu hak BM'nin 28 Temmuz 2010 tarihli Genel Kurulu ile tanınmaktadır. Ancak BM ve diğer kuruluşların su hakkının doğrudan bir insan hakkı olmasına yönelik uzun yıllardır yapmış olduğu çalışmalar su hakkı sorununun tam olarak çözülebilmesine yetmemiştir. Devletler, su hakkına yönelik çalışmalarını anayasalarına, yasalarına ve yönetmeliklerine ve iç hukuklarına etmekten kaçınabilir. Çünkü su hakkı teoride uygulanabilir, pratikte uygulanması güç bir hak olarak görülmektedir.

Su hakkı konut hakkı gibi maliyeti yüksek, denetimi zor bir haktır. Ancak zorluğu, maliyeti, uygulanabilirliği ne kadar zor olursa olsun suyun bir insan hakkı olarak tanımlanması önemlidir. Örneğin; Konut hakkı bir haktır, fakat her bireyin insan onuruna yakışan bir konuta erişmesi devletler için büyük maliyetler ortaya çıkarmaktadır. Devletler iç politikaları ile konut sorununu çözebilmek için toplu konutlar, sosyal konutlar, krediler vb. çalışmalar yaparak bu hakkın kullanılmasına katkıda bulunur. Beslenme hakkı bir haktır. Ancak hala dünya genelinde açlıktan ölen çocuklar bulunmaktadır. Su hakkının da bir hak olarak devletler tarafından benimsenerek iç hukuka entegre edilmesi, su hizmetlerinin ise konut örneğinde olduğu gibi kamu eliyle sağlanarak veya sübvansede edilerek uygun bir bedelle sunulması gerekir.

İnsan hakları devletin onayına tabi değildir. Bu sebeple geçici olmamakla birlikte geri alınabilecek bir niteliğe sahip değildir. Su hakkının birçok insan hakkının ön bileşeni olması, suyun olmaması durumunda birçok insan hakkından bahsedilemeyeceği için doğal olarak bir insan hakkı şeklinde görülmesi gereklidir. Devletler suyu bir insan hakkı olarak tanımlamalı ve kendi iç hukuklarına dahil etmelidir.

Devletler iyi bir su yönetimi için ülke genelinde suyun tek elden yönetilmesini sağlamalıdır. (su yönetiminin yerelden ziyade merkezileştirilmesi). Özellikle dezavantajlı durumda olan

kadın, kız, engelli, yoksul, yaşlı, mahkum, işçi, göçmen gibi kişilerin suya erişimine öncelik verilmesi ve bu kesimlerin eşitsizliğe maruz kalmaması için anayasal tedbirler alınmalıdır.

Su tüketimi ile mücadele edebilmek için her bireyin yeterli miktar ve kalitede suya erişimi devlet tarafından öncelikli ve bedelsiz olarak temin edilmeli, bireylerin günlük ihtiyaçlarını aşan miktardaki suyun tüketilmesini önlemek için aşırı tüketimle mücadele edilmelidir. Bunun için ailelerin kişi başına düşen su miktarı belirlenmeli, kontrollü ve kotalı sistemler ile son kullanıcının aşırı su tüketimi önlenmelidir. Suyu belirlenenin üstünde kullanmak isteyen bireylerden su hizmetleri için ilave ücretler alınmalıdır. Böylelikle suyu ihtiyaç olarak kullanan kişilere su bir hak olarak verilmeli, aşırı tüketerek suyun gelecek nesillere aktarılmasına zarar veren kişilere karşı tedbir alınmalıdır.

Su şebekesinin olmadığı yerlerde suyu hak olarak tanımlayarak öncelikle %100 oranında su şebeke hizmeti verilmeli, bunun olmadığı yerlerde ise günlük su ihtiyaçları su taşımacılığı ile yapılmalıdır. Bu yerlerde kurulacak hijyenik su depolarına su taşımacılığı yapıp oluşan maliyet ise devletlerce karşılanmalıdır. Su arıtma sistemleri elektrik enerjisi ile çalıştığı için su hizmetleri yüksek maliyetle sunulmaktadır. Bunun yerine güneş ve rüzgar gibi enerji sistemleri ile elektrik üreterek maliyetler düşürülmelidir.

Suyun geri dönüşümü sağlanarak su kaynaklarının tüketiminin azalması sağlanmalı, geri dönüşüm tesislerinin sayısı arttırılmalıdır. Su kaynaklarının hasar görmesine sebebiyet veren sel vb. doğal olayların gerçekleşme ihtimali göz önünde bulundurularak su taşıyan sistemler teknolojik olarak geliştirilmelidir. Gecekondu gibi su şebekesinin ulaştırılmadığı, su kaynağının sınırlı veya mevcut olmadığı alanlarda su büfelerinin kurulması teşvik edilmeli, suya erişim uygun maliyetlerle karşılanabilmelidir. Su tesislerinin yapılmasında siyasi kaygılar güdülmeyen az nüfuslu alanlara yüksek maliyetli tesisler yapmak yerine daha fazla insanın erişim sağladığı bölgelere gerekli yatırımlar yapılmalıdır. Kaçak su çekimi yapan kişi veya kişilere gerekli cezai yaptırımlar arttırılmalı, bu kişilerin diğer insanların su ve sanitasyon haklarını ihlal etmeleri önlenmelidir.

Sonuç olarak; Su hakkı kavramı tüm insanların biyolojik ve fiziki ihtiyaçlarının asgari düzeyde karşılanması için var olması gereken bir haktır. Bu hak su kıtlığı karşısında bireylerin yeterli düzeyde güvenli, nitelikli suya ulaşabilmesini kabul eder. Suyun özelleştirilmesi ile birlikte

tekelci bir anlayış faturaların yükselmesine ve doğal olarak tüm insanların suya erişebilmesine zarar verebilir. Bu durum başka insan haklarının elde edilebilme için tarihsel süreçte yer alan eylem ve protestolar ile toplumsal huzursuzluklara neden olabilir.

Su ve sanitasyon insan haklarının gerçekleştirilmesi için esastır ve her hakkın gerçekleştirilmesi diğer haklar için önemli bir etkiye sahiptir. Yetersiz su; yaşam, çevre, konut, gıda, sağlık ve eğitim hakkını kısıtlar veya bu hakların oluşmasını engeller. Bu sebeple su bir insan hakkıdır ve devletlerin bu hakkı mutlak suretle kendi ulusal mevzuatlarına entegre etmeleri gerekmektedir.

### **ÖZET**

Sanat ve edebiyat dünyamızın önemli isimlerinden biri olup pek çok kitaba imza atmış olan Rasim Özdenören, yaklaşık elli yıllık yazarlık serüveninde on bir hikâye kitabı yayımlamıştır. Pek çok edebiyat dergisinin de kurucuları arasında yer alan Özdenören, edebiyat kuramına dair yazdığı yazılarla da edebî eserlerine düşünce boyutu kazandıran yazarlardan birisidir. İslam uygarlığının kendine özgü değer yargılarını ve duyarlılığını hikâyelerine taşıyan yazar, hikâyelerini bir mesaj verme kaygısı ile yazmadığının da altını çizer. Hikâye kitapları tematik olarak okunduğunda yabancılaşma ve başkaldırı, çözülmenin ekonomik boyutları, ölüm ve ahiret düşüncesi, aile, çocuk, ev ve tasavvuf üzerine yoğunlaştığı görülür. Rasim Özdenören’in eserlerindeki “aile” meselesi, kendisini besleyen alt meseleler arasında biraz daha belirginleşen “geçim sıkıntısı”, “bireyler arası ilişkileri etkileyen bir unsur olarak geleneksel yapı” başta olmak üzere değişik açılardan ele alınabilir. Kişilerin çoğunu bir ailenin bireylerinin oluşturduğu Özdenören hikâyelerinde aile, daha çok “oğul”un hikâyesi vasıtasıyla anlatılır. Bu çalışmada yazarın hikâye türündeki eserlerinin; anlatma, diyalog, bilinç akışı, iç monolog vb. anlatım teknikleri kullanılarak hikâye metodolojisi çerçevesinde incelemesi yapılacak, hikâyelerinde “aile” temasını nasıl ele aldığı ve aile temasına verdiği önem ortaya konulacaktır. Daha önce bu konu ile ilgili yapılan çalışmalar incelendiğinde yazarın hikâye metinlerinde yer alan birçok konuya temas edildiği fakat aile temasının derinlemesine incelenmemiş olması dikkatimizi çekmiştir. Bu çalışma ile Özdenören’in hikâyelerinde aile temasını nasıl ele alıp işlediği ayrıntılı bir şekilde ortaya konulacaktır.

**Anahtar Kelimeler:** Rasim Özdenören, Hikâye, Tema, Aile, Tasavvuf.

## **FAMILY IN RASİM ÖZDENÖREN'S STORIES**

### **ABSTRACT**

Rasim Özdenören, who is one of the important names of our art and literature world and has signed many books, has published ten story books in his fifty-five-year adventure of writing. Özdenören, who is among the founders of many literary magazines, is one of the authors who bring a thought dimension to his literary works with his articles on literary theory. The author, who carries the unique value judgments and sensitivity of Islamic civilization to his stories, also underlines that he does not write his stories with the concern of giving a message. When the story books are read thematically, it is seen that they focus on alienation and rebellion, the economic dimensions of disintegration, the thought of death and the hereafter, family, children, home and mysticism. The "family" issue in Rasim Özdenören's works can be handled from different perspectives, especially "liveability", which becomes more evident among the sub-issues that feed him, and "traditional structure as a factor affecting interpersonal relations". In Özdenören stories, where most of the people are members of a family, the family is mostly told through the story of the "son". In this study, the author's works in the genre of stories; narration, dialogue, stream of consciousness, internal monologue, etc. It will be examined within the framework of story methodology by using narrative techniques, how he handles the theme of "family" in his stories and the importance he gives to the theme of family will be revealed. When the previous studies on this subject are examined, it has drawn our attention that many subjects in the author's story texts have been touched on, but the family theme has not been examined in depth. With this study, it will be revealed in detail how Özdenören handles the family theme in his stories.

**Key words:** Rasim Özdenören, Story, Theme, Family, Sufism.

## GİRİŞ

Türk edebiyatında hikâyenin menşei sözlü anlatı edebiyat dönemine kadar uzanmaktadır. Mitolojik hikâyeler, destan türleri, masallar ile başlayan ilk anlatı türlerinin genel amacı insanları sosyo-dini yönden geliştirerek, onların kâmil insan olmasını sağlamaktır. Bu durum, bu tip edebi eserlerin genel ağırlıkta, halk hikâyesi kategorisinde değerlendirilmesine yol açmaktadır. Türk hikâye tarihinin ilk örnekleri sayılabilecek eserler olarak destanların mensur bölümleri ve Uygur Türk topluluğuna ait *çatıklar* gösterilebilir. Yapılan çalışmalarda İslamiyet'in kabulünden başlayarak Tanzimat dönemine kadar geçen süreçte pek çok hikâye türüne rastlanılmaktadır. Bunların gazâvâtnâme, fetihnâme, siyer, menâkıbnâme gibi sıralanması mümkündür. Nitekim tüm bu bilgilerin yanında Türk bilim ve sanat dünyası hikâye türünün ilk örneğini *Dede Korkut Hikayeleri* olarak kabul etmektedir. Dede Korkut hikâyelerinin mekan-zaman ve yüceltilmiş insan tipini barındırması Türk hikâyeciliği açısından önem arz etmektedir.<sup>1</sup> Nitekim gerek halk edebiyatı, gerekse divan edebiyatında, mensur ve manzum hikâyenin varlığı bilinen bir gerçekliktir<sup>2</sup>.

Türk halk edebiyatında hikâye ise, bambaşka bir boyutta olup zengin bir kültürü içerisinde barındırmaktadır. Burada belirli bir zaman dilimi, coğrafya çerçevesinde bir anlatıya dönüşerek farklı unsurlardan beslenip; dini, tarihi ve sosyal olayların harmanlanması ile oluşmuş eserlere rastlamak mümkündür. Bu kapsamda halk edebiyatı eski zamanlarda anlatı türündeki destanlardan oldukça fazla beslenerek şekillenmiştir. Örneğin halk edebiyatında döşeme ve soylama geleneği, destan geleneğinin devamı sayılmaktadır. Nitekim Eski Türklerdeki şamanlar, halk hikâyelerinde ozanlara dönüşerek hikâye geleneğini sürdürmüştür<sup>3</sup>.

Genel ağırlıkta destanları referans alan halk hikâyeleri, düzyazı ve şiir olmakla beraber zaman içerisinde yazınsal sanat kısmının ivme kazanmasıyla, kişi ve olayların gerçeğe daha uygun bir perspektife girmesiyle aşk, tarih, gibi konular ile destanlardan ayrılmıştır. Gelişimini sürdüren halk hikâyeleri zamanla farklı kaynaklardan da beslenmeye başlar. Ve zaman içinde farklı kaynaklardan da beslenerek gelişimini sürdürür. Yaşayan veya yaşadığı rivayet edilen saz şairlerinin (âşık) hayatları, dinî ve millî hâdiselere dayalı kahramanlıklar ve özellikle Anadolu coğrafyasında yaşanan gerçek olaylar, halk hikâyelerine kaynaklık eder.<sup>4</sup>

<sup>4</sup> Ali İhsan Kolcu, **Öykü Sanatı**, (3. Baskı), Erzurum: Salkımsöğüt. s.17-19.

Hikâye sözcüğünü Arapça'dan devşiren Türk edebiyatı, Tanzimat dönemiyle beraber Batı edebiyatında edebî bir tür olarak ivme kazanan hikâye ile tanışır. Hikâye, edebi bir tür olarak kabul görene dek, gerek Batı edebiyatı olsun, gerekse Arap-Fars edebiyatlarında farklı adlandırmalar altında zaten bulunmaktaydı. Fransız edebiyatı ve dilinde “narration “anlatım”, conte “masal”, récit “anlatı”, historie “tarih”, historiette, nouvelle “roman”; Alman edebiyatında ise “Geschichte, Märchen “tarih” sözcükleri hikâyeye karşılık ya da onu da içerecek şekilde kullanılmıştır.<sup>5</sup>

Bahsedildiği üzere Türk edebiyatında hikâye, 19. Yüzyılın ikinci yarısında ivme kazanmıştır. Bu alanda ilk örneklere Samipaşazade'nin *Küçük Şeyler* adlı eserinde bulunan kısa hikayelerde rastlamaktayız. 1880 sonrası dönemde, yukarıda saydığımız ilk örneklerden sonra henüz roman, tiyatro oyunu ve şiir kadar popüler bir tür olmamakla birlikte kısa hikâye yazılmaya ve okunmaya başlanmıştır. Hüseyin Rahmi Gürpınar (1864-1944), Halit Ziya Uşaklıgil (1866-1945), Hüseyin Cahit Yalçın (1874-1957), Mehmet Rauf (1875-1931), Ahmet Hikmet Müftüoğlu (1870-1927), Ömer Seyfettin (1884-1920), Refik Halit Karay (1888-1965), Halide Edip Adıvar (1882-1964), Yakup Kadri (1889-1974) kısa hikâye türünde yapıtlar ortaya koyarlar<sup>6</sup>.

Bundan sonraki dönemde gerek Tanzimat sonrası, gerekse Cumhuriyet döneminde hikâye türünde çalışmalar hız kazanmaya devam ederek gelişimini sürdürmüştür<sup>7</sup>. Çalışmamızın ana temasını oluşturan Rasim Özdenören'in hikayelerinde ‘aile’ kavramı yaklaşık 50 yıl hikâye yazmaya devam eden yazarın hayatında önemli bir yere sahiptir. 1970 sonrası Türk hikâyeciliğinin önemli kalemlerinden olan yazarın, hikâyelerinde öne çıkan üç mesele etrafında hikâyeciliği değerlendirilmiştir<sup>8</sup>.

Burada bizim için aile manevi bağ duygusu önem kazanmaktadır. İlişkiler bazında baba-oğul ve baba-kız ilişkileri açısından yapılan değerlendirmelerde, çocuğun gözünden babanın olumsuz bir karakter olduğu dikkat çekmektedir. Ancak yazarın karakterler açısından kendi ailesinden bir yansıma olmadığı da bilinmektedir. Bu durumu şöyle özetlemekte Özdenören;

<sup>5</sup> M. Kayahan Özgül, *Hikâyenin Romani. Hece Türk Öykücülüğü* Özel Sayısı 46/47,2005, s. 33-41.

<sup>6</sup> S. Dilek Yalçın-Çelik, *Türk Edebiyatında Kısa Hikâye Hakkında Yapılan Çalışmalar*, Türkbilig Dergisi, 2002/3, s. 106-129.

<sup>7</sup> Eyüp Güneş, “*Rasim Özdenören’le Modernizm ve Edebiyat Üzerine Söyleşi*”, Akademik Sosyal Araştırmalar Dergisi, Y. 2, S. 8, Aralık 2014, s. 601-613.

<sup>8</sup> Kemal Erol- Emin Emrullah Erol, *Rasim Özdenören’in Gül Yetiştiren Adam’ında Kültürel Yabancılaşmaya Karşı Geleneksel Tepki*, Türkiyat Mecmuası, C.27/2, 2017, s..132.

‘Hiçbir hikâyemde babam ile olan ilişkiye yer vermedim.’ diyerek, karakterlerin hikâye çatısı altında toplanmasını sağlayan bir virtüöz olduğunu kanıtlamaktadır<sup>9</sup>.

Aile kavramına dair çözümleneleri İkinci kitabı *Çözülme*’de görmek daha mümkündür. Yazarın 1973 yılında kaleme aldığı eserde; günümüz insanının içine düştüğü bunalımlar, öz değerlerinden çözümlenmeyle birlikte gelen sorunların aileye yansımaları üzerinde durmuştur. *Çözülme*, edebiyat çevrelerinde, Türk edebiyatındaki en dikkate değer uzun hikâyeler arasında gösterilmiştir. Ülkemizdeki sosyal değişimi aile üzerinden yansıtan bu hikâyelerde bireyin devindiği çevre, ilk kitaba nazaran oldukça genişlemiştir<sup>10</sup>.

Özdenören hikâyelerinde aile üzerinden dönemin sosyo-ekonomik şartları da göz önüne alındığında geçim sıkıntısı, bireylere yansımaları ve ailedeki etkileri üzerinde durmaktadır. Hikâyelerinde aile karakterleri üzerinde baba ve oğul perspektifinde bakan Özdenören, dönem koşulları da dikkate alındığında baba ve oğul arasında bir gerginlik, iletişimsizlik, uyumsuzluk, çatışma temalarını sıkça görürüz<sup>11</sup>.

Gerek baba-oğul ilişkisinin öne çıktığı hikâyelerde, gerekse babanın bu ilişki dışında yer aldığı yazarın diğer hikâyelerinde baba, istisnalar dışında olumsuz bir tiptir<sup>12</sup>. Babanın olumsuz bir karakterde olması dönemin giriftli baba-oğul çatışmasından kaynaklanmaktadır. Dönemin babalarının ataerkil bir mizaçta olması, sertlik ve dolaylı bir yakınlık, bu duruma bir örnek oluşturabilir<sup>13</sup>.

Baba karakterlerinin “baba-oğul” ilişkisinde olumsuz ve yer yer suçlu bir tip olarak çizilmesi, yazarın “sadece gördüklerini” yazdığını söylediği toplumsal gerçeklerle ilgili bir durum olarak düşünülebilir. Ancak “baba-oğul” ilişkisinin yazarın hikâyelerinin pek çoğunda öne çıkması ve söz konusu ilişkinin belirtilen şekillerde hikâyeye dünyasına yansımaları yazarın toplumsal gerçeklere belli bir açıdan bakıp bakmadığı sorusunu da akla getirir. Mesela “Bu toplumsal gerçeklik içinde hikâyeye dünyasına taşınmaya değer bulunacak hiç mi farklı bir baba portresi, baba-oğul ilişkisi olmaz” sorusu bu noktada ilk olarak akla gelmektedir. Hikâyelerde annelerin hasta olduğu pek görülmezken, birçok hikâyede babanın hasta olması da acaba yalnızca bu toplumsal gerçeklikle mi ilgilidir? Buradan da anlaşılacağı üzere ailede anne baba karakterlerinden hareketle ailedeki bağları, toplumsal çizgideki yerleri, konumları üzerinde

<sup>9</sup> Kaplan, Ramazan, “*Çözülme Veya Ailedeki Yangın*”, *İşyan Kelimeler* (Hazırlayan: Âlim Kahraman), Kaknüs Yayınları, İstanbul 2007. 269.

<sup>10</sup> Rasim Özdenören, *Çözülme*, İz Yayıncılık, Ankara 2012, S.49-61.

<sup>11</sup> İlyas Dirin, “*Rasim Özdenören*”, *Yedi İklim* yayımları, İstanbul 1999, s. 55-56.

<sup>12</sup> Rasim Özdenören, *Hastalar ve Işıklar*, Yayıncılık, Ankara 1998, s.55-56.

<sup>13</sup> Alim Kahraman, “*Rasim Özdenören’le Üç Oturum (III. Oturum)*”, *İşyan Kelimeler*, Kaknüs Yayınları, İstanbul, 2007, s.194.

durulmuştur. Özdenören; ailede anneyi bir adım öne alırken, baba karakterine hem olumsuz bir çizgi çizmiş, aynı zamanda hayatın tüm yükünü yüklenen ve bu yolda hastalıklarla boğuşan bir figür ortaya koymaktadır<sup>14</sup>.

Rasim Özdenören, *Hastalar ve Işıklar* adlı eserinde çeşitli nedenlerle işsiz kalmış, doğru düzgün işi olmayan yoksul kişileri anlatır<sup>15</sup>. Eserde, bu kişilerin yaşadığı maddî sıkıntılar ve bu sıkıntıların aileye yansımaları ile yaşanan değişimler sonucu ortaya çıkan çözülme de ele alınır. Çözülme ve değişimler sıkıntılar doğurur. Bu sıkıntılar, değişim ve modern dünyanın çekici tarafıyla aşılmaya çalışılır. Bu eserdeki hikâyelerin çoğunda geleneğe ait diyebileceğimiz bir dünya ile modern yaşamın çatışma havası karşımıza çıkar.<sup>16</sup>

Özdenören'in hikayelerinde, köy yada kent farketmeksizin bir sosyo-ekonomik çatışma karşımıza çıkmaktadır. Aile temalı eserlerde yoksulluk ve bunun aileler üzerindeki etkileri, yetinememe ya da, kaybolan figürler anlatılır. Burada ailelerin hayata tutunma mücadeleleri göze çarpmaktadır. Usta bir kalem olan Özdenören'in döneme eğilerek uyarladığı analizler aslında hayattan birer kesit olarak karşımıza çıkar<sup>17</sup>.

*Çözülme*, Özdenören'in ikinci hikâye kitabı olarak okuyucuya ulaşmıştır. Bu hikâyeye 1973'te yayımlanmıştır. *Çözülme* adlı hikâyede okuyucu gelenek modernizm çatışması ile karşı karşıya kalır. Yazar, bu eserin de sosyal hayatta yaşanan ekonomik, soysal ve kültürel değişimlerin şahısların ve ailelerine sirayet eden değişiklikleri, çatışmaları ortaya koyarken yeni düzene uyum sağlamaya çalışan şahısların ve ailelerin yaşadığı çözülmeyi de anlatır. Bu eserde dört öykü işlenmektedir. Eserde aile mefhumu noktasında önem arz eden *Çözülme* adlı hikâyeye, 1977 senesinde TRT adına Yücel Çakmaklı tarafından televizyon filmi olarak uyarlanmış ve beyaz perdeye aktarılmıştır.<sup>18</sup>

Özdenören'in bir diğer hikâyeye kitabı olan *Çarpılmışlar* adlı hikâyesinde; yanlış yollara sevk edilmiş insanların dini inanç sınırlarından da uzaklaşması nedeni ile herkese ve herşeye nasıl

<sup>17</sup> Tosun, Necip, **Türk Öykücülüğünde Rasim Özdenören**, s.38-41.

<sup>18</sup> Rasim Özdenören, **Çözülme**. İstanbul. İz Yayıncılık, İstanbul 2012, s.7.

da yabancılaştığı ve toplum nezdinde açmazlara sürüklendiği anlatılmaktadır<sup>19</sup>. Hikâyenin gerek toplum nezdinde, gerekse aile hayatı çerçevesinde etkileri, usta bir biçimde işlenmiştir. Eserde aile teması işlenirken, geçmişteki aile tipleri ve figürleri ile dönemdeki modern aile yapısı dikkat çekmektedir. Burada da diğer hikâye kitaplarında olduğu gibi zor bir hayatı omzuna almış baba karakteri karşımıza çıkmaktadır. Anlaşılan o ki burada da baba ve oğullarda olduğu gibi bir çatışma söz konusudur<sup>20</sup>.

Özdenören'in edebiyat dünyasına önemli eserler bırakan bir yazar olduğu yazmış olduğu eserlerden de anlaşılmaktadır. Yazarın, olay örgüsü ve bunun işleyişi olsun -tabiri caizse- ustalık ile eserlerini kaleme aldığı bilinmektedir<sup>21</sup>. Bu nedenle eserlerinin her biri birbirinden kıymet arz etmektedir. Özdenören hikâye türünde olan bir diğer eseri ise *Çok Sesli Bir Ölüm* adlı eseridir. Bu eseri diğerlerinden ayıran yegane özellik ise eser, Özdenören'in askerlik zamanında yazdığı bir çalışmadır. Bu çalışma meydana getirilirken Nuri Pakdil üstadın da, Özdenören'e pozitif baskısının etkili olduğu yadsınamaz bir gerçektir. Eser; 1974 yılında kaleme alınmış olup, aile noktasında değinildiği noktalar bulunmaktadır. Aile bireylerinin modern hayata ayak uydurmak uğruna giriştikleri hırs, aile temellerine verilen zararların bir unsuru olarak karşımıza çıkmaktadır. Yazarın diğer hikâyelerinde de olduğu gibi modernizm çatışması aile içerisine kadar indirgenmiştir. Bu çatışma sonucunda ise yok olan, kaybolan aileler işlenmiştir<sup>22</sup>.

Aile, yazarın hemen hemen her eserinde işlediği bir tema olarak karşımıza çıkmaktadır. Yazar eserlerinde aile temasını işlerken gelenek ve modernizm çatışması üzerine sık sık durmuştur. Bu temayı yazarın yedinci kitabı olan *Hışırta* adlı eserinde de görmekteyiz. *Hışırta* adlı hikâye kitabı incelendiği zaman kadının ön planda olduğu bir eserle karşılaşılır. Eserde aşk, ihtiras, evlilik konularının yanında ailelerdeki boşanmaların ana nedeni olarak modernizm çatışması sonrasındaki mutsuzluklar, yetinemeyişler ve ihtiraslar sonrası yıkılan yuvalar işlenmektedir.

<sup>19</sup> Ramazan Kaplan, “Çözülme Veya Ailedeki Yangın”, *Işıyan Kelimeler* (Hazırlayan: Âlim Kahraman), Kaknüs Yayınları, İstanbul 2007, s.269

<sup>20</sup>Rasim Özdenören. *Çarpılmışlar*, İz Yayıncılık, İstanbul 1998, S.25-27.

<sup>21</sup> Mehmet Nezir Eryarsoy. . *Gül yetiştiren adam*, İlke Yayınları, İstanbul 2009, s.129-177.

<sup>22</sup> Rasim Özdenören *Çok Sesli Bir Ölüm*, İz Yayıncılık, İstanbul 1998, S.27-29.

Eserdeki hikâyelerde kadın, ana tema olarak işlenmektedir. Kadına toplumsal baskı özellikle mutsuz evliliklerde, boşanmalarda kadınların yaşadığı toplumsal tepkimeler, çocuklarıyla yaşamış oldukları zorlukları, modern yaşamın çarklarına uymuş, buna uygun yaşayan, gününü gün eden kadınları, bu kadınların imkânsız aşklarını kadınların gözünden anlatan yazar, ara sırada işlemiş olduğu konulara eleştirel bir biçimde yaklaşır<sup>23</sup>.

Yazarın, eserlerini kaleme alırken, kendi ailesi temelli bir anlatı oluşturmadığı, bağımsız bir anlatı tekniği kullandığı eserleri incelendiği zaman ortaya çıkmaktadır. *Hışırta* adlı eserinde kadın temasının işlenmesi diğer eserlerinde erkek temasının kullanılmasından kaynaklanmaktadır. Nitekim diğer eserlerinde baba-oğul çatışması yahut babanın biraz uzak bir kişilik olarak işlenmesi *Hışırta* adlı eserini diğer hikâyelerinden ayırmaktadır. Yazarın dil, üslub ve biçem olarak mükemmel bir akış sergilediği görülmektedir. Hikayeler ağır bir havada başlayarak çatışmaların yaşandığı bir arenaya dönüşmektedir.

## SONUÇ

Rasim Özdenören kaleme aldığı eserlerinde gelenek ve bunun doğuşunu, toplum hayatına olan katkılarını okuyucuya aktaran ender hikâyecilerimizdendir. Ait olduğu dönem içerisinde geleneklerin hali hazırda canlılığını koruyor olması; yazarın, gerek ailesi gerekse çevresinden almış olduğu bilgi birikimi ile harmanlanarak, Türk edebiyatına zengin eserler vermesinde yardımcı olmuştur.

Özdenören'in hikâyeleri incelendiği zaman bazı karakterlerin diğerlerinden bir tık daha önde olduğu söylenebilir. Burada baba karakteri ağırlık kazanırken, olumsuz baba tipi, her soruna olumlu yaklaşan ve aile içerisindeki dengeyi sağlayan bir anne tipi karşımıza çıkmaktadır. Özdenören'in hikâyelerinde kadınlar 'sevgili' konumunda daha çok sınav aracı olarak analiz edilmektedir. Bilhassa tasavvuf temalı hikâyeleri için bu durum geçerlidir. Hikâyelerinde evin kız çocukları; ekseriyetle şanssızdırlar, yahut bedensel olarak engellilerdir. Bir başka talihsizlikleri ise başlarından geçen kötü bir evlilik yapmış tiplerdir. *Çarpılmışlar* adlı hikâyede ise bu kez alışılmış baba-oğul çatışması, yerini baba-kız çatışması olarak göze çarpmaktadır. Rasim Özdenören'in öykülerinde en dikkat çekici özelliklerin başında hikâye kahramanlarının duruşları ön plandadır. Kahramanlar, yetişme şartlarına, içinde buldukları ortama, mensup oldukları kuşağa ve kültürel etkilere göre bir durum alış sergiler.

<sup>23</sup> Eyüp Güneş- Mustafa Karabulut, *Rasim Özdenören'in Hikâyelerinde Gelenek-Modernizm Çatışması*, s.1294.

Sonuç olarak kahramanlar, kendileri için biçilmiş rolü yaşayan karakterlerdir. Yazarın hikâyelerinde karamsar anlatı metodu aktarılması, öykü kişilerinin genellikle umutsuz ve olumsuz tipler olmasından kaynaklanmaktadır. Özdenören, amacının hiçbir zaman öykü üzerinden mesaj vermek olmadığını ısrarla vurgulamıştır. Öte yandan öykülerin yansıttığı tarihsel ve sosyal gerçeklik de göz ardı edilmemelidir. Esasen bu tavır yazarın gerçekçi yaklaşımının bir yorumudur. Özdenören, ideal öykü kişileri çizmemiştir. Eserlerde genel olarak geçmiş ve gelecek çatışması, bunun aile üzerindeki etkileri üzerinde durulmuştur. Nitekim eserlerindeki çatışma, kuşak yahut geçmişteki geleneksel adetler ile modern zamanların aile düzenine ayak uyduramaması ve bunun için hırs boyutunda ait olunmayan bir sisteme adapte olunmak istemesi, aile mefhumun dağılmasına kadar giden olumsuz durumların okuyucuya ustalıkla aktarımı yapılmıştır.

**ÖZET**

1970'lerin ekonomik sorunlarına alternatif bir çözüm getirebilmek için ABD'de ortaya çıkan ve vergi indirimlerine dayanan arz yönlü ekonomi politikası birçok ülkede uygulanmıştır. Arthur Laffer, vergi oranlarındaki indirimlerin vergi gelirlerini artırırken, vergi oranlarındaki artışların vergi gelirlerini azaltacağı görüşünü dile getirmiştir. Bu fikir daha sonra Laffer eğrisi olarak tanımlanmıştır. Laffer etkisi halen tartışmalı konulardan biri olmasına rağmen, farklı ekonomiler için farklı dönemlerde test edilmiş ve genel olarak Laffer'ın görüşlerini destekleyen sonuçlara ulaşılmıştır. Bu çalışmanın amacı, Türkiye'nin 1980-2020 dönemi için Laffer eğrisini tahmin etmektir. 1980 yılının seçilmesinin nedeni, 1980 sonrası ekonomik yapıdaki değişimlere paralel olarak vergi sisteminde de kapsamlı değişikliklerin yapıldığı bir dönem olmasıdır.

**Anahtar Kelimeler:** ARDL, Laffer Eğrisi, Yaklaşım Vergi Oranları, Vergi Gelirleri, Türkiye

**EVALUATION OF THE RELATIONSHIP BETWEEN TAX RATES AND TAX REVENUES IN ACCORDANCE WITH THE LAFFER CURVE: THE CASE OF TURKEY**

**ABSTRACT**

In order to bring an alternative solution to the economic problems of the 1970s, the supply-side economic policy, which emerged in the USA and was based on tax reductions, was implemented in many countries. Arthur Laffer expressed the view that while tax rate cuts increase tax revenues, increases in tax rates will decrease tax revenues. This idea was later described as the Laffer curve. Although the Laffer effect is still one of the controversial issues, it has been tested for different economies in different periods and generally, results supporting Laffer's views have been reached. The aim of this study is to estimate Turkey's Laffer curve for the period 1980-2020. The reason for choosing the year 1980 is that it was a period in which extensive changes were made in the tax system in parallel with the changes in the economic structure after 1980.

**Keywords:** ARDL, Laffer Curve, Approach Tax Rates, Tax Revenues, Turkey

## GİRİŞ

1970’li yıllarda Keynesyen iktisadın talep yönlü bakış açısına getirilen eleştiriler sonucu ekonomide Arz yanlı iktisadın görüşleri özellikle ABD’de etki alanı bulmuştur. 1980’li yıllardan itibaren daha çok vergi indirimleri politikasına ağırlık veren arz yanlı iktisat politikaları uygulanmaya başlanmıştır. Keynesyen iktisadın sorunlarına çözüm olarak Amerikalı iktisatçı A. Laffer vergi indirimlerini önermiş ve vergi indirimleri sonucu toplam piyasa üretiminin ve toplam vergi gelirlerinin artacağını savunmuştur. Diğer bir deyişle Laffer vergi oranlarında yapılan indirimin vergi gelirlerini azaltmayacağını aksine arttıracığını iddia etmiştir. Laffer’in vergi oranları ile vergi gelirleri arasındaki ilişkiyi farklı dönemlerde farklı ülkeleri ele alarak oluşturduğu hipoteze Laffer Eğrisi denilmektedir. Ancak vergi oranları ile vergi gelirleri arasındaki ilişkiyi ilk defa ele alan kişi 14. yüzyılda İbni Haldun’dur.

İbni Haldun Mukaddime adlı eserinde konuyu ele alarak toplumlar oluşurken küçük matrahlar karşılığında alınan vergilerin yüksek vergi gelirleri sağladığını bununla birlikte toplumlar genişleyince büyük matrahlı vergilere karşılık düşük vergi gelirleri elde edildiğini belirtmiştir (Khalidun, 1981:230).

Bu çalışmanın amacı 1980-2020 dönemi itibariyle Türkiye için vergi gelirleri ve vergi oranları arasındaki ilişkiyi Laffer Eğrisi ile tahmin ederek Türkiye’de uygulanan vergi politikalarının etkinliğinin değerlendirilmesidir. Bu doğrultuda çalışmanın birinci bölümünde literatürde vergi gelirleri ile vergi oranları ilişkisini ele alan çalışmalar özetlenmiş, ikinci bölümünde ekonometrik yöntemle değişkenler arasındaki ilişki analiz edilmiştir. Üçüncü bölümde de analiz sonucu elde edilen ampirik sonuçlar uygulanan politikalar çerçevesinde değerlendirilerek yorumlanmış ve politika önerilerinde bulunulmuştur.

Şekil 1: Laffer Eğrisi

Hükümetler daha düşük bir vergi oranı ile aynı vergi gelirini elde etmeleri mümkün olduğu için uzun dönemde A noktasının sağ tarafında faaliyette bulunmak istemeyeceklerdir. Bununla birlikte Laffer eğrisi tek başına vergi oranlarındaki indirimin vergi gelirlerini arttıracakını ya da azaltacağını anlatmamaktadır. Çünkü vergi gelirlerinin vergi oranındaki değişime tepkisi dikkate alınan zaman dilimine, mevcut vergi sistemine, mevcut vergi oranlarının düzeyine, kayıt dışı ekonomiye kayma kolaylığına ve üretim faktörlerinin eğilimlerine bağlıdır. Eğer mevcut vergi oranı çok yüksek ise vergi oranı indiriminin iktisadi etkisi aritmetik etkisine bağlı olarak vergi gelirlerini arttıracaktır (Bilgin, 2018:87).

Laffer'in Laffer eğrisi ile ilgili ortaya koyduğu ulusal ve uluslararası literatürde farklı dönemler ve farklı veri setleriyle çeşitli ülke ekonomileri için test edilmiştir.

Vergi gelirleri ile vergi oranları arasındaki ilişkiyi açıklayan Laffer Eğrisi, bireylerin vergi sonrası karlarının artması durumunda daha çok çalışacakları; firmaların ve girişimcilerin de vergi sonrası karlarının artması durumunda daha çok yatırım yapacakları varsayımına dayanmaktadır (Kurt, 2017:9).

## LİTERATÜR TARAMASI

**Tablo 1.1:** Laffer Eğrisine Yönelik Literatür Taraması

Yazar	Veri Seti	Yöntem	Sonuçlar
Beenstock (1979)	1946-1977	Sıradan En Küçük Kareler (SEK)	Analiz sonuçlarına göre İngiltere Laffer Eğrisinin normal bölgesindedir. İngiltere için optimal vergi oranı %60'tır.
Moldoff (1980)	1954-1978	Sıradan En Küçük Kareler (SEK)	Amerika için çan şeklide bir eğri elde edilememiştir. Vergi oranları ve vergi gelirleri reel olarak artmakla beraber enflasyondan dolayı bireyler daha yüksek vergi dilimlerine itilmekte bu yolla da vergi gelirleri yükselmektedir.
Blinder (1981)	-	Teorik	Blinder, Laffer eğrisinin matematiksel olduğunu bu nedenle de Laffer eğrisinin faktör esnekliklerine bağlı olarak uygulanabileceğini ileri sürmüştür. Esneklikler arttıkça vergi gelirleri maksimum olacak vergi oranları daha düşük olacaktır.
Fullerton (1982)	-	Simülasyon	Amerika Laffer eğrisinin sağ tarafında diğer bir deyişle caydırıcı bölgesinde yer almaktadır.
Derdiyok (1993)	1960-1988	Sıradan En Küçük Kareler (SEK)	Çalışmada iki model kurulmuştur. Her iki modelin sonuçlarına göre de Türkiye'de yönetimler eğrinin normal bölgesindedir.
Yamak ve Yamak (1995)	1960-1990	Sıradan En Küçük Kareler (SEK)	Türkiye için Laffer eğrisini dolaylı vergiler, dolaysız vergiler ve toplam vergiler için tahmin etmişlerdir. Dolaylı vergiler açısından 1963-1977 döneminde ve toplam vergiler açısından 1971-1973 ve 1975-1981 dönemlerinde

			Türkiye eğrinin caydırıcı bölgesinde faaliyette bulunmuştur.
Yamak (1996)	1960-1993	Sıradan En Küçük Kareler (SEK) Ve Kalman-Filtre	Analiz sonuçlarına göre uygulanan ortalama vergi oranı açısından vergi yönetimlerinin Laffer eğrisinin caydırıcı ya da normal bölgesinde olup olmadığı tam olarak belirlenememiştir.
Doğan (2002)	1979-2000	Sıradan En Küçük Kareler (SEK)	Türkiye dolaysız vergiler açısından eğrinin solunda yer alırken, toplam vergi gelirleri açısından eğrinin sağ tarafında yer almaktadır.
Karabulut (2006)	1980-2003	Sıradan En Küçük Kareler (SEK)	Türkiye 1997 yılına kadar eğrinin sol tarafında yer alırken, bu yıldan itibaren eğrinin sağ tarafındadır.
Erinç (2009)	1982-2008	Sıradan En Küçük Kareler (SEK)	Toplam vergi gelirleri için Laffer eğrisi yoktur.
Kurt (2017)	2004-2015	Sıradan En Küçük Kareler (SEK) Ve Hodrick-Prescott Filtreleme	
Bilgin (2018)	1982-2016	Sıradan En Küçük Kareler (SEK)	

Beenstock (1979), 1946-1977 dönemi yıllık verileri ile Laffer eğrisini İngiltere ekonomisi için sıradan en küçük kareler yöntemi (SEK) ile ortaya koymaya çalışmıştır. Vergi gelirleri olarak “merkezi yönetimin gelir ve harcamalar üzerinden alınan vergiler + milli sigorta katılım payları + yerel yönetim payları” toplamını almıştır. Vergi oranını ise vergi gelirlerinin GSYH’ya oranı şeklinde hesaplamıştır. Analiz sonuçlarına göre İngiltere için optimal vergi oranı %60’tır.

Moldoff (1980), Beenstock’un 1979 yılındaki çalışmasını 1954-1978 dönemi çeyrek verileri kullanarak ABD için SEK yöntemi ile gerçekleştirmiştir. Enflasyonun kişileri daha yüksek bir vergi dilimine ittiğini belirterek vergi gelirleri ve vergi oranı arasındaki ilişkiyi hem cari hem de sabit fiyatlarla ele almıştır. Analiz sonucunda ABD için vergi gelirleri ile vergi oranları için Laffer eğrisi şeklinde bir eğri elde edilememiştir.

Derdiyok (1993) Türkiye’de vergi gelirleri ile vergi oranları arasındaki ilişkiyi 1960-1988 dönemi yıllık verileri ile tahmin etmiştir. Tahmin tekniği olarak SEK kullanmıştır. Analiz

sonuçlarına göre 1988 yılında %27,95 ile zirve yapmıştır. Türkiye Laffer eğrisinin normal bölgesinde yer almaktadır.

Doğan (2002) Laffer eğrisini 1979-2000 dönemi için Beenstock'un İngiltere için Türkiye için tahmin etmiştir. Çalışmada iki ayrı model kurulmuştur. İlk modelde dolaysız vergi gelirlerini, ikinci modelde ise toplam vergi gelirlerini ele almıştır. Analiz sonuçlarına göre Türkiye 2000 yılında dolaysız vergiler açısından eğrinin solunda yer alırken, toplam vergi gelirleri açısından eğrinin sağ tarafında yer almaktadır.

Kurt (2017), Türkiye ekonomisi için Laffer eğrisini 2004:Q1-2015:Q2 dönemi verilerini kullanarak Sıradan En Küçük Kareler (SEK) tahmin etmiştir. Çalışmada olası bir sahte regresyon ve çoklu bağıntı sorununu kaldırmak amacıyla Hodrick-Prescott Filtreleme yöntemi kullanılmıştır. Analiz sonuçlarına göre 2015:Q2'de optimal vergi oranları sırasıyla %25.3, %16.7 ve %9.06'dır.

Bilgin (2018), Türkiye için 1982-2016 dönemi verilerini kullanarak Laffer eğrisini Beenstock'un öne sürdüğü statik, dinamik ve GSYİH'nin gecikmesini içeren 3 farklı model ile tahmin etmiştir. Dinamik modele uygulanan analiz sonuçlarına göre 1982-1999 yılları arası ve 2003-2010 arası Laffer eğrisinin normal alanını göstermektedir. Diğer modelin analiz sonuçlarına göre ise 1982-2010 döneminde Türkiye Laffer eğrisinin normal bölgesinde yer almaktadır. Bu dönemde vergi oranındaki artışlar vergi gelirlerini arttırmaktadır.

### **EKONOMETRİK MODEL**

Çalışmada Laffer Eğrisinin etkisini ölçebilmek adına 1980 ile 2020 yılları arasında vergi gelirleri ile vergi oranı verileri kullanılarak zaman serisi analizlerinden faydalanılmıştır. 1980-2020 yılları arasındaki vergi gelirleri verisi OECD DATA BASE, Dünya Bankası ve Hazine Maliye Bakanlığı veri setlerinden alınmıştır. GSYH verisi Türkiye İstatistik Kurumu (TÜİK), TEFE-TÜFE verisi Türkiye Cumhuriyet Merkez Bankası Elektronik Veri Dağıtım Sistemi (EVDS)'den alınmıştır. Vergi geliri verisi TEFE verisi ile reelleştirilmiştir. Vergi oranı verisi ise reel vergi geliri verisinin GSYH ile bölünmesiyle oluşturulmuştur.

Çalışmada Eviews 10 paket programından yararlanılarak ARDL Sınır Testi yaklaşımıyla eşbütünleşme ilişkisi tespit edilmiş, devamında uzun ve kısa dönemli etkiler ortaya konmaya çalışılmıştır.

Çalışmanın matematiksel kalıbı Eşitlik 3.1'deki şekilde kurulmuştur.

$$RVergiGeliri_t = \beta_0 + \beta_1 Trend + \beta_2 RVergiOranı_t + \varepsilon_t \quad (3.1)$$

Değişkenlerin durağanlığı Genişletilmiş Dickey-Fuller (ADF) testiyle, değişkenler arası eşbütünleşmenin varlığı ise ARDL sınır testi yaklaşımıyla incelenecektir.

Durağan olmayan veri setlerinde çıkan sonuçlar yanıltıcı olabilmektedir. Zaman serilerinde durağanlık testlerinde serinin ortalaması ve varyansına dikkat edilir. Eğer ortalama ve varyans iki dönem arasındaki uzaklığa bağlı kalıyorsa durağandır. Bu durum zayıf durağanlık olarak tanımlanmaktadır (Gujarati, Porter, Şenesen & Günlük. 2012, s. 740). Bir  $Y_t$  zaman serisi için aşağıdaki gibidir;

$$E(Y_t) = \mu \quad (3.2)$$

$$var(Y_t) = E(Y_t - \mu)^2 = \sigma^2 \quad (3.3)$$

$$Y_k = E[(Y_t - \mu)(Y_{t+k} - \mu)] \quad (3.4)$$

Burada  $Y_k$  ile ifade edilen değişken  $k$  gecikmedeki ardışık ortak varyansı yani  $Y_t$  ile  $Y_{t+k}$  arasındaki farkın ortak varyansını göstermektedir.

Dickey-Fuller (1979) birim kök testine ilave olarak bağımlı değişkenin gecikmeli değerlerinin de eklenmesiyle oluşturulan Genişletilmiş Dickey-Fuller (1981) birim kök testinde hata terimlerde otokorelasyon problemi olduğunda da birim kök testi uygulanabilmektedir.

*Sabitli*

$$\triangleright \Delta Y_t = \alpha_1 Y_{t-1} + \sum_{i=1}^p \beta_i \Delta Y_{t-i} + \varepsilon_t \quad (3.5)$$

*Sabitli*

$$\triangleright \Delta Y_t = \mu + \alpha_1 Y_{t-1} + \sum_{i=1}^p \beta_i \Delta Y_{t-i} + \varepsilon_t \quad (3.6)$$

*Trendli*

$$\triangleright \Delta Y_t = \mu + \alpha_1 Y_{t-1} + a_2 t + \sum_{i=1}^p \beta_i \Delta Y_{t-i} + \varepsilon_t \quad (3.7)$$

ADF birim kök testinin sıfır hipotezi seri “birim kök içerir” şeklinde kurulmuştur. Bu nedenle yapılan testler sonucunda olasılık değerlerinin %1-%5 ve %10 anlamlılık düzeylerinin altında çıkması boş hipotezi reddetmemize; serilerin birim kök içermediği sonucuna ulaşılmaktadır. ADF birim kök testi sonuçları Tablo 3.1’de verilmiştir.

**Tablo 0.1:** Genişletilmiş Dickey-Fuller Birim Kök Test Sonuçları

<b><u>DÜZEYDE</u></b>						
	<b>SABİTLİ</b>		<b>SABİTLİ - TRENDLİ</b>		<b>SABİTSİZ</b>	
	<i>T-statistic</i>	<i>Prob.</i>	<i>T-statistic</i>	<i>Prob.</i>	<i>T-statistic</i>	<i>Prob.</i>
<b>VERGİ GELİRİ</b>	0.458936	0.9830	-2.230315	0.4603	3.403050	0.9997
<b>VERGİ ORANI</b>	-2.631614	0.0954	-2.517843	0.3183	-0.977112	0.2884
<b><u>BİRİNCİ DERECE FARKI ALINDIĞINDA</u></b>						
	<b>SABİTLİ</b>		<b>SABİTLİ – TRENDLİ</b>		<b>SABİTSİZ</b>	
	<i>T-statistic</i>	<i>Prob.</i>	<i>T-statistic</i>	<i>Prob.</i>	<i>T-statistic</i>	<i>Prob.</i>
<b>VERGİ GELİRİ</b>	-5.075676	0.0002	-5.111867	0.0009	-3.946297	0.0002
<b>VERGİ ORANI</b>	-9.462900	0.0000	-9.849056	0.0000	-9.409342	0.0000

Tablo 3.1’de görüldüğü üzere vergi geliri verisi Sabitli, Trendli ve Sabitsiz modellerde %10 istatistiksel anlamlılık düzeyinde durağan olmadığı görülmüştür. Vergi oranı ise sadece sabitli modelde %10 anlamlılık düzeyinde durağandır. Ancak %5 ve %1 istatistiksel anlamlılık düzeyinde durağan olmadığı görülmektedir.

Her iki veri de birinci derece farkları alındığında %1 istatistiksel anlamlılık düzeyinde dahi sıfır hipotezi reddederek durağan olduğu sonucuna ulaşılmaktadır.

Çalışmada değişkenlerin  $I(1)$ ’den büyük olmamak kaydıyla farklı derecelerde durağanlaştığı görülmektedir. Bu nedenle, ARDL sınır testi yöntemi ile eşbütünleşme ilişkisinin aranması gerekmektedir. Akaike bilgi kriterlerine göre uygun ARDL modeli, ARDL(5,4) şeklinde tahmin edilmiştir. Eşbütünleşme ilişkisinin olup olmadığının tespitinde kullanılan ARDL sınır testi sonuçları Tablo 3.2’te verilmiştir.

**Tablo 0.2: Eşbütünlük Testi (F Bound Test)**

<b>F Bound Test</b>		Sıfır Hipotez: Eşbütünlük Yok		
<b>k</b>	<b>F İstatistiği</b>	<b>Önem Seviyesi</b>	<b>Alt Sınır</b>	<b>Üst Sınır</b>
		10%	4.05	4.49
<b>1</b>	<b>8.129408</b>	5%	4.68	5.15
		2,5%	5.3	5.83
		1%	6.1	6.73

F İstatistik değeri kritik değerlerin üzerinde ise eşbütünlüğün olduğu, kritik değerlerin altında ise eşbütünlüğün olmadığı sonucuna ulaşılmaktadır. F-İstatistik değeri (8.129408) tüm kritik değerlerin üzerinde olduğu, modelde eşbütünlük olmadığını ifade eden sıfır hipotez reddedilerek değişkenler arası eşbütünlük olduğu görülmüştür.

Eşbütünlüğün olduğu görülen modelde kısa ve uzun dönemli tahminler yapılabilmektedir. Hesaplanan uzun dönemli ilişki Tablo 3.3'de gösterilmiştir.

**Tablo 0.3: Uzun Dönem Katsayıları**

<b>Değişken</b>	<b>Katsayı</b>	<b>Standart Hata</b>	<b>t-İstatistiği</b>	<b>Olasılık Değeri</b>
<b>C</b>	-2.226280	4.986953	-4.464208	0.0002
<b>@Trend</b>	1.217859	2.511392	4.849340	0.0001
<b>RVergiGelir(-1)</b>	-0.955154	0.198003	-4.823936	0.0001
<b>VergiOran(-1)</b>	1.085160	2.445657	4.441180	0.0002
<b>D(RVergiGelir(-1))</b>	0.306625	0.170158	1.802006	0.0847
<b>D(RVergiGelir(-2))</b>	0.142240	0.178779	0.795619	0.4344
<b>D(RVergiGelir(-3))</b>	-0.152109	0.178956	-0.849978	0.4041
<b>D(RVergiGelir(-4))</b>	-0.294431	0.167713	-1.755561	0.0925
<b>D(VergiOran)</b>	4.708826	2.002511	2.351461	0.0276
<b>D(VergiOran(-1))</b>	-8.531527	2.550691	-3.344791	0.0028
<b>D(VergiOran(-2))</b>	-7.930541	2.489851	-3.185147	0.0041
<b>D(VergiOran(-3))</b>	-3.890021	2.029008	-1.917203	0.0677

Tablo 3.3'de ARDL uzun dönem sonuçları verilmektedir. Elde edilen bulgulara göre vergi oranındaki değişim aynı dönem içerisinde etkisi literatüre ters bir şekilde pozitif etkilemekte ve istatistiksel olarak anlamlıdır.

Ancak vergi oranlarındaki tüm gecikmeler istatistiksel olarak anlamlı olmakla birlikte literatür uygun bir şekilde vergi gelirlerini negatif etkilemektedir. Bu negatif etkinin dönem geçtikçe azaldığı görülmektedir.

Elde edilen bulgulara göre, vergi oranlarının vergi gelirlerini etkisi istatistiksel olarak anlamlıdır. Buna göre vergi oranlarındaki %1’lik bir değişim vergi gelirlerini %8 oranında ters yönde etkilemektedir.

Bir sonraki gecikme ele alındığında ise istatistiksel olarak anlamlı olan sonuçlara göre vergi oranlarındaki %1’lik bir artış vergi gelirlerini %7 oranında azaltmaktadır. Bu etki 3. gecikmede ise daha da azalmaktadır ve vergi oranlarındaki %1’lik bir değişim vergi gelirlerini %3 oranında negatif yönde etkilemektedir.

### Hata Düzeltme Modeli

Modelimizde değişkenler arasındaki kısa dönem ilişkinin analizinde ARDL hata düzeltme modeli kullanılmıştır. Model Eşitlik 3.8’deki gibidir:

$$\Delta \text{Vergi Geliri} = c + \sum_{i=1}^k \beta_i \Delta \text{VergiOran}_{t-i} + \tau_i \text{CointEq}_{t-1} + \varepsilon_t \quad (3.8)$$

Eşitlik 3.8’de yer alan “c” modeldeki sabit terimi, CointEq ise hata düzeltme terimini temsil etmektedir. Modelde gecikmeli değişkenlerin sayısı “k”, gecikme sayısı ise “i” olarak gösterilmektedir. Kısa dönem katsayıları ise Tablo 3.4’de gösterilmiştir.

**Tablo 0.4:** Kısa Dönem Katsayıları

<u>Değişken</u>	<u>Katsayı</u>	<u>Standart Hata</u>	<u>t-İstatistiği</u>	<u>Olasılık Değeri</u>
<u>C</u>	-2.104494	4.389036	-4.794888	0.0001
<u>D(RVergiGelir(-1))</u>	0.306625	0.153821	1.993385	0.0582
<u>D(RVergiGelir(-2))</u>	0.1422401	0.155106	0.917050	0.3686
<u>D(RVergiGelir(-3))</u>	-0.152109	0.154337	-0.985565	0.3346
<u>D(RVergiGelir(-4))</u>	-0.294431	0.150495	-1.956421	0.0627
<u>D(VergiOran)</u>	4.708826	1.581343	2.977739	0.0067
<u>D(VergiOran(-1))</u>	-8.531527	2.394063	-3.563619	0.0017
<u>D(VergiOran(-2))</u>	-7.930541	2.380647	-3.331255	0.0029
<u>D(VergiOran(-3))</u>	-3.890021	1.944187	-2.000847	0.0573
<u>CointEq(-1)</u>	-0.955154	0.185514	-5.148683	0.0000

Hata düzeltme modelinde, hata düzeltme katsayısı olarak adlandırılan CointEq (-1) katsayısının negatif ve anlamlı olması beklenmektedir. Hata düzeltme katsayısının anlamlı ve negatif olması değişkenlerin uzun dönem ilişkisinden sapmanın sonraki dönemlerde yeniden dengeye geleceği anlamına gelmektedir. Tablo 3.4’deki değer incelendiğinde CointEq (-1) katsayısı (-)0.955154

ve %1 önem seviyesinde dahi istatistiksel olarak anlamlı olduğu görülmektedir. Yani uzun dönem dengesinden sapmalar yaşandığında yaklaşık 1 yılda tekrar dengeye gelmektedir. Diğer bir ifade ile uzun dönem dengede meydana gelen sapmanın %95,51'i bir sonraki dönemde dengeye gelmektedir.

Vergi oranlarındaki değişimin vergi gelirlerine olan etkiye bakıldığında kısa dönemli modelde de uzun dönem ile paralel ve yakın seyrettiği görülmektedir.

Vergi oranlarındaki değişim seviyesinde vergi gelirlerini pozitif etkilediği ve %1 önem seviyesinde ise istatistiksel olarak anlamlıdır.

Vergi oranlarındaki gecikmeler ise yine uzun dönemde olduğu gibi vergi gelirlerini aynı doğrultuda negatif etkilemektedir. Vergi oranlarının birinci gecikmesine bakıldığında vergi oranlarındaki yukarı yönlü bir değişim vergi gelirlerini ters yönde etkilemektedir.

Aynı durum diğer iki gecikmede de geçerli olup ikinci gecikme %1 üçüncü gecikme ise %10 istatistiksel önem seviyesinde anlamlı olup vergi gelirleri üzerinde ters yönlü ilişkisi bulunmaktadır.

### **Model Varsayımları**

Modelin güvenilirliğini sorgulamak amacıyla aranan varsayımlardan birisi normallik testidir. Normallik sınaması Jarque-Bera test istatistiği ile belirlenmiş ve sonuç Şekil 3.1'de gösterilmiştir.

**Şekil 0.1** Normallik Testi (Jarque-Bera)

Şekil 3.1'de de görüldüğü üzere olasılık değerinin 0.05 anlamlılık düzeyinden büyük olması "hata terimleri normal dağılmaktadır" şeklinde belirlenen sıfır hipotezi reddedememektedir. Hata terimlerinin normal dağılım koşulunu sağladığı sonucuna ulaşılmıştır.

Bir diğer varsayım ise sıfır hipotezin “otokorelasyon yoktur” şeklinde kurulduğu otokorelasyon testidir. Tablo 3.5’de otokorelasyon testi sonuçları gösterilmiştir.

**Tablo 0.5:** Breusch-Godfrey Serial Correlation LM Test Sonuçları

<b>F-İstatistiği</b>	<b>0.774527</b>	<b>Olasılık F(2, 21)</b>	<b>0.4736</b>
<b>R2</b>	2.404396	<b>Olasılık, Ki-Kare(2)</b>	0.3005

Tablo 3.5’de görüleceği gibi olasılık değeri %10 istatistiksel anlamlılık düzeyinde dahi “Otokorelasyon Yoktur” şeklinde kurulan sıfır hipotezi sınamakta ve reddedilememektedir. Bu sonuç ile tahmin edilen modelde otokorelasyon sorununun olmadığına karar verilmiştir.

Değişen varyans sorununu ise Breusch-Pagan-Godfrey değişen varyans testi uygulanarak incelenmiştir. Test sonuçları Tablo 3.6’da verilmiştir.

**Tablo 0.6:** Breusch-Pagan-Godfrey Değişen Varyans Testi

<b>F-İstatistiği</b>	<b>0.475497</b>	<b>Olasılık F(32, 20)</b>	<b>0.9706</b>
<b>R2</b>	22.89996	<b>Olasılık, Ki-Kare(32)</b>	0.8814

Breusch-Pagan-Godfrey değişen varyans testinde boş hipotez olasılık değerinin 0.05 istatistiksel anlamlılık düzeyinden büyük olması halinde değişen varyans sorununun olmadığı yönünde kurulmuştur. %10 istatistiksel anlamlılık düzeyinde dahi sıfır hipotez reddedilemediğinden hata teriminde değişen varyans sorunu gözlemlenmediği ortaya konulmuştur.

Modelin matematiksel kalıbını doğru seçilip seçilmediği Ramsey Reset testi ile belirlenmektedir. Test sonuçlarının 0.05 istatistiksel anlamlılık seviyesinden büyük çıkması “modelin matematiksel kalıbı doğru seçilmiştir” şeklindeki sıfır hipotezi reddedilememektedir. Ramsey reset test bulguları Tablo 3.7’de verilmiştir.

**Tablo 0.7: Ramsey Reset Testi**

	Değer	SD	Olasılık
<b>t-İstatistik</b>	0.993311	22	0.3314
<b>F-İstatistik</b>	0.986668	(1, 22)	0.3314

Tablo 3.7’de yer alan olasılık değerlerine bakıldığında %10 istatistiksel anlamlılık düzeyinde dahi sıfır hipotez reddedilememektedir. Bu durum modele eklenen üssel değişkenlerin bağımlı değişken üzerinde etkisi olmadığı ve matematiksel kalıbının doğru formda kurulduğu kararını desteklemektedir.

Model varsayımlarından son olarak uzun dönem katsayıların istikrarlılığını belirlemek amacıyla yapılan CUSUM ve CUSUMSQ testleri Grafik 3.1 ve 3.2’de sunulmuştur.

**Grafik 0.1: CUSUM Testi**

**Grafik 0.2: CUSUMSQ Testi**

Grafik 3.1'e bakıldığında CUSUM testinde hata terimleri toplamının standart sapmaya oranının %5 kritik değerler arasında kaldığı ve sapma yapmadığı görülmektedir.

Grafik 3.2'de ise daha hassas olan CUSUMSQ testinde hata terimleri kareleri toplamı varyansının %5 kritik değer sınırlarından çıkmadığı görülmektedir. Bu durum tahmin sonuçlarının istikrarlı olduğunu göstermektedir.

## SONUÇ

İktisadi düşünceler tarihinde dönemin konjonktürel şartlarına bağlı olarak klasik ve Keynesyen iktisat temelli arz ve talep yönlü politikalar uygulanmıştır. 1929 Dünya bunalımına kadar klasik iktisadi düşüncenin arz yanlı politikaları geçerli iken bu bunalımın Klasik politikalarla aşlamaması sonrasında Keynesyen iktisadi düşüncenin talep yönlü politikaları gündeme gelmiştir. Keynesyen politikalar da 1970 petrol krizine kadar geçerli olmuş ve o dönemde yaşanan stagflasyon olgusuna talep yönlü politikalar çözüm olamamıştır. Bu süreçte arz yönlü politikalar yeniden gündeme gelmiştir. Özellikle ABD'de gelişen arz yönlü iktisadın temel aracı vergi indirimleridir. ABD'li iktisatçı A. Laffere'e göre vergi indirimleri vergi gelirlerini azaltmayacak aksine arttıracaktır. Laffer'in bu hipotezi günümüzde hala tartışılrsa da farklı ekonomiler için farklı dönemlerde test edilmiştir.

Çalışmada elde edilen bulgulara göre vergi oranındaki değişimin vergi gelirlerine etkisi literatüre ters şekilde pozitifdir. Yani vergi oranındaki bir değişim aynı dönem içerisinde vergi gelirlerini pozitif etkilemektedir ve istatistiksel olarak anlamlıdır. Bu durum vergi oranındaki değişimin bir sonraki dönemde geliri etkilemesi ile ilişkilendirilebilir. Vergi oranındaki artış nedeniyle bir sonraki döneme kalmak istemeyen mükellefler cari yıl içerisinde vergi ödemelerini tamamlamakta ve sonraki döneme aktarım yapmamaktadırlar. Bu durum da vergi gelirlerini, vergi oranının arttırıldığı cari yıl içerisinde arttırmaktadır.

Gecikmelere bakıldığında ise literatüre uygun bir şekilde vergi oranlarındaki artış vergi gelirlerini ters yönde etkilemekte ve istatistiksel olarak anlamlı olduğu görülmektedir. Vergi oranlarındaki %1'lik bir değişim vergi gelirlerini birinci gecikmede %8 oranında ters yönde etkilediği görülmektedir. Bu etkinin her bir gecikmede azaldığı gözlemlenme ve literatüre uygun olduğu görülmektedir.

Laffer eğrisine göre cari vergi oranları optimal vergi oranından yüksek ise vergi oranındaki artış karşısında vergi gelirleri artmayacaktır. Böyle bir durumda vergi gelirlerini arttırmanın yolu vergi oranlarında indirime gitmektir. Türkiye'de son yıllarda cari vergi oranları optimal vergi

oranlarını üzerinde seyretmektedir. Bu durum vergi yükünde artış demektir ki ekonomiyi ve vergi gelirlerini olumsuz yönde etkiler. Ağır vergi yükü kayıt dışı ekonomiyi teşvik edici bir unsur olarak karşımıza çıkar.

Yapılan tahmin ve analizler neticesinde Laffer eğrisinin Türkiye için çalıştığı söylenebilir. Bu durum beraberinde kayıt dışılığı da arttırmaktadır. Artan oranlar vergi gelirlerini oluşturan vergisini ödeyen kişilerin yükünü arttırmakta ancak kümülatif vergi gelirlerinde bir yükseliş olmamaktadır. Kayıt dışının kayıt altına alınması, vergi idare ve denetimini daha etkin ve işlevli bir hale getirebilmek ve vergi yükünün daha adil bir biçimde dağıtılabilmesi için Türk Vergi Sistemi üzerinde kapsamlı bir reform veya Avrupa Birliği'ne uyum sürecindeki vergi politikaları değerlendirilmeye alınmalıdır. Vergi gelirini arttırmak vergi yükünü daha adil dağıtabilmekle mümkündür.

## **ÖĞRETMENLERİN GÖZÜNDEN ÖĞRETMENLİK MESLEK KANUNU**

**Özkan ASLAN (Orcid ID: 0000-0002-7584-6110)**

Recep Tayyip Erdoğan Üniversitesi Eğitim Yönetimi YL Öğrencisi

### **ÖZET**

Son dönemlerde ülkemizde eğitim alanında önemli yenilikler yapılmıştır. Bu yeniliklerin en önemlilerinden birisi eğitim sisteminin en stratejik paydaşı olan öğretmenlere yönelik çıkarılan Öğretmenlik Meslek Kanunudur. Öğretmenlik Meslek Kanunu'nun üçüncü maddesinde öğretmenlik, "Eğitim ve öğretim ile bununla ilgili yönetim görevlerini üzerine alan özel bir ihtisas mesleğidir." şeklinde tanımlanmıştır. Bu tanımdan anlaşılacağı gibi özel bir ihtisas gerektiren öğretmenlik, aday öğretmenlik sürecinden emeklilik sürecine kadar hem ekonomik hem sosyal hem de kültürel anlamda çağa ayak uyduran, öğretmene toplumsal nitelik ve statü kazandıran bir meslektir. Bu çalışmada Öğretmenlik Meslek Kanunu'nun ekonomik, sosyal, kültürel ve mesleki yeterlilik anlamında öğretmenler tarafından nasıl algılandığının ortaya konulması amaçlanmıştır. Bu amaç doğrultusunda çalışmada nitel araştırma yöntemlerinden olan durum çalışması deseni tercih edilmiştir. Çalışmanın evrenini 2022-2023 eğitim-öğretim yılında Ağrı İli Merkez İlçesi'nde görev yapan tüm öğretmenler oluşturmaktadır. Araştırmada evren içerisinden amaçlı örneklem yöntemlerinden olan maksimum çeşitlilik yöntemi kullanılarak 20 öğretmenin görüşü alınmıştır. Görüşü alınan öğretmenlerin seçiminde cinsiyet, eğitim düzeyi, branş ve görev yaptıkları okulların sosyo-ekonomik düzeylerinin farklı olmasına dikkat edilmiştir. Araştırmada yarı yapılandırılmış görüşme formu kullanılmıştır. Görüşme yoluyla toplanan verilerin çözümlenmesinde içerik analizi kullanılmıştır. İlk aşamada toplanan veriler bilgisayara aktarılarak ham veri metinleri elde edilmiştir. Daha sonra bu metinler, araştırmacı tarafından birkaç kez okunup değerlendirilmiş ve ön kodlamalar yapılmıştır. Kodların oluşturulmasında alan yazında kullanılan kavramlar ve görüşmelerden elde edilen veriler göz önünde bulundurulmuştur. Bu çalışmanın ardından, kodlar bir araya getirilerek ortak yönleri bulunmuş, böylece araştırma bulgularının ana hatlarını oluşturacak temalar belirlenmiştir.

**Anahtar kelimeler:** Öğretmen, öğretmenlik meslek kanunu

**TEACHING PROFESSIONAL LAW FROM TEACHERS' EYES****ABSTRACT**

In recent years, important innovations have been made in the field of education in our country. One of the most important of these innovations is the Teaching Profession Law, which was enacted for teachers, who are the most strategic stakeholders of the education system. In the third article of the Teaching Profession Law, teaching is a special profession that takes on education and training and related management duties. defined as. As it can be understood from this definition, teaching, which requires a special specialization, is a profession that keeps up with the times both economically, socially and culturally, from the candidate teaching process to the retirement period, and gives the teacher a social qualification and status. In this study, it is aimed to reveal how the Teaching Profession Law is perceived by teachers in terms of economic, social, cultural and professional competence. For this purpose, the case study design, which is one of the qualitative research methods, was preferred in the study. The universe of the study consists of all teachers working in the Central District of Ağrı Province in the 2021-2022 academic year. In the research, 20 teachers' opinions were taken by using the maximum diversity method, which is one of the purposeful sampling methods from the universe. In the selection of the teachers whose opinions were taken, attention was paid to the fact that gender, education level, branch and socio-economic levels of the schools they work in were different. A semi-structured interview form was used in the research. Content analysis was used to analyze the data collected through interviews. In the first stage, the collected data were transferred to the computer and raw data texts were obtained. Afterwards, these texts were read and evaluated several times by the researcher and pre-coded. In the creation of the codes, the concepts used in the literature and the data obtained from the interviews were taken into consideration. After this study, the codes were brought together and common aspects were found, so that the themes that would form the main lines of the research findings were determined.

**Keywords:** Teacher, teaching professional law

## 1. GİRİŞ

Teknolojinin hızla geliştiği ve dünyaya yön verdiği bir dönemde insanlık henüz deneyimlemediği bir dünyaya doğru yolculuk yapmaktadır. Bu yolculuk artık dünya sınırlarını aşmakta ve gelişmeler karşısında insanlığı ilerde nelerin beklediğini tahmin etmek gittikçe zorlaşmaktadır. Salgın hastalıklar, küresel ısınma, savaş ve kavgalar, hızlı nüfus artışı, finansal krizler, işsizlik, göçler, mülteci krizleri gibi toplumsal olaylar insanlığı bir bilinmezliğin içerisine doğru sokmakta ve tehdit etmektedir.

Tüm bu olumsuzluklar karşısında ülkeler toplumsal ve ekonomik kalkınma planları doğrultusunda çeşitli çalışmalar yapmakta ve başarılı olabilmek için çaba harcamaktadır. Bu planların başarıya ulaşmasında en önemli unsur ise nitelikli insan kaynağıdır. Böyle bir durumda ülkeler vatandaşlarının ekonomik ve toplumsal refahını artırma konusunda eğitime ve dolayısı ile nitelikli öğretmenlere ihtiyaç duymaktadır.

Ülkelerin toplumsal ve ekonomik kalkınma programlarında başarılı olmasındaki en önemli unsurların başında eğitim sisteminin geldiği bilinmektedir. Böyle bir durumda genç nüfus oranı fazla olan Türkiye’ de eğitim sistemi ve buna bağlı olarak öğretmenlerin niteliği çok önemlidir (Altan ve Özmuşul, 2022).

Öğretmen Yetiştirme Genel Müdürlüğü tarafından 2017 yılında yayımlanan “Öğretmen Mesleğinin Genel Yeterlilikleri” konulu çalışmada ulusal ve uluslararası uzmanlar, akademisyenler, öğretmenler, diğer katılımcılar ve paydaş görüşleri neticesinde 6 ana yeterlik alanı oluşturulmuştur. Bunlar;

- Kişisel ve mesleki değerler- mesleki gelişim,
- Öğrenciyi tanıma,
- Öğrenme ve öğretme süreci,
- Öğrenmeyi, gelişimi izleme ve değerlendirme,
- Okul, aile ve toplum ilişkileri,
- Program ve içerik bilgisidir (ÖYGM, 2017).

Dünyanın neredeyse her yerinde karşılaşılan olumsuzluklarda ilk başvuru alanı eğitimidir. Yapay zekânın ve sanal öğrenme ortamlarının kullanılmaya başladığı hatta sanal yaşam alanlarının oluşturulmaya çalışıldığı, ekonomik alışverişlerin yapıldığı bir sanal evrende toplumsal değerleri korumanın, geleceğimizi şekillendiren gençlerin milli ve manevi temellerini korumanın yolu hiç kuşkusuz ki eğitimden geçmektedir. Dolayısı ile kendisini sürekli güncel tutmaya çalışan, dijitalleşen dünyadaki hızlı değişim ve dönüşümleri yakından takip eden,

uygulamaya koyan ve bunun yanında gelecek nesillerin yetiştirilmesinde özel bir yeri olan öğretmenlere verilen önemin artırılması gerekmektedir.

Gelecek kaygısı yaşamadan maddi ve manevi sıkıntılardan sıyrılmış, toplumsal statü kazanmış, refah düzeyi yükseltilmiş mutlu bir öğretmen profili oluşturulduğunda eğitimin kalitesinin artacağı kuşkusuzdur. Bu bağlamda öğretmenlik meslek kanunu, hem ekonomik hem kültürel hem de sosyal statü açısından tatmin edici olmalıdır.

Öğretmenlik mesleği ile ilgili kamuoyunun ve eğitim paydaşlarının profesyonel bir meslek olma konusundaki düşüncelerinin sonucunda ilk olarak 2005 yılında yayınlanan yönetmelik ile öğretmenlik kariyer basamakları getirilmiş ve 2006 yılında uzman öğretmenlik sınavı yapılmıştır. Daha sonra sınavın tekrarı yapılmamış ve sonraki yıllarda yönetmelik uygulanmamıştır. 1-3 Aralık 2021 tarihinde 20. Milli Eğitim Şurası'nda tekrar gündeme gelen Öğretmenlik Meslek Kanunu, 14 Şubat 2022 tarihinde 31750 sayılı Resmi Gazete'de yayımlanarak tekrar yürürlüğe girmiştir.

Türkiye'de öğretmenlik mesleği; 1739 sayılı Milli Eğitim Temel Kanunu'nun 43.Maddesinde ve 31.12.2021 tarihinde meclise sunulan, 03.02.2022 tarihinde kabul edilen, 14.02.2022 tarihinde Resmi Gazete'de yayımlanarak yasalaşan Öğretmenlik Meslek Kanunu'nun 3.Maddesinde "Devletin eğitim, öğretim ve bununla ilgili yönetim görevlerini üzerine alan özel bir ihtisas mesleğidir." şeklinde tanımlanmıştır. Bu tanımdan anlaşılacağı gibi özel bir ihtisas gerektiren öğretmenlik, aday öğretmenlik sürecinden emeklilik sürecine kadar hem ekonomik hem sosyal hem de kültürel anlamda çağa ayak uyduran, öğretmene toplumsal nitelik ve statü kazandıran bir meslektir.

Yayımlanan Öğretmenlik Meslek Kanunu 12 maddeden oluşmaktadır. Bu kanunun 6.maddesinde öğretmenlik kariyer basamakları, uzman öğretmenlik ve başöğretmenlik olmak üzere ikiye ayrılmıştır.

Uzman öğretmenlik için;

1. Aday öğretmenlik dâhil öğretmenlikte en az on yıl hizmetin bulunması,
2. Mesleki gelişime yönelik 180 saatlik eğitimi tamamlamış olmak,
3. Mesleki gelişim alanında uzman öğretmenlik için öngörülen asgari çalışmalarını tamamlamış olmak,
4. Kademe ilerlemesi cezası bulunmamak,
5. Yazılı sınavdan 70 ve üzeri puan almak, şartlarının yerine getirilmesi gerekmektedir.

Başöğretmenlik için;

1. Uzman öğretmenlikte en az on yıllık hizmetin bulunması,

2. Mesleki gelişime yönelik 240 saatlik eğitimi tamamlamış olmak,
3. Yazılı sınavdan 70 ve üzeri puan almış olmak, şartlarının yerine getirilmesi gerekmektedir. Kanunun aynı maddesinde “*Yüksek lisans eğitimini tamamlayanlar uzman öğretmen ünvanı için öngörülen, doktora eğitimini tamamlayanlar ise başöğretmen ünvanı için öngörülen yazılı sınavdan muaf tutulur.*” ifadesi ile uzman öğretmenlik ve başöğretmenlik sınavlarından muaf olma durumu da ayrıca belirtilmiştir (ÖMK, 2022).

Kanunun 8.maddesinde ise Öğretmenlik Meslek Kanunu kapsamında, 657 sayılı Devlet Memurları Kanunu’nun 152’nci maddesi değiştirilerek uzman öğretmen ve başöğretmen unvanına sahip kişilerin, eğitim ve öğretim tazminatında artış yapılmaktadır. Uzman öğretmenlere yapılan eğitim-öğretim tazminatı %20’den %60’a çıkarılmaktadır. Aynı ödeme başöğretmenler için %40’tan %120’ye çıkarılmaktadır. Ayrıca öğretmenlerin derecelerine göre ek göstergeleri ayrıntı bir şekilde ifade edilmiştir (ÖMK, 2022).

Diğer mesleklerde olduğu gibi öğretmenlik mesleğinde de kişilerin mesleki davranışları, meslek bağlılıkları, başarılı olma durumları ve refah düzeyleri kişilerin meslekleri ile ilgili düşünceleri ile ilişkilidir. Toplumun öğretmenlik mesleğini algılama düzeyi kadar öğretmenlerin mesleklerini ve toplumsal algıyı nasıl algıladıkları da önem arz etmektedir (Altan ve Özmuşul, 2022).

Öğretmenlik mesleği toplum nezdinde “kutsal” bir meslek olarak görülmekte iken profesyonel öğretmenlik kelimesi günlük hayatta kullanılmamaktadır. Fakat bu durum öğretmenlik mesleğinin profesyonel bir meslek olduğu gerçeğini değiştirmemektedir. Kanun ve tanımlarda yer alan öğretmenlik mesleğine yönelik ifadeler mesleğe ilişkin algıların oluşması ve yerleşmesi istendik düzeyde değildir (İş ve Birel, 2022).

Bu bağlamda araştırmanın problem cümlesini oluşturan “Öğretmenlerin gözünden öğretmenlik meslek kanunu nasıl algılanmaktadır?” sorusu ile Öğretmenlik Meslek Kanunu’nun ekonomik, sosyal, kültürel ve mesleki yeterlilik anlamında öğretmenler tarafından nasıl algılandığının ortaya konulmasının literatüre katkı sağlayacağı düşünülmektedir.

### **Etik Durum**

Bu bildiri, araştırma sürecinde herhangi bir canlıdan veri elde edilmediğinden dolayı etik kurul izni gerektirmeyen araştırmalar kategorisinde yer almaktadır.

### **Araştırmanın Amacı**

Ağrı İli Merkez İlçesi’nde görev yapan öğretmenler ve yarı yapılandırılmış görüşme formundan elde edilen veriler ile sınırlı olan araştırmada, okullarda kadrolu olarak görev yapan öğretmenlerin bakış açısıyla öğretmenlik meslek kanununa ilişkin görüşlerinin belirlenmesi amaçlanmaktadır.

Bu amaç doğrultusunda “Öğretmenlerin gözünden öğretmenlik meslek kanunu nasıl algılamaktadır?” sorusu araştırmanın ana problem cümlesi olarak belirlenmiştir.

Bu çalışma ile 2022 yılında yürürlüğe giren öğretmenlik meslek kanununun öğretmenler açısından ne ifade ettiği ve ideal bir meslek kanununda neler olması gerektiğine ilişkin araştırmacılara veri sağlaması bakımından önem arz etmektedir.

Bu araştırma ile öğretmenlik meslek kanununun öğretmenlere ekonomik, sosyal, kültürel ve mesleki yeterlilik anlamında neler kazandırıldığının ortaya konulması ve sonraki süreçte olası bir kanun değişikliğinde ideal bir meslek kanununda nelerin olması gerektiği konusunda ilgili literatüre katkı sağlaması düşünülmektedir.

## **2. YÖNTEM**

### **Araştırma Modeli**

Bu çalışmada öğretmenlerin gözünden öğretmenlik meslek kanununun nasıl algılandığının incelenmesi amaçlandığından nitel araştırma modeli olan durum çalışması deseni kullanılmıştır. Çalışmada öğretmenlerin öğretmenlik meslek kanunu hakkında görüşleri derinlemesine incelenmiştir. Nitel araştırmayı, gözlem, görüşme ve doküman analizi gibi nitel veri toplama yöntemlerinin kullanıldığı, algıların ve olayların doğal ortamda gerçekçi ve bütüncül bir biçimde ortaya konmasına yönelik nitel bir sürecin izlendiği araştırma olarak tanımlamak mümkündür (Yıldırım ve Şimşek, 2021).

### **Evren ve Örneklem**

Araştırma evrenini 2022-2023 eğitim-öğretim yılında Ağrı ilinde görev yapan tüm branşlardaki kadrolu öğretmenler oluşturmaktadır. Araştırmada evren içerisinden amaçlı örneklem yöntemlerinden olan maksimum çeşitlilik yöntemi kullanılarak 20 öğretmenin görüşü alınmıştır. Görüşü alınan öğretmenlerin seçiminde cinsiyet, eğitim düzeyi, branş ve görev yaptıkları okulların sosyo-ekonomik düzeylerinin farklı olmasına dikkat edilmiştir.

### **Veri Toplama Aracı**

Araştırmada verilerin elde edilmesi için yarı yapılandırılmış görüşme formu kullanılmıştır. Öğretmenli meslek kanunu ile ilgili görüşlerin tespit edilebilmesi için formda aşağıda yer alan sorular sorulmuş ve cevapları elektronik ortama kaydedilmiştir:

1. Öğretmenlik Meslek Kanunu’nu incelediniz mi?
2. Öğretmenlik Meslek Kanunu’nun yeterli olduğunu düşünüyor musunuz?
  - 2.1. Kanunu öğretmenlerin toplumsal statüsü bakımından yeterli görüyor musunuz? Neden?
  - 2.2. Kanunu öğretmenlerin özlük hakları bakımından yeterli görüyor musunuz? Neden?

2.3. Kanunu maddi kazanç bakımından yeterli görüyor musunuz? Neden?

3. Sizce ideal bir öğretmenlik meslek kanununda nasıl olmalıdır?

### Verilerin Analizi

Görüşme yoluyla toplanan verilerin çözümlenmesinde içerik analizi kullanılmıştır. İlk aşamada toplanan veriler bilgisayara aktararak ham veri metinleri elde edilmiştir. Daha sonra bu metinler, araştırmacı tarafından birkaç kez okunup değerlendirilmiş ve ön kodlamalar yapılmıştır. Kodların oluşturulmasında alanyazında kullanılan kavramlar ve görüşmelerden elde edilen veriler göz önünde bulundurulmuştur. Bu çalışmanın ardından, kodlar bir araya getirilerek ortak yönleri bulunmuş, böylece araştırma bulgularının ana hatlarını oluşturacak temalar belirlenmiştir.

**Tablo 1:** Görüşü alınan öğretmenlere ait demografik bilgiler

### BULGULAR

Bu bölümde öğretmenlerden alınan görüşler doğrultusunda tema ve kod bilgileri ile tablolar oluşturulmuş. Kodlara ilişkin frekanslar verilmiştir. Tema ve kodlar ile ilgili öğretmenlerden alınan görüşler değiştirilmeden verilmeye çalışılmıştır.

Aşağıda yer alan tabloda çalışmanın birinci temasını oluşturan Öğretmenlik Meslek Kanunu'nu incelediniz mi? sorusuna karşılık verilen bilgilere yer verilmiştir.

**Tablo 2:** Öğretmenlik Meslek Kanunu'nun incelenme durumu frekans bilgileri

Tema	Kod	Frekans (f)
Öğretmenlik Meslek Kanununun İncelenmesi	Evet	16
	Hayır	4

Tablo 2 incelendiğinde Öğretmenlik Meslek Kanunu'nun öğretmenler tarafından incelenip incelenmediği araştırılmak istenmiştir. Katılımcı 20 öğretmenden 16 tanesi kanunu incelemiş, 4 öğretmen ise kanunu kısmen incelediğinden dolayı hayır cevabını vermiştir.

Çalışmanın ikinci teması öğretmenlerin gözünden Öğretmenlik Meslek Kanununun Yeterli olup olmadığı ile ilgilidir. Öğretmen görüşleri doğrultusunda ikinci temaya ait kodlar ve frekans bilgileri aşağıdaki tabloda verilmiştir.

**Tablo 3:** Öğretmenlik Meslek Kanunu'nun yeterliliği görüşü ile ilgili frekans bilgileri

Tema	Kod	Frekans (f)
Öğretmenlik Meslek Kanununun Yeterliliği	Yetersiz	16
	Yeterli	1
	Kısmen Yeterli	3

Tablo 3 incelendiğinde Öğretmenlik Meslek Kanununun yeterliliği ile ilgili öğretmen görüşlerine başvurulmuş ve 20 katılımcı öğretmenden 16 tanesi kanunun yetersiz olduğunu belirtirken, 1 öğretmen yeterli olduğunu ve 3 öğretmeninde kanunun kısmen yeterli olduğunu geliştirilmesi gerektiğini belirtmişleridir.

Yetersiz kategorisinde katılımcı öğretmenlerden biri “...oldukça sade bir kanun olmuş. Tartışmalı olan pek çok konu ele alınmamış, durumu yönetmeliklere bırakılmıştır. Mesleğe seçilme şartlarını, icrası sırasında uyulması gereken prosedürleri, emeklilik ve sonrası ile özel durumları düzenlemesi gibi konular yok. Sadece 12 madde ile sınırlı kalması pek çok açıdan kanunu yetersiz kılıyor.” (Ö<sub>9</sub>) şeklinde görüş belirtmiştir.

Kısmen yeterli kategorisinde ise katılımcı öğretmenlerden biri “Kanunu kısmen yeterli görüyorum. Olmaması gereken bir aday öğretmenlik sınavının kaldırıldı ve 3600 ek gösterge verildi. Bunların dışında bir kazanım göremiyorum...” (Ö<sub>1</sub>) şeklinde görüşlerini belirterek kanunun kısmen yeterli olduğunu belirtmiştir.

Çalışmanın üçüncü teması Öğretmenlik Meslek Kanunu'nun öğretmenlerin toplumsal statüsü bakımından yeterli olup olmadığı ile ilgilidir. Öğretmen görüşleri doğrultusunda oluşturulan kodlar ve frekans bilgileri aşağıdaki tabloda verilmiştir.

**Tablo 4:** Öğretmenlik Meslek Kanunu'nun öğretmenlerin toplumsal statüsü bakımından yeterli olup olmadığı ile ilgili kod ve frekans bilgileri

Tema	Kod	Frekans (f)
Öğretmenin Toplumsal Statüsü	Ayrıştırma ve çekişme	8
	Mesleğin Değersizleşmesi	6
	Sınav kaygısı ve motivasyon	6
	Öğretmen-Öğrenci-Veli İlişkisi	4
	Sınav uygulaması	2

Tablo 4 incelendiğinde kanunun toplumsal statü temasına ait kodlar ile ilgili (ayrıştırma ve çekişme, mesleğin değersizleştirilmesi, sınav kaygısı ve motivasyon, öğretmen-öğrenci-veli ilişkisi ve sınav uygulaması) 20 öğretmen görüş belirtmiştir. Bu temalara ait öğretmen görüşleri aşağıda belirtilmiştir.

Ayrıştırma kodu ile ilgili görüşleri incelendiğinde öğretmenlerden biri “*Kanunun öğretmenlerin statüsünü artıracığından daha çok ayrıştıracağına inananlardım. Unvan sınavını kazanamayan öğretmenlerin sırtında gereksiz bir yük oluşacağı kanaatindeyim. Öğretmen zaten zorlu bir KPSS sürecinden geçip atandığı için alanında uzman olan kişidir. Sınav olmadan belli bir senesini dolduran öğretmenin uzman ve başöğretmen sıfatını alması daha mantıklı olabilir. Fakat bu durum bile öğretmenler arasında ayrılmaya yol açabilir.*” (Ö<sub>16</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “*Kanunun öğretmenin toplumsal statüsündeki yerine katkısı yok bence. Ayrıca uzman öğretmen ve başöğretmen kariyer basamakları öğretmenler arasında ayrılmaya da neden olabilir...*” (Ö<sub>9</sub>) şeklinde görüş belirtmiştir.

Mesleğin değersizleşmesi kodu ile ilgili olarak öğretmenlerden biri “*Öğretmenlere günümüzde eskisi kadar değer verilmiyor, veliler okula öğrencilerini verirken öğretmenin kadrolu, sözleşmeli, ücretli niteliklerinden hangisine sahip olduğunu sorgulayıp ona göre tavır sergileyebiliyor. Bu durumun içine başöğretmen, uzman öğretmende dâhil olursa daha karmaşık bir hal alacağını, öğretmenler arasında işbirliği yerine çekişmenin artacağını düşünüyorum. Öğretmenlerin toplumsal statü bakımından gereken saygı ve değeri şu anda bile yeterince gördüğünü düşünmüyorum.*” (Ö<sub>11</sub>) şeklinde görüş belirtirken başka bir öğretmen ise “*Öğretmenlerin toplumsal statüsü bakımından 12 maddelik bir kanunun yeterli olmadığını düşünüyorum. Bu kanun kendi içinde yetersiz kalmışken öğretmenin toplumsal statüsüne de bir etki yaratacağını düşünmüyorum. Hatta öğretmenlerin toplum içindeki değerine olumsuz etki edeceği kanaatindeyim.*” (Ö<sub>10</sub>) şeklinde görüş belirtmiştir.

Sınav kaygısı ve motivasyon kodu ile ilgili olarak öğretmenlerden biri “*Kariyer basamakları sınavını kazanamayan öğretmenlerin sırtında gereksiz bir yük oluşacağı ve motivasyonlarının düşeceği kanaatindeyim.*” (Ö<sub>16</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “*İnsanların*

genel yargısı unvan odaklı olduğunu özellikle öğretmeni tanımayan velilerin öğretmenin yaptığı işleri, başarıları bilmediği için unvanına bakıp ona göre karşılaştırma yapacağını düşünüyor. Bu durumun özellikle bulunduğu okula yeni gelen öğretmenler için motivasyon düşürücü etken olabilir.” şeklinde görüş belirtmiştir.

Öğretmen, öğrenci ve veli ilişkisi kodu ile ilgili olarak öğretmenlerden biri “Kanun öğretmenleri toplumsal statü bakımından ayırtmaktadır. Böyle bir durumda da zaman içinde öğretmen-veli, öğretmen-öğrenci ilişkilerini zedeleneyecektir.” (Ö<sub>3</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “...veliler okula öğrencilerini verirken öğretmenin kadrolu, sözleşmeli, ücretli niteliklerinden hangisine sahip olduğunu sorgulayıp ona göre tavır sergileyebiliyor. Bu durumun içine başöğretmen, uzman öğretmende dâhil olursa daha karmaşık bir hal alacaktır. Bu da öğretmenlerin velilerle ve öğrencilerle daha fazla sıkıntı yaşayacağı anlamına gelmektedir...” (Ö<sub>11</sub>) şeklinde görüş belirtmiştir.

Sınav uygulaması kodu ile ilgili olarak öğretmenlerden biri “...öğretmenlerin uzman olduğunu gösteren unsurlar yapılan sınav değil edindikleri tecrübeler en güzel kanıttır. Sınava girmek için sağlanan kriterler bence en iyi tecrübeler listesidir. Bu maddelerden örneğin 5 tanesini tamamlayan öğretmen zaten kanunu ayarlayan kişilerin gözünde de uzman öğretmen kriterinde. Bu sebeple öğretmenin bilgisine ve tecrübesine göre kariyer basamakları düzenlenmeliydi.” (Ö<sub>19</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “...öğretmenin uzman öğretmen veya başöğretmen ünvanını alabilmesi için 10 yıl gibi bir zamanın şart koşulması ya da bir sınava tabi tutulmasının doğru olduğunu düşünmüyorum. Yüksek lisansın akademik kariyer ve alanında uzmanlaşmak değil de artık ‘yapmak için yapmak’ konumuna getirildiğini düşünüyorum.” (Ö<sub>6</sub>) şeklinde görüş belirtmiştir.

Çalışmanın dördüncü teması Öğretmenlik Meslek Kanunu’nun öğretmenlerin özlük hakları bakımından yeterli olup olmadığı ile ilgilidir. Öğretmen görüşleri doğrultusunda oluşturulan kodlar ve frekans bilgileri aşağıdaki tabloda verilmiştir.

**Tablo 5:** Öğretmenlik Meslek Kanunu’nun öğretmenlerin özlük hakları bakımından yeterli olup olmadığı ile ilgili kodlar ve frekans bilgileri

Tema	Kod	Frekans (f)
Öğretmenin Özlük Hakları	Özlük haklarının detaylandırılması	12
	3600 ek gösterge	6
	10 yıl kuralı	4
	Yazılı sınav	3

Tablo 5 incelendiğinde kanunun öğretmenlerin özlük hakları temasına ait kodlar ile ilgili ( Özlük haklarının detaylandırılması, 3600 ek gösterge, 10 yıl kuralı, yazılı sınav ve aday öğretmenlik) 20 öğretmen görüş belirtmiştir. Bu temalara ait öğretmen görüşleri aşağıda belirtilmiştir.

Özlük haklarının detaylandırılması kodu ile ilgili olarak öğretmenlerden biri “...özlük haklarına yeterince düzenleme getirilememiştir. Daha detaylı, öğretmenin sorunlarını arttıracak haklar değil, gerçek sorunlarını çözebilecek düzenlemeler getirilebilir...” (Ö<sub>4</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “Özlük hakları konusunda yüzeysel bir kanundur. Sadece kariyer ve ek gösteregeyi konu almış. Eğer ki bir meslek kanununu çıkarılmışsa bunun sürekli değişen yönetmeliklere bırakılmadan hakların garanti altına alındığı bir kanun olmasını dilerdim.” (Ö<sub>19</sub>) şeklinde görüş belirtmiştir.

Bu görüşlerin dışında öğretmenler, özlük haklarının detaylandırılmasını gerektiren düzenlemelerin gerekli olduğu yönündeki görüşleri de dile getirmişlerdir. Bu bağlamda öğretmenlerden biri “Kadın öğretmenlerin doğum için verilen ücretli izin sürelerinin arttırılması gerekiyor. Ayrıca 2010 öncesi atamalarda zorunlu hizmet süreleriyle beraber hesaplanan ek derece ve kademelerin 2010 sonrası atamalarda verilmemektedir. Kanunla beraber bu maddede düzenlenebilirdi.” (Ö<sub>5</sub>) şeklinde izin ve terfi haklarının düzenlenmesi ile ilgili görüş belirtmiştir. Bir başka öğretmen ise “Sözleşmeli öğretmenliğin kaldırılarak eşit işe eşit hakların verilmesi gerektiği ve tayin haklarının düzenlenmesi gerektiğini düşünüyorum.” (Ö<sub>13</sub>) şeklinde sözleşmeli öğretmenlik ile ilgili görüş bildirmiştir.

3600 ek gösterge kodu ile ilgili olarak öğretmenlerden biri “Öğretmenlik Meslek Kanunu’nu ile birlikte aday öğretmenlik kaldırıldı ve en önemli kazanımlardan birisi olan 3600 ek gösterge verildi.” (Ö<sub>1</sub>) şeklinde görüş belirtmiştir.

10 yıl kuralı kodu ile ilgili olarak öğretmenlerden biri “...yıl ve sınav şartı ile öğretmenlerin uzman ve başöğretmen unvanlarını alması tuhaf. Sınav olabilir ama her unvan için 10 yıl şartının olması benim açımdan adil değil. Bir öğretmenin 10 yıl görev yapması onun öğretmenlik mesleğinde daha iyi bir unvan hak ettiği anlamına gelmemelidir.” (Ö<sub>1</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “...zaten aldığımız eğitimler ve seminerlerle sürekli kendini güncelleyen öğretmenler olarak bundan 10 yıl sonra da başka bir sınav önkoşulu getirerek alanımızda uzmanlaşabileceğimiz varsayılıyor. Öğretmenin mesleki yeterliliğini bir sınavla ölçebilecek geçerliliği ve güvenilirliği yüksek bir sınav mümkün mü? Diye düşündürüyor bana. Aynı zamanda yüksek lisans eğitimini tamamlamış ve diplomasını alarak alanında uzmanlaşmış sayılan bir öğretmenin 10 yıl geçmeden uzman olarak görülmemesi başka bir tezatlık doğuruyor.”(Ö<sub>6</sub>) şeklinde görüş belirtmiştir.

Yazılı sınav kodu ile ilgili olarak öğretmenlerden biri “*Yazılı sınav içeriği öğretmenlik mesleğini ileriye taşıyacak düzeyde değil, uzmanlık deneyim ve alanında yapılan eğitim ürünleriyle olur.*” (Ö<sub>17</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “*Öğretmen zaten zorlu bir KPSS sürecinden geçip atandığı için alanında uzman olan kişidir. Sınav olmadan belli bir senesini dolduran öğretmenin uzman ve başöğretmen sıfatını alması daha mantıklı olabilir.*” (Ö<sub>16</sub>) şeklinde görüş belirtmiştir.

Çalışmanın beşinci teması Öğretmenlik Meslek Kanunu’nun öğretmenlerin ekonomik refah düzeylerini ne kadar etkilediği ile ilgilidir. Öğretmen görüşleri doğrultusunda oluşturulan kodlar ve frekans bilgileri aşağıdaki tabloda verilmiştir.

**Tablo 6:** Öğretmenlik Meslek Kanunu’nun öğretmenlerin ekonomik refah düzeylerini ne kadar etkilediği ile ilgili kodlar ve frekans bilgileri

Tema	Kod	Frekans (f)
Ekonomik Refah	Geçim kaygısı	11
	Ekonomik haklar ve itibar	6
	Zorunlu hizmet bölgesi	3

Tablo 6 incelendiğinde kanunun öğretmenlerin ekonomik refahı temasına ait kodlar ile ilgili (Geçim kaygısı, ekonomik haklar ve itibar, zorunlu hizmet bölgesi) 20 öğretmen görüşü belirtmiştir. Bu temalara ait öğretmen görüşleri aşağıda belirtilmiştir.

Geçim kaygısı kodu ile ilgili olarak öğretmenlerden biri “*...her öğretmenin maaşının ve ek ödemelerinin günümüz ekonomik şartlarına uygun olarak düzenlenmesini, geçim sıkıntısının motivasyonlarının önüne geçmeyererek öğretmenlerin eğitim öğretime odaklanmalarını sağlayabilmelidir. Öğretmen ay sonunu getirebilmeyi, kira ödemeyi düşünmek yerine kendini geliştirecek aktivitelere yönelecek ekonomik gücü emeğinin haklı karşılığı olarak almalıdır.*” (Ö<sub>11</sub>) şeklinde görüş bildirmiştir. Bir başka öğretmen ise “*...diğer meslek gruplarıyla kıyaslandığında ve öğretmenlik mesleğinin ana temasında “insan yetiştirmek” olduğu için ekonomik olarak kaygıların minimal düzeyde olması gerektiğini düşünüyorum.*” (Ö<sub>15</sub>) şeklinde görüş belirtmiştir.

Ekonomik haklar ve itibar kodu ile ilgili olarak öğretmenlerden biri “*... yaptığımız meslek değeri paha biçilemez değerdir. Verilecek olan kariyer başmakları ücreti ve sınav ile bunun yapılması öğretmenlik mesleğinin itibarını zedeleyici bir durumdur.*” (Ö<sub>7</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “*Toplumsal statüsü bakımından bir meslek grubunun güçlü, çekici ve itibarlı olmasının en etkili yolu ekonomik olarak kişiyi rahata erdirecek bir maaşının olması gerektiğini*

*düşünüyorum. Meslek kanunu incelediğimizde iyi bir iyileştirmenin yapılmadığını düşünüyorum.*” (Ö<sub>15</sub>) şeklinde görüş belirtmiştir.

Zorunlu hizmet bölgesi kodu ile ilgili olarak öğretmenlerden biri “...zorunlu koşulan şark görevinde öğretmene mesleki anlamda içinde bulunduğu koşullara rağmen tatmin edebilecek ve motivasyonun sağlayabilecek ekstra bir maaş karşılığının olmaması ve bu hakların bütün devlet memurları arasında sadece öğretmenlere tanınmıyor oluşunu eksiklik olarak görüyorum.” (Ö<sub>6</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “...ek ders ücretleri, nöbet görevleri, maaş karşılığı ders saatleri gibi konulara değinilmemiştir. Ayrıca zorunlu hizmet bölgesindeki öğretmenlere ilave tazminat verilmelidir.” (Ö<sub>12</sub>) şeklinde görüş belirtmiştir.

Çalışmanın altıncı teması öğretmenlerin gözünden ideal bir Öğretmenlik Meslek Kanunu'nun nasıl olması gerektiği ile ilgilidir. Öğretmen görüşleri doğrultusunda oluşturulan kodlar ve frekans bilgileri aşağıdaki tabloda verilmiştir.

**Tablo 7:** Öğretmenlerin gözünden ideal bir Öğretmenlik Meslek Kanunu'nun nasıl olması ile ilgili kodlar ve frekans bilgileri

Tema	Kod	Frekans (f)
İdeal Meslek Kanunu	Geniş kapsamlı bir meslek kanunu	10
	Hukuki kapsam	7
	Bölge ve okul şartları	5
	Atama ve yer değiştirme	3
	Okul yöneticileri	3
	Niteliğe önem verilmesi	2
	Paydaş görüşleri	2
	Basın açıklaması ve grev hakkı	1

Tablo 7 incelendiğinde öğretmenlerin gözünden ideal bir Öğretmenlik Meslek Kanunu'nun nasıl olması gerektiği ile ilgili (Geniş kapsamlı bir meslek kanunu, Hukuki kapsam, bölge ve okul şartları, atama ve yer değiştirme, okul yöneticileri, niteliğe önem verilmesi, paydaş görüşleri, basın açıklaması ve grev hakkı) 20 öğretmen görüş belirtmiştir. Bu temalara ait öğretmen görüşleri aşağıda belirtilmiştir.

Geniş kapsamlı bir meslek kanunu kodu ile ilgili olarak öğretmenlerden biri “*Öğretmenlik Meslek Kanunu maalesef beklentilerin çok altında kalmış bir kanun olduğundan dolayı birçok eksiği vardır. Öğretmenlik Meslek Kanunu öğretmenlerin üzerindeki toplumsal baskıyı azaltmasını, öğretmenlerin yoksulluk sınırının altında ücretlere çalıştığı gerçeğini değiştirmesini, branşlar arasındaki ücret, çalışma yoğunluğu gibi konularının da kanunda olmasını bekliyordum. Bu bakımdan daha ayrıntılı ve kapsamlı olmalıydı.*” (Ö<sub>10</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “*Tüm öğretmenlerin kendini geliştirmesi ve bu yönde eğitimler alması konusunda*

*hem fikirim fakat bunun bazı şartlara bağlı olması (yüksek lisans, 10 yıl vb.) ve sonucunda sınav şartı konulmasının öğretmenlerin saygınlığını zedelediğini düşünüyorum. Öğretmenlerin barışçıl şekilde çalışmalarını sürdürmelerinin sektöre uğrayacağını ve rekabetin, hırsın artacağını daiminde öğrencilerinde, eğitim camiasının da bu durumdan olumsuz etkileneceğini sanıyorum. Bunun yerine her branş için çağdaş eğitime uygun olarak tüm öğretmenlere gerekli kurslar verilmesini ve tüm öğretmenlerin maaşları ile ek ödemelerinin iyileştirilmesini kapsayan geniş kapsamlı bir kanunu daha doğru buluyorum.” (Ö<sub>11</sub>) şeklinde görüş belirtmiştir.*

Hukuki kapsam kodu ile ilgili olarak öğretmenlerden biri “...tıpkı sağlık sektöründe olduğu gibi öğretmene şiddet uygulayanların ilave yaptırımlara, caydırıcı para ve hapis cezalarına maruz bırakılmıyordu.” (Ö<sub>9</sub>) şeklinde şiddet ile ilgili görüş belirtmiştir. Bir başka öğretmen ise “...öğretmenin inanç, düşünce özgürlüğü, kendisini veyahut ailesini tehdit eden, sözlü ya da fiili şiddetten korunmasını sağlayan hükümlere yer verilmiştir.” (Ö<sub>14</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “İdeal bir kanun öğretmenlerin kendilerini güvende ve huzurlu hissettirebilecek bir kanun olmalı. En önemlisi tehdit ve şiddete karşı korunmalı öğretmen. Değer görmeli toplum nezdinde. Maddi yönden desteklenmeli ki öğretmen kendini öğrencilerine adayabilmeli.” (Ö<sub>12</sub>) şeklinde görüş belirtmiştir.

Bölge ve okul şartları kodu ile ilgili olarak öğretmenlerden biri “...doğu görevi farkı olmalıydı. Her meslekte olan bu ayrıcalığın öğretmenlikte olmayışı bu bölgelerde yıllarca çalışan öğretmenleri en kısa sürede kaçmaya yönlendiriyor. Kalkınmada öncelikli yörelerde çalışan yönetici ve öğretmenler daha fazla ücret almalıdır.” (Ö<sub>9</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “...sosyo-ekonomik olarak dezavantajlı okullarda görev yapan öğretmenlere iş ve işlemlerini gerçekleştirirken esneklik sağlanmalıdır.” (Ö<sub>3</sub>) şeklinde görüş belirtmiştir.

Atama ve yer değiştirme kodu ile ilgili olarak öğretmenlerden biri “sözleşmeli öğretmenlere kadro, öğretmenlerin yer değiştirme önündeki engel, öğretmenleri şiddete karşı koruma kanunu olmalıdır.” (Ö<sub>8</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “Hizmet içi eğitim, yöneticilikte geçen süreler, çalışma saatleri ve izinler, annelere yönelik pozitif tutum, doğu görevi, tazminatlar, yer değiştirme ve atama gibi pek çok unsuru açıklayan/düzenleyen maddeler olmalıydı.” (Ö<sub>9</sub>) şeklinde görüş belirtmiştir.

Okul yöneticileri kodu ile ilgili olarak öğretmenlerden biri “Okul yöneticisi kadrosuyla alakalı düzenlemeler yapılabilirdi. Çünkü öğretmenlikte idarecilik geçici kadro olarak görünüyor. Herhangi bir tayin durumunda öğretmenliğe tekrar dönmek zorunda kalınıyor.” (Ö<sub>4</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “Meslek Kanununda atamalar, öğretmen idareci

*hakları ve özellikle velilerin uyması gereken kurallar olarak madde olması.” (Ö<sub>19</sub>) şeklinde görüş belirtmiştir.*

*Niteliğe önem verilmesi kodu ile ilgili olarak öğretmenlerden biri “Eğitimlerin niceliğinden niteliğine odaklanılmalıdır. Öğretmen haklarını gerçek anlamda gözetildiği bir kanun oluşturulmalıdır.” (Ö<sub>6</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “Yıllarını mesleğine adanmış öğretmenleri motive edici bir kazanım yok, öğretmenlik mesleği bir süreçtir ve değerlendirme sürece göre olmalı yazılı sınav olmamalı, Türkiye’nin bütün bölgeleri aynı sosyal, ekonomik ve iklimi sahip değil doğuda çalışan öğretmenlere destek olunmalı niteliği arttıracak maddeler konulmalı.” (Ö<sub>17</sub>) şeklinde görüş belirtmiştir.*

*Paydaş görüşleri kodu ile ilgili olarak öğretmenlerden biri “Mevcut eğitim sisteminde yapılması planlanan değişiklikler veya uygulamalar, öğretmenlerin, görüş ve önerileri dikkate alınarak belirlenmelidir.” (Ö<sub>3</sub>) şeklinde görüş belirtmiştir. Bir başka öğretmen ise “Böyle bir kanun çıkarılmak istenilecek ama bu işin mutfağındaki öğretmenin görüşlerine başvurulmayacak, bu işin sahasında olan öğretmenin talep ve şikâyetleri göz ardı edilecek. Bu şekilde, bu yöntemle hazırlanmış bir yasanın kabul görülebilirliği mümkün mü? Bana göre bu yasanın en büyük eksikliği budur. Bu, gömleğin üst düğmesini yanlış iliklediğinde ondan sonraki tüm düğmelerin de yanlış ilikleneceği gerçeği gibidir. Doğru sonuca yanlış yoldan gidilmez. Sorun eksiklik en başta yapılmıştır. İzlenen yol yöntem yanlıştır. Öğretmenin görüşleri, talepleri göz ardı edilmiştir.” (Ö<sub>14</sub>) şeklinde görüş belirtmiştir.*

*Basın açıklaması ve grev hakkı kodu ile ilgili olarak öğretmenlerden biri “Öğretmenlerin maalesef grev hakkı yok. Devlet memuru olan doktorlar istedikleri zaman grev yapabiliyorlar öğretmenler yapamıyor. Öğretmenler haklarını savunmak için grev hakkının olması gerektiğini düşünüyorum. Yine öğretmenler hakkını savunmak için diğer devlet memurlarından farklı olarak basına demeç verebilmeli ve sorunlarını sıkıntılarını anlatabilmeli.” (Ö<sub>1</sub>) şeklinde görüş belirtmiştir.*

## **SONUÇ VE DEĞERLENDİRME**

14.02.2022 tarihinde Resmi Gazete’de yayımlanarak yasalanan Öğretmenlik Meslek Kanunu’nu öğretmenlerin nasıl algıladığı ile ilgili öğretmen görüşleri ortaya konulmuş ve yarı yapılandırılmış görüşme formu ile elde edilen veriler analiz edilmiştir.

Tüm meslek gruplarında olduğu gibi öğretmenlik mesleğinde de hazırlanan kanunlar, yönetmelikler ve yenilikler ilgili meslek gruplarına mensup kişilerce incelenmektedir. Öğretmenler de kendilerini yakından ilgilendiren ve güncel bir mesele olan Öğretmenlik Meslek

Kanunu' nu nasıl algıladıkları çok önemlidir. Bu durum öğretmenlerin çalışma hayatlarını, mesleğe bağlılıklarını, toplumun mesleğe bakış açısının öğretmene yansımaları, öğretmenin okuldaki başarısını ve motivasyonunu doğrudan etkilemektedir.

Çalışmanın birinci temasında kanunun öğretmenler tarafından incelenip incelenmediği araştırılmıştır. Görüşmeye katılan 20 öğretmenin 16'sı kanunu incelemiş, 4 öğretmen ise kısmen incelemiştir. Bu durum Öğretmenlerin meslekleri ile ilgili yayımlanan kanun, yönetmelik ve yenilikler yakından takip ettikleri sonucunu ortaya çıkarmaktadır.

İkinci temada, öğretmenler tarafından genel olarak kanunun yetersiz olduğunu belirtilmiştir. Yetersizlik konusunda en çok kanunun özlük hakları, öğretmene şiddet ve ekonomik refah bakımından eksik olduğu yönünde görüş belirtilmiştir. Bu bağlamda 12 maddeden oluşan kanunun öğretmenliğin aday öğretmenlik sürecinden başlanarak emeklilik sürecine kadar olan sürecini kapsayan bir şekilde detaylandırılması gerektiği sonucuna ulaşılmıştır. Kanunun yeterli veya kısmen yeterli olduğu yönündeki görüşler ise aday öğretmenlik sınavının kaldırılması, 3600 ek göstergenin verilmesi ile ilgilidir.

Üçüncü temada, kanunun toplumsal statüyü nasıl etkilediği yönündeki görüşler incelendiğinde genel olarak kariyer basamaklarının öğretmenleri ayrıştıracağı ve toplumsal statüye zarar vereceği yönünde düşünce ortaya çıksa da kariyer basamaklarının belirlenmesinde sınavın olmaması gerektiği yönünde görüşler de belirtilmiştir. Bu durumda öğretmenlerin her ne kadar kariyer basamaklarını doğru bulmasa da sınavsız bir kariyer basamaklarına da olumlu yaklaştıkları sonucuna ulaşılabilir.

Katılımcı öğretmenler öğretmenlik mesleğinin değersizleşmesi, sınav kaygısının oluşması, öğretmen motivasyonunun olumsuz etkilenmesi, öğretmen, öğrenci ve veli ile ilişkilerin zarar görebileceği yönünde görüşler belirtilmiştir. Öğretmenlik mesleğinin eskisi kadar değer görmediği ve veliler tarafından öğretmen seçimine kadar müdahale edilmeye çalışıldığı belirtilmiştir. Velilerin öğrencilerini okula gönderdiğinde sözleşmeli öğretmen, kadrolu öğretmen veya ücretli öğretmen gibi ayrımları yaparak okul idarelerine sınıf seçiminde baskı yapmaktadırlar. Öğretmenlik kariyer basamakları ile birlikte öğretmenlik türlerine bir de uzman öğretmenlik ve başöğretmenlik ünvanlarının eklenmesi daha karmaşık bir durumu ortaya çıkacağı sonucunu ortaya çıkarabilir. Ulaşılabilen bir diğer sonuç ise kariyer basamakları sınavına girmek istemeyen öğretmenlerin alanında uzmanlaşmak için değil, sınavdan muaf olabilmek için ücret karşılığında yüksek lisans yapma yoluna gittikleridir.

Dördüncü temada, kanunun öğretmenlerin özlük haklarını nasıl etkilediği yönündeki görüşler genel olarak kanun maddelerinin daha ayrıntılı bir şekilde ele alınması gerektiği şeklindedir. Bu detaylandırma kadın öğretmenlerin izin hakları, 2010 sonrası göreve başlayan öğretmenlerin kademe ve derece olarak 2010 öncesi göreve başlayan öğretmenlerden avantajlı olmaları, sözleşmeli ve kadrolu öğretmen ayrımının ortadan kaldırılması, uzman öğretmen ve başöğretmen unvan tanımlarının ve haklarının net bir biçimde ifade edilmesi, sınavın kaldırılması şeklinde olduğu söylenebilir. Kanun ile 3600 ek göstergenin getirilmesi öğretmenler tarafından olumlu olarak ifade edilmesine karşın kariyer basamaklarında 10 yıl kuralının olması ve yazılı sınav şartının olması adil karşılanmamaktadır.

Öğretmenlik mesleğinin özel ihtisas gerektiren bir meslek olması, kendisini sürekli güncel tutan ve yeniliklere açık bir meslek olması dolayısıyla 10 yıl kuralını beklemeden öğretmenlerin uzman öğretmen ve başöğretmen ünvanlarını alabilmeleri gerektiği öğretmenler tarafından belirtilmiştir. Bu bağlamda yüksek lisans ve doktorasını tamamlamış olan öğretmenlerin zaten alanlarında uzman oldukları ve yıl şartına gerek duyulmadan ünvanların verilmesi gerektiği sonucuna ulaşılabilir.

Beşinci temada, kanunun öğretmenlerin ekonomik refah düzeylerini nasıl etkileyeceği yönündeki görüşler genel olarak insan yetiştirme en zor meslekler arasında yer aldığı ve mesleğin karşılığının maddi olarak alınmadığı, geçim sıkıntı yaşayan öğretmenlerin işlerine odaklanmalarını olumsuz etkilediği şeklindedir. Bunun yanında ekonomik olarak rahat olan mesleklerin daha çekici ve itibarlı olduğu yönünde görüşler belirtilmiştir. Zorunlu hizmet bölgelerinde çalışan öğretmenlerin ekonomik refahlarını arttırma yönünde kanunda herhangi bir maddenin bulunmaması da öğretmenler tarafından belirtilen görüşler arasında yer almaktadır. Tüm bu görüşler doğrultusunda Öğretmenlik Meslek Kanunu'nda ekonomik refahın arttırılması yönündeki maddeler ve zorunlu hizmet bölgelerinde çalışan öğretmenlerin haklarının yer aldığı maddelere yer verilmesi gerektiği sonucuna ulaşılabilir. Ayrıca öğretmenler tarafından kanunda yer alan kariyer basamakları sınavı ile ekonomik hakların iyileştirilmesi arasındaki bağlantının mesleğin itibar kaybına neden olduğu ve bu sebeple sınav uygulamasının kaldırılması gerektiği sonucuna ulaşılabilir.

Altıncı temada, öğretmenlerin gözünden ideal bir Öğretmenlik Meslek Kanunu'nun nasıl olması gerektiği yönündeki görüşler genel olarak ekonomik şartları iyileştirmenin yanında hukuki yönden öğretmenlerin haklarını koruyan, çalıştığı bölge şartlarının göz önüne alan, asıl kadrosu öğretmen olan okul idarecilerinin haklarının yer aldığı, öğretmenlerin sınıflara ayrılmadığı, öğretmenlik mesleğinin bir bütün olarak değerlendirildiği daha geniş kapsamlı bir kanun olması

şeklindedir. Ayrıca öğretmenler tarafından kanunda atama ve yer değiştirme, şiddete karşı yaptırımlar, izin hakları, çalışma saatleri, sözleşmeli öğretmenlerin kadroya alınması, hizmet içi eğitim gibi maddelerinde yer alması gerektiği belirtilmiştir. Öğretmenlik Meslek Kanunu'nun uygulamaya konulması başlangıç için olumlu bir kazanımdır. Bunun yanında daha nesnel ve kapsamlı bir kanuna sahip olunması gerektiği düşünülmektedir. Bu süreçten sonra da mesleğin bir kariyer mesleği olarak toplum gözünde değer bulabileceği düşünülmektedir.

Tüm bu görüşler doğrultusunda öğretmenlerin haklarının korunması, genişletilmesi ve çağa ayak uydurması için hazırlanan Öğretmenlik Meslek Kanunu, öğretmenlerin gözünden:

1. Kanunun resmiyet kazanması
2. Aday öğretmenlik sınavının kaldırılması
3. 3600 ek göstergenin verilmesi gibi konularından dolayı kısmen yeterli olduğu algısını oluşturmaktadır.

Bunun yanı sıra:

1. Geniş kapsamlı olmadığı
2. Ekonomik refaha katkısının az olduğu
3. Özlük haklarının detaylandırılmadığı
4. Toplumsal statüye katkı sağlamadığı
5. Öğretmenler arasında çekişme ve ayrıştırmaya neden olabileceği
6. Sınav ile paranın bir araya gelmesinin mesleğin itibarını azaltacağı
7. Öğretmeni şiddete karşı korumadığı
8. Kadın öğretmenlerin annelik izinlerine yer verilmediği
9. Okul yöneticilerinin haklarına yer verilmediği
10. Sözleşmeli öğretmen haklarına yer verilmediği
11. Atama ve yer değiştirme maddelerine yer verilmediği sonuçlarına ulaşılarak öğretmenlerin gözünden Öğretmenlik Meslek Kanunu'nun öğretmenler tarafından yeterli olmadığı şeklinde algılamasına neden olmaktadır.

## **ÖNERİLER**

Öğretmenlerin kariyer basamaklarında yükselebilmeleri için sınav yerine nitelik olarak fark yaratan çalışmalara ve öğretmen veya öğrenci başarılarına göre değerlendirilmeler yapılabilir.

Yüksek lisans ve doktora yapılan alanlar ilgili branş veya eğitim alanlarından olmak şartı ile 10 yıl kuralı kaldırılarak uzman öğretmen veya başöğretmen ünvanlarının verilmesi yönünde değerlendirme yapılabilir.

Uzman öğretmen veya başöğretmen ünvanı alan öğretmenlere yöneticilik tercihlerinde bulduklarında öncelik verilebilir.

Zorunlu hizmetini tamamladıktan sonra zorunlu hizmet bölgesi olan bölgede çalışmaya devam eden öğretmenlere ek ödemeler yapılarak bu bölgeler cazip çalışma alanlarına dönüştürülebilir.

Dezavantajlı okullarda çalışan öğretmenlere barınma, kırtasiye, ulaşım vb. alanlarda motivasyonunu sağlamak amacıyla destek olunabilir.

Öğretmenlerin çağa ayak uydurabilmesi, teknolojiyi yakından takip edebilmesi, sosyal ve kültürel etkinliklere katılabilmesi için ekonomik refah düzeyini arttıracak ek maddeler ile kanun detaylandırılabilir.

Okul yöneticisi olarak görev yapan öğretmenlerin yıllık izinlerde ek ders kayıplarının önüne geçebilecek ve yönetici olarak iller arasında yer değiştirme yapabilmesinin önünü açacak düzenlemeler kanunda yer alarak detaylandırılabilir.

Unutulmamalıdır ki geleceğimizin teminatı olan çocuklarımızı ve gençlerimizi yetiştirme görevi öğretmenlerdedir. Tüm toplumun birliktelik sağlayabilmesi için de öğretmenlik mesleğine itibar kazandırmak ve öğretmenlerin ekonomik, sosyal ve kültürel refahını sağlamak çok önemlidir.

**ÖZET**

Kişilerarası ilişkilerde ve eylemlerde normatif uygunluk dâhilinde yönetim sergileyen, karar almada etik düşünce yapısını ilke alan, önyargısız ve tarafsız davranan, kişilerin haklarını savunan ve çalışanlar üzerinde güven duygusu oluşturan liderlik yaklaşımı etik liderlik olarak tanımlanır. Bireyler ve kurumlar arasında yaşanan duygulardan etkilenen, davranış, tutum, sosyal ilişkiler ve beklentiler doğrultusunda gelişen örgütsel güven; çalışanların kurum tarafından verilen taahhütlere uyulacağına ilişkin algıları doğrultusunda oluşan inancı ifade eder. Bireylerin etik liderlik algılarının örgütsel güven duyguları üzerindeki etkisi bu çalışmada incelenmiştir. Bu kapsamda İstanbul'da faaliyet gösteren 4 yıldızlı otellerde yönetici ve çalışan konumundaki bireylerde anket tekniği ile veriler toplanmıştır. Tesadüfi örneklem yöntemiyle elde edilen verilerde SPSS programı ile analizler yapılmış, değişkenlerin tanımlayıcı istatistikleri, korelasyon ve regresyon testleri ile önermeler arasındaki ilişkinin yönü ve etki düzeyi incelenmiştir. Değişkenler arasında yapılan korelasyon analizi sonucunda; etik liderlik ile örgütsel güven ve örgütsel güvenin alt boyutları olan bilişsel güven ve duygusal güven arasında istatistiksel olarak anlamlı pozitif yönde önemli ilişkilerin olduğu bulunmuştur. Regresyon analizi sonuçlarına göre ise etik liderliğin çalışanların örgütsel güven duygularını yükselttiği görülmüştür. Elde edilen bu bulgular doğrultusunda etik liderlik davranışlarını benimseyen işletmelerin, çalışanların güven duygusunu kazanacağı ve bunun olumlu etkilerinin de işletmelerin faaliyetlerine yansıtacağı sonucuna ulaşılmıştır.

**Anahtar Kelimeler:** Etik Liderlik, Örgütsel Güven, 4 Yıldızlı Oteller.

**A FIELD RESEARCH ON THE IMPACT OF ETHICAL LEADERSHIP ON  
ORGANIZATIONAL TRUST**

**ABSTRACT**

Ethical leadership is defined as a leadership approach that demonstrates normative compliance in interpersonal relations and actions, and takes ethical thinking as a principle in decision-making. Ethical leaders are people who act impartially, without prejudice, defend the rights of people, and create a sense of trust on employees. Organizational trust, on the other hand, develops in line with behaviour, attitude, social relations and expectations, which are affected by the emotions experienced between individuals and institutions. It refers to the belief formed in line with the perceptions of the employees that the commitments given by the organization will be respected. The effect of individuals' ethical leadership perceptions on organizational trust has been examined in this study. In this context, data were collected from individuals who are managers and employees in 4-star hotels operating in Istanbul by survey technique. The data obtained by the random sampling method were analysed with the SPSS program. The descriptive statistics of the variables, correlation and regression tests and the direction and effect level of the relationship between the propositions were examined. As a result of the correlation analysis between the variables; it was found that there are statistically significant positive and significant relationships between ethical leadership and organizational trust and cognitive trust and emotional trust, which are sub-dimensions of organizational trust. According to the results of the regression analysis, it was seen that ethical leadership increased the organizational trust of the employees. In line with these findings, it has been concluded that the businesses that adopt ethical leadership behaviours will gain the feeling of trust of the employees and the positive effects of this will be reflected in the activities of the businesses.

## **GİRİŞ**

Bireyler gereksinimlerini karşılamak için bir topluluk içerisinde yaşamak durumundadırlar. Belirli bir amaca yönelik insanların bir araya gelmiş olması yönetilme ihtiyacını gerekli kıldığından, bu durum liderlik olgusunu ortaya çıkarmaktadır (Bakan ve Doğan, 2013: 3). Gruplar halinde yaşayan ve sosyal bir varlık olan insanlar, birlikte yaşamının bir ihtiyacı olarak kendilerini belirli hedeflere taşıyacak bir lider etrafında birleşmeye gereksinim duyarlar. Eğer bireyler hedeflerine ulaşmak için herhangi bir kişinin etkisinde kalıyor ve onu takip ediyorsa, o toplulukta liderlik olgusunun varlığından söz edilebilir. Bu yüzden liderlik kavramı ile insan yaşamının her evresinde karşılaşmak kaçınılmaz olmaktadır. Herhangi bir topluluğu belirli bir hedefe taşımak için onları etkileme ve kendisini takip ettirme yeteneğine sahip olan liderlik günümüze kadar gelmiş ve önemini hiç kaybetmemiştir (Gündüz ve Dedekorkut, 2014: 95).

Liderlik, bir işletmede öngörülen hedeflerin belirlenmesinde bu hedeflere ulaşılması için alınacak kararların neler olacağı, işletmenin kısımları ve çalışan bireyler arasındaki koordinasyon, iş birliği ve ahengin sağlanması görevlerini üstlenen bir yapıdır (Bakan, 2007: 104). Farklı liderlik tarzları içerisinde önemi giderek daha çok artan ve çeşitli araştırmalara konu olan liderlik türlerinden birisi de etik liderliktir. Bu tarz liderler etik davranışları ilke yapan, önyargısız ve tarafsız davranan, kişilerin haklarını savunan ve çalışanlar üzerinde güven duygusu oluşturan bireylerdir (Teyfur vd., 2013: 85). Bireyler üzerinde genellikle olumlu bir etki bırakan etik liderlik, diğerleri ile ilişkilerinde normatif olarak uygun davranan ve bu faaliyetleri artırmayı hedefleyen, iki yönlü iletişim ve etkin düşünme yöntemlerini kullanan liderlik tipidir. Etik liderler, topluluğu göz önünde tutarak ilkeli ve dikkatli kararlar alarak doğruluk, dürüstlük ve adalet ilkeleri içinde hareket ederler (Brown vd., 2005: 117).

İşletmelerde önem verilmesi gereken diğer bir olgu da örgütsel davranış şekilleridir. İnsanların bir kuruma katılması ve kurumuna aidiyet duygusu taşıması kişinin tutum ve davranışlarında etkili olmaktadır (Koç, 2009: 201). Bireyler sahip oldukları sınırlı imkânlar ile ihtiyaçlarını karşılamada çoğu zaman yetersiz kalmaktadır. İnsanlar bu yetersizliği gidermek için diğer bireyler ile etkileşime girerek eksikliklerini karşılama yoluna girdiğinden ortak hedeflere sahip insanlar bir araya gelmektedir. Bu birliktelik, kişiler arasında maddi ve duygusal bağlar kurulmasına yardımcı olan örgütleri oluşturmaktadır (Bağcı, 2013: 164). Örgütler, birden fazla kişinin çabalarını birleştirmesi sonucu ortaya çıkan işbirliği organizasyonu veya bireylerin ortak hedefler ve değerler uğruna ortaya koydukları birliktelik olarak tanımlanabilir (İşcan ve Timuroğlu, 2007: 120).

Günümüzde yaşamın her alanında yer alan örgütsel olgunun ortaya çıkmasının nedeni bireylerin tek başına başaramadığı şeyleri elde edebilme isteğidir. Örgütlerde ana unsur insan olduğundan bireyler faaliyetlerini bazı anlamlar üzerine kurarak sürdürmektedirler. Bu yüzden örgüt yöneticilerinin görevleri, örgütsel bütünlemeyi sağlayarak çalışanları ortak algılar ve paylaşımlar üzerinde bir arada tutmaktır (Şahal, 2005: 7). Bu tanımlamalara bağlı olarak örgütsel davranış türleri işletme bilimi dünyasında farklı kategorilere ayrılarak incelenmektedir. Örgütsel davranış türleri içerisinde çalışanların, örgütün sağladığı desteğe ilişkin algıları, liderin sözünün doğru olacağı ve sözünde duracağına olan inancı olarak tanımlanan örgütsel güven iş yaşamı yönünden büyük öneme sahiptir. Genel olarak bireyler tarafından doğruluk ve dürüstlük üzerine kurulmuş bir kavram olarak kabul edilen güvenin, kurumların başarılı olmasında önemli bir faktör olduğu kabul edilir. Kısa sürede oluşmayan güven duygusunun yerleşmesi için uzun ve özverili çabalara ihtiyaç vardır. Kişi ve kurum arasında güvenin oluşmasında örgütlere düşen yükümlülük daha fazladır. Kurum değerlerinin çalışanlarca benimsenmesi, örgütün hedef, vizyon ve inançlarının kabul edilmesi ancak çalışanların örgütlerine karşı duydukları güvenle sağlanabilir. Güven, genellikle kişiler arasında karşılıklı olduğundan ve birçok faktör tarafından etkilendiğinden geniş anlamda bir güven ortamı oluşturmak zor olsa da, lider konumundaki kişilerin örnek tutum ve davranışları ile bu başarılabilir bir durum olmaktadır. Bir kurumda ilişkilerin güven duygusu temeline oturması ve bireylerinde güven algısının oluşması örgütüne bağlı, örgütü ile bütünleşen ve işlerinde başarılı bireylerin sayısını artırır (Demircan ve Ceylan, 2003: 139).

Küreselleşmenin yaşandığı günümüzde liderlik türleri ile ilgili çalışmaların giderek artmasının yanı sıra liderlik türlerinin örgütsel yönetim kavramlarıyla ilişkilerini açıklayan çalışmalar da yapılmakta ve liderlik kavramının örgütsel davranışlar üzerinde farklı düzeylerde etkilerini görmek mümkün olmaktadır (Teyfur vd., 2013: 85). Kurumlarda güvene dayalı bir çalışma ortamının yaratılmasında etik lider davranışları önemli olduğundan, etik lider davranışı sergileyen bireylerin işletmelere kazandırılması için çaba sarf edilmelidir (Engelbrecht, 2017: 377). Bu araştırmada turizm sektöründe çalışanların etik liderlik ve örgütsel güven kavramlarına ilişkin algıları ile bunlar arasındaki ilişkinin düzeyi ortaya konulmaya çalışılmıştır.

### **ETİK LİDERLİK KAVRAMI**

Bireylerin birlikte yaşaması ile ortaya çıkan lider ve liderlik kavramlarının başlangıcı çok eski dönemlere kadar gitmekte ve bu kavramlar yönetim bilimlerinde önemli çalışma konularının başında gelmektedir. İnsan yaşamında toplulukların oluştuğu her alanda liderlik olgusu ile

karşılaşmak mümkündür. Liderlik, lider durumundaki kişinin kendisi ile birlikte hareket eden bireyleri ortak bir hedefe ulaştırmasında kullanılan önemli bir araçtır (Bektaş, 2016: 43).

Liderlik kavramı, belirlenen hedeflere ulaşabilmek için mevcut koşullar altında bir topluluktaki kişileri etkileyerek; onların öngörülen hedeflere yönlendirilmesi olarak tanımlanabilir. Belirli bir amaca yönelik olarak kişileri yönlendiren, onları etkileyen ve topluluğun kendisini takip etmesini sağlayan kişiler lider olarak tanımlanmaktadır. Göstermiş olduğu örnek davranışları, aldığı kararların olumlu veya olumsuz sonuçlarından etkilenen kişi sayısı ve topluluğun gelecekteki durumu liderin önemini belirler (Koçel, 2015: 677).

İnsanlar, sürekli gelişen ve değişimlere uğrayan sosyal, kültürel ve ekonomik bir ortamda hangi alanda yer alırlarsa alsınlar her dönemde toplum içerisinde kendisine rehberlik edebilme yeteneğine sahip güçlü ve donanımlı bir lider arayışı içerisinde girmektedir (Bakan ve Doğan, 2013: 75). Kurumların gelişebilmeleri için yönetim, etik prensiplere bağlı olarak hareket etmelidir. Etik değerlerin ön planda tutulduğu işletmelerde çalışanlar yalnızlık duygusu taşımazlar, çalıştıkları kuruma karşı aidiyetleri gelişir ve verimlilikleri daha yüksek olur (Erogluer ve Yılmaz, 2015: 281). Lider konumundaki kişiler, kendisini takip edenlerin belirli bir hedefe yönelmelerini sağlarken, etik tutumlarını eylemleri ile göstermek zorundadırlar. Çünkü etik değerler; beraber yaşamanın, nitelikli insan olmanın ve kişileri etkilemenin en önemli unsurudur (Yılmaz, 2006: 28).

Kurumlarda liderlik yeteneklerine sahip olmakla birlikte aynı zamanda iş etiğini anlama ve sergileme olanağı sağlayan bir liderin seçilmesi önemli bir husustur (Chan vd., 2011: 228). Etik liderlerin sahip olduğu gücün kaynağını örgütteki etik uygulamalardan alması bu liderlik tipinin en karakteristik özelliğidir. Etik liderler, işletme içerisinde oluşan yanlış müdahale ederek yanlışın büyümesini engellerler. Bu yüzden etik liderler, kurumun başarısı ve gelişimine engel olacak durumlara karşı savunma stratejileri geliştirirler. Örgütte oluşacak etik yapı, çalışanlar arasında güven oluşturacağından liderlerin başarılı olabilmeleri için etik açıdan yeterli olgunluğa sahip olmaları gerekir. Liderlerin etik davranışları uygulamasında, liderin bireyler üzerinde oluşturduğu güven duygusu büyük bir etkiye sahiptir (Yaman, 2010: 11). Dürüst ve güvenilir olduğu düşünülen etik liderler; insanları ve toplumu ilgilendiren konularda etik ve adil davranan dengeli kararlar üreten, sevecen ve ilkeli karar mercileri olarak görülür. Takipçileri ile etik konularda iletişim kurarak standartlar belirler ve bu standartların takip edildiğini görmek için ödül ve cezalar uygulatırlar. Bireyler, ödül ve disiplin uygulamalarını dikkatle izleyerek neyin kabul edilebilir veya kabul edilemez olduğunu görüp kendi davranışlarını düzenlerler (Brown ve Trevino, 2006: 597).

Etik liderler, kuruluşun hedefleri ile çalışanların ve dış paydaşların amaçlarını bütünleştirir, paydaşlarla saygı ve güven temeli üzerine kurulmuş ilişkiler içerisinde olmanın tüm örgütsel çabaların altın standardı olduğunu kabul ederler. Etik liderler güven, saygı, dürüstlük, eşitlik, adalet ve merhamet gibi temel ilkelerin etik bir ortamda oluşacağına inanır ve tüm çalışanlar için etik açıdan samimi bir çalışma ortamı oluşturur, etik konuları paylaşır, rol modeli olarak hizmet verir ve çalışanların gelişimine yönelik faaliyetlerde bulunur. Çalışanların ihtiyaçlarını ve haklarını göz önünde tutarak onlara karşı adil şekilde davranır (Bello, 2012: 231). Etik lider konumunda olan bireyler, çalışanlara açık bir şekilde yaklaştıklarından ve çalışanlar için önemli olan konularda adil karar verdiklerinden dolayı kişilerin kurumun işlerine katılımlarını sağlarlar (De Hoogh ve Den Hartog, 2008: 300).

Etik liderliğe önem verilmesi ile kurumlar, yalnızca bireysel örgüt üyelerini değil aynı zamanda bu örgütün hizmet verdiği toplulukları da etkileyen ekonomik tuzaklardan kaçınabilirler (Resick vd., 2006: 357). Etik ilkelerin kabul edilmesi ve pratiğe dönüştürülmesinde lider konumundaki kişilere önemli görevler düştüğünü ifade eden Bakan ve Doğan (2013: 81) etik liderlerin; beraber çalıştığı kişilerin beceri kazanmalarına yardımcı olan, etik değerleri, belirlenen misyon ve vizyon doğrultusunda aldığı kararları uygulayan, etik davranan, adil ve ilkeli kararlar veren, dürüst ve güvenilir olan, beraber çalıştığı kişileri olumlu yönde etkileyen ve onları motive eden kişiler olduğunu ifade etmişlerdir. Ayrıca grubunda yer alan bireyler ile iletişim halinde olan, koşulların gerektirdiği şekilde ödül ve cezalar uygulayan, kendini takip eden bireylere cesaret veren, kurumun amaç ve değerlerini sık bir şekilde hatırlatan, paydaşları ile etik değerlerin yaratılması ve paylaşımında iletişim halinde bulunan kişiler olduklarını belirtmişlerdir.

### **ÖRGÜTSEL GÜVEN KAVRAMI**

Güven kavramı hem bireysel hem de örgütsel alanda üzerinde çok durulan ve tartışılan bir konudur. Kişilerin kendi aralarında ve kurumları ile olan ilişkilerinin sağlıklı ve sürdürülebilir olmasında güven duygusu büyük öneme sahiptir. Güven, tek taraflı olmayan, karşılıklı olarak gelişen bir duygudur (Karcıoğlu ve Naktiyok, 2015: 20). Bireylerin tüm ilişkilerinin temelini oluşturan güven, onların kendilerini emniyette görmelerini ve psikolojik yönden birlik içerisinde olmalarını sağlar. Bir kurumda çalışmaya başlayan bireyin ilk yapacağı faaliyet, çalıştığı örgüt ile ilgili araştırma yaparak kuruma ve yöneticilere ne düzeyde güvenebileceği hakkında bilgi toplamaktır. Hiçbir kişi güven ortamının oluşmadığı bir işletmede çalışmak veya bulunmak istemez. Çünkü insanlar kendilerini güvende gördükleri zaman mutlu ve huzurlu hissederler (Bakan, 2011: 168).

Ekonomik ve çevresel faktörlerin değişkenlik gösterdiği yüzyılımızda kişilerin işbirliği ve takım halinde çalışma ihtiyaçlarının artması örgütsel güven anlayışını ön plana çıkarmıştır. Güven, kişileri bir arada tutup bir nevi yapıştırıcı rol oynayarak sosyal sermayenin temel unsuru olmaya başlamıştır. Güven duygularının geliştiği işletmelerde, kurumun amaç ve hedeflerini yakalaması daha kolay olmaktadır. Karşılıklı olarak gelişen güven olgusu, bireyler ve kurumlar arasındaki ilişkilerin önemli bir ögesidir (İşcan ve Sayın, 1010: 195). Bireylerde güven duygusunun gelişmesinde, örgütün dürüst ve tutarlı davrandığına yönelik düşüncenin oluşması önemlidir. İşletmelerde güven ortamının oluşmasında dürüstlüğün yanı sıra eylem ve davranışlardaki tutarlı davranışlar da etkili unsurlar olarak görülmektedir (Aksoy ve Özkan, 2016: 33).

Bireyler ve kurumlar arasında yaşanan duygulardan etkilenen ve farklı olay ve olgulardan yola çıkılarak oluşan güven; davranış, tutum, sosyal ilişkiler ve beklentiler doğrultusunda gelişir. Çağdaş işletmelerde çoğulculuk ilkesine dayalı, geniş kapsamda katılımı öngören, hiyerarşinin olmadığı ya da çok az olduğu yapılar geçerli olmaya başlamıştır. Güven duygusu, sosyal yapılarda sağlıklı ilişkilerin devam ettirilmesinde temel unsurdur. Çalışanlar, örgütlerine güven duyduklarında olumsuz şartlar karşısında kendilerinde daha fazla mücadele etme gücü bulurlar (Asunakutlu, 2002: 10). Günümüzde işletmeler arasında artan rekabet gücü ile başa çıkabilmek için örgüt içi güvenin geliştirilmesi gerekir. Böyle bir ortamda kişiler ve kurumlar arasında güvene yüksek düzeyde ihtiyaç vardır (Huff ve Kelley, 2003: 81).

Liderlere, çalışanların örgüte olan güvenlerini ve işe adanmışlıklarını sağlayabilmek için büyük sorumluluklar düştüğünden lider konumunda yer alan kişilerin bu bilinçte olmaları gerekir. (Taşlıyan vd., 2016: 2558). Yatay ilişki olarak kabul edilen örgüt içindeki güven ilişkisi de kurum için önemlidir (Rindfleisch, 2000: 81). Örgüt içindeki ve diğer örgütler arasındaki güvenin iyi ölçülmesi gerekir. Güven düzeyinin doğru bir şekilde belirlenmesi örgütlerin daha iyi yönetilmesine ve geliştirilmesine yardımcı olacaktır (Seppanen vd., 2007: 261). Kurumlar, şeffaflığı arttırmak ve yardımsever davranmakla birlikte güven arayan bireyler için örgütsel güveni de sağlamalıdır. Yine aynı şekilde işletmeler paydaşlarında güven algısını oluşturacak bilgi kaynaklarından faydalanarak güven mesajları vermelidirler (Pirson ve Malhotra, 2011: 1100).

Mayer vd. (1995: 711) tarafından organizasyonlarda güven ve risk olaylarının birbiriyle ilişkili olduğu, ikisi arasındaki ilişkinin net bir şekilde tanımlanması gerektiği belirtilmiştir. Bu ilişki belirlenirken güvenen ve güvenilen tarafların göz önünde tutulması gerekliliği ifade edilmiştir. İşletmelerde oluşan bir riski yönetmek için genellikle güven ve kontrol sistemlerinden faydalandığından bunların birbirini dışlayan faktörler olarak düşünülmesi gerektiği

vurgulanmıştır. Çünkü güven sınırlarını aşan bir risk söz konusu olduğunda, kontrol sistemi devreye girerek bu riski güvenle yönetilebilecek düzeye düşürebilir. Ancak dikkat edilmesi gereken husus bir örgütte kontrol sisteminin çok güçlü olması örgütte güvenin oluşumuna engel olabilir.

İşletmelerde oluşacak güven ile kurum ve çalışanlar arasındaki işbirliği gelişecek, bireylerin örgüte olan bağlılıkları, yenilik yapma arzuları ve motivasyonları artacaktır (Hubbell ve Chory Assad, 2005: 47). Örgütlerin temel fonksiyonlarından biri olan ve geliştirilmesi gereken güven, örgütün hedef ve amaçlarına ulaşma ve örgütsel etkinlik düzeyine bağlı olarak gelişir. Kurumlarda güven artırıcı faaliyetler çalışanın örgüte olan bağlılığını geliştirir (Ayden ve Özkan, 2014: 165). Çalışanların yetenek, bilgi ve becerilerini görev yaptıkları kurumlar için kullanma istekleri kurumlarına duymuş oldukları güven duygusu ile yakından ilişkilidir. Kişiler arasındaki ilişkileri oluşturan sosyal sistemler ve kurallar, güven esasına bağlı olarak gelişmektedir. İşletmenin hedeflerine ulaşabilmesi için kişilerin ve kurumun birbirine güvenerek görevlerini yapması gerekir (Eroğlu, 2014: 53, 63).

Örgütsel güven üzerine yapılan çalışmalar içerisinde ön plana çıkan Cummings ve Bromiley (1996: 317)' e göre örgütsel güven davranışsal, bilişsel ve duygusal olmak üzere üç temel esas üzerinde değerlendirilmiştir. Yapılan değerlendirmeler sonucunda davranışsal boyut göz ardı edilerek diğer iki boyut esas alınmıştır. Araştırmacılar tarafından örgütsel güven, iyi niyet ve dürüstlük üzerine kurulmuş ve bir kişinin ya da topluluğun başka bir kişiye veya topluluğa yönelik düşünce ve inanışları olarak tanımlanmıştır. Örgütsel güven, bir örgütte karşılıklı etkileşim ve iyi niyetli yaklaşım temelinde oluştuğundan fırsatçılık ve istismarcılık türü davranışlardan uzak durmayı gerektirir. Bu tanımlamalar ışığında örgütsel güven, iyi niyetli çabaları içeren ve dürüstlük ilkesini benimseyen bir olgu olarak kabul edilir.

**Bilişsel Güven:** Bilişsel güven kavramında, örgüt veya kişilerin dürüstlükleri, yetkinlikleri ve becerileri göz önünde tutulur. Bu özelliklere sahip olma düzeylerine göre çalışanlarda bilişsel güven olgusu oluşmaya başlar. Bireyler bir başkasına güvenebilmek için gerçekçi nedenler ararlar. Bu değerlendirme sonucunda karşı tarafın dürüstlük, yetkinlik ve becerilerinin bireyde oluşturduğu algılara bağlı olarak bilişsel güven gelişir (McAllistar, 1995: 30). Bilişsel güvenin gelişiminde kişi veya topluluklara güven duymak için bilişsel bir süreç takip edilir. Bilişsel güven, inandırıcı bilgiyi içeren rasyonel bir tercihin sonucunda kişilere güven duyulması ile oluşur. Güven duymayı isteyen taraf, karşı tarafın taşıdığı özellikleri hesaplayarak güvenilirliği değerlendirir. Ancak bilişsel güven, kişilerin elde ettiği bilgiler doğrultusunda ve duygusal güvenin de etkisi ile zamanla değişime uğrayabilir (Morrow vd., 2004: 53).

**Duygusal Güven:** Kişilerde duygusal güven, bilişsel güvenin oluşumundan sonra gelişmeye başlar ve oluştuktan sonra bilişsel güvenin etkileri azalır. Oluştuktan sonra ortadan kalkması çok zor olan duygusal güven uzun süreli olarak devam eder. Kişiler arasındaki etkileşim arttıkça duygusal güvenin derinliği de artmakta, ilişkilerde duygusal faktörler daha ön plana çıkmaktadır. Bu etkileşimin sonucunda, karşı tarafın da aynı düşünceler içinde olduğu düşünülerek duygusal bağlılık gelişmekte, kişiler arasındaki iyi düşünceler ön plana çıkmaktadır (McAllistar, 1995: 30). Duygusal güven, söz ve davranışlar ile arzu ve isteklerin birbiriyle örtüşmesi veya aralarındaki tutarlılık düzeyi olarak ifade edilir. Duygusal güven, kısmen bilişsel güveni de içine alan bireyin istekleri ile tutumlarının uyuma düzeyine bağlı olarak gelişen güvendir. Duygusal güvenin gelişmesi için öncelikli olarak bilişsel güvenin belirli bir düzeye ulaşması gerekir (Cummings ve Bromiley, 1996: 328).

### **ETİK LİDERLİK ve ÖRGÜTSEL GÜVEN İLİŞKİSİ**

Etik liderlik ile örgütsel güven arasındaki ilişkiyi belirlemek amacı ile yapılan bir araştırmada, etik liderlerin çalışanlar için güvene dayalı bir çalışma ortamının yaratılmasında kilit rolünün olduğu vurgulanmıştır. Bu yüzden kuruluşların etik temelli iş sistemlerinin uygulanması ile duyulan güvenin geliştirilmesini sağlamak için sorumluluk almaları gerektiği ifade edilmiştir (Engelbrecht, 2017: 377). Çalışanların etik liderlik algılarının örgütsel güven seviyeleriyle pozitif ilişkili olduğunu ortaya koyan bir araştırmada, etik liderlerin ahlaklı olarak algılanmalarına bağlı olarak çalışanlara karşı ilgili ve işverenleriyle güçlü bir bağa sahip güvenilir kişiler olarak değerlendirildikleri görülmüştür. Çalışanların ise örgütsel sonuçlardan yüksek memnuniyet duydukları ve kuruluşlarının daha etkili olduğunu düşündükleri belirtilmiştir (Johnson vd., 2012: 3). Yine yapılan bir araştırmada, etik liderlik davranışları ile bireylerin örgütsel güven algıları arasında pozitif yönde ve yüksek düzeyde anlamlı bir ilişki bulunduğundan lider konumundaki kişilerin bireylerin güvenlerini artırmak için etik davranışları ve bu konuda evrensel eğitimlerin verilmesi gerektiği vurgulanmıştır (Ertürk, 2019: 119).

Etik liderlik becerilerinin örgütsel güven düzeyini anlamlı bir şekilde etkilediğini belirten araştırma sonucunda, yöneticilerinin etik liderlik becerilerini geliştirecek eğitim programlarının hazırlanması ve çalışanların örgütsel güven düzeylerini olumsuz etkileyen faktörlerin araştırılmasının gerektiği ifade edilmiştir (Teyfur vd., 2013: 104). Yapılan başka bir çalışmada ise etik liderlik davranışının çalışanların örgütlerine olan güveni oluşturduğu, güvenilir ve adil bir iş yeri yaratmak için etik lider yetiştirmenin önemli olduğu vurgulanmıştır (Xu vd., 2016: 493). Etik liderliğin, liderler ve takipçileri arasında daha güvenilir bir ilişkinin kurulmasında önemli bir

role sahip olduğu (Akker vd., 2009: 116), etik liderlik davranışları yerine getirildikçe bireylerin örgütsel güven düzeyleri artacağından etik liderlik becerilerini geliştirecek eğitim programlarının hazırlanması önerilmiştir (Cemaloğlu ve Kılınç, 2012: 147). Üstün vd. (2021: 225) tarafından etik liderlerin istenilen uygun davranışları göstermesi durumunda izleyenleri koruyan ve onlara güven veren bir yapıya sahip olduğu ifade edilmiştir. Farklı araştırmacılar tarafından yapılan çalışmalarda da etik liderlik ile örgütsel güven arasında pozitif yönlü önemli ilişkilerin olduğu sonucuna ulaşılmıştır (Taşlıyan vd., 2016: 2541; Sökmen, 2019: 917; Pucetaite, 2014: 234). Bu çalışmada da etik liderliğin örgütsel güven üzerindeki etkisi turizm sektöründe incelenmiştir. Hizmet sektöründe hem etik ilkelere yönelik davranış sergilemek hem de kaliteli hizmet sunumunda bulunmak için etik liderlik ve örgütsel güven davranışları önem arz etmektedir. Bu nedenle, turizm sektörünün, araştırma amacı için seçilmiş doğru sektör olduğu kanaati oluşmuştur.

#### **ARAŞTIRMANIN AMACI ve MODELİ**

Kurumlarda farklı liderlik ve yaklaşım tarzı gösteren lider konumundaki kişilerin bu davranışları, örgütsel davranış türleri üzerinde farklı şekillerde etkili olabilmektedir. Bireylerin lider davranışına göre örgütsel davranış türlerini değerlendirmeleri hizmet sektöründe daha belirgin olarak görülmektedir. Yapılan bu çalışmada İstanbul ilinde aktif olarak faaliyette bulunan 4 yıldızlı otellerde görev yapan kişilerin, işletmelerinde lider konumundaki bireylerin etik liderlik davranışlarının algıladıkları örgütsel güvene olan etkileri belirlenmeye çalışılmıştır. Bu kapsamda sektörde çalışanlar ile yapılan anket uygulamasında kişilerin etik liderlik ve örgütsel güven algıları ölçümlenmeye çalışılmıştır. Araştırma sonucunda ulaşılan bulgular ile lider davranışlarının kuruma olan etkisi ortaya konularak işletmelerin daha verimli düzeye getirilmesi için bilimsel düzeyde katkı sağlamak hedeflenmiştir. Etik liderlik konusu üzerine yapılan araştırmalar incelendiğinde etik liderliğin örgütsel güvenin artmasında önemli düzeylerde etkili olduğu görülmüştür. Daha önce yapılan bu araştırma sonuçları da dikkate alınarak etik liderlik ve örgütsel güvenin alt boyutları arasında aşağıdaki hipotezler geliştirilmiştir. Oluşturulan hipotezler doğrultusunda araştırmanın modeli Şekil 1’ de verilmiştir,

**H1:** Etik liderlik, örgütsel güvenin alt boyutu olan bilişsel güveni anlamlı ve pozitif yönde etkiler.

**H2:** Etik liderlik, örgütsel güvenin alt boyutu olan duygusal güveni anlamlı ve pozitif yönde etkiler.

**Şekil 1.** Araştırmanın Modeli

### **ARAŞTIRMANIN YÖNTEMİ**

İşletmeleri daha verimli ve etkin düzeylere getirebilmek için turizm sektöründe faaliyette bulunan 4 yıldızlı otel çalışanlarıyla, bir lider davranış türü olan etik liderliğin örgütsel güvenin alt boyutlarına yönelik etki düzeyini belirlemek için bir anket uygulaması yapılmış ve araştırmada ilişkisel tarama modeli seçilmiştir. Araştırmanın amacı doğrultusunda İstanbul ilinde faaliyette bulunan 4 yıldızlı otellerde görev yapan 200 kişide tesadüfi örneklem yöntemiyle bir anketör firma aracılığı ile anket uygulaması yapılmıştır.

Araştırma kapsamında etik liderlik ve örgütsel güven kavramları üzerine yapılan araştırmalar incelenerek olabildiğince geniş bir literatür taraması yapılmış, önermeler hedef kitle tarafından daha iyi anlaşılması için düzenlenmiştir. Ankette katılımcıları tedirgin edecek hiçbir özel bilgi istenmemiştir. Anket uygulamasında etik liderlik ve örgütsel güven önermeleri, “1 Kesinlikle Katılmıyorum”, “2 Katılmıyorum”, “3 Kararsızım”, ”4 Katılıyorum” ve “5 Kesinlikle Katılıyorum” ifadelerinden oluşan 5’ li Likert tarzı ölçek ile ölçülmeye çalışılmıştır. Anketten elde edilen veriler SPSS programına girilmiş, SPSS statistics adlı program yardımı ile analizleri yapılmıştır. Anket ölçeklerinin ilk önce Cronbach’s Alfa ile güvenilirlik düzeyleri tespit edilmiş, değişkenlere ait ortalama ve standart sapma değerleri hesaplanmış, korelasyon ve regresyon analizleri ile önermeler arasındaki ilişkilerin düzeyi, yönü ve etki derecesi belirlenmeye çalışılmıştır. Yapılan bu analizler sonucunda etik liderlik ve örgütsel güven üzerine daha önce yapılan araştırma bulguları da incelenerek değişkenler arasındaki ilişkiler yorumlanmış ve çıkarımlar elde edilmeye çalışılmıştır.

İşletmelerde lider konumundaki kişilerin etik liderlik davranış düzeylerini belirlemek için Brown vd. (2005: 126) tarafından geliştirilen tek alt boyutlu ve 10 önermeden oluşan ölçek kullanılmıştır. Brown vd. (2005: 126)’nin oluşturduğu ölçek; Çoklar (2012: 90), Güçel vd. (2012: 105) ve Akdoğan ve Demirtaş (2014: 114) tarafından yapılan araştırmalarda da kullanılmış ve ölçeğin güvenilir olduğu kabul edilmiştir.

Çalışanların örgütsel güven algılarını belirlemek için Cummings ve Bromiley (1995: 328) tarafından geliştirilen, bilişsel ve duygusal olmak üzere 2 alt boyutu olan ölçek kullanılmıştır. Cummings ve Bromiley (1996: 317) tarafından oluşturulan örgütsel güven ölçeğinin uluslararası literatürde en yaygın kullanılan ölçek olduğu görülmüştür. Kuramsal yapısı güçlü olan ölçeğin oluşturulan kısa formunda davranışsal boyut elemine edilmiş, bilişsel ve duygusal alt boyutları altında toplanmıştır. Kısa formunun düşünülmesinin nedeni kısa formun uzun forma göre daha uyumlu ve geçerlilik düzeyinin daha yüksek bulunmasıdır. Araştırmacılar ölçeğin kısa formunda, önemli ölçüm varlıklarının ödün vermeden kullanılmasından dolayı daha kullanışlı bir ölçek olduğunu ifade etmişlerdir. Kullanılan örgütsel güven ölçeği; bilişsel boyut 8 ve duygusal boyut 4 önerme olmak üzere toplam 12 önermeden oluşmaktadır. Cummings ve Bromiley (1995: 328)'in örgütsel güven ölçeği Güçel vd. (2012: 105), Ayden ve Özkan (2014: 157) ve Arslan ve Esatoğlu, (2017: 325) tarafından yapılan araştırmalarda da kullanılmış, ölçeğin güvenilir olduğu görülmüştür.

## **BULGULAR**

### **Araştırmanın Güvenirliliği**

Yapılan araştırmada veri toplama aracı olarak kullanılan ölçeklerin güvenirliliği Cronbach's Alfa değerleri ile belirlenerek test edilmiştir. Araştırmacılar tarafından Cronbach's Alfa 0,70 ve üzeri ( $0,70 \leq \alpha \leq 1$ ) olduğunda ölçek güvenilir olarak değerlendirilmektedir (Tavakol ve Dennick, 2011: 54). Araştırmada kullanılan ölçeklerin Cronbach's Alfa değerleri 0,70'in üzerinde bulunduğundan ölçekler güvenilir kabul edilmiştir (Tablo 1).

**Tablo 1.** Araştırmada Kullanılan Ölçeklerin Güvenirlilik Analizleri

<b>Değişkenler</b>	<b>Önerme Sayısı</b>	<b>Cronbach's Alfa</b>
Etik liderlik	10	0,949
Bilişsel Güven	8	0,943
Duygusal Güven	4	0,826

### **Katılımcıların Demografik Özellikleri**

Turizm sektöründe faaliyette bulunan otel işletmelerinde çalışanlar ile yapılan araştırmaya katılanların cinsiyet, yaş, medeni durum, eğitim durumu, çalışma süresi ve işletmedeki pozisyonları incelenmiştir. Çalışanların çoğunluğunun erkeklerden oluştuğu, genç çalışanların ağırlıkta olduğu sektörde bekâr bireylerin evlilerden daha fazla yer aldığı görülmüştür. Eğitim durumlarına göre ise lise mezunlarının ilk sırada bulunduğu, bunları lisans ve ön lisans mezunlarının takip ettiği, çalışanların büyük kısmının işyerlerinde kısa süredir çalıştığı (1-5 yıl)

ve katılımcıların büyük çoğunluğunun çalışan pozisyonunda (%82) olduğu görülmüştür (Tablo 2).

### Araştırma Değişkenlerinin Ortalama ve Standart Sapma Değerleri

Katılımcıların etik liderlik ve örgütsel güvenin alt boyutlarında yer alan önermelere vermiş oldukları cevaplar değerlendirildiğinde olumlu yönde görüş bildirdikleri söylenebilir (Tablo 3).

**Tablo 2.** Araştırmaya Katılanların Demografik Özellikleri

	Frekans	Yüzde		Frekans	Yüzde
<b>Cinsiyet</b>			<b>Medeni Durum</b>		
Erkek	126	63,0	Bekâr	106	53,0
Kadın	74	37,0	Evli	89	44,5
			Diğer	5	2,5
<b>Yaş</b>			<b>Eğitim Düzeyi</b>		
20-25	72	36,0	Lise	82	41,0
26-30	67	33,5	Ön Lisans	48	24,0
31-35	38	19,0	Lisans	49	24,5
36-40	17	8,5	Lisans Üstü	15	7,5
41-45	4	2,0	Diğer	6	3,0
46-50	1	0,5			
51 ve üzeri	1	0,5			
<b>Çalışma Süresi</b>			<b>Pozisyon</b>		
1-5 yıl	146	73,0	Üst düzey yönetici	8	4,0
6-10 yıl	24	12,0	Orta düzey yönetici	18	9,0
11-15 yıl	24	12,0	Alt düzey yönetici	10	5,0
16-20 yıl	6	3,0	Çalışan	164	82,0
21 yıl ve üstü	0	0,0			

**Tablo 3.** Araştırma Değişkenlerinin Ortalama ve Standart Sapma Değerleri

Değişkenler	Ortalama	S.S
Etik liderlik	3,48	0,747
Bilişsel Güven	3,28	0,742
Duygusal Güven	3,23	0,732

### Araştırma Değişkenlerine Ait Korelasyon ve Regresyon Değerleri

Araştırma değişkenleri olan etik liderlik ile örgütsel güvenin alt boyutları arasındaki ilişkiyi incelemek için yapılan korelasyon analizinde, etik liderlik ile örgütsel güvenin alt boyutları arasında pozitif yönlü istatistiksel olarak önemli ve anlamlı ( $p < .01$ ) ilişkilerin olduğu tespit edilmiştir (Tablo 4). Olumlu lider davranışı olarak görülen etik lider davranışlarının bireylerin bilişsel ve duygusal güvenlerinin gelişiminde önemli role sahip olduğu görülmüştür. Elde edilen bulgular doğrultusunda, işletmelerde etik lider davranışlarının çalışanların örgüte olan güven duygularını arttırdığı sonucu çıkarılabilir. Araştırmada bağımsız değişken olan etik liderlik ile bağımlı değişkenler olan bilişsel ve duygusal güven arasında yapılan regresyon analizi

sonuçlarına göre, etik liderliğin, örgütsel güvenin alt boyutları olan bilişsel güveni %53,6 ve duygusal güveni %50,4 düzeylerinde istatistiksel olarak anlamlı ve önemli düzeylerde açıklama gücüne sahip olduğu sonucuna ulaşılmıştır (Tablo 5). Yapılan literatür araştırmasında Xu vd., (2016: 493) tarafından gerçekleştirilen bir araştırmada etik lider davranışlarının örgütsel güven üzerinde olumlu yönde, önemli etkisinin olduğu bulunmuştur. Yine Akker vd., (2009: 116) ile Cemaloğlu ve Kılıncı (2012: 147) tarafından yapılan araştırmalarda da bu çalışmada elde edilen bulguları destekleyen sonuçlara ulaşılmış; araştırmacılar, etik liderliğin örgütsel güvenin oluşumunda önemli etkisinin olduğunu belirterek kurumların etik liderliğe önem vermeleri gerektiğini vurgulamıştır.

**Tablo 4.** Araştırma Değişkenlerinin Korelasyon Değerleri

Değişkenler	Bilişsel Güven	Duygusal Güven
Etik Liderlik	,732**	,710**

\*\* Korelasyon 0.01 düzeyinde anlamlıdır.

**Tablo 5.** Etik Liderlik ile Örgütsel Güvenin Alt Boyutları Regresyon Analizi

Değişkenler	Bilişsel Güven (p: 0,001)		Duygusal Güven (p: 0,001)

Etik Liderlik	,732 $\Delta R^2=,536$	15,122 F: 228,678	,710 $\Delta R^2=,504$	14,187 F: 201,270

## SONUÇ VE DEĞERLENDİRME

Sosyal bir varlık olan insanlar kendilerini belirli hedeflere taşıyacak bir lider etrafında birleşmeye ihtiyaç duyarlar. Kişiler hedeflerine ulaşmak için bir kişinin etkisinde kalıyor ve onu takip ediyorsa o toplulukta liderlik olgusundan söz edilebilir. Bu yüzden insan yaşamının her evresinde liderlik kavramı ile karşılaşmak mümkündür (Gündüz ve Dedekorkut, 2014: 95). Liderlik, bir kurumda hedeflerin belirlenmesinde ve bu hedeflere ulaşılmasında alınacak kararların neler olacağını ve çalışanlar arasında iş birliğini sağlayan bir yapıdır (Bakan, 2007: 104). Kurumlarda gözlenen farklı liderlik tarzları içerisinde önemi giderek daha çok artan etik liderler, etik davranışları ilke edinen, tarafsız davranan, kişilerin haklarını savunan ve çalışanlar üzerinde güven duygusu oluşturan kişilerdir (Teyfur vd., 2013: 85). Bireyler üzerinde genellikle olumlu bir etki bırakan etik liderler, etkin düşünme yöntemlerini kullanıp ilkeli ve dikkatli kararlar alarak doğruluk ve dürüstlük içinde hareket ederler (Brown vd., 2005: 117).

İşletmelerin, artan rekabet gücü ile başa çıkabilmeleri için kişi ve kurum arasında güvene ihtiyaç duyulduğundan örgüt içi güvenin oluşturulması gerekir (Huff ve Kelley, 2003: 81). Örgütsel

güven, iyi niyet ve dürüstlük üzerine kurulan ve bir kişinin ya da topluluğun başka bir kişi veya topluluğa yönelik olarak düşünce ve inanışlarıdır. Örgütsel güven, iyi niyetli çabaları içeren ve dürüstlük ilkesini benimseyen bir olgu olarak kabul edilir (Cummings ve Bromiley, 1996: 317). Sosyal yapılarda sağlıklı ilişkilerin devam ettirilmesinde temel faktör olan güven duygusu, bireylere olumsuz şartlar karşısında kendilerine daha fazla mücadele etme gücü katar (Asunakutlu, 2002: 2, 10).

İşletmeler için önemli kavramlar olan etik liderlik ve örgütsel güven arasındaki ilişkiler bu çalışmada incelenmeye çalışılmıştır. Bu kapsamda turizm sektöründe hizmet veren otel çalışanlarında bir anket uygulaması yapılmıştır. Araştırma bulguları sonucunda etik liderlik ile örgütsel güvenin alt boyutları olan bilişsel güven ve duygusal güven arasında pozitif yönlü istatistiksel olarak anlamlı ve önemli ilişkilerin olduğu görülmüştür. Yapılan regresyon analiz sonuçlarında etik liderliğin bilişsel güveni %53,6 ve duygusal güveni %50,4 düzeylerinde istatistiksel olarak etkileme ve açıklama gücüne sahip olduğu sonucuna ulaşılmıştır. Yapılan analiz sonuçlarına göre etik lider davranışlarının uygulanmasına önem verilen işletmelerde bireylerin çalıştıkları işletmelerine olan güven duygularının olumlu yönde etkilendiği ve arttığı ifade edilebilir. Elde edilen sonuçlar, bu konuda çalışmalar yapan araştırmacıların bulguları ile değerlendirildiğinde; Johnson vd. (2012: 3), Ertürk (2019: 119), Teyfur vd. (2013: 104) ve Pucetaite (2014: 234) tarafından yapılan araştırmalar ile desteklenmiş ve uyumlu bulunmuştur. Yine araştırmacılar tarafından; etik liderlerin çalışanlar için güvene dayalı bir çalışma ortamının yaratılmasında kilit rolünün olduğu (Engelbrecht, 2017: 377), güvenilir ve adil bir iş yeri yaratmak için etik lider yetiştirmenin önemli olduğu (Xu vd., 2016: 493) ve etik liderliğin, bireyler ile güvenilir bir ilişkinin kurulmasında önemli bir etkiye sahip olduğu belirtilmiştir (Akker vd., 2009: 116).

Yapılan araştırma ile elde edilen sonuçlar ve diğer araştırmacıların bulguları değerlendirildiğinde, çalışanlarda işletmelerine duyulan güvenin gelişmesinde etik liderlerin önemli bir etkisinin olduğu görülmektedir. Kurumlar için en önemli güç kaynakları olan çalışanlarda güven duygusunun oluşması işletmelerin varlığını sürdürmelerinde ve rakipleri ile rekabet edebilmelerinde önemli bir üstünlük sağlayacaktır. Bu yüzden kurum yöneticilerinin işletmelerinde lider konumundaki kişilerin etik lider davranışlarını ne düzeyde uyguladıklarını önemsemeleri gerekmektedir. Ayrıca kurumlar tarafından etik lider davranışlarının yerleşmesi için hangi uygulamaların yapılması gerektiği belirlenmelidir.

**ÖZET**

Çalışanların kurumlarında meydana gelen mesleki suiistimali, yetersizliği, ihmali veya tehlikeyi ortaya çıkaran bir davranış türü olan whistleblowing eylemi içsel ve dışsal boyutları ile riskler içeren bir faaliyettir. Çalışanlarda yalnızlık, güçsüzlük, anlamsızlık, memnuniyetsizlik ve duyarsızlaşma gibi duyguların yaşanmasına neden olan işe yabancılaşma ise bireyin, ürün ve süreç üzerindeki kontrolünü ve dolayısıyla işte kendini ifade etme kapasitesini kaybettiği durumlarda ortaya çıkan bir olgudur. Bu araştırmada kurumlarda çalışanların whistleblowing davranışlarının işe yabancılaşma duyguları üzerindeki etkisi incelenmiştir. Bu kapsamda turizm sektöründe çalışan yönetici ve çalışan konumundaki kişilerden anket tekniği ile veriler sağlanmıştır. Tesadüfî örneklem yönetimi ile elde edilen veriler SPSS istatistik program ile analiz edilmiş, korelasyon ve regresyon testleri ile önermeler arasındaki ilişkilerin yönü, düzeyi ve etkisi belirlenmeye çalışılmıştır. Korelasyon analizi sonuçlarına göre; whistleblowingin alt boyutu olan içsel ve dışsal ifşa ile işe yabancılaşma arasında negatif, kayıtsızlık ile işe yabancılaşma arasında ise pozitif yönlü önemli ilişkiler bulunmuştur. Bu bulgular doğrultusunda içsel ve dışsal ifşa yapan bireylerin işlerinde yabancılaşma duygularını yaşamadığı hatta işlerini benimsedikleri ifade edilebilirken, whistleblowing eylemine kayıtsız kalan kişilerin işlerine çok fazla önem vermediklerinden yabancılaşma duygularını daha derin hissettikleri sonucuna ulaşılmıştır.

**Anahtar Kelimeler:** Whistleblowing, İşe Yabancılaşma, Turizm.

**HOW EFFECTIVE IS WHISTLEBLOWING ON WORK ALIENATION?****ABSTRACT**

The act of whistleblowing, which is a type of behaviour that reveals professional misconduct, inadequacy, negligence or danger in the institutions of the employees, is an activity that includes risks with its internal and external dimensions. Experiencing feelings such as loneliness, powerlessness, meaninglessness, dissatisfaction and depersonalization in employees can cause work alienation in employees. Work alienation is a phenomenon that occurs when the individual loses his/her control over the product and process and thus the capacity to express himself/herself at work. In this study, the effect of whistleblowing behaviours of employees on their feelings of work alienation was examined in institutions. In this context, data were obtained from the managers and employees working in the tourism sector with the survey technique. The data obtained by random sampling management were analysed with the SPSS statistical program. With correlation and regression tests, the direction, level and effect of the relations between the propositions were tried to be determined. According to the results of the correlation analysis; negative relationships were found between internal and external disclosure, which is the sub-dimension of whistleblowing, and work alienation, and positive relationships were found between indifference and work alienation. In line with these findings, it was found that individuals who made internal and external disclosure did not experience feelings of work alienation and even adopted their jobs. However, it has been concluded that people who are indifferent to the whistleblowing act feel alienation more deeply since they do not attach much importance to their work.

**Keywords:** Whistleblowing, Work Alienation, Tourism.

## **GİRİŞ**

Kurumlarda ortaya çıkan birtakım olumsuz gelişmeler çalışanlar tarafından bazı yerlere aktarılabilmektedir. Literatürde whistleblowing olarak tanımlanan ifşa etme, tüm sektörlerde ortaya çıkabilecek bir olgudur. Bu kavram genellikle bir işletmedeki etik ve meşru olmayan bir eylem ve davranışın kurumun içindeki veya dışındaki bireylere iletilmesidir. Belirli bir enformasyona sahip olan, whistleblowingi gerçekleştiren kişi kurumda daha önce çalışmış veya hâlâ çalışan durumunda birisi olabilir (Aktan, 2015: 21). Tanımı konusunda net bir görüş birliği sağlanamayan whistleblowing kavramını bazı araştırmacılar sadece kurum içerisinde duyurulan davranışlar olarak ifade ederken, bazı araştırmacılar bu davranışın kurum dışına taşınması ile gerçekleştiğini ifade etmektedir. Genel olarak bireyin örgüt kaynaklarını kendisi için kullanması, hukuksuz davranışlar sergilenmesi ve ayrımcılık yapılması gibi davranışlar whistleblowing içerisinde değerlendirilen eylemlerdir (Esen ve Kaplan, 2012: 49). Kurumlarda yanlış uygulamaların önüne geçilmesi ve işletmelerin amaçlarına ulaşması bakımından önemli olan ifşa eylemi, risk taşıyan bir faaliyet olup, eylemi gerçekleştiren kişi hakkında bazen olumsuz bir algı oluşmasına ve yaptırımlara maruz kalmasına neden olabilmektedir (Kozak ve Şahin, 2018: 1; Dungan vd., 2019: 1).

Çalışanlarına değer veren, amaçların gerçekleştirilmesine yardımcı olan, moral ve motivasyon sağlayan bir yönetim tarzının benimsenmesinin bireysel ve örgütsel çıktılara olumlu olarak yansımaları beklenen bir durumdur. Ancak örgütte uygulanan yönetim tarzının çalışanlar tarafından olumsuz olarak değerlendirilmesinin bireylerin tutum ve davranışlarına olumsuz yönde yansımaları da muhtemel bir gelişmedir. Yani yönetim tarzının; bireylerin pozitif ve isteğe bağlı davranışlar sergilemesinin öncülü olabileceği gibi, iş tatminsizliği, işten ayrılma niyeti, üretkenlik karşıtı iş davranışları ve işe yabancılaşma gibi olumsuz çıktılara da yol açması beklenmektedir (Kanten ve Ülker, 2014: 17). İnsanlar, işlerinde hiçbir etkilerinin olmadığını ve özellikle kendilerini değersiz ve anlamsız hissettiklerinde bu durumun önemli olumsuz etkileri olur (Tummers ve Den Dulk, 2013: 850). Sanayileşme ile birlikte üzerinde en fazla durulan konulardan birisi olan işe yabancılaşma, çalışanın işi ile arasındaki bağın ortadan kalkması ya da azalmasıdır. İşe yabancılaşma yaşayan işletmeler, diğerlerinden daha dezavantajlı hale gelirler (Taştan vd., 2014: 132). Rekabet koşulları nedeniyle iş yaşamında yüksek düzeyde örgütüne bağlı, örgüt desteği ile birlikte performansını yükselten ve işine karşı yabancılaşma hissetmeyen çalışanlara daha fazla ihtiyaç duyulmaktadır (Çalışkan ve Pekkan, 2017: 29).

İnsanlığın yaratılışı ile var olduğu düşünülen yabancılaşma olgusunun en çok görüldüğü alanlardan birisi çalışma ortamlarıdır. Örgütteki bireyler, olumsuz olarak algıladıkları birtakım

durum ve olayların etkisiyle örgüt içerisinde kendilerini güçsüz ve değersiz hissetmekte, zamanla işlerinden, diğer çalışanlardan ve kendilerinden uzaklaşmaktadır. İşletmeler açısından büyük ölçüde bir iş gücü kaybı yaratan bu durum, kurumlarda etkinliği ve verimliliği azaltmakta, örgütsel faaliyetlerin başarısızlıkla sonuçlanmasına yol açabilmektedir. Özellikle nitelikli çalışanlarda oluştuğunda, örgütün performansını ciddi boyutta olumsuz yönde etkileyebilecek bir sorun olan yabancılaşma, iş görenlerin işine ve kurumuna karşı soğukluk hissederek uzaklaşması durumudur (İrdem, 2021: 274). Yapılan bu araştırmada işletmelerde etik, ahlak ve yasalara uymayan davranışların içerdeki veya dışardaki kişilere iletilmesi olarak (Kozak ve Şahin, 2018: 1) ifade edilen whistleblowing ile bireyin işi üzerindeki kontrolünü ve dolayısıyla kendini ifade etme kapasitesini kaybettiği durum olarak (Mendoza ve Lara, 2007: 57) tanımlanan işe yabancılaşma arasındaki ilişki incelenmiştir.

### **WHISTLEBLOWING KAVRAMI**

Örgütlerde ortaya çıkan yanlış davranışlar kuruma, çalışanlara ve müşterilere zarar verebilir. Kurum çalışanları, işyerlerindeki yanlışları bulmak ve bildirmek için kuruluş tarafından etkin bir şekilde yönlendirildiğinde yanlışlar azaltılabilir ya da zamanla düzeltilebilir. Whistleblowing (ifşa etme), yanlış davranışların (yasadışı, ahlak dışı veya gayri meşru uygulamalar) mevcut veya eski örgüt üyeleri tarafından ifşa edilmesidir. İfşa edenlerin karşı karşıya kaldığı olumsuz misilleme nedeniyle çalışanlar iş arkadaşlarının yanlış davranışlarını ihbar etme konusunda isteksizlik yaşadığında kurumlar, yanlışlarını kendi kendilerine düzeltme fırsatını kaçırmaları. Ayrıca çalışanlar tarafından bu durum dışarıdaki kişiler ile paylaşıldığında, potansiyel olarak kuruluşların itibarı zedelenebilir veya yasal maliyetlere maruz kalınabilir. Bu yüzden whistleblowing davranışına çalışanların nasıl teşvik edileceği örgütsel etik yönetimi açısından önemli bir konudur (Zhou vd., 2018: 197).

Kurumlarda meydana gelen mesleki suiistimali, yetersizliği, ihmali veya tehlikeyi ortaya çıkaran kişilerin davranışı olan whistleblowing eylemi içsel ve dışsal boyutları ile riskler taşıyan faaliyettir. Bu nedenle bireyin, ifşa kararı alması asla kolay olmayıp yasal bir bildirim zorunluluğu olmadığı sürece her şey başarısız olduğunda atılacak bir adım olarak düşünülmelidir. Çalışanların, gördüğü bir yanlış düzeltmek için dışsal bir ifşada bulunmadan önce organizasyon içindeki tüm kanalları kullanması ve başarısız olması gerekir (Ray, 2006: 438). İçsel ifşa genellikle sağduyulu bir yaklaşım ile yönetimde gücü olan kişilerin dikkatini çekmeyi amaçlamaktadır. Kurumların içsel ifşaları teşvik etmesi ve bunlara yanıt vermesi dışsal ifşaları önleyebilir veya azaltabilir (Jubb, 1999: 91). İşletmelerde yönetici konumundaki kişiler tarafından bir ifşa politikası

belirlenebilir ve uygulanabilir. Ancak elde edilen bilgiler denetim komitesine veya yönetim kuruluna aktarılmalıdır. Bu aşamalarda bilgiyi ifşa eden kişinin gizliliğinin korunması ve bilginin doğruluğu önemlidir. Kurumlar ortaya konulan iddiaları araştırmalı, değerlendirmeli ve gerektiğinde yaptırımlar uygulamalıdır (Eaton ve Akers, 2007: 70).

Whistleblowing, kurum içine veya kurum dışına yönelik olarak yapıldığında farklı şekillerde değerlendirilebilmektedir. Kurumsal yanlışın dışarıdaki bir alıcıya ifşa edilmesi sadakatsizlik olarak görülürken, dâhili bir alıcıya ifşa edilmesi sadakat olarak görülebilmektedir (Andrade, 2015: 321). Çalışanlar, kuruluşlar ve genel olarak toplum üzerindeki whistleblowing etkisi tartışmalı olsa da topluma sağladığı faydaları nedeniyle yükselişte olan ve sosyal açıdan önemli bir eylem tarzıdır. Nasıl, neden, kim tarafından, ne oldu ve kime sorularının cevabı ifşa etmenin kapsamı içerisindedir. İfşa etmenin toplum, kurum ve yöneticiler açısından olumsuz sonuçları olabileceğinden yöneticiler ifşa etmenin farklı özelliklerini iyi anlamalı, oluşabilecek yanlış davranışı önlemek veya zararını en aza indirmek için konunun tüm yönlerini dikkatlice değerlendirmelidir (Culiberg ve Mihelic, 2017: 787-799). İfşa edicilerin bireysel farklılıklarına bağlı olarak whistleblowing eylemlerinin sonucunda farklı çıktılar elde edilebilir (Watts ve Buckley, 2017: 671). İfşacının gücü, organizasyondaki otorite düzeyine ve durumdaki rolüne bağlıdır. İfşa edici, örgütte denetçi pozisyonunda ise daha fazla yetki ve resmi güce sahip olduğundan diğerlerini etkilemede daha başarılıdır ve başkalarının bu kişiye misilleme yapma olasılığı daha düşüktür (Rehg vd., 2008: 225).

Sisteme sempati duyan ve kurumlarına bağlı kişiler olarak tanımlanan whistleblowerler (ifşa ediciler), genellikle güçlü bir şekilde sorgulayabilen, kuruluşuna hizmet etmeye çalışan, iyilikle uyumlu bir duruşa sahip olan ve kilit bilgileri elinde tutan kararlı kişilerdir (Lemoine ve Michael, 2021: 5). İfşa edenler, etik olmayan davranışların potansiyel olumsuz sonuçlarına karşı ifşa etmenin faydalarını göz önünde bulundurlar. Ancak ifşa etme süreci bir dizi zor kararı içerir. Whistleblower (ifşa ediciler), içerisinde bulunduğu kuruluşa karşı yapılan yanlışları bildirdiğinde üstü kapalı bir gerilimle karşı karşıya kalabilir ve bu süreçte işini kaybetme tehlikesi ile yüz yüze gelebilir (McGlynn ve Richardson 2014: 14).

Kurumlarda, etik dışı davranışların belirlenmesi ve hilelerin ortaya çıkarılmasında önemli bir araç olan whistleblowing bazen kahramanca görünürken bazen de kınanabilir (Uyar ve Yelgen, 2015: 102; Dungan vd., 2010: 129). İş yaşamında giderek daha fazla yaygınlaşmaya başlayan ifşa etme davranışları çalışanlara ve müşterilere zarar verecek uygulamaların durdurulmasında yardımcı olabilmektedir. Ancak ifşa edenlerin misillemeden korkması ve hatta buna maruz kalması cesaretlerini kırabilmektedir (Magnus ve Viswesvaran, 2005: 295). Bazı durumlarda bir çalışan

tarafından kurumun herhangi yasa dışı veya gayri meşru bir eylemi açıklandığında bu durum yasal işlem ile sonuçlanabilir. Bir kişi whistleblowing (ifşa etme) yapmaya karar verdiğinde; yanlış yapmanın ciddiyetini ve ifşa etmeden böyle bir faaliyeti durdurmanın mümkün olup olmadığını düşünmeli, suçu kime bildirmesi gerektiğine karar vermelidir. Çalışanlar yanlış davranışları tespit edebilecek en iyi kişilerdir. Bu nedenle çalışanlar, bu tür eylemleri zamanında bildirmeye teşvik edilmelidir. Çünkü böyle bir davranış, kurumu herhangi bir zararlı faaliyete karşı koruyabilir (Dasgupta ve Kesharwani, 2010: 12).

### **İŞE YABANCILAŞMA KAVRAMI**

İşletmelerin yoğun rekabet ortamına uyum sağlayabilmeleri ve varlıklarını sürdürebilmeleri oldukça zordur. Yaşanan bu zor rekabet koşulları, kuruma ve bireylere yeni sorumluluklar yüklediğinden bu durum çalışanların kendi benliklerinden yavaş yavaş kopmasına ve uzaklaşmasına neden olabilmektedir (Örücü vd., 2021: 602). Organizasyonların sahip oldukları çalışanlar en önemli sermayeleridir. Bu sermayeden en doğru şekilde faydalanabilmek için çalışanların verimliliğini ve etkinliğini artırabilecekleri ortam ve koşulların sağlanması gerekmektedir. İşletmelerin geleceklerini doğrudan etkileyen ve kurumu başarıya götürecek kişi olan çalışanların önemi özellikle son yıllarda ortaya çıkan rekabetçi iş ortamları ve koşulları nedeniyle daha da büyük önem taşımaktadır. Örgütün hedeflerine ulaşmasında önemli bir fonksiyona sahip olan bireyler, bazı faktörlerin etkisine bağlı olarak işe yabancılaşma duygusu yaşayabilmektedir. Çalışanın işe yabancılaşması, fiziksel ya da psikolojik anlamda kendisini kurumdan soyutlaması veya uzaklaştırmasıdır. Bireylerin motivasyon ve çalışma isteğini olumsuz yönde etkileyen işe yabancılaşma, zamanla daha da derinleşerek işten ayrılmalara neden olabilmektedir. Bu nedenle kurumlar tarafından işe yabancılaşmaya neden olan faktörlerin belirlenmesi önemlidir (Demirez ve Tosunoğlu, 2017: 69-80).

İşletmelerde hizmet kalitesinin en temel belirleyicisi olan çalışanların; kurumunun temel politikalarına ve stratejilerine güvenmesi, diğer çalışanlarla ilişkilerinde yardımlaşma ve dayanışma duygularına sahip olması önemlidir. Çalışanların yaşayacağı olumsuz gelişmeler çalışan verimliliğinin düşmesine, örgüt içi çatışma ortamının doğmasına ve özellikle çalışanların işe yabancılaşmasına neden olabilmektedir (Aşık, 2018: 32). Bireyler, iş özerkliklerine sınır getirildiğinde güçsüzlük ile birlikte anlamsızlık ve kendine yabancılaşma duygularını da yaşayabilirler (Sarros vd., 2002: 287). İşletmelerin en önemli girdisi olarak görülen çalışanların yabancılaşma olgusunu yaşamaları kurumu olumsuz yönde etkileyen pek çok sorunu ortaya çıkarmaktadır. Yabancılaşan bir kişi kendisini mutsuz hissetmekte, fiziksel ve zihinsel yönden

kendini geliştirememekte, çalışmalarını basit ve monoton bir döngü olarak görmektedir (Korkmazer ve Ekingen, 2017: 468).

Bireylerin iş yükünün fazla olması, katı hiyerarşik yapılar, işin özellikleri ve çalışanların karar alma süreçlerine katılamaması gibi faktörler bireyi işinden soyutlayabilmektedir. Ayrıca bireyin, rolünün ne olduğu konusunda belirsizlik yaşaması işle ve örgütle bağlarını zayıflatabilir. Aynı zamanda işe yabancılaşma, bireye psikolojik yönden zarar vererek iş doyumunu da azaltabilir (Atay ve Gerçek, 2017: 322). Yabancılaşma benlik kaybı, umutsuzluk, yalnızlık, güçsüzlük, ayrılma, kayıtsızlık, kaygı, tecrit, anlamsızlık, hoşnutsuzluk, memnuniyetsizlik ve duyarsızlaşma duyguları şeklinde kendisini gösterebilmektedir. İşe yabancılaşma kişinin iş arkadaşlarıyla olan sosyal ilişkilerindeki memnuniyetsizliği ve amirlerinden memnun olmaması sonucu da oluşabilir (Hoy, 198: 110). Yabancılaşma diğer insanlardan, kişinin değerlerinden, benlikten ve genel olarak topluma bağlayan kısımlardan uzaklaşma hissini kapsar. Yabancılaşma, sinir bozucu bir durumun sonucunda da oluşabileceğinden zihinsel sağlığı zayıf olan bireylerde daha hızlı ve kolay görülebilir. İşe yabancılaşma nereden kaynaklanmış olursa olsun bireylerin tutumlarını ve sosyal davranışlarını etkileyebilmektedir. Bu sadece bireyin genel sosyal hayatı için değil mesleği ile ilgili sosyal hayatı için de geçerlidir (Yadav ve Nagle, 2012: 338).

Bireylerin yabancılaşması, sadece siyasal ve ekonomik temelli ilişkilerde bozulma olmayıp bütün ilişkilerde de bir bozulmayı kapsayabilir. Gelişen bu bozulmanın sonucunda, bireyler kendi benliklerine uygun olmayan biçimde yaşamak durumunda kalabilirler (Tuna ve Yeşiltaş, 2014: 108). Çalışanlar, daha fazla sorumluluk ve daha zorlu görevler üstlenmeye istekli olsalar da artan beklentileri karşılanmadığında işlerine yabancılaşabilirler. İşe yabancılaşma kritiktir çünkü yabancılaşmış çalışanlar işlerini çok az önemserler, işlerine çok az enerji harcarlar ve işleri yalnızca dışsal ödüller için yaparlar (Ramaswami vd., 1993: 179). İşe yabancılaşma, bir kişinin iş dünyasından duygusal, psikolojik ve aktivasyon olarak ne ölçüde koptuğunu temsil eder (Hirschfeld ve Feild, 2000: 792).

Yabancılaşma duygusunu yaşayan bir çalışan, bilişsel ve duygusal anlamda yaptığı işle bağımlı koparabileceğinden yabancılaşmanın önlenmesi için örgütsel düzeyde bazı müdahalelerin yapılması önem kazanmaktadır. Yabancılaşmayı azaltmak için; bireyin yaptığı işin değiştirilmesi ve zenginleştirilmesi, çalışma saatlerinin esnekleştirilmesi, bağımsız çalışma gruplarının oluşturulması, etkili bir iletişimin kurulması, işyerinde sağlıklı ve güvenli bir iş ortamının sağlanması ve işle ilgili süreçleri geliştirme konusunda çalışanın katılımının teşvik edilmesi gibi uygulamalar örgütsel düzeyde yapılabilir (Korkmazer ve Ekingen, 2017: 469). Ayrıca yorucu çalışma koşullarının iyileştirilmesi, terfi ve ödül sistemlerinin geliştirilmesi, monotonluğun

azaltılması, çalışanların kendi aralarındaki ve yönetimle olan ilişkilerinin güçlendirilmesi, çalışana güven duyulması ve takdir edilmesi yardımcı olabilecek faaliyetlerdir (Aşkın, 2018: 38).

### **WHISTLEBLOWING ve İŞE YABANCILAŞMA İLİŞKİSİ**

Yapılan literatür taramasında whistleblowing ve işe yabancılaşma arasındaki ilişkiyi doğrudan araştıran bir çalışmaya ulaşılamamıştır. Whistleblowing ve işe yabancılaşma arasındaki ilişkiyi inceleyen bu araştırmanın bu yönüyle literatüre önemli katkı sağlayacağı düşünülmektedir. Garrick (2017: 40) tarafından yapılan bir araştırmada ifşa edicilerin (whistleblower) kurumdaki çalışanlar tarafından misillemeye, ayrımcılığa ve izolasyona uğrayabileceği ancak bunu ifşa edicilerin anlayabileceği belirtilmiştir. Yapılan diğer bir araştırmada whistleblowing eyleminde bulunan kişilerin yanlışları bildirmeleri halinde çalışanlar tarafından dışlanmaya maruz kalacaklarının farkında oldukları ifade edilmiştir (Watts ve Buckley, 2017: 675). Kurumlarda gizlilik kültürünün yerleşmemesi, kamu otoritelerinin hesap vermemesi, işleyişin açık olmaması ve gücün kötüye kullanılmasının yolsuzluğun artmasına neden olacağı, whistleblowing gibi serbest bilgi akışının kısıtlanması ile de bireylerde güçsüzlük ve yabancılaşma duygularının filizleneceği belirtilmiştir (Jacob, 2014: 1).

İfşa edicilerin dışlanması ve sözlü veya fiziksel tacizle karşılaşılması çoğunlukla whistleblowing konusunun ve ifşa edenin gerçek niyetinin anlaşılması ve önyargılı meslektaşların desteğinin olmamasından kaynaklanabilmektedir. Çalışanların misilleme ile karşılaşma ve yönetimden güvence alamama korkusu, suiistimalleri bildirmekten kaçınmalarına neden olabilmektedir (Ahmad ve Shariff, 2009: 6). Yapılan başka bir çalışmada ise ifşa edicilere kurumları tarafından destek verilip verilmemesine bağlı olarak yabancılaşma yaşanabileceğinden bu konuda daha fazla araştırma yapılmasının faydalı olacağı sonucuna ulaşılmıştır (McGlynn ve Richardson, 2014: 232). Dolayısıyla literatür bilgilerinden de anlaşılacağı gibi whistleblowing eyleminde bulunan bireylerin işe yabancılaşma yaşayıp yaşamadığına yönelik araştırmalar yapılmamış olup, diğer bireylerin bu kişilere yönelik duygu ve düşünceleri ile bu kişilerin olası maruz kalabileceği eylemlerin belirlenmesine yönelik araştırmalar yapılmıştır. Ancak, literatürde whistleblowing faaliyetinin yabancılaşma ile sonuçlanabileceği yönünde görüşler olduğu da görülmektedir (Jacob, 2014: 1). Bu araştırmaya orijinallik kazandıracak unsur, whistleblowing faaliyetinde bulunan bireyin bu eyleminin sonucunda işe yabancılaşma duygusunu yaşayıp yaşamadığını belirlemeye yönelik olması ve bu iki değişken arasındaki ilişkiyi detaylı şekilde inceleyen bir çalışmanın literatürde bulunamamasıdır. Ayrıca, bu çalışmada whistleblowing davranışı çok boyutlu (içsel ifşa, dışsal ifşa ve kayıtsızlık) olarak ele alınmış olup, ifşa eyleminin (içsel veya

dışsal) ve kayıtsızlığın, çalışanın yabancılaşma davranışını ne yönde etkilediğinin de açığa çıkarılması amaçlanmaktadır.

### **ARAŞTIRMANIN AMACI**

Bu araştırmada, işletmelerdeki olumsuz gelişmeleri ifşa etme olarak tanımlanan whistleblowing ile bireylerde umutsuzluk, yalnızlık, güçsüzlük, kayıtsızlık, memnuniyetsizlik ve duyarsızlaşma gibi duygular ile ortaya çıkan işe yabancılaşma arasındaki ilişkinin incelenmesi amaçlanmıştır. Yapılan literatür taramasında bu iki değişken arasındaki ilişkiyi inceleyen kapsamlı bir çalışmaya ulaşılamamıştır. Araştırmada whistleblowing faaliyetinde bulunan bireylerin işe yabancılaşma duygusunu yaşayıp yaşamadığı belirlenerek bu alanda literatüre bilimsel katkı sağlanması hedeflenmiştir.

### **ARAŞTIRMANIN MODELİ ve HİPOTEZLER**

Araştırma, Nevşehir ilinde turizm sektöründe çalışanların whistleblowing davranışlarının işe yabancılaşmaya etkisini belirlemek amacıyla taşıdığından ilişkisel tarama modeli seçilerek hazırlanan model doğrultusunda aşağıdaki hipotezler oluşturulmuştur (Şekil 1).

**Şekil 1.** Araştırmanın Modeli

**H1:** Whistleblowingin alt boyutu olan içsel ifşa, işe yabancılaşmayı negatif yönde etkiler.

**H2:** Whistleblowingin alt boyutu olan dışsal ifşa, işe yabancılaşmayı negatif yönde etkiler.

**H3:** Whistleblowingin alt boyutu olan kayıtsızlık, işe yabancılaşmayı pozitif yönde etkiler.

### **ARAŞTIRMANIN YÖNTEMİ ve KULLANILAN ÖLÇEKLER**

Whistleblowing ve işe yabancılaşma arasındaki ilişkiyi araştırmak için araştırma verilerini elde etmek amacıyla Nevşehir ilinde turizm sektöründe yönetici ve çalışan konumundaki kişilerde anket uygulaması yapılmıştır. Anket tekniği ile elde edilen verilerin sağlıklı olması için katılan

bireylerden onları tanımlayacak hiçbir özel bilgi istenmemiştir. Whistleblowing ve işe yabancılaşma önermeleri; “1 Kesinlikle Katılmıyorum”, “2 Katılmıyorum”, “3 Kararsızım”, “4 Katılıyorum” ve “5 Kesinlikle Katılıyorum” ifadelerinden oluşan 5 aşamalı Likert ölçeği ile değerlendirilmiştir. Elde edilen verilerin analizi SPSS adlı program ile yapılmış, anketlerde kullanılan ölçeklerin güvenirliliği Cronbach’s Alfa ile test edilmiştir. Korelasyon ve regresyon analizleri ile değişkenler arasındaki ilişkilerin düzeyi, yönü ve etki derecesi belirlenmiş, bulgular yorumlanmış ve araştırmanın bulguları oluşturulmuştur.

Whistleblowing ölçmek için Park vd. (2005: 394)’nin geliştirdiği üç alt boyut (dışsal ifşa, içsel ifşa ve kayıtsızlık) ve 9 önermeden oluşan ölçekten faydalanılmıştır. Ölçek; “Örgüt içindeki resmi raporlama kanallarını kullanırım”, “İç prosedürleri kullanarak rapor ederdim” ve “Kötülük hakkında sessiz kalırdım” gibi önermeleri içermektedir. Park vd. (2005: 394) tarafından oluşturulan ölçek Chamberlin vd. (2017: 38) ve Nayir ve Herzig (2012: 205) tarafından kullanılmış ve güvenilir bulunmuştur. İşe yabancılaşmayı ölçmek için Hirschfeld ve Feild (2000: 791) tarafından oluşturulan ölçek tek boyut altında 10 önermeden oluşmaktadır. Ölçek; “Çalışmanın ne işe yaradığını merak ediyorum”, “İş hayatının çoğu anlamsız faaliyetlerde boşa harcanıyor” ve “ İş ile ilgili büyük bir heves göstermeyi gereksiz görüyorum” gibi önermeleri içermektedir. Hirschfeld ve Feild (2000: 791) tarafından geliştirilen işe yabancılaşma ölçeği Kurtulmuş ve Karabıyık (2016: 464); Tuna ve Yeşiltaş (2014:109) ve Tokmak (2014: 144) tarafından yapılan araştırmalarda da kullanılmış ve güvenilir bulunmuştur.

## **BULGULAR**

### **Araştırmanın Güvenirliliği**

Araştırma değişkenleri olan whistleblowing ve işe yabancılaşma ölçeklerinin güvenirliliği Cronbach’s Alfa ile ölçülmüştür. Tavakol ve Dennick (2011: 54) tarafından Cronbach’s Alfa değerleri 0,70 ve üzerinde ( $0,70 \leq \alpha \leq 1$ ) olduğunda güvenilir olarak değerlendirilmektedir. Araştırmada yer alan whistleblowing ve işe yabancılaşma değişkenlerinin Cronbach’s Alfa değerleri 0,797-0,911 arasında bulunduğundan ölçekler güvenilir kabul edilmiştir (Tablo 1).

**Tablo 1.** Araştırmada Kullanılan Ölçeklerin Güvenirlik Değerleri

<b>Değişkenler</b>	<b>Önerme Sayısı</b>	<b>Cronbach’s Alfa</b>
İçsel İfşa	4	0.797
Dışsal İfşa	3	0.909
Kayıtsızlık	2	0.799
İşe Yabancılaşma	10	0,911

### Kişilerin Demografik Özelliklerine İlişkin İstatistikler

Katılımcıların demografik özellikleri ile (cinsiyet, yaş, medeni durum, eğitim durumu, çalışma süresi ve işletmedeki pozisyonları) ilgili bulgular Tablo 2’ de verilmiştir. Araştırmanın yapıldığı turizm sektöründe yer alan katılımcılardan yaklaşık her üç kişiden ikisinin erkek ve 20-45 yaş aralığındaki bireylerin çoğunlukta olduğu görülmüştür. Katılımcıların, eğitim durumları incelendiğinde lise ve ön lisans mezunlarının ilk sıralarda yer aldığı, çalışma sürelerinin genellikle 10 yıldan daha az ve yarısının çalışan (yönetici konumunda bulunmayan) konumunda olduğu görülmüştür (Tablo 2).

**Tablo 2.** Araştırmaya Katılanların Demografik Özellikleri

	Frekans	Yüzde		Frekans	Yüzde
<b>Cinsiyet</b>			<b>Medeni Durum</b>		
Erkek	128	64.0	Bekâr	99	49.5
Kadın	72	36.0	Evli	94	47.0
			Diğer	7	3.5
<b>Yaş</b>			<b>Eğitim Düzeyi</b>		
20-25	66	33.0	Lise	63	31.5
26-30	50	25.0	Ön Lisans	77	38.5
31-35	28	14.0	Lisans	36	18.0
36-40	18	9.0	Lisans Üstü	11	5.5
41-45	15	7.5	Diğer	13	6.5
46-50	17	8.5			
51 ve üzeri	6	3.0			
<b>Çalışma Süresi</b>			<b>Pozisyon</b>		
1-5 yıl	83	41.5	Üst düzey yönetici	19	9.5
6-10 yıl	69	34.5	Orta düzey yönetici	43	21.5
11-15 yıl	31	15.5	Alt düzey yönetici	38	19.0
16-20 yıl	11	5.5	Çalışan	100	50.0
21 yıl ve üstü	6	3.0			

### Araştırma Değişkenlerinin Ortalama ve Standart Sapma Değerleri

Katılımcıların whistleblowingin alt boyutu olan içsel ifşaya katılıyorum ifadesine ve dışsal ifşaya kararsızıma daha yakın düzeylerde olumlu yönde, kayıtsızlık alt boyutuna ise katılmıyorum ifadesine daha yakın düzeyde olumsuz yönde görüş bildirdikleri görülmüştür. Yine iş yabancılaşma ifadelerine kararsızıma daha yakın olmak üzere olumsuz yönde görüş ifade ettikleri söylenebilir (Tablo 3).

**Tablo 3.** Araştırma Değişkenlerinin Ortalama ve Standart Sapma Değerleri

Değişkenler	Ortalama	S.S
İçsel İfşa	3.65	0.867
Dışsal İfşa	3.07	1.198
Kayıtsızlık	2.39	1.154
İşe Yabancılaşma	2,79	0,904

### Araştırma Değişkenlerine Ait Korelasyon ve Regresyon Değerleri

Korelasyon analizi bulgularına göre; whistleblowingin alt boyutu olan içsel ifşa (-0,282\*\*) ve dışsal ifşa (-0,327\*\*) ile işe yabancılaşma arasında negatif yönlü olmak üzere istatistiksel olarak anlamlı ( $p < .01$ ) ve önemli ilişkilerin olduğu sonucuna ulaşılmıştır. Whistleblowingin alt boyutu olan kayıtsızlık ile işe yabancılaşma arasında pozitif yönlü (0,395\*\*) istatistiksel olarak anlamlı ( $p < .01$ ) ve önemli düzeyde ilişki görülmüştür (Tablo 4).

Regresyon analizi sonuçlarına göre whistleblowingin alt boyutu olan içsel ifşa işe yabancılaşmayı %7,9 ve dışsal ifşa ise yabancılaşmayı %10,7 düzeyinde etkileme gücüne sahip olduğu tespit edilmiştir. Whistleblowingin alt boyutu olan kayıtsızlığın ise işe yabancılaşmanın artmasını %15,6 düzeyinde etkileme ve açıklama gücüne sahip olduğu görülmüştür (Tablo 5). Bu bulgular doğrultusunda whistleblowing davranışları olan içsel ifşa, dışsal ifşa ve kayıtsızlık davranışlarının işe yabancılaşma davranışını etkiledikleri ancak whistleblowing davranışının alt boyutlarının işe yabancılaşma üzerinde farklı yönde (pozitif ve negatif) ve düzeyde etkiler oluşturduğu sonucuna ulaşılmıştır. Araştırma bulguları sonucunda whistleblowing davranışlarından olan içsel ifşa ve dışsal ifşa eylemlerinde bulunan kişiler işlerine yabancılaşma duygusu yaşamazken, işletmede gelişen olaylara kayıtsız kalan kişilerin işe yabancılaşma duygusunu yüksek düzeyde yaşadıkları gözlenmiştir. Elde edilen verilerden içsel ve dışsal ifşa eyleminde bulunan kişilerin işlerini benimsedikleri, önem verdikleri ve bundan dolayı bu eylemde buldukları; kayıtsız kalan kişilerin ise tam tersi yönünde işlerini benimsemedikleri ve işlerine yabancılaştıklarından işletmelerinde gelişen bazı olumsuz olayları görmezlikten gelerek kayıtsız kaldıkları çıkarımı yapılabilir.

Yapılan literatür araştırmasında whistleblowing ile işe yabancılaşma arasındaki ilişkiyi doğrudan inceleyen bir çalışmaya ulaşılamamıştır. Ancak konuya yakın çalışmalar incelendiğinde; ifşa edicilerin (whistleblower) kurumdaki çalışanlar tarafından misillemeye, ayrımcılığa ve izolasyona uğrayabileceği ancak bunu ifşa edicilerin anlayabileceği belirtilmiştir (Garrick, 2017: 40). Yine whistleblowing eyleminde bulunanların yanlışları bildirmeleri halinde dışlanma gibi olası olumsuz sonuçların farkında oldukları ancak ifşayı ahlaki bir davranış olarak gördükleri ifade edilmiştir (Watts ve Buckley, 2017: 675). İfşa edicilerin kendilerine kurumları tarafından

destek verilip verilmemesine bağlı olarak yabancılaşma yaşayabileceklerinden bu konuda daha fazla araştırmanın yapılması önerilmiştir (McGlynn ve Richardson, 2014: 232). Dolayısıyla, bu çalışmada önemli bulgular elde edilmiş olup, bu bulguların geliştirilebilmesi için whistleblowing davranışının işe yabancılaşma üzerindeki etkisi incelenirken, örgütsel destek değişkeninin aracı etkisinin incelenmesi faydalı ve doğru bir yaklaşım olacaktır.

**Tablo 4.** Araştırma Değişkenlerinin Korelasyon Değerleri

Değişkenler	İçsel İfşa	Dışsal İfşa	Kayıtsızlık
İşe Yabancılaşma	-,282**	-,327**	,395**

\*\* Korelasyon 0.01 düzeyinde anlamlıdır.

İşe Yabancılaşma	-,282 $\Delta R^2=,079$	-4,134 F: 17,087	-,327 $\Delta R^2=,107$	-4,867 F: 23,689	,395 $\Delta R^2=,156$	6,056 F: 36,673

## SONUÇ ve DEĞERLENDİRME

İşletmelerde çalışanlara, kuruma ve müşterilere zarar verebilen bazı yanlış davranışlar ortaya çıkabilir. Çalışanlar, işyerindeki yanlışları bulmak ve bildirmek için yönlendirildiğinde (kurum tarafından veya yönetici düzeyinde) daha büyük sorunların önleneme veya düzeltilme imkânı olabilir. Whistleblowing (ifşa etme), yasadışı veya ahlak dışı yanlış davranışların mevcut veya eski örgüt üyeleri tarafından ifşa edilmesidir Zhou vd., 2018: 197). Kurumlarda ortaya çıkan suiistimali, ihmali veya tehlikeyi ortaya çıkaran bireylerin bir davranışı olan whistleblowing içsel ve dışsal boyutları ile riskler taşıyan bir eylemdir (Ray, 2006: 438).

Yabancılaşma ise umutsuzluk, yalnızlık, güçsüzlük, kayıtsızlık, kaygı, tecrit, anlamsızlık, hoşnutsuzluk, memnuniyetsizlik ve duyarsızlaşma duygularını içeren bir duygu halidir. İşe yabancılaşma bireyin, diğer çalışanlara kıyasla göreceli konumu, büyüme ve gelişme fırsatları, iş arkadaşlarıyla olan sosyal ilişkilerindeki sorunları, amirlerinden ve meslektaşlarından memnun olmaması sonucu oluşabilmektedir (Hoy, 198: 110). Kişinin, işe yabancılaşması nereden kaynaklanmış olursa olsun tutumlarını ve sosyal davranışlarını etkileyebilmektedir (Yadav ve Nagle, 2012: 338). Bu kapsamda whistleblowing davranışı ile işe yabancılaşma arasında bir ilişkinin olup olmadığını belirlemek amacı ile turizm sektöründe bu araştırma yapılmıştır.

Yapılan araştırma verileri ve verilerin analizleri sonucunda; whistleblowingin alt boyutu olan içsel ifşa ve dışsal ifşa ile işe yabancılaşma arasında negatif yönlü; kayıtsızlık ile işe yabancılaşma

arasında pozitif yönlü olmak üzere istatistiksel olarak anlamlı ve önemli ilişkilerin olduğu sonucuna ulaşılmıştır. Regresyon analizi sonuçlarına göre whistleblowingin alt boyutu olan içsel ifşanın işe yabancılaşmayı %7,9 düzeyinde ve dışsal ifşanın %10,7 düzeyinde işe yabancılaşmayı negatif olarak etkilediği görülmüştür. Whistleblowingin alt boyutu olan kayıtsızlığın ise işe yabancılaşmanın artmasını %15,6 düzeyinde etkileme ve açıklama gücüne sahip olduğu bulgusuna ulaşılmıştır. Elde edilen bulgular whistleblowing davranışları olan içsel ifşa, dışsal ifşa ve kayıtsızlık ile işe yabancılaşma arasında farklı etkileşimlerin olduğunu göstermiştir. Whistleblowing eylemini içsel ve dışsal ortamlarda yapan kişilerin işe yabancılaşma duygusu yaşamadığı ve hatta tersi yönde işe yabancılaşmalarının azaldığı, işletmelerde olumsuz şekilde gelişen olaylara kayıtsız kalan kişilerin işe yabancılaşma duygusunu yüksek düzeyde yaşadığı gözlenmiştir. Bu bulgulardan işlerini benimseyen ve önemseyen bireylerin yaşanan olumsuzluklardan kurumlarının zarar görmesini önlemek amacı ile içsel ve dışsal ortamlara bu olumsuzlukları aktardığı ve bundan dolayı işe yabancılaşma duygularının azaldığı sonucuna ulaşılabilir. Çalıştıkları kurumda işlerini önemsemeyen, benimsemeyen kişilerin ise işletmelerinde gelişen bazı olumsuz olayları görmezlikten gelerek kayıtsız kaldıkları çıkarımı yapılabilir.

Whistleblowing ile işe yabancılaşma arasındaki ilişkiyi inceleyen araştırmalara literatür taramasında ulaşılamasa da elde edilen bu sonuçları kısmen destekleyen araştırmaların olduğu görülmüştür. İfşa edicilerin kurumdaki çalışanlar tarafından ayrımcılığa ve izolasyona uğrayabileceği ve bunu ifşa edicilerin öngördükleri belirtilmiş (Garrick, 2017: 40), ancak bu kişilerin faillerin eylemlerini ifşa etmeyi ahlaki bir davranış olarak gördükleri ifade edilmiştir (Watts ve Buckley, 2017: 675). Lemoine ve Michael (2021: 5) ifşa edicilerin (whistleblower) işlerine ve kurumlarına bağlı olan, kuruluşlarına hizmet etmeye çalışan, iyilikle uyumlu bir duruşa sahip ve kararlı kişiler olduklarını belirtmiştir. Diğer bir araştırmada da whistleblowing gibi bilgi akışının kısıtlanması ile bireylerde güçsüzlük ve yabancılaşma duygularının gelişeceği belirtilmiştir (Jacob, 2014: 1). Whistleblowing ve işe yabancılaşma arasındaki ilişkiyi doğrudan inceleyen bir çalışmaya ulaşamadığından bu durumun araştırmaya orijinallik kazandıracağı ve literatüre önemli katkı sağlayacağı düşünülmektedir. Ancak, bu çalışma yalnızca turizm sektöründe çalışan, kısıtlı sayıda katılımcı ile yapılmış olup, bulguların genelleştirilebilmesi için farklı sektörlerde daha büyük örneklem ile yeni çalışmaların yapılması faydalı olacaktır. Ayrıca iki değişken arasındaki ilişki ve etkileşim incelenirken örgütsel destek gibi bazı değişkenlerin aracıl değişken olarak çalışılması da önerilmektedir. Yönetimin, kendi işletmelerinde var olan ve önlem alınmadığı takdirde önemli negatif sonuçları ortaya çıkabilecek durumların çalışanlar

tarafında dile getirilmesi için gerekli desteği sunacak öneri sistemleri gibi mekanizmaları kurgulamaları kendileri için faydalı sonuçlar doğurabilecektir. Uygulayıcıların, whistleblowing davranışını bir nevi işletmeyi ispiyonlama, zorda bırakma davranışı olarak değil, olumlu eleştiri mekanizması olarak algılamaları da önem arz etmektedir. Hiçbir bilginin gizli kalamayacağı, bir olumsuzluğu ilk duyanın işletme yetkililerinin olmasının önlem alma anlamında daha faydalı olacağı bilinmelidir. Şayet whistleblowing gibi davranışlar işletme içerisinde yönetilecek önemli davranışlar olarak algılanmayacaksa, bu durumda işletmelerde ve kurumlarda yapılan iç denetim faaliyetlerinin etkinliğini de sorgulamak gerekecektir.

**ÖZET**

Tarımsal üretim ve tarım dışı alanlarda önemli sorunlara neden olan yabancı otlara karşı kullanılan herbisitler ciddi çevresel ve ekolojik sorunlara neden olmaktadır. Etkili bir mücadele yöntemini seçmek için olan yabancı ot türlerini bilmek önem taşımaktadır. Bundan dolayı bu çalışmayı 2022 yılında Şanlıurfa ili tarım alanlarında ve kültür bitkilerinde sorun olan yabancı ot türlerini, tarım ve tarım dışı alanlarda kimyasal mücadele durumunu ve herbisitlere dayanıklı yabancı ot durumunu belirlemek amacıyla yürütülmüştür. Çalışma kapsamında Şanlıurfa Tarım ve Orman Müdürlüğüne bağlı ruhsatlı 100 Bitki Koruma Ürünleri (BKÜ) Bayileri ile yüz yüze anketler yapılmıştır. Araştırma sonucunda, bayilerin yarısından fazlası (%52) tarım alanlarında yoğun bir yabancı ot probleminin olduğunu ifade etmişlerdir. Tarım alanlarında en fazla yoğunlukta bulunan yabancı ot türleri sırasıyla; *Sorghum halepense* (L.) Pers. (%80), *Avena sterilis* L (%78) ve *Amaranthus retroflexus* L. (%60) olduğunu belirtmişlerdir. Yabancı otların en fazla sorun teşkil ettiği kültür bitkileri içerisinde sırasıyla; mısır (%82), pamuk (%78) ve buğday (%78) geldiğini ve bundan dolayı kimyasal mücadelenin de en fazla bu bitkilerde yapıldığını ifade etmişlerdir. Bayilerin %72'si çiftçilerin yabancı otlar sorun olduktan sonra bayilere geldiğini belirtmişlerdir. Bayilerin büyük bir çoğunluğu herbisitlerin yoğun bir şekilde kullanıldığının ve bazı yabancı otların kontrol altına alınamadığını belirtmişlerdir. Bu yabancı otların başında da sırasıyla; *Sorghum halepense* (L.) Pers. (%58), *Myagrum perfoliatum* L. (%26) ve *Convolvulus arvensis* L. (%22) türlerin geldiğini belirtmişlerdir. Sonuç olarak Şanlıurfa ilinde yabancı otların tarım dışı ve tarım alanlarda sorun teşkil ettiğini ve yabancı otlara karşı mücadele etmek amacıyla herbisitlerin sık ve yoğun kullanımından dolayı herbisit dayanıklılığı gün geçtikçe artmaya devam edeceği ve sorun teşkil edeceği görülmektedir.

## DETERMINATION OF WEED PROBLEMS and CHEMICAL CONTROL STATUS OF ŞANLIURFA PROVINCE

### ABSTRACT

Herbicides used for weed control that cause significant problems in agricultural production areas and non-agricultural areas cause serious environmental and ecological problems. It is important to know the weed species in order to choose an effective control method. Therefore, this study was carried out to determine the weed species that are a problem in agricultural areas and crop plants in Şanlıurfa province in 2022, the chemical control situation in agricultural and non-agricultural areas and the status of weed resistant to herbicides. Within the scope of this study, face-to-face questionnaires were conducted with 100 licensed Plant Protection Products (CPP) Dealers affiliated to Şanlıurfa Directorate of Agriculture and Forestry. As a result of the research, more than half of the dealers (52%) stated that there is an intense weed problem in agricultural areas. Weed species with the highest density in agricultural areas are respectively; *Sorghum halepense* (L.) Pers. (80%), *Avena sterilis* L (78%) and *Amaranthus retroflexus* L. (60%). Among the crop plants in which weeds cause the most problems, respectively; They stated that corn (82%), cotton (78%) and wheat (78%) come and that chemical control is mostly done in these plants. 72% of the dealers stated that the farmers came to the dealers after weeds became a problem. Majority of the dealers stated that herbicides are used intensively hence some weeds cannot be controlled. These weeds are reported as; *Sorghum halepense* (L.) Pers. (58%), *Myagrum perfoliatum* L. (26%) and *Convolvulus arvensis* L. (22%) respectively. As a result, it is seen that weeds cause a serious problem in both non-agricultural and agricultural areas in Şanlıurfa province and herbicide resistance will continue to increase gradually and will become a problem due to the frequent and intensive use of herbicides to control weeds.

**Keywords:** Weeds, Herbicide, Resistance, Questionnaire, *Sorghum halepense*

## 1. GİRİŞ

Güneydoğu Anadolu bölgesinde yer alan Şanlıurfa İli mevcut tarım potansiyeli itibariyle zengin ve elverişli bir durum arz etmektedir. Yüzölçümü 19.451 km<sup>2</sup> olan ilin 10.445.551 da tarım alanı mevcuttur. Türkiye’de toplam tarım alanlarının %4,45’ine sahip olup, tarım alanları en fazla olan üçüncü il konumundadır. Güneydoğu Anadolu bölgesinde ise toplam tarım alanlarının %20,3’üne sahip olup ilk sırada gelmektedir (TÜİK, 2022). Şanlıurfa ili toplam tarım alanlarının %70’ini tarla bitkileri ekim alanları oluşturmaktadır (Şekil 1.1).

Şekil 1.1. Şanlıurfa ili 2021 yılı tarım alanları dağılımı

Şanlıurfa ilinde pek çok ürün yetiştirilmekte olup, tarla bitkileri bakımından en fazla pamuk (5.503.824 da), buğday (3.097.490 da) ve mısır (1.278.420 da), meyvecilik bakımından antep fıstığı (1.489.025 da) ve sebzeler bakımından domates (39.128 da) gibi ürünler en fazla ekim alanlarına sahiptir (Çizelge 1.1).

**Çizelge 1.1.** Şanlıurfa ilinde 2021 yılında yetiştiriciliği yapılan kültür bitkileri ekim/dikim alanları ve üretim miktarları (TÜİK, 2022)

Ürünler	Ekim alanı (da)	Üretim miktarı (ton)	Ürünler	Ekim alanı (da)	Üretim miktarı (ton)	Ürünler	Ekim alanı (da)	Üretim miktarı (ton)
Pamuk	5.503.824	1.759.023	Adi Fiğ	8.418	631	Domates	39.128	204.153

Dünya nüfusu artmaya devam ederken, tarımsal üretimin de buna uygun şekilde artması gerekiyor. Önümüzdeki 40 yılda, insanlığa uygun miktarda ve kalitede gıda sağlanabilmesi için tarımsal üretim yaklaşık %60 oranında artması gerekmektedir (Röös *et al.*, 2017). Önümüzdeki 30 yıl içinde dünya nüfusunun ciddi bir oranda artması öngörülmektedir (Hofstra and Vermeulen, 2016). Küresel nüfusun ise 2050 yılına kadar 9-11 milyar arasında olacağı tahmin edilmektedir (BM, 2012). Artan dünya nüfusu beslenme ihtiyacını karşılamak için bitkisel üretimi arttırmak gerekmektedir (Riggs *et al.*, 2018). Tarımsal üretim alanlarının genişletilme imkânının olmamasından dolayı, üretimi artırmanın tek yolu verimi arttırmaktan geçmektedir (Demirbaş ve Atış, 2005). Fakat tarım alanlarında verimi azaltan etmenler bulunmakta olup, bunların başında yabancı otlar gelmektedir (Swinton and Van Deynze, 2017). Tarım alanlarında yabancı otlar önemli verim (Tepe, 1998; Gharde *et al.*, 2018) ve kalite kayıplarına sebep olmaktadır (Jabran and Chauhan 2018). Yabancı otlar, sürdürülebilir tarımsal üretimin ve küresel gıda güvenliğinin önündeki en önemli engellerden birisidir (Oerke, 2006). Yabancı otlar bol miktarda tohum

üretmeleri, hızlı şekilde büyümeleri ve rizom, yumru, stolon gibi bitkinin farklı kısımlarıyla çoğalmalarından dolayı çevreye kolayca yayılmaktadırlar (Yıldırım ve Ekin, 2003). Böylelikle yabancı otlar kültür bitkileri ile besin, ışık ve su gibi kaynaklar için rekabete girerek kültür bitkilerinin büyümelerini ve fizyolojik aktivitelerini olumsuz etkileyerek ürünün verim ve kalitesini düşüreceğinden ekonomik kayıplara neden olmaktadır (Rajcan ve Swanton 2001; Kholi *et al.*, 2004).

Yabancı otlar değişik kültür bitkilerinde oluşturduğu zarar oranı birbirinden farklılık göstermektedir. Bazı yabancı otlar sadece bir kültür bitkisinde sorun oluştururken, diğer bazı türler birden fazla kültür bitkisinde sorun oluşturabilmektedir. Ayrıca sebep oldukları zararlar coğrafik bölgelere göre de değişiklik göstermektedir (Günca, 2016). Yabancı otlar sadece tarım alanlarında değil tarım dışı alanlarda da sorun oluşturmaktadır (Günca, 2016: Gürbüz ve Alptekin, 2022). Tarım dışı alanlarda ve kültür bitkilerinde sebep oldukları zararları ve verim kayıplarını önlemek için yabancı otları erken dönemde kontrol etmek büyük bir önem arz etmektedir (Günca, 2016: Su, 2020: Gürbüz ve Alptekin, 2022).

Günümüzde tarım dışı (Günca, 2016: Gürbüz ve Alptekin 2022) ve tarım alanlarında iş gücü ve maliyetlerinin de artmasından dolayı, hızlı sonuç vermesi, kolay uygulanabilmesi ve düşük maliyetinden dolayı yabancı otlarla mücadele etmek için kimyasal mücadele yöntemleri tercih edilmektedir (Kitiş, 2011). Yabancı otlara karşı kimyasal mücadele İkinci Dünya Savaşı'ndan sonra yaygın olarak kullanılmaya başlanmış (Vats, 2015) ve günümüzde Dünyada pestisit kullanımının %52,51'sini herbisitler oluşturmaktadır (FAO, 2022). Türkiye'de ise kullanılan toplam 52.965 ton pestisitinin %25'i herbisitler oluşturmaktadır (TÜİK, 2022). Dünyada pestisitler içinde en fazla herbisitler kullanılırken (FAO, 2022), Türkiye'de ise fungisitlerden sonra ikinci sırada gelmektedir (TÜİK, 2022).

Yabancı otları kontrol etmek için kullanılan herbisitler (Su, 2020), hatalı ve yoğun olarak kullanıldıklarından dolayı, ciddi çevresel ve ekolojik sorunlara yol açmakta (Sardana *et al.*, 2017), ayrıca insan sağlığına (Silva *et al.*, 2019; Jabłońska-Trypuć *et al.*, 2019) olumsuz etkilere neden olmaktadır. Herbisit kullanımından dolayı su, toprak ve gıda maddelerinde herbisit kalıntısının artmasına sebep olarak insanlar için tehdit oluşturmaktadır (Ugbede Itodo, 2019). Ayrıca yüksek dozda herbisit kullanımı yabancı ot dayanıklılığına sebep olmaktadır (Heap and Duke, 2018; Peterson *et al.*, 2018). Herbisitlere karşı dayanıklılık kazanan yabancı otlar, modern tarımda önemli bir endişe kaynağı olup (Perotti *et al.*, 2020), tarımsal üretim maliyetleri de arttırmaktadır (Beckie, 2020). Günümüzde bilinen 31 herbisit etki mekanizmasının 21'in de 165 farklı aktif maddeye karşı 267 yabancı ot türü dayanıklılık kazanmıştır. Bunlar 97 farklı kültür bitkisi

içerisinde 72 farklı ülkede dayanıklı hale gelmiştir (Heap, 2022). Bundan dolayı herbisitleri bilinçli ve doğru bir şekilde kullanmak büyük önem taşımaktadır. Yabancı otlarla ekonomik ve etkili bir mücadele yapmanın en temel ilkesi, yabancı ot türlerinin ve bu türlerin biyolojilerinin iyi bilinmesi gerekmektedir (Özer ve ark., 1998). Bu sebeple tarım ve tarım dışı alanlarda bulunan yabancı otların bilinmesi ve bunların biyolojik özelliklerinin ve ekolojik isteklerinin bilinmesi uygulanacak yabancı ot kontrol yönteminin seçilmesinde ve etkili olmasında büyük önem arz etmektedir. Sonrasında bölgenin ekolojik özellikleri de göz önünde bulundurarak bölgeye göre özel çözüm önerileri geliştirilmelidir (Özaslan ve Kendal, 2014).

Bu araştırma Şanlıurfa ili genelinde tarım alanlarında ve kültür bitkilerine göre sorun olan yabancı ot türleri, tarım ve tarım dışı alanlarında kimyasal mücadele durumunu ve ildeki herbisitlere dayanıklı yabancı ot durumunu belirlemek amacıyla yürütülmüştür.

## **2. MATERYAL ve YÖNTEM**

Güneydoğu Anadolu bölgesinde yer alan Şanlıurfa, 37 49'- 40 10' doğu meridyeni ile 36 41'- 37 57' kuzey paralelleri arasında yer alır. Ortalama yükseltisi 518 m olup, karasal iklim özelliği bulunmaktadır. Çalışma 2022 yılında Şanlıurfa İl Tarım ve Orman Müdürlüğü'ne bağlı Bitki Koruma Ürünleri (BKÜ) ve Zirai Mücadele Alet ve Makineleri Bayileriyle yüz yüze anket çalışması olarak yapılmıştır. Şanlıurfa ili Tarım ve Orman Müdürlüğüne bağlı 100 BKÜ bayisi ile yüz yüze görüşülüp 18 soruluk anket çalışması yapılmıştır.

Yapılan anket çalışması araştırmaya katılanların;

- Yaş gruplarına göre dağılımı, eğitim durumları ve kaç yıllık bayi oldukları,
- Şanlıurfa ili tarım alanlarında ve kültür bitkisine göre sorun olan yabancı ot türleri,
- Yabancı otların en fazla sorun teşkil ettiği kültür bitkileri,
- Yaygın olarak kullanılan herbisitler ve herbisitlerin kültür bitkilerine göre kullanımı,
- Çıkış öncesi ve çıkış sonrası herbisit kullanımı,
- Herbisitlerin kontrol altına almadığı yabancı ot türlerinin olup olmadığı,
- Yabancı otlara karşı total kimyasal mücadelenin yapılıp yapılmadığı gibi konularda sorular sorulmuştur.

### **Veri Analizi**

Anket sonucunda elde edilen verilerin SPSS 20 istatistik paket programında dökümleri alınmıştır. Bulgular frekans ve yüzde dağılımı olarak gösterilmiştir.

### 3. BULGULAR ve TARTIŞMA

Çalışmaya katılım gösterenlerin yaş gruplarına göre dağılımı, eğitim durumları ve kaç yıllık bayi oldukları ile ilgili yöneltilen sorulara verilen cevapların frekans ve yüzde değerleri Çizelge 3.1’de verilmiştir

**Çizelge 3.1.** Yaş aralıkları, eğitim durumları ve kaç yıllık bayi oldukları gibi sorulara verilen cevapların frekans ve yüzde (%) değerleri

Yaş	F	%	Eğitim Durumu	F	%	Kaç Yıllık Bayi	F	%
20-30	16	16	Üniversite	94	94	1-5	22	22
31-40	40	40	Yüksek lisans	6	6	5-10	20	20
41-50	34	34				10-15	44	44
50+	10	10				15+	12	12
Toplam	100	100	Toplam	100	100	Toplam	100	100

Katılımcıların %16’sı 20-30 yaş aralığının da, %40’ı 31-40 yaş aralığında %35’i 41-50 yaş aralığında ve %10’u ise 50+ yaşındadır (Çizelge 3.1). Eğitim durumları bakıldığında, %94’ü üniversite mezunu ve %6’sı yüksek lisans mezunu olmaktadır. Araştırmaya katılım gösteren bayilerin 22 tanesinin 1-5 yıllık bayi, 20 tanesinin 6-10 yıllık, 44 tanesinin 10-15 yıllık ve 12 tanesinin 15 yıllık bayilerden oluşmaktadır (Çizelge 3.1). Bayilere sorulan Şanlıurfa ili tarım alanlarında bulunan yabancı ot yoğunluk seviye durumu sorusuna verilen cevapların frekans ve yüzde (%) değerleri Şekil 3.1’de verilmiştir.

**Şekil 3.1.** Şanlıurfa ili tarım alanlarında bulunan yabancı ot yoğunluk seviye durumu nedir sorusuna verilen cevapların yüzde (%) değerleri

Ankete katılım gösteren bayilere, ilinizde yabancı ot yoğunluk hangi seviyededir sorusuna, bayilerin %52’si yoğun, %38’i orta yoğunlukta ve %10’u ise çok yoğunlukta olduğunu belirtmişlerdir (Şekil 3.1). Alptekin ve ark. (2022), Mardin ilinde yaptıkları çalışmada bayilerin %60’ı tarım alanlarında yabancı otların ‘yoğun’ olduğunu belirtmişlerdir. Buda yürüttüğümüz

çalışma sonucu ile benzerlik taşımaktadır. Ankete katılım gösteren bayilere yöneltilen Şanlıurfa ilinde tarım alanlarında yoğun olarak bulunan yabancı ot türleri hangileridir sorusuna verilen cevapların frekans ve yüzde (%) değerleri Çizelge 3.2’de sunulmuştur.

**Çizelge 3.2.** Tarım alanlarında yoğun olarak bulunan yabancı ot türleri hangileridir sorusuna verilen cevapların frekans ve yüzde (%) değerleri

Diğer	6	6

\*Birden fazla şık işaretlendiğinden dolayı toplam %100'ü aşmaktadır

Bayilerin %82'si Şanlıurfa ilinde yabancı otların yoğun olarak mısır, %78'i buğday, %78'i pamuk, %52'si mercimek, %24'ü arpa, %14'ü nohut, %8'i domates ve %6'sı biber ve diğer kültür bitkileri ekim alanlarında olduklarını belirtmişlerdir (Çizelge 3.3). Çalışmada elde ettiğimiz sonuçlar ile Alptekin ve ark. (2022), elde ettiği sonuçlar benzerlik taşımaktadır. Ayrıca bayiler tarafından belirtilen yabancı otların yoğunlukta olduğu kültür bitkileri mısır ekim alanlarında için (Hançerli ve Uygur, 2017; Arslan, 2018), buğday ekim alanlarında için (Sırrı, 2019; Özkan, 2022) pamuk ekim alanlarında için (Şahin ve ark., 2020), domates ekim alanlarında için (Torun, 2022; Akelma, 2022) tarafından yapılan çalışmalarla örtüşmektedir. Bayilere sorulan kültür bitkilerine göre yoğunlukta bulunan yabancı ot türleri sorusuna verilen cevapların frekans ve yüzde (%) değerleri Çizelge 3.4'te sunulmuştur.

**Çizelge 3.4.** Kültür bitkilerine göre en fazla yoğunlukta bulunan yabancı ot türleri hangileridir sorusuna verilen cevapların frekans ve yüzde (%) değerleri

Yabancı ot türleri	Buğday	Mısır	Pamuk	Arpa	Domates	Mercimek	Nohut	Biber

\*Birden fazla şık işaretlendiğinden dolayı toplam %100'ü aşmaktadır

Ankete katılım gösteren bayilerin %88'i Şanlıurfa ili buğday ekim alanlarında en fazla yoğunlukta *A. sterilis*, %82'si *S. arvensis* ve %32'si *M. perfoliatum* yabancı ot türlerinin olduğunu belirtmişlerdir (Çizelge 3.4). Bayiler tarafından belirtilen buğday ekim alanlarında sorun olarak belirtilen yabancı ot türleri ile Tepe (2014), Gökalp ve Üremiş (2015), Gürbüz ve ark. (2018), Pala ve ark. (2018), Sırrı, (2019), Ücrak ve ark. (2019), Ateş ve Üremiş (2020) ve Özkan, (2022)'in yaptıkları çalışmalarda belirtilen yabancı ot türleri arasında paralellik belirlenmiştir. Bayiler mısır ekim alanlarında yoğunlukta, *S. halepense* (%80), *A. retroflexus* (%68) ve *C. arvensis* (%52) yabancı ot türlerinin olduğunu bildirmişlerdir (Çizelge 3.4). Arslan (2018), mısır alanlarında yoğun olarak *S. halepense* *P. oleracea*, *E. crus-galli* ve *X. strumarium*, Açıkgoz (2019), *S. halepense*, *P. oleraceae* ve *X. strumarium*, Yeşilayer ve ark. (2022), *S. halepense* ve *A. retroflexus* yabancı ot türlerinin olduğunu belirtmiştir. Bu da bayiler tarafından belirtilen mısır ekim alanlarında yoğunlukta bulunan yabancı ot türleri ile benzerlik taşımaktadır. Bayiler pamuk ekim alanlarında yoğunlukta, *S. halepense* (%70), *A. retroflexus* (%68) ve *C. arvensis* (%64) yabancı ot türlerinin olduğunu belirtmişlerdir (Çizelge 3.4). Elde ettiğimiz bulgular ile Turan (2019), Özkil ve ark., (2019) ve Şahin ve ark. (2020), pamuk ekim alanlarında yaptıkları surveyler sonucunda yoğun olarak tespit ettikleri yabancı ot türlerine benzerlik taşımaktadırlar.

Ankete katılım gösteren bayilerin %68'i arpa ekim alanlarında en fazla yoğunlukta *A. sterilis* yabancı ot türünün olduğunu belirtmişlerdir. Sonrasında sırasıyla en fazla yoğunlukta *S. arvensis* (%60) ve *M. perfoliatum* (%48) yabancı otların olduğunu bildirmişlerdir (Çizelge 3.4). Kordali ve Zengin (2009) ve Kordali ve Zengin (2011), yürüttükleri çalışmada arpa ekim alanlarında yoğun olarak rastlanılan yabancı ot türleri ile çalışmamızda elde ettiğimiz sonuçlar benzerlik taşımaktadır. Bayiler domates ekim alanlarında en fazla yoğunlukta, *S. halepense* (%30) ve *Orobancha* spp (%26) yabancı ot türlerinin olduğunu belirtmişlerdir (Çizelge 3.4). Domates ekim alanlarında yaptıkları çalışmada Sırrı ve Özaslan, (2020), en fazla yoğunlukta *P. oleracea*, *S. halepense* ve *O.crenata/O. aegyptiaca*, Akelma (2022), *S. halepense*, *C. arvensis* *X. strumarium*, *P. oleracea* ve *A. retroflexus*, Usanmaz Bozhüyük ve ark. (2022), ise *S. halepense*, *C. arvensis* ve *X. strumarium* yabancı ot türlerinin en fazla yoğunlukta olduğunu bildirmişlerdir. Bu da bayilerin domates ekim alanlarında yoğun olarak bildirdikleri yabancı ot türleriyle yüksek oranda paralellik göstermektedir. Bayilerin %76'sı mercimek ekim alanlarında en fazla yoğunlukta *A. sterilis* yabancı ot türünün en fazla yoğunlukta olduğunu ve bu yabancı otu *S. arvensis* (%72) ve *M. perfoliatum* (%40) yabancı ot türlerinin takip ettiğini belirtmişlerdir (Çizelge 3.4). bayilerin mercimek ekim alanlarında yoğun olarak belirttiği yabancı ot türleri ile Kordali ve Zengin (2009), Aksoy ve ark., (2014) ve Pala ve ark., (2018)'nin mercimek ekim alanlarında yoğun olarak tespit

ettikleri yabancı ot türleri benzerlik taşımaktadır. Ankete katılım gösteren bayiler nohut ekim alanlarında en fazla yoğunlukta, *A. sterilis* (%64), *S. arvensis* (%44) ve *M. perfoliatum* (%35) yabancı ot türlerinin olduğunu bildirmişlerdir (Çizelge 3.4). Elde edilen bulgular ile Demir ve ark. (2001), yürüttüğü çalışmada nohut alanlarında yoğun olarak tespit ettiği yabancı ot türleri benzerlik taşımaktadır. Bayiler Şanlıurfa ilinde biber ekim alanlarında yoğun olarak *A. retroflexus* (%14), *S. halepense* (%12) ve *M. perfoliatum* (%10) yabancı ot türlerinin olduğunu belirtmişlerdir (Çizelge 3.4). Bayilerin biber ekim alanlarında yoğun olarak bulunuyor dedikleri yabancı ot türleri ile Ateş ve Uygur, (2013) ve Torun, (2022) biber ekim alanlarında yoğun olarak tespit ettikleri yabancı otlar benzerlik taşımaktadır. Bayilerin sorulan üretici size ne zaman gelir sorusuna verdikleri cevapların frekans ve yüzde (%) değerleri Şekil 3.2’de sunulmuştur.

\*Birden fazla şık işaretlendiğinden dolayı toplam %100’ü aşmaktadır

**Şekil 3.2.** Üretici size ne zaman gelir sorusuna verilen cevapların frekans ve yüzde (%) değerleri

Bayilere yöneltilen üretici size ne zaman gelir? sorusuna, bayilerden %74’ü yabancı ot çıktıktan sonra, %48’i ekimden önce %42’si kültür bitkisi çıktıktan sonra, %24’ü ürünü ektikten sonra çıkış yapmadan önce ve %18’i yabancı ot istilasından sonra geldiklerini bildirmişlerdir (Şekil 3.2). Mardin ilinde bayilerle yapılan çalışmada bayilerin %60’ı yabancı ot çıktıktan sonra çiftçilerin bayilere geldiklerini bildirmişlerdir (Alptekin ve ark., 2022). Yabancı otlara karşı kimyasal mücadeleye nasıl karar veriyorsunuz sorusuna verilen cevapların frekans ve yüzde (%) değerleri Şekil 3.3’te verilmiştir.

\*Birden fazla şık işaretlendiğinden dolayı toplam %100'ü aşmaktadır

**Şekil 3.3.** Kimyasal mücadeleye nasıl karar veriyorsunuz sorusuna verilen cevapların frekans ve yüzde (%) değerleri

Bayilere sorulan Kimyasal mücadeleye nasıl karar veriyorsunuz sorusuna, bayilerin %72'si üreticinin isteğine göre, %62'si kendim arazide dolaşarak, %24'ü üreticilerin getirdiği numune ve fotoğraflara bakarak, %4'ü etraftaki diğer tarlalara bakarak ve %2'si bir önceki ekilen ürüne bağlı olarak mücadeleye karar verdiklerini belirtmişlerdir (Şekil 3.3). Bayilere sorulan kimyasal mücadelenin yoğun olarak yapıldığı kültür bitkileri sorusuna verilen cevapların frekans ve yüzde (%) değerleri Çizelge 3.5'te sunulmuştur.

**Çizelge 3.5.** Herbisitlerin yoğun olarak kullanıldığı kültür bitkileri hangileridir sorusuna verilen cevapların frekans ve yüzde (%) değerleri

Kültür bitkisi	Frekans	Yüzde (%)
Arpa	24	24
Buğday	86	86
Mercimek	72	72
Mısır	84	84
Nohut	20	20
Pamuk	84	84
Diğer	12	12

\*Birden fazla şık işaretlendiğinden dolayı toplam %100'ü aşmaktadır

Bayilere yöneltilen “En fazla kimyasal mücadele yapılan kültür bitkileri ekim alanları hangileridir?” sorusuna, bayilerin %86'sı buğday ekim alanlarında herbisitlerin kullanıldığını belirtmişlerdir. Sonrasında bayilerin %84'ü pamuk, %84'ü mısır, %72'si mercimek, %24'ü arpa %20'si nohut ve %12'si diğer ekim alanlarında herbisitlerin kullanıldığını belirtmişlerdir (Çizelge

3,5). Yapılan araştırmada bayilere yöneltilen yabancı ot yoğunluğu bulunan kültür bitkisi ekim alanları sorusuna verilen yanıtlar ile kimyasal mücadelenin yoğunlukta yapıldığı tarım alanları sorusuna verilen cevaplar paralellik görülmektedir. Yetkin ve ark. (2013), yaptıkları çalışmada bayilere sordukları ilimizde en çok bitki koruma ürünü satışı yapılan kültür bitkilerinin oranı sorulduğunda %28'i pamuk, %23'ü buğday, %17'si mısır, %13 mercimek %10'nu Antep fıstığı %9'u sebze bitkilerinde olarak bildirdiklerini belirtmişlerdir. Ayrıca Mardin ilinde bayilerle yapılan çalışmada herbisitlerin en fazla yoğunlukta kullanıldığı kültür bitkilerin mısır (%80), pamuk (%77,5) ve buğday (%75) olduğunu belirtmişlerdir (Alptekin ve ark., 2022). Yukarıdaki çalışmalarda elde ettikleri sonuçlar ile çalışmamız paralellik göstermektedir. Herbisitlerin kültür bitkilerine göre uygulama dönemleri sorusuna verilen cevapların frekans ve yüzde (%) değerleri Çizelge 3.6'da verilmiştir.

**Çizelge 3.6.** Kültür bitkilerine göre herbisit uygulama dönemleri sorusuna verilen cevapların frekans ve yüzde (%) değerleri

Kültür bitkisi	Çıkış öncesi		Çıkış sonrası		Çıkış öncesi+ çıkış sonrası	
	Frekans	Yüzde (%)	Frekans	Yüzde (%)	Frekans	Yüzde (%)

Yonca-fiğ	-	-	24	24	-	-

\*Birden fazla şık işaretlendiğinden dolayı toplam %100'ü aşmaktadır

Araştırmaya katılım gösteren bayilerin %73'ü tarım alanlarında en fazla çıkış sonrası herbisitlerin kullanıldığını, %24'ü ise çıkış öncesi herbisitlerin kullanıldığını belirtmişlerdir. Ayrıca bayilerin %82'si hem çıkış öncesi hem de çıkış sonrası herbisitlerin birlikte kullanıldığını ve %18'i ise kullanılmadığını bildirmişlerdir. Araştırmaya katılan bayiler çıkış öncesi herbisit herbisitlerin en fazla pamuk (%86), mısır (%82) ve mercimek (%64) kültür bitkilerinde kullandıklarını belirtmişlerdir. En fazla çıkış sonrası herbisitleri ise buğday (%88), mısır (%86) ve pamuk (%80) kültür bitkilerinde kullandıklarını belirtmiştir. Hem çıkış öncesi hem de çıkış sonrası herbisit en fazla kullanıldığı 4 kültür bitkisi olduğunu ve bunlar sırasıyla mısır (%80), pamuk (%78), mercimek(%58) ve buğday (%4) bitkileri olduğunu bildirmişlerdir (Çizelge 3.6). Alptekin ve ark. (2022), En fazla çıkış sonrası herbisitlerin kullanıldığı, çıkış öncesi herbisitlerin en fazla pamuk

(%80) ve mısır (%75), çıkış sonrası herbisitlerin buğday (%82,5), pamuk (%80) ve mısır (%80), hem çıkış öncesi hem çıkış sonrası herbisitlerin mısır (%52) ve pamuk (%37,5) ekim alanlarında yoğun olarak kullanıldığını ifade etmişlerdir. Buda çalışmamızda elde ettiğimiz bulgulara paralellik göstermektedir. Bayilere yöneltilen yabancı ot mücadelesinde tarım alanlarında yoğun olarak kullanılan herbisitler hangileridir sorusuna verilen cevapların frekans ve yüzde (%) değerleri Çizelge 3.7’de verilmiştir.

**Çizelge 3.7.** Tarım alanlarında yabancı otlara karşı yoğun olarak kullanılan herbisitler hangileridir sorusuna verilen cevapların frekans ve yüzde (%) değerleri ve ruhsatlı olduğu ürünler

Akrif Madde	Kullanılan Ürün	Frekans	Yüzde (%)
280 g/l Dimethenamid-p + 250 g/l Terbutylazine	Mısır	88	88
225 g/L Isoxaflutole + 90 g/l Thiencarbazone-methyl + 150 g/L Cyprosulfamide	Mısır	64	64
30 g/L Mesosulfuron-methyl + 90 g/L Mefenpyr-diethyl	Buğday	72	72
450 gr / lt Pendimethalin	Soğan-Pamuk-Ayçiçeği - Mısır-Fasulye -Tütün-Havuç	90	90
37,5 g/l Mesotrione + 15 g/l Nicosulfuron	Mısır	18	18
%60 Dicamba + %15 Nicosulfuron	Mısır	4	4
45 g/l Tepraloxymid	Bağ-Pamuk-Soğan-Domates-Mercimek-Şeker Pancarı	42	42
116,2 g/l Clethodim	Pamuk-Domates-Kırmızı mercimek-Patates-Soğan-Şeker Pancarı	66	66
270 g/l Terbutylazine + 64 g/l Pendimethalin	Mısır	18	18
Diğer		24	24

\*Birden fazla şık işaretlendiğinden dolayı toplam %100’ü aşmaktadır

Ankete katılım gösteren bayilere yöneltilen Şanlıurfa ili tarım alanlarında yaygın olarak kullanılan herbisitler hangileridir sorusuna, bayiler çoğunlukta mısır ekim alanlarında ruhsatlı herbisitleri olduğunu bildirmişlerdir. Fakat bayilerin %90’ı tarım alanlarında en fazla soğan, pamuk, ayçiçeği, mısır, fasulye, tütün ve havuç ekim alanlarında ruhsatlı 450 gr / lt pendimethalin aktif maddeli herbisitini kullandığını belirtmişlerdir (Çizelge 3.7). Sonrasında bayilerin %88’i mısırdaki ruhsatlı 280 g/l dimethenamid-p + 250 g/l terbutylazine ve %66’sı ise pamuk, domates, kırmızı mercimek, patates, soğan ve şeker pancarı ekim alanlarında ruhsatlı 116,2 g/l clethodimin kullandığını bildirmişlerdir. Kaplan (2014), yaptığı anket çalışmasında en fazla kullanılan tarım ilacı sorusuna üreticiler GAP Bölgesi %46, Diyarbakır %55, Mardin %51 Şanlıurfa %34 oranlarında herbisit kullandıklarını belirtmişlerdir. Yapılan başka çalışmada tarım alanlarında en

fazla yabancı otların yoğun olarak bulunduğu mısır pamuk buğday ekim alanlarında ruhsatlı olan herbisitlerin kullanıldığı bildirmiştir (Alptekin ve ark., 2022) Bayilere sorulan herbisitler ile kontrol edilemeyen yabancı ot türleri var mı sorusuna verilen cevapların frekans ve yüzde (%) değerleri Çizelge 3.8’de verilmiştir.

**Çizelge 3.8.** Herbisitler ile kontrol edilemeyen yabancı ot türleri var mı sorusuna verilen cevapların frekans ve yüzde (%) değerleri

Latince adı	Türkçe adı	Frekans	Yüzde (%)
<i>Alopecurus myosuroides</i> Huds.	Tilki kuyruğu	20	20
<i>Amaranthus retroflexus</i> L.	Kırmızı köklü horoz ibiği	13	13
<i>Avena sterilis</i> L.	Kısır yabancı yulaf	18	18
<i>Convolvulus arvensis</i> L.	Tarla sarmaşığı	22	22
<i>Cyperus rotundus</i> L.	Topalak	4	4
<i>Echinochloa crus-galli</i> (L.) P.Beauv.	Darıcan	5	5

Diğer		5	5

\*Birden fazla şık işaretlendiğinden dolayı toplam %100’ü aşmaktadır

Araştırmada bayilere yöneltilen “Herbisitleri kullanıldıktan sonra kontrol altına alınamayan yabancı ot türleri var mı?” sorusuna; bayilerin %78’i evet %22’si ise hayır olarak belirtmiştir. Yöneltilen soruda evet diyenlere herbisitlerin kullanıldıktan sonra hangi yabancı ot türlerini kontrol edilemediği sorusu yöneltilmiştir. Bu soruya bayilerin %58’i *S. halepense*, %26’sı *M. perfoliatum*, %22’si *C. arvensis*, %20’si *A. myosuroides*, %18’i *A. sterilis*, %13’ü *A. retroflexus*, %5’i *E. crus-galli* ve %4’ü *C. rotundus* yabancı ot türlerinin kontrol edilemediğini bildirmişlerdir (Çizelge 3.8). Ayrıca çalışmanın yürütüldüğü bayilerle görüşme sırasında herbisitlerin yoğun ve bilinçsizce kullanımından dolayı dayanıklılık probleminin her geçen gün daha da sorunlu hale geldiğini ve yabancı otların gün geçtikçe daha da kontrol edilemez hale geldiklerini belirtmişlerdir. Bayiler tarafından herbisitlerin etki etmediği olarak belirttikleri yabancı ot türleri Dünya’da *A. sterilis*, *A. myosuroides*, *S. halepense*, *C. arvensis*, *A. retroflexus* ve *E. crus-galli* Türkiye’de, ise *A. myosuroides*, *E. crus-galli* ve *A. sterilis* herbisitlere karşı dayanıklılık kazandıkları rapor edilmiştir (Heap, 2022). Bayilere sorulan total kimyasal mücadelenin yapıldığı alanlar hangileridir sorusuna verilen cevapların yüzde (%) değerleri Şekil 3.3’te verilmiştir.

Total kimyasal mücadelenin yapıldığı alanlar

Şekil 3.3. Total kimyasal mücadelenin yapıldığı alanlar

Araştırmaya katılan bayilere Total kimyasal yabancı ot mücadelesi yapıyor musunuz sorusuna, bayilerin %68'i yabancı otlara karşı total kimyasal mücadele yaptıklarını ve %32'si ise yapmadıklarını belirtmişlerdir. Bu soruya evet diyenlere “Hangi alanlarda total kimyasal yabancı ot mücadelesi yapıyorsunuz?” sorusu yöneltilmiştir. Bu soruya bayilerin %61'i bahçelerde, %22'si parklarda, %7'si sulama kanalları ve %8'i ise diğer alanlarda kimyasal mücadele yaptıklarını belirtmişlerdir (Şekil 3.3). Alptekin ve ark. (2022), Mardin ilinde bayilerle yaptıkları çalışmada bayilerin %30'u total yabancı ot mücadelesinin en fazla bahçelerde yaptıklarını bildirmişlerdir. Bayiler total kimyasal mücadelede en fazla kullanılan herbisitleri Kara demiryolu kenarları, havaalanları, fabrika bahçeleri, tarihi alanlar, tarla kenarları, banketler, su ve drenaj kanalları turuncgiller, bağ, fındık, meyve bahçeleri ve ekili olmayan alanlarda ruhsatlı glyphosate 1sopropylamin tuzu aktif maddeli herbisit olduğunu belirtmişlerdir.

#### 4. SONUÇ ve ÖNERİLER

Yabancı otlar tarım alanlarında verim ve kalite kayıplarına, tarım dışı alanlarında ise önemli sorunlara neden olmaktadır. Yabancı otlarla mücadele etmek için kullanılan herbisitler beraberinde önemli çevresel ve ekolojik sorunlara neden olmaktadır. Bu sorunların önüne geçebilmek için problem olan yabancı ot türlerini ve yaygın olarak kullanılan herbisitleri önceden bilmek önem taşımaktadır. Bu kapsamda Şanlıurfa ilinde yaptığımız çalışmada Ankete katılım gösteren bayilerin yarısına yakını tarım alanlarında yabancı otların ‘yoğun’ olduğunu ve yoğun olarak *S. halepense* (%80), *A. sterilis* (%78) ve *A. retroflexus* (%60) yabancı ot türlerinin olduğunu

bildirmişlerdir. Yabancı otların en fazla yoğunlukta olduğu kültür bitkilerin mısır, buğday ve pamuk ekim alanların olduğu ve bu kültür bitkileri ekim alanlarında yabancı otlara karşı yoğun olarak kimyasal mücadelenin yapıldığını ifade etmişlerdir. Ayrıca en fazla kullanılan herbisitlerin çıkış sonrası herbisitler olduğu ve bu kültür bitkilerinde ruhsatlı olan herbisitler olduğunu bildirmişlerdir. Kimyasal mücadeleyi üreticinin isteğine göre karar verdiklerini belirtmişlerdir. Bayiler kullanılan herbisitlerin en fazla *S. halepense*, *M. perfoliatum* ve *C. arvensis* gibi yabancı ot türlerini kontrol etmediğini ayrıca herbisitlerin yoğun olarak kullanıldığını ve dayanıklılık probleminin her geçen gün daha büyük problem olduğunu belirtmişlerdir. Bayiler Şanlıurfa ilinde total kimyasal mücadelenin en fazla bahçelerde yapıldığını ifade etmişlerdir. Sonuç olarak Şanlıurfa ilinde yabancı ot yoğunluğunun fazla olduğu ve ilde en fazla üretimi yapılan kültür bitkilerinde yabancı otların yoğunlukta olduğu ve yoğun bir şekilde yabancı otlara karşı herbisitlerin kullanıldığı bunun da yabancı otlarda herbisit dayanıklılığına neden olduğu sonucuna varılmıştır.

**ABSTRACT**

Plastics, which we encounter in every field, cause pollution through domestic, industrial and medical wastes. Polymers that are long and difficult to dissolve in nature, the plastics in the structure turn into microplastics in various types and shapes when decomposed. These microplastics are transported to ecosystems by various ways and cause pollution. Microplastic pollution causes various damages due to both their presence in the environment and their accumulation in the bodies of living things. Little is known about the effects of microplastics on plants and terrestrial ecosystems. In this study, it was aimed to determine the effects of microplastics on barley (*Hordeum vulgare* L.) seed germination rate. 4x2 mm polyethylene mulch materials, which are widely used in farming and caused plastic pollution in fields, were used as microplastics. Microplastics were added to the soil at four different rates % 0, % 0.5, % 1.5 and % 2.5. Barley seeds were sterilized and planted in pots. Germination rates of barley seeds were recorded daily. Differences were determined in seed germination rates among experiment sets. The highest seed germination rate was found in pots containing 2.5% microplastic. The results indicated that occurrence of the microplastic in the soils proportionately increased the barley seed germination rates.

**Keywords:** Agriculture, barley, germination, microplastic, pollution.

## **1. INTRODUCTION**

Plastics are artificial polymers that are widely used today because they are flexible, insulating, light, economical and durable. Polyethylene (PE), polystyrene (PS), polypropylene (PP), polyvinyl chloride (PVC) and polyethylene terephthalate (PET) are some of the most used polymers in the making of plastic products today. Plastics are separated into their monomers by various mechanisms such as abrasion, fragmentation and human activities. These tiny plastic particles ranging in size from 1  $\mu\text{m}$  to 5 mm are called microplastics. Although microplastics are very small in size, they create an invisible pollution in the ecosystem where they are found. Thus, it harms all components of ecosystems.

Studies with microplastics have shown that microplastics are mostly composed of plastic (secondary microplastic) sources such as liquid soap, peeling and cleaning materials, which are called personal care products (Anbumani and Kakkar, 2018). Classification of microplastics is more difficult than the classification of visible waste. Therefore, they can be classified with the help of microscope and Fourier Transform Infrared Spectrophotometer (FD-IS) (Yurtsever, 2015). Different types of microplastics such as granules, fragments, pellets, spheroids, flakes, fibers or beads have been encountered in ecosystems (Güneş and Erçetin, 2020).

Since microplastics are easier to obtain in aquatic ecosystems, most of the studies have been carried out in aquatic ecosystems. Since the number of studies on terrestrial ecosystems and their effects on terrestrial organisms is very limited, there is not enough data.

In this study, it was aimed to determine the effects of microplastics on barley (*Hordeum vulgare* L.) seed germination rate. The effects of microplastics on barley, an important food crop all over the world, have importance for agriculture, economy and health of organisms and ecosystems.

## **2. MATERIAL AND METHOD**

Polyethylene mulch materials in size 4x2 mm, which are widely used in farming and caused plastic pollution in fields, were used as microplastics. The mulch was cut with scissors (Lozano et al., 2021). The experimental soils were collected from the top layer (0-20 cm) in Suluova, Amasya, Turkey. The soil was sieved with a 4x4 mm sieve and homogenized (Huang et al., 2020; Isari et al., 2021; Wang et al., 2021). The sieved soils were weighed 1200 g and mixed with the appropriate amount of microplastics and placed in 12x12x15 cm pots. Barley seeds were obtained from Republic of Turkey Ministry of Agriculture and Forestry Field Crops Central Research Institute and TARM 92 variety was used in the experiment.

The research was carried out in the greenhouse located in the garden of Amasya University Suluova Vocational School. Microplastics were added to the soil at four different rates: without the addition 0 % (CK), 0.5 % (6 g), 1.5 % (18 g) and 2.5 % (30 g). The amount of microplastic to be applied for pots was determined by literature review (de Souza Machado et al., 2018; Wu et al., 2019; Mohajerani and Karabatak, 2020; Li et al., 2020; Meng et al., 2021). A total of 48 pots are used, 12 of each dosage. After adding soil-MP mixture to the pots, 350 mL of tap water (field capacity) was added to each pot and incubated for 1 week (Wang et al., 2020). The soil was laid on a cover in the greenhouse in order to remove its wetness and was mixed periodically and dried until it became air dry. Barley seeds were sterilized with 20% NaClO for 10 min and washed with sterilized water for 5 times (Chen et al., 2020). After the seeds were sterilized, they were dried on filter paper and made ready for planting. 3 barley seeds were planted in each pot to increase the chance of germination. Seeds were sown on 20 June. For the germination of the seeds, each pot was watered with 100 mL of tap water once every 2 days. The amount of germinated seeds in the pots was counted and noted every day since the seeds were planted. SPSS 20.0 statistical software was used for statistical analyses and differences in means among treatments were determined by one-way ANOVA.

### **3. RESULTS AND DISCUSSION**

The mean number of germinated seeds and differences among treatments were shown in Table 1. Significant variations were determined in the number of germinated barley seeds among treatments (Table 2). The maximum numbers of germinated seeds were found in 2.5% microplastic added soil treatments. The number of the germinated barley seeds displayed three trends. At the beginning, numbers of first germinated seedlings were similar in all treatments and there was no significant difference (Figure 1). On the sixth days after sowing, the significant differences were determined in the number of seedlings between control groups and 2.5% microplastic added soil treatments (Figure 2). On the eleventh day, the variations in the number of seedlings between control groups and microplastic added soil treatments were clarified (Figure 3).

**Table 1.** Mean number of germinated seeds and differences among treatments.

		N	Mean $\pm$ Std. Deviation

**Figure 1.** The number of germinated seeds at the beginning of germination.

**Figure 2.** The number of germinated seeds on the sixth day.

**Figure 3.** The number of germinated seeds on the eleventh day.

While polyethylene microplastic addition exhibited significant positive effect on barley germination rate. Zhang et al. (2021) reported that the polystyrene microplastics did not significantly affected the germination of rice seeds. Consistent with the current study, Bosker et al. (2019) determined that the microplastic addition did not alter the germination rate after 24 h of seed germination. Similar with the result of the current study, previous studies were reported that microplastic addition to the soil would alters the germination rate. In contrast, Boots et. al. (2019), Pflugmacher et al. (2020) and Li et al. (2021) determined that fewer seeds were germinated when microplastics were added to the soil. These differences in results of the studies may be resulted from type and of microplastics, soil structure or plant species. Because seeds need much water during the germination, microplastic addition would affect germination rates. Additionally, microplastics affect ecological functioning of soils such as microbial activity, microbial diversity and substance cycle (Zhou et al., 2021).

Some of the previous studies stated that high amount of microplastics may inhibit water absorption by blocking seed pores and retard germination. But, in contrast to these findings, Zhang et al., (2021) determined that low amount of microplastics promoted the germination rate in rice seeds, consistent with the results of the current study.

In this study, it was understood that microplastic additions not effective in early stages of barley seed germination. However, it significantly increased the seed germination gradually with time and microplastic concentrations. It was thought that the positive effect of microplastics to the seed germination is related with number of pores, water supply in the soils and nutrient uptake.

According to the current results of this study and the previous studies, effect of microplastics differ according to type and amount of microplastics, soil structure, plant species and time.

### **ÖZET**

Kuraklık, ne zaman meydana geleceği bilinmeyen ve ne kadar süreceği belli olmayan doğal bir afettir. Bir bölgede kuraklık meydana geldiğinde, su miktarındaki azalmadan kaynaklı olarak kısa süre içerisinde bertarafı da mümkün olmamaktadır. Günümüzde kuraklık, iklim değişikliğinin etkisinde çevresel etkilerini günden güne daha da arttırarak küresel bir problem halini almıştır. İçme ve kullanma suyu temin edilen su sistemlerinin kuraklıktan etkilenmesi durumunda bir kuraklık çeşidi olan meteorolojik kuraklık meydana gelmektedir. Su döngüsünde meydana gelen aksamaların devam etmesi ise tarım sektörünü olumsuz olarak etkilemektedir. Bir diğer kuraklık çeşidi olan tarımsal kuraklık oluşması durumunda Dünya genelinde gıda temini ve gıdaya ulaşma hususunda önemli aksamalar meydana gelmektedir. Çevresel ve sosyal etkileri bulunan kuraklık probleminden kaynaklanan olumsuzlukların tolere edilmesi yerküre genelinde oldukça karmaşıktır. Bölgesel olarak yapılacak çalışmalarda ise kuraklık yönetimi oldukça zor bir süreçtir. Bu hususta, kamu kurum ve kuruluşlarının birlikte çalışması kuraklık probleminin yönetilmesinde anahtar niteliğindedir. Bu çalışmada Türkiye'nin tarımsal kuraklık ile mücadele politikaları tartışılmıştır.

**Anahtar kelimeler:** Tarımsal kuraklık, iklim değişikliği, gıda güvenliği, çevre ve halk sağlığı, sürdürülebilirlik, Kuraklık önleme politikaları

## **TURKEY'S AGRICULTURAL DROUGHT PREVENTION POLICIES**

### **ABSTRACT**

Drought is a natural disaster that is unknown when it will occur and how long it will last. When drought occurs in a region, it is not possible to dispose of it in a short time due to the decrease in the amount of water. Today, drought has become a global problem by increasing its environmental effects day by day under the influence of climate change. Meteorological drought, which is a type of drought, occurs when the water systems that provide drinking and utility water are affected by drought. The continuation of the disruptions in the water cycle negatively affects the agricultural sector. In case of agricultural drought, which is another type of drought, significant disruptions occur in food supply and access to food throughout the world. Tolerating the negativities arising from the drought problem, which has environmental and social effects, is quite complex throughout the world. In regional studies, drought management is a very difficult process. In this regard, the cooperation of public institutions and organizations is key in the management of the drought problem. In this study, Turkey's agricultural drought-fighting policies are discussed.

**Keywords:** Agricultural drought, climate change, food security, environment and public health, sustainability, drought prevention policies

## **1. GİRİŞ**

Kuraklık, yavaş meydana gelen ve etkileri öngörülemeyen önemli doğal afetler arasında yer almaktadır (Partigöç ve Soğancı, 2019). Günümüzde olumsuz etkilerini sürdüren küresel ısınmaya bağlı sıcaklık artışları neticesinde toprak bünyesinde bulunan su, önceki dönemler ile kıyaslandığında daha fazla buharlaşma eğilimi göstermektedir. Aynı olumsuz durum kendisini sucul sistemlerde de göstermektedir (Öztürk, 2002). Sıcaklık artışlarının dünya genelindeki artışlarının devam etmesi durumunda ise ilerleyen zaman dilimlerinde daha da fazla bölgede kuraklık tehlikesi ile karşı karşıya kalınacaktır (Turan, 2018).

Dünya genelinde kuraklık ile mücadele politikaları sürekli olarak güncellenmektedir. Bu konuda yerel yönetimler tarafından uygun değerlendirmeler yapılarak kamu kurum kuruluşları, sivil toplum örgütleri ile birlikte çalışarak kuraklık ile mücadele çalışmalarını sürdürmektedir Ayrıca konusunda uzman araştırmacılar da kuraklık ile mücadele politikalarında katkı sağlamaktadır (Demirbaş ve Aydın, 2020). Bu hususta Türkiye uluslararası politikaları ve stratejileri takip ederek yasal mevzuatlar ile birlikte başta Birleşmiş Milletler olmak üzere çeşitli uluslararası ortamda gerekli katılımı gerçekleştirmektedir. Ülkemizde kuraklık öncesi, kuraklık sürerken ve kuraklık sonrasında yapılacak olan faaliyetler ile ilgili çeşitli yönetim planları ve politikaları teşkil edilmiştir. İlgili güncellemeler ise sürekli olarak sürdürülmektedir (Link 1).

Türkiye'nin kuraklık ile mücadelesi yer alan kamu kurum ve kuruluşları ile birlikte tüm paydaşlar bölge halkı ile birlikte çalışmalarını sürdürülmektedir. Alınacak kararlarda ve politikalarda verimin daha da artırılması için katkıda bulunabilecek tüm katılımcılar etkin bir şekilde destek olması gerekmektedir. Bu hususta ise özellikle tarımsal kuraklık ile mücadele çalışmalarında başta çiftçiler olmak üzere tüm bölge halkının verimli bir şekilde katkı sağlaması gerekmektedir (UKYS, 2017). Aksi halde ülkemizin tarıma elverişli topraklarında tarımsal faaliyetlerin sürdürülmesi gerçekleştirilemeyecek olup başta geçimini tarımdan sağlayan çiftçiler olmak üzere sistemde yer alan her etmen bu durumdan zarar görecektir. Bu çalışmada kuraklık probleminin meydana getireceği çevresel problemler özetlenmiştir. Ayrıca küresel iklim değişikliğinin kuraklığa etkisi incelenerek Türkiye'nin kuraklık ile mücadele politikaları değerlendirilmiştir.

## **2. KURAKLIK VE KURAKLIK ÇEŞİTLERİ**

Kuraklık, su miktarındaki azalma neticesinde ortaya çıkan iklimsel bir afettir. Özellikle günümüzde hidrolojik çevrimde meydana gelen aksamalar sebebiyle ülkemizin çeşitli bölgelerinde ve zaman dilimlerinde kuraklık problemi ilerleyen dönemlerde daha da sık bir şekilde yaşanacaktır. Ülkemizde yaşanan önemli kuraklıklardan bazıları 1971-1974, 1983-1984,

1989-1990, 2007-2008, 2013-2014, 2020-2021 yılları arasında geniş alanlarda ve şiddetlerde gerçekleşmiştir. Ülkemizde gerçekleşmiş olan kuraklık problemi neticesinde tarımsal ürün kayıpları, yer üstü ve yeraltı sularında azalmalar meydana gelmiş olup ülke genelinde içme ve kullanma suyu hususunda yetersizlikler ile sonuçlanmıştır Kuraklık çeşitleri meteorolojik, tarımsal ve hidrolojik olmak üzere üç çeşittir (Kapluhan, 2013; Kurnaz, 2014; Link 2; Link 3).

**Çizelge 1.** Kuraklık Çeşitleri (Kapluhan, 2013)

<b>Kuraklık Çeşidi</b>	<b>Tanımı</b>
Meteorolojik Kuraklık	Genellikle en az 30 yıllık zaman periyodunda normal meteorolojik şartlarda meydana gelen sapma olarak tanımlanmaktadır.
Tarımsal Kuraklık	Bitkinin yer aldığı toprakta yeterli nem bulunmaması neticesinde bitkinin gelişiminde meydana gelen aksama durumu olarak tanımlanmaktadır.
Hidrolojik Kuraklık	Uzun süre yağış yağmaması sebebiyle yeryüzü ve yer altı sularında bulunan mevcut suyun azalması olarak ifade edilmektedir.

Meteorolojik kuraklık neticesinde mevcut su miktarında gerçekleşen azalmalar yerini zaman içerisinde tarımsal kuraklık tehlikesi ile karşı karşıya bırakmaktadır. Tarımsal kuraklık oluşması durumunda tarımsal üretim düşerek geçimini tarımcılık faaliyetlerinden gerçekleştiren bireyler için olumsuz etkiler meydana gelecektir. Hidrolojik kuraklık meydana gelmesi sonucunda ise su sistemlerinde meydana gelecek olan azalmalar neticesinde içme ve kullanma suyu temininde aksamalar meydana gelecektir (Partigöç ve Soğancı, 2019).

### **3. TARIMSAL KURAKLIK**

Bitkinin büyümesi ve ürün vermesi için gerekli suya erişememesi durumunda tarımsal kuraklık meydana gelmektedir. Bitkilerin büyümesini etkileyen tarımsal kuraklık, ekinlerden alınan ürün miktarının azalması ve gıdaya erişim problemlerin meydana getirmektedir. Uzun süren kuraklık neticesinde ise bitki beslenemediğinden ekilen ürünlerin kuruması ile sonuçlanmaktadır (Partigöç ve Soğancı, 2019).

Tarımsal kuraklık probleminin olumsuz etkilerinin azaltılması aşamasında en büyük paydaş tarımcılık faaliyetleri ile uğraşan çiftçilere düşmektedir. Bölgeye uyumlu ve az su tüketen bol ürün veren ekinlerin seçimi ile su politikalarına destek olabileceklerdir. Ayrıca salma sulama yerine damlama sulama ya da daha modern seçimler gerçekleştirmek suretiyle daha az su tüketimi gerçekleştirebileceklerdir (Kapluhan, 2013).

Tarımsal kuraklık meydana gelmesi neticesinde bölgesel olarak başlayan su kıtlığı ve gıda temini zorluğu ilerleyen zamanlarda küresel boyutlara ulaşacaktır. İklim değişikliği etkisi ile birlikte ise

meydana gelecek tarımsal kuraklığın süresi uzayacağından etkin ürün ve yeterli gıda teminine erişim daha da kısıtlı bir hale gelecektir.

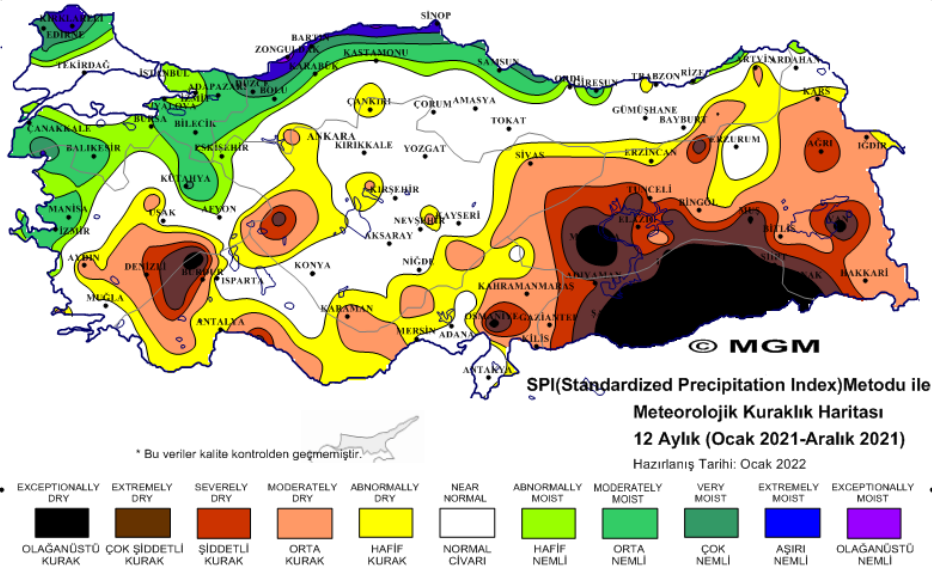

#### **4. TÜRKİYE’NİN SÜRDÜRDÜĞÜ KURAKLIK ÇALIŞMALARI VE TÜRKİYE’NİN TARIMSAL KURAKLIK ÖNLEME POLİTİKALARI**

Günümüzde ulusal düzeyde T.C. Tarım ve Orman Bakanlığı tarafından yürütülen kuraklık ile mücadele çalışmaları kapsamında sürdürülebilir kuraklık ile mücadele politikalarına devam etmektedir. Uluslararası düzeyde ise kuraklık ile ilgili çalışmalar 1998 yılında kabul edilmiş olan Birleşmiş Milletler Çölleşme ile Mücadele Sözleşmesi ile başlamıştır. Söz konusu sözleşmenin kuraklık yönetiminde önemi ise 196 ülke ile birlikte Avrupa Birliği’nde taraf olmuş olmasıdır. Günümüzde ise hâlihazırda kuraklık ile ilgili çalışmaların büyük bir kısmı tarımsal kuraklık alanında sürdürülmektedir (Link 1).

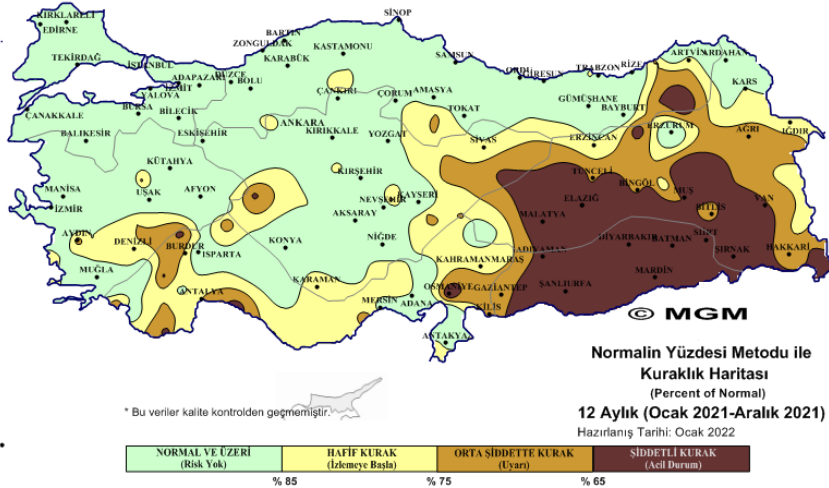

T.C. Tarım ve Orman Bakanlığı tarafından kuraklık ile mücadele aşamasında ulusal envanterler oluşturularak mevcut kuraklık problemlerini ve geçmişte yaşanmış olan olumsuz kuraklık felaketleri bilgi sistemleri vasıtasıyla güncel olarak işlenmektedir. Elde edilmiş olan güncel verilerin değerlendirilmesi neticesinde ise geleceğe yönelik tahminler yapılmakta ve kuraklıktan olası etkilenecek olan bölgeler belirlenmektedir. Bu aşamada ise ilgili bölge için alınması gereken tedbirler ve yönetim planları oluşturulmaktadır.

T.C. Çevre, Şehircilik ve İklim Değişikliği Bakanlığı Meteoroloji Genel Müdürlüğü tarafından sürdürülen çalışmalarda ise Türkiye için elde edilmiş olan meteorolojik veriler matematiksel eşitliklere veri olarak kullanılmaktadır. Standart Yağış İndeksi (Standardized Precipitation Index - SPI) ve Normalin Yüzdesi İndeksi (Percent of Normal Index - PNI) kullanılarak elde edilen kuraklık haritaları ise tüm ülkemiz tarafından elektronik ortam üzerinden ulaşabilmektedir. Şekil 1 ve 2’de T.C. Çevre, Şehircilik ve İklim Değişikliği Bakanlığı Meteoroloji Genel Müdürlüğü tarafından kullanılan matematiksel modellere ait 2021 yılı kuraklık çıktıları yer almaktadır (Link 4; Link 5).

Şekil 1. Standart yağış indeksi ile oluşturulmuş kuraklık haritası (Link 5)

Şekil 2. Normalin yüzdesi indeksi ile oluşturulmuş kuraklık haritası (Link 5)

Şekil 1 ve Şekil 2’de yer alan iki saptama yöntemi arasında bölgesel bazda bir takım değişiklikler gözlenmektedir. Aynı verinin farklı metotlar ile işlenilmesi neticesinde birden fazla senaryo aynı anda elde etmek mümkün olmaktadır. Elde edilen sonuçlar doğrultusunda ilgili bölgelere yönelik kısa, orta ve uzun vadeli politikalar sürdürmektedir. T.C. Tarım ve Orman Bakanlığı tarafından

kendi bünyesi ile birlikte diğer kamu kuruluşları ve araştırmalardan elde edilen verilerin değerlendirilmesi neticesinde ise Türkiye Kuraklıkla Mücadele Eylem Planı ve Türkiye'nin Tarımsal Kuraklık ile Mücadelesinde önemli rol oynayan strateji planları hazırlanmaktadır.

Söz konusu eylem planlarında ise kurumsal altyapının güçlendirilmesi, Devletimizin tüm sistemlerinin birlikte işleyebilmesi ve tarım sektörünün en az etkilenecek şekilde gerekli tüm planlamaların yapılması hedeflenmektedir.

Türkiye'nin tarımsal kuraklık ile mücadele stratejilerinin öncelikli adımını kuraklık risk tahminleri ve riskli bölgede gerçekleştirilecek olan yönetim faaliyetleri yer almaktadır. Riskli bölgelerin belirlenmesini takiben gerekli suyun hangi kaynaktan ve ne şekilde ulaştırılabileceği planlanırken aynı zamanda ilgili bölgede mevcut suyun tutulması ve sisteme girecek olan su girdilerinin korunması amacıyla planlar yapılmaktadır. Bölgede etkin bitki deseni ve tarımsal alanların belirlenmesi neticesinde ise uygun sulama metodu ve yönteminin planlanması ile birlikte güncel metotlar ile sulama işleminin sürdürülebilir olması yönünde politikalar belirlenmektedir. İlgili bölgede yapılacak olan eğitim ve araştırma faaliyetleri neticesinde ise alınan verimin artırılması sağlanarak bölge halkı ile birlikte sürdürülebilir yönetim politikaları daha güncel haline getirilmektedir. Son olarak ise mevcut kurum ve kuruluşların alt yapılarının güçlendirilmesi amacıyla gerekli güncellemeler planlanmaktadır. Ayrıca kuraklık ile mücadele hususunda önemli olan bir diğer çalışma kuraklık tahmin ve erken uyarı sistemleri olmaktadır. Bu hususta ise gerekli çalışmalar sürdürülmektedir.

## **5. SONUÇLAR**

Tarımsal kuraklık neticesinde önemli gıda krizleri meydana gelerek maddi olarak da bu alanda çalışan bireylere önemli zararlar verecektir. Bu hususta Ülkemizde yer alan çeşitli kurum ve kuruluşlar birlikte ortak çalışmalar sürdürmektedir. Türkiye'nin tarımsal kuraklık ile mücadelesinde ise en güçlü yanı tüm kamu kurum ve kuruluşlarının birlikte uyumlu bir şekilde süreci yönetmesidir. Ayrıca konusunda uzman araştırmacılar ile birlikte uluslararası kuraklık politikalarına uygun olarak yönetim planları oluşturulması neticesinde güncel ve işlevselliği yüksek planlar üretilebilmektedir.

Kamu kurum ve kuruluşlarının yürüttükleri kuraklık ile mücadele çalışmalarına sivil toplum kuruluşları da birlikte uyum içinde çalışmaktadır. Ayrıca ülkemizde tarımsal faaliyetlerinin sürdürüldüğü alan miktarının büyüklüğü teşkil edilmiş olan yönetim planlarının tam anlamıyla kontrol edilmesinde aksamalara sebep olması muhtemeldir. Bu hususta ise bölge halkının ve tarımcılık faaliyetlerine katılan tüm paydaşların gereken desteği ve özeni göstermeleri ile gerekli yönetim planlarının başarısı arttırılabilecektir.

Tarımsal kuraklık, su kaynaklarına ulaşım gücünü de beraberinde getireceği için özellikle tarımsal üretimin gerçekleştiği bölgelerde kuraklık esnasında su temin edilebilecek sistemlerin tahrip edilmemesi ve bir aksama durumunda yetkili kuruma bilgi verilmesi gerekmektedir. Daha az su tüketen sulama metotları ve ürün desenindeki uygun seçimler için gerekli eğitim faaliyetlerinin daha arttırılması ile kuraklık ile mücadele de verimi arttırmak mümkündür.

**ÖZET**

Sucul ekosistemler, içme ve kullanma suyu teminin yanı sıra rekreasyonel amaçlı olarak insanlar tarafından kullanılmaktadırlar. Bünyelerinde barındırdıkları canlılık açısından eşsiz olan sucul sistemlerin korunması ve mevcut su kalitelerinin belirlenmesi ise mevcut sistemin kontrol edilebilmesi açısından oldukça önemli bir husus olmaktadır. Su sistemlerinde kalitenin korunması ve sürdürülebilirliğin sağlanması amacıyla yerel yönetimler tarafından düzenli olarak numuneler alınarak pH, iletkenlik, askıda katı madde ve organik madde miktarının tespiti gibi çeşitli kirletici parametreler düzenli olarak takip edilmektedir. Bir su sisteminden alınan numuneler ile analizleri tamamlanan parametrelerin sayısının fazla olması ise değerlendirme ya da karşılaştırma açısından her zaman pratik olmamaktadır. Bu hususta ise sucul sistemlerden alınan numune sonuçlarının sunulmasında daha pratik bir çıktı ile sunulabilmesi önem kazanmaktadır. Bu hususta ise son yıllarda araştırmacılar ve yerel yönetimler tarafından çeşitli su kalite indeksleri kullanılmaya başlanmıştır. Bu çalışmada su kalitesi değerlendirmesinde kullanılan indeksler ve kullanılan indekslerin kapsadığı parametreler tartışılmıştır. Ayrıca su kalite indekslerinin birbirleri ile benzerlikleri ve farklılıkları değerlendirilmiştir.

**Anahtar kelimeler:** Su kalite indeksi, su kalitesi, sucul ekosistemler, su kirlenmesi

**WATER QUALITY INDEXES IN DETERMINATION OF WATER QUALITY OF  
AQUATIC SYSTEMS**

**ABSTRACT**

Aquatic ecosystems are used by humans for recreational purposes as well as for the supply of drinking and utility water. The protection of aquatic systems, which are unique in terms of the vitality they contain, and the determination of existing water qualities are very important issues in terms of controlling the existing system. In order to maintain quality and ensure sustainability in water systems, samples are taken regularly by local governments and various pollutant parameters such as pH, conductivity, suspended solids and organic matter are monitored regularly. The large number of samples taken from a water system and the parameters whose analyzes have been completed is not always practical in terms of evaluation or comparison. In this regard, it becomes important to present the results of samples taken from aquatic systems with a more practical output. In this regard, various water quality indices have been used by researchers and local governments in recent years. In this study, the indices used in water quality assessment and the parameters covered by the used indices are discussed. In addition, the similarities and differences of water quality indices with each other were evaluated.

**Keywords:** Water quality index, water quality, aquatic ecosystems, water pollution

## **1. GİRİŞ**

Yaşamın sürekliliği ve canlılık için gerekli su, sucul sistemler bünyesinde bulunmaktadır (Tunç Dede ve Sezer, 2017; Baştürk ve Alver, 2019). Sucul sistemler, tarımsal ve hayvancılık faaliyetleri için gerekli su temininin yanı sıra bünyesinde barındırdığı besin maddeleri açısından da canlılar için oldukça değerli bir kaynaktır (Varol ve Şekerci, 2018; Kılıç, 2020). Günümüzde temiz suya ulaşım güçlükleri ve kuraklık problemleri neticesinde ise değeri daha iyi anlaşılmıştır (Davraz ve Ünver, 2014; Kurt ve ark., 2022).

Günümüzde artan popülasyona bağlı olarak su temininde artışlar gerçekleşmekte olup aynı şekilde meydana gelen atıksu miktarın da artış meydana gelmektedir (Baştürk ve Alver, 2019; Boretti ve Rosa, 2019). Su sistemlerine arıtılmadan deşarj edilen atıksular ise alıcı ortamların kirlenmesine sebep olmaktadır (Güneş, 2019). Sucul sistemlerde meydana gelen kirlilik su sistemlerinden elde edilen verimin düşmesine sebep olurken bünyesinde yaşayan canlılara da zarar vermektedir (Mushtaq ve ark., 2020).

Bir su sisteminin işlevine uygun olarak kullanılması için mevcut su kalitesinin bilinmesi gereklidir (Maraşlıoğlu ve ark., 2018). Ülkemizde su sistemlerinin mevcut su kalitesinin anlaşılması ve ölçülmesi hususunda uygun yasal mevzuat bulunmaktadır (Bulut ve Birben, 2019). Fakat bir su sisteminin değerlendirilmesinde, birden fazla kalite parametresinin aynı anda yorumlanarak bir arada sunulması gerekmektedir (Baştürk ve Alver, 2019). Su kalite indeksleri kullanılarak veri grubu yükü tek veriye kadar indirgenmekte ve mevcut su kalitesinin daha kolay bir şekilde değerlendirilmektedir (Koç, 2018).

Bu çalışmada, sucul sistemlerin ekosistem için değeri hakkında bilgi verilmiştir. Su kalitesi ve su kalitesinin önemi hakkında değerlendirmeler gerçekleştirilmiştir. Ayrıca su sistemlerinde mevcut su kalitesinin yorumlanmasında kullanılan su kalite indeksleri ve bu indekslerin birbirleri arasındaki farklılıkları incelenmiştir.

## **2. SUCUL SİSTEMLER**

Deniz, göl, akarsu gibi yer üstü ve yer altı sularını kapsayan en geniş adlandırma sucul sistem tanımlaması olmaktadır (Link 1). Sucul sistemlerin bünyesinde bulunan suyun %97,5'i denizler ve okyanuslar'da %2,5'i akarsu ve göllerde tatlı su olarak bulunmaktadır. Yerkürenin %70'i su ile kaplı olup bu su kütesinin deniz ve okyanustaki kısmı tuzlu su niteliğindedir (Tunç Dede ve Sezer, 2017). Su sistemlerinin beslenmesi ve suyun diğer sistemler arasındaki etkileşimi hidrolojik döngü vasıtasıyla gerçekleşmektedir. Şekil 1.'de hidrolojik döngüye alt görsel yer almaktadır (Link 2).

Şekil 1. Hidrolojik döngü

Tüm Dünya’da bulunan su sistemleri Şekil 1’de yer alan döngü ile birbirlerine ilişki durumdadır. Hidrolojik çevrimin elemanlarından herhangi birinde meydana gelecek aksamalar belirli bir seviyeye kadar doğal olarak tolere edilebilmektedir. Fakat özellikle insanlardan kaynaklanan faaliyetler sonucunda su döngüsünde istenmeyen olumsuzlukların oluşması mümkündür. Bu duruma yerkürede mevcut ortam sıcaklığının sera gazları neticesinde artışı olan küresel ısınma örnek verilebilir (Bayazıt, 2011; Raimi ve ark., 2021).

Sucul sistemler, bünyesinde barınan canlılar için birer yuva görevi görmektedir. Eşsiz ekosistemleri bünyesinde barındıran sucul ortamlar, çevresinde yaşayan canlılar için su ve gıda temininde de katkı sağlamaktadır (Kocataş, 2012). Ayrıca tarım, hayvancılık ve endüstriyel faaliyetlerde de sucul sistemlerden fayda sağlanmaktadır (Erkek ve Ağırlioğlu, 2002).

### 3. SU KALİTESİ

Su, doğada katı, sıvı ve gaz halinde bulunan kimyasal formülü H<sub>2</sub>O olan kimyasal bir bileşiktir (Link 3). Su sistemlerinde doğaları gereği katı ve çözülmüş olarak çeşitli safsızlıklar yer almaktadır (Karpuzcu, 2009; Samsunlu, 1999). Ayrıca bünyelerinde yaşayan canlılar da bu ekolojik sistemin parçasıdır (Kocataş, 2012). Kalite kavramı ise kişiden kişiye değişmekte olan bir terim olup su sistemlerinin kalitesi yasal mevzuatlar ile düzenlenmektedir (Bulut ve Birben, 2019; Link 4). Su sistemlerinde kullanım amaçlarına uygun olarak su kalitesi kimyasal, fiziksel, biyolojik ve radyolojik parametreler ile izlenmektedir (İTAY, 2005; YSKY, 2012; YSKB, 2012). Su sistemlerinde meydana gelen tahribatlar ve çevresel problemler tüm dünya genelinde meydana gelmektedir (Maraşlıoğlu ve ark., 2018; Akkan ve Mutlu, 2022). Su sistemlerinin su kalitesi, insanlardan kaynaklı faaliyetler sonucunda oluşan atıksular ile kirlenmektedir. Ayrıca yağışlar ve

yüzeysel akışların etkisinde tarımsal alanlardan gelen sular vasıtasıyla çeşitli kirleticiler su sistemlerine ulaşmaktadır. Alıcı ortamlara ulaşan bu kirleticiler sucul sistemlerde organik, inorganik ve ısıl kirlilik olmak üzere çeşitli zararlar vermektedir (Aksever ve Büyükşahin, 2015; Güneş, 2019).

Sucul sistemlerin su kalitesinin belirlenmesi, çevresel yönetim planlarının hazırlanması aşamasında öncelikli unsurdur (Arkoç, 2016). Özellikle günümüzde sucul ortamlarda meydana gelen tahribatlardan kaynaklı olarak küresel ısınma etkisinde daha da ciddi sorunlar meydana gelmeden su sistemlerin korunması ve sürdürülebilirliğin sağlanması gerekmektedir (Taş ve ark., 2021). Bu hususta ise pH, elektriksel iletkenlik, organik madde muhtevası, askıda katı madde, çözülmüş oksijen, azot, fosfor gibi çeşitli parametreler su sistemlerinden alınan numunelerde uygun metotlar ile ölçülmektedir (Samsunlu, 1999).

#### **4. SU KALİTE İNDEKSLERİ**

Su kalite indeksleri, büyük veri gruplarının birkaç rakamdan oluşan basit bir ifadeye dönüştürülmesi vasıtasıyla yorumlanmaktadır. Su kalite indeksi, sucul sistemlerin su kalitesinin belirlenmesi amacıyla yapılan fiziksel, kimyasal ve biyolojik analizlerin ölçüm değerlerinin matematiksel modellere veri olarak kullanılması ile hesaplanmaktadır (Baştürk ve Alver, 2019). Su kalitesi modeli ilk Horton tarafından 1965 yılında geliştirilmiş olup zaman içerisinde çeşitli araştırmacılar ve resmi kurumlar tarafından kullanımı artış göstermiştir (Kılıç, 2020).

Dünya genelinde birden fazla su kalite indeksi bulunmaktadır (Koç, 2018; Küçükönder ve ark., 2022). Fakat küresel olarak kabul edilmiş bir su kalite indeksi bulunmamaktadır (Alver ve Baştürk., 2019). Su kalite indeksleri arasında yaygın olarak Horton İndeksi, Ulusal Sanitasyon Vakfı Su Kalite İndeksi, Kanada Çevre Bakanlığı Konseyi Su Kalite İndeksi, Kolombiya Su Kalite İndeksi, İskoç Araştırma Geliştirme Departmanı İndeksi, Oregon Su Kalite İndeksi, Malezya Su Kalite İndeksi ve Baskaron İndeksi kullanılmaktadır (Alver ve Baştürk, 2019; Küçükönder ve ark., 2022).

Su sistemlerinde kirlilik durumunun tespiti için su kalite indeksi kullanılmadan önce hangi amaç ile çalışmanın gerçekleştirileceğinin belirlenmesi önemli bir husustur. Endüstriyel faaliyetler ile birlikte içme suyu eldesi ve ekosistem korumak amacıyla bir çalışma sürdürülecek ise Oregon ya da Kolombiya indeksleri kullanılabilir (Alver ve Baştürk, 2019). Ulusal Sanitasyon Vakfı Su Kalite İndeksinin kullanılması durumunda ise dokuz adet parametre (çözülmüş oksijen, fekal koliform, biyolojik oksijen ihtiyacı, nitrat, fosfat, pH, bulanıklık, toplam çözülmüş madde ve sıcaklık) için su analizi gerçekleştirilmesi gerekmektedir (Baştürk ve Alver, 2019). Kanada Çevre

Bakanlığı Konseyi Su Kalite İndeksinde, en az dört parametrenin ölçüm sonucu gerekmekte olup bu parametrelerin ise en az dört dönemine ait ölçüm sonucunun bulunması gerekmektedir (Küçükönder ve ark., 2022). Su kalite indekslerinde ayrıca su sisteminin kullanım amacına uygun olarak matematiksel modelde kullanılan su analizi parametresi değiştirilerek modifiye su kalite indeksi elde edilebilmektedir. Bu hususta ise su kalite indeksi sonuç çıktısının değerlendirilmesi aşamasında mevcut olan kalite sınıf aralığının yanlış yorumlanmamasına özen gösterilmesi gerekmektedir (Baştürk ve Alver, 2019).

Su kalite indeksi modellerinin kullanılmasında seçilmiş olan indekse göre farklı matematiksel eşitlikler bulunmaktadır. Örneğin Horton indeksinde içme suyu kalitesinin su kirliliğine etkisinin öncelik derecesinin belirlenmesi gerekmektedir (Şener ve Şener, 2022). Kanada Çevre Bakanlığı Konseyi Su Kalite İndeksinde ise matematiksel model su kalite parametresi ya da zaman dilimi öncelikli olmayıp kirleticinin çevre koşullarına bağlı olarak konuma göre farklılık göstereceği kabul edilmektedir (Tunç Dede ve Sezer, 2017). Çizelge 1 ve 2’de sırası ile Horton indeksi ve Kanada Çevre Bakanlığı Konseyi Su Kalite İndeksi hesaplamalarına göre elde edilen sonucun yorumlanmasında kullanılan sonuç çizelgeleri yer almaktadır (Tunç Dede ve Sezer, 2017; Şener ve Şener, 2022).

**Çizelge 1.** Horton indeksi (sol) hesaplamalarında kullanılan sonuç çizelgeleri

<b>Horton indeksi</b>		
<b>Su Kalite İndeksi</b>	<b>Durum</b>	<b>Muhtemel Kullanım</b>
0-25	Mükemmel	İçme, sulama ve endüstriyel
26-50	İyi	Evsel, sulama ve endüstriyel
51-75	Makul, uygun	Sulama ve endüstriyel
76-100	Kötü	Sulama
101-150	Oldukça Kötü	Sulama için sınırlı kullanım
>150	İçme suyu olarak uygun değil	Kullanım öncesi uygun arıtma

**Çizelge 1.** Kanada Çevre Bakanlığı Konseyi Su Kalite İndeksi (sağ) hesaplamalarında kullanılan sonuç çizelgeleri

<b>Kanada Çevre Bakanlığı Konseyi Su Kalite İndeksi</b>	
<b>Su Kalite İndeksi</b>	<b>Kullanım Durumu</b>
0-44,9	Kötü
45-64,9	Zayıf
65,79,9	Orta
80-90,4	İyi
95-100	Mükemmel

Çizelge 1 ve 2 incelendiği zaman Horton indeksi ile Kanada Çevre Bakanlığı Konseyi Su Kalite İndeksi hesaplama sonuç çizelgelerin yorumlanma aşamasında farklılık gösterdiği görülmektedir.

Horton indeksine göre 60 değeri makul ve uygun durumu ifade ederken Kanada Çevre Bakanlığı Konseyi Su Kalite İndeksi için 60 değeri zayıf olarak değerlendirilmektedir. Bu durumda ise aynı su kalitesi indeksi ve matematiksel ifade de aynı parametrelerin kullanılması sonuçların başka çalışmalar ya da su sistemleri için değerlendirilmesinde önemli olmaktadır.

## **5. SONUÇLAR**

Su sistemlerinden alınan verimin tüm etmenler için sürdürülebilir olması için gerekli önlemlerin yerel yönetimler tarafından alınması gerekmektedir. Su sistemlerinin planlanması ve yönetimi aşamasında uygun su kalite indeksinin belirlenmesi gerekmektedir. Bu hususta en önemli etmen seçilen kirletici parametresi ve analiz sonucunun doğruluğudur. Ayrıca su sistemi üzerinde belirlenen numune alma ve izleme noktalarının sistemin tümünü yansıtması ve su sistemine etki drenajlar ile birlikte tüm olumsuz etmenleri içerecek şekilde belirlenmesidir.

**ABSTRACT**

This study was focused on determining if there were the toxic effects of two boron forms ( $H_3BO_3$  and  $Na_2B_8O_{13}.4H_2O$ ) at different doses on the germination and seedling growth of sugar beet. In this experiment performed at the Seed Science and Technology Laboratory, Eskişehir Osmangazi University in 2022, the seeds of sugar beet cv. Kuno were germinated between filter papers moistened with 5, 10, 30, 60, and 90 ppm of two boron forms at 25°C in the dark for 14 days. Distilled water served as a control. The results showed that increasing boron doses did not affect germination percentage, mean germination time, and seedling dry matter. Shoot and root lengths were significantly reduced when B doses increased. Increased B levels resulted in shortening shoot length from 6.42 cm to 5.69 cm in boric acid and from 6.80 cm to 4.43 cm in sodium borate. Also, the fresh and dry weight of the sugar beet seedling reduced significantly at 60 and 90 ppm in sodium borate. It was concluded that the germination performance of sugar beet was not influenced by increasing boron dose and form, indicating that there were no toxic effects of B on seed germination; however, the inhibitory effect on seedling growth was identified at 60 and 90 ppm regardless of B forms.

## **INTRODUCTION**

Boron (B) is a microelement required for the development of growing plant parts such as roots and new leaves, as well as the development of the flower, seed, and fruit, the elongation of pollen tubes, and the production of plant hormones (Goldbach and Wimmer, 2007; Herrera-Rodriguez et al., 2010; Gupta, 2016). B transports water, macro- and micronutrients, and organic molecules to the plant's active growing parts. It promotes the delivery of sugars produced to active growth parts and developing fruits or seeds (Gupta et al., 1985; Goldbach et al., 2001). In most agricultural soils, B content changes between 1 and 467 mg kg<sup>-1</sup>, on average between 9 and 85 mg kg<sup>-1</sup>. However, B availability ranges from 0.5 to 5 mg kg<sup>-1</sup> (Gupta, 2016). In Turkey, which has 73% of the world's B reserves (Anonymous, 2022), it has been reported that 46.2% of the soil is insufficient, 31.1% sufficient, 19.4% high, and 3.3% excessive in terms of B levels (Killioğlu, 2022). B deficiency influences both vegetative and reproductive development of the plants such as root development (Dell and Huang, 1997; Gupta, 2016), leaf elongation (Huang et al., 1996), and inducing cell expansion restriction (Marchner, 1995). Because sugar beet is sensitive to B deficiency and needs high B requirement, insufficient B concentration causes the leaf petiole to exhibit a corky top surface (Bergmann, 1976). Its growth is delayed, and young leaves curl and turn black. Surface cracking, cupping, and curling are visible on the old leaves. On the other hand, B toxicity can inhibit the photosynthetic capability of sugar beet, limit the transfer of photosynthesis products, uptake active oxygen in cells, and cause oxidative stress, all of which can limit sugar beet plant growth (Hao et al., 2020). A lot of research on determining suitable B doses for sugar beet have been focused on seed yield, root yield, and sugar content (Dordas et al., 2007; Armin and Asgharipour, 2012; Nemeata Alla, 2017; Ghaly et al., 2019; Aly et al., 2020), and limited information about the toxicity or promoter effects of boron applications during germination and early seedling stage of sugar beet has been demonstrated. Hence, the present study was performed to evaluate two boron forms (H<sub>3</sub>BO<sub>3</sub> and Na<sub>2</sub>B<sub>8</sub>O<sub>13</sub>.4H<sub>2</sub>O) at different doses on the germination and seedling growth of sugar beet.

## **MATERIAL AND METHODS**

To investigate the effects of boron (B) sources on germination and seedling growth of sugar beet cv. Kuno, an experiment was designed at the Seed Science and Technology Laboratory, Eskişehir Osmangazi University, in 2022. Boron doses were arranged as 5, 10, 30, 60, and 90

ppm. Distilled water was used for the control treatment. Two boron sources, boric acid (17%  $H_3BO_3$ ) and Etidot-67 (20.9% disodium octaborate tetrahydrate;  $Na_2B_8O_{13} \cdot 4H_2O$ ), were used in the study. The standard germination test was conducted with four replicates of 50 seeds according to ISTA (2003) rules. The 50 seeds were placed in three-layer filter papers moistened with 21 mL of respective B solutions and they were rolled. And then, they were placed to a sealed plastic bag to prevent water evaporation. The germination test was performed in an incubator arranged at 25°C under dark conditions, and the seed with a 2 mm radicle was counted as germinated. Counting was performed every 24 h for 14 days. To assess the germination velocity, mean germination time (MGT) was computed by ISTA (2003). On the final day, ten seedlings from each B level were randomly sampled to measure shoot length (SL), root length (RL), seedling fresh weight (SFW), seedling dry weight (SDW), and dry matter (DM). The experiment made use of two factorials arranged in a Completely Randomized Design (CRD) with four replicates. The experimental data were analyzed by ANOVA and the differences were compared by the Least Significant Difference (LSD) test ( $P < 0.05$ ). For all investigated parameters, an analysis of variance was performed using the MSTAT-C computer software program (Michigan State University v.2.10).

## **RESULTS AND DISCUSSION**

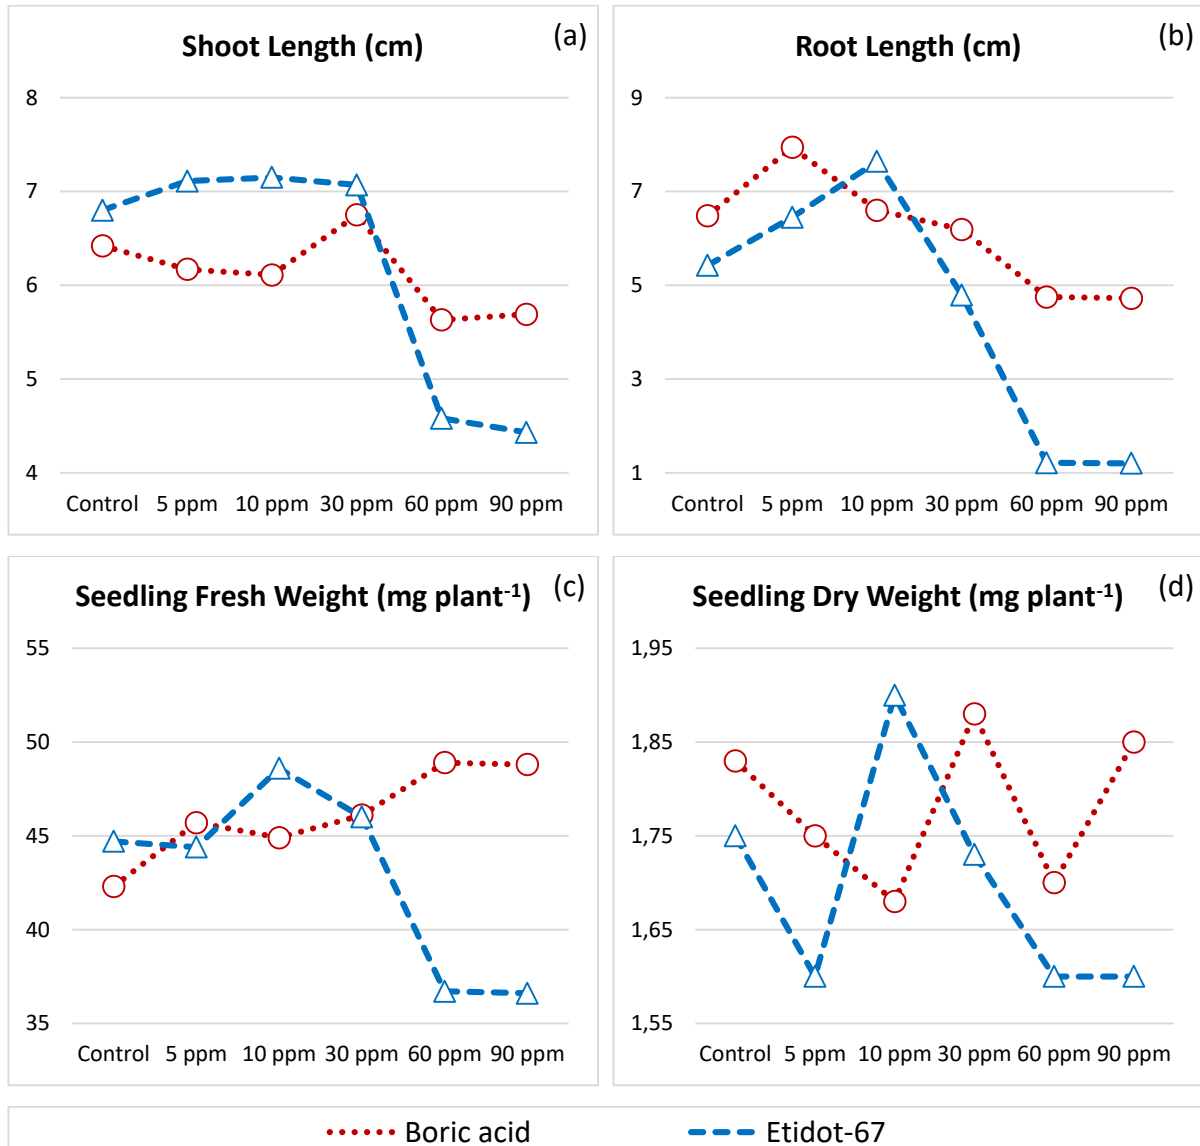

The increasing concentration of boron forms did not significantly influence germination percentage, mean germination time, and seedling dry matter (Table 1). GP was over 90% in all interactions between boron forms and doses. This result confirmed the findings of Shah et al. (2013), Muhmood et al. (2014), and Jokanovic et al. (2010), who found that increasing boron concentrations had no significant effects on germination percentages in maize and wheat. Contrarily, other researchers noted that boron adversely affects germination percentage in safflower (Ashagre et al., 2014a), wheat (Yau et al., 1995; Iqbal et al., 2017), and broccoli (Noorun Nisa et al., 2013). The MGT increased up to 10 ppm B, but higher levels led to decreasing it significantly. The lowest MGT was observed at control, 60, and 90 ppm B doses of both boron forms. Our findings showed a similarity to the results of Noorun Nisa et al. (2013). They determined that low boron doses reduced the MGT of broccoli. Shoot length (SL), root length (RL), seedling fresh weight (SFW), and seedling dry weight (SDW) were significantly reduced by increasing B levels. SL and SDW were inhibited at 60 ppm B level, while RL was 30 ppm B. Compared to the control treatment, SL and RL at 60 and 90 ppm of

sodium borate were approximately decreased by 35% and 80%, respectively (Figure 1). B primarily limits root development by reducing cell elongation (Brown et al., 2002). Nable et al. (1997) found that higher B levels depressed shoot and root development. According to Ashagre et al. (2014a) and Ashagre et al. (2014b), SL, RL, SFW, and SDW of safflower and wheat decreased as B concentrations were increased. The highest SL, RL, SFW, and SDW were recorded at the doses of 10 to 30 ppm B for two boron forms. The considerable enhancement in seedling growth at low boron concentrations could be explained due to its role in cell elongation, cell division, and meristematic growth (Khan et al., 2006).

Table 1. Effects of different boric acid and Etidot-67 levels on germination and seedling growth of sugar beet cv. Kuno

## CONCLUSION

This study revealed that increased boron doses did not cause any toxic effects on seed viability performance such as germination percentage and mean germination time. However, seedling growth of sugar beet was considerably inhibited when B doses were increased. At 60 and 90 ppm of sodium borate, the fresh and dry weights of sugar beet seedlings reduced dramatically. It was concluded that B had no toxic effects on seed germination but its inhibitory effects on seedling growth were identified at 60 and 90 ppm regardless of B form.

## **SULAMA SAHALARININ PERFORMANSININ DEĞERLENDİRİLMESİ**

**Prof. Dr. Harun KAMAN (Orcid ID: 0000-0001-9308-3690)**

Akdeniz Üniversitesi, Ziraat Fakültesi, Tarımsal Yapılar ve Sulama Bölümü, Antalya, Türkiye

### **ÖZET**

Küresel ısınma sonucu ortaya çıkan iklim değişikliği, hayatın her alanında etkisini göstermektedir. İklim değişikliği sonucu yaşanan kuraklık, özellikle su kaynakları üzerinde olumsuz etkiler meydana getirmektedir. Kuraklıkla birlikte iyi kaliteli suya erişim de güçleşmektedir. Öte yandan, sektörler arasında suyu en fazla kullanan tarımsal üretim alanıdır. Tarımsal üretimin artırılmasında diğer etkenlerin yanı sıra sulamanın payı çok büyüktür. Yerel sulama organizasyonları, sulama kooperatifleri, halk sulamaları (özel sulamalar), sulama birlikleri, kamu sulama vb. organizasyonlar ile geniş sahalarda bitkisel üretim yapılabilmektedir. Söz konusu organizasyonların sahip oldukları sahalarda sulama amaçlı kullanılan suyun yüksek randıman ile beklenen hedeflere ulaşması son derece önemlidir. Sulama birlikleri gibi geniş alanlardaki sulama organizasyonlarının, sulama performansının belirlenmesi su kaynaklarının yönetimi açısından son derece önemli bir konudur. Suyun iletimi, dağıtımı ve uygulaması sırasında muhtemel hataların/yanlışlıkların araştırılıp tespit edilmesi gerekir. Bu konuyla ilgili olarak, sulu tarımda suyun verimli ya da ne derece faydalı kullanıldığını belirlemek için kimi parametrelerin gözlem ve ölçümlerinin yapılması gerekmektedir. Böylece sulama sahalarının performans analizi yapılmış olabilecektir. Bunun sonucunda, gözlem ve ölçümlere dayalı elde edilen değerler veya göstergeler ile bir sulama sahasındaki sulamanın performansı belirlenip izlenebilecektir. Sulama sahalarının performans analizi için farklı değerlendirme yöntemleri geliştirilmiştir. Bu çalışmada sulama performans analiz yöntemleri ve değerlendirme sistemleri ele alınmıştır. Çalışma sonucunda, küçük ve/veya geniş bitkisel üretim sahaları için sulama performans yöntem ve analizlerinin önemi ortaya konulmuştur.

**Anahtar kelimeler:** Sulama Yönetimi, Sulama Organizasyonları, Sulama Birliği, Sulama Performans Göstergeleri.

**ASSESSMENT OF PERFORMANCE OF IRRIGATION AREAS****ABSTRACT**

The climate change that has arisen due to global warming has shown its impact on every area of life. The drought experienced due to climate change has negative effects, especially on water resources. Access to good quality water is also becoming difficult with the drought. On the other hand, it is agriculture that consumes the most water among all sectors. The share of irrigation, among other factors, in increasing agricultural production is very big. Plant production can be carried out in large areas with organizations such as local irrigation organizations, irrigation cooperatives, private irrigation, irrigation districts, public irrigation etc. The water used for irrigation purposes in the fields owned by these organizations must reach the expected targets with high efficiency. Determining the irrigation performance of these irrigation organizations in large areas is an extremely important issue in water resource management. Possible errors/inaccuracies should be examined and identified during the distribution and application of water. For this purpose, observations and measurements of some parameters are needed to determine how efficiently or beneficially water is used in irrigated agriculture. Thus, the performance analysis of irrigation fields can be performed. As a result, the performance of irrigation in an irrigation field can be determined and monitored with the values or indicators obtained based on these observations and measurements. Different evaluation methods have been developed for the performance analysis of irrigation fields. This study discussed irrigation performance analysis methods and evaluation systems. As a result of the study, the importance of irrigation performance methods and analyzes for small and/or large crop production areas was revealed.

## **1. GİRİŞ**

Su insan, hayvan ve bitki sisteminin içinde yer aldığı tüm canlıların yaşam faaliyeti için en temel gereksinimdir. Su olmadan yaşam olmayacaktır. Dünya nüfusundaki artış ile birlikte küresel ısınma sonucu yaşanan iklim değişikliği su kaynakları üzerinde olumsuz sonuçlar doğurmaktadır. İklim değişikliği sonucu ortaya çıkan kuraklık tüm su kullanıcı sektörlerini derinden etkilemektedir.

Su kullanıcı sektörler arasında tarım en fazla paya sahip olduğundan, iklim değişikliği sonucu ortaya çıkan kuraklıktan daha çok etkilenmektedir. Örneğin, Türkiye’de DSİ 2018 yılı faaliyet raporuna göre toplam su potansiyelinin 2018 yılı gerçekleşmesi 54 milyar m<sup>3</sup> olarak bildirilmiştir (DSİ, 2019). Sözkonusu miktarın çeşitli maksatlara yönelik olarak 40 milyar m<sup>3</sup>’ü (%74.08) sulama suyu, 7 milyar m<sup>3</sup>’ü (%12.96) içme-kullanma ve 7 milyar m<sup>3</sup>’ü (%12.96) ise sanayi suyu olarak kullanıldığı tespit edilmiştir (DSİ, 2019).

Yine DSİ raporuna göre Türkiye, sanılanın aksine, su zengini bir ülke değildir (DSİ, 2019). Türkiye halihazırda kişi başına düşen 1366 m<sup>3</sup>’lük su miktarı ile “su kısıtı yaşan” bir ülke kabul edilmektedir (DSİ, 2019). Türkiye genelinde yıllık ortalama yağış miktarı yaklaşık 643 mm (DSİ, 2006: Çiçek ve Ataol, 2009’dan) iken 574 mm’ye (DSİ, 2019) gerilmiştir.

Yukarıdaki bilgilerinden de anlaşılacağı üzere Türkiye için yıllık ortalama kullanılabilir suyun büyük çoğunluğu (yaklaşık dörtte üçü) tarım sektöründe kullanılmaktadır. Bu nedenlerle, kullanıcıları tarafından yapılan uygulamaların, özellikle tarıma ayrılan suyun, genel anlamda performans analizlerinin yapılması gerekmektedir.

## **2. SULAMA PERFORMANSININ DEĞERLENDİRİLMESİ**

Bitkisel üretimde sulama uygulamalarının randımanlı ya da ne derece faydalı kullanıldığını belirlemek için kimi parametrelerin gözlem ve ölçümlerinin yapılması bir zorunluluktur. Burada gözlem ve ölçümlere dayalı elde edilen değerler veya göstergelerle sulama alanlarındaki kullanıcıların sulamanın performansı belirlenip izlenebilecektir. Bu amaçla, farklı ülke ve bölgeler için sulama sistemlerinin performansının belirlenmesinde çok sayıda göstergeler geliştirilmiştir.

Sulama performans analizleri için özellikle Uluslararası Sulama ve Drenaj Teknoloji ve Araştırma Programı (IPTRID: International Programme for Technology and Research in Irrigation and Drainage) tarafından drenaj ve sulama sistemlerinde performansların mukayeseli olarak değerlendirilmesi için çeşitli yöntemler tavsiye edilmiştir (Malano ve Burton, 2001).

Buna ilave olarak, Uluslararası Su Yönetimi Enstitüsü (IWMI: International Water Management Institute) tarafından da sulama sistemlerinin performanslarının ölçümü için geliştirilen performans göstergeleri mevcuttur. IWMI tarafından geliştirilen karşılaştırmalı performans göstergelerinin yanında çeşitli araştırmacıların önerdikleri performans göstergeleri de sulama sistemlerinin performansını değerlendirmede kullanılabilir (Ateşal, 2022). Bunlar sulama oranı ve sulama randımanının da içinde yer aldığı 10 adet göstergeden oluşmaktadır (Rao, 1993; Bos, 1997; Beyribey ve ark., 1995; Hamdy, 2000). Tüm bu bilgilerin ışığında sulama performans analizleri genel olarak aşağıda maddeler halinde belirtilen göstergelerde değerlendirilmelidir (Öztürk, 2021):

- Su iletim performansı,
- Finansal performans,
- Tarımsal etkinlik ve üretim performansı,
- Kurumsal etkinlik performansı.

Sulama performans analizlerinde genel olarak; proje alanı eşdeğer brüt üretim değeri, fiilen sulanan alan eşdeğer brüt üretim değeri, saptırılan suya karşılık eşdeğer brüt üretim değeri, su temini oranı, sulama oranı gibi göstergeler bunlara örnek olarak verilebilir (Çakmak, 2001).

Sulama sahalarının sistem performansının belirlenmesine yönelik araştırmalar ve değerlendirmeler neticesinde aşağıda belirtilen hedeflere ulaşmak mümkün olabilecektir (Öztürk, 2021):

- ✓ Toprak ve su kaynaklarının etkin kullanımı,
- ✓ İşletmeleri sürdürülebilir kılma,
- ✓ Devir çalışmalarının amacına erişip erişmediğinin tespiti,
- ✓ Hem çiftçinin sulama gereksinimlerinin karşılanabilmesi hem de işletmecilik sorunlarına çözüm getirilmesi,
- ✓ Tarımsal üretimde verimliliği ve istihdamı artıracak, sosyal ve ekonomik açıdan büyük oranda olumlu bir getiri sağlaması,
- ✓ Sistemin mevcut başarı düzeyinin saptanması.

### **3. SONUÇ VE DEĞERLENDİRME**

Tarımsal üretimin arttırılmasında diğer etkenlerin yanı sıra sulamanın payı oldukça büyüktür. Diğer taraftan, kuraklık su kaynaklarının kullanımını olumsuz etkilemektedir. Bununla birlikte nüfus, sanayi ve kentsel kullanım için suya olan talep gün geçtikçe artmaktadır. Bunlara ilave

olarak, suyun en büyük kullanıcı sektörü tarımdır. Dolayısıyla, kuraklık söz konusu olduğunda suyun kullanımının kısıtlanacağı ilk yer tarım olmaktadır. Bundan dolayı tarımda kullanılan suyun en verimli bir şekilde kullanılması önemli araştırma konuları arasında kendine yer bulmaktadır. Suyun verimli kullanılıp kullanılmadığını belirlemek için çeşitli göstergelerden faydalanılabilir. Bunların başında sulama randımanı ve sulama birliklerinin sulama performansının değerlendirilmesi gelmektedir. Sulu tarımda suyun verimli ya da ne derece faydalı kullanıldığını belirlemek için kimi parametrelerin gözlem ve ölçümlerinin yapılması gerekmektedir. Gözlem ve ölçümlere dayalı elde edilen değerler ve/veya göstergeler ile bir sulama sahasındaki sulamanın performansı belirlenip izlenebilecektir.

## **YARI ISLATMALI VE GELENEKSEL KISINTILI SULAMA**

**Prof. Dr. Harun KAMAN (Orcid ID: 0000-0001-9308-3690)**

Akdeniz Üniversite, Ziraat Fakültesi, Tarımsal Yapılar ve Sulama Bölümü, Antalya, Türkiye

### **ÖZET**

Bitkisel üretimde verimin arttırılmasında diğer etkenlerin yanı sıra sulamanın payı çok büyüktür. Su diğer bütün canlılar için olduğu gibi, bitki yetiştiriciliğinde de en temel öğedir. Öte yandan, dünyada yaşamı en çok etkileyen sorunların başında küresel ısınma ve buna bağlı olarak ortaya çıkan iklim değişikliği gelmektedir. İklim değişikliği sonucu yağış rejiminde düzensizlikle birlikte kuraklık meydana gelmektedir. Türkiye'nin kurak ve yarı kurak iklim kuşağı içerisinde bulunması nedeniyle, küresel ısınma sonucu meydana gelen kuraklıktan önemli ölçüde etkilenmektedir. Kuraklık son yıllarda etkisini şiddetli bir biçimde göstermekte ve bunun sonucunda günümüzde önemli boyutlarda tarımsal kuraklık yaşanmaktadır. Buna ilave olarak suyun kullanımında daha çok sanayi ve kentsel kullanıma öncelik verilmesiyle, bitkisel üretim için ayrılan su giderek azalmaktadır. Bu nedenle bitkisel üretimde sulama suyundan tasarruf sağlayabilecek ve sulama randımanı yüksek olabilecek uygulamalar son derece önemlidir. Bu durumda, verimde azalma olmaksızın, hatta verimi artırıcı yeni sulama uygulamalarının araştırılması gerekmektedir. Bu çalışmada, verimde azalma olmaksızın ve yeni olduğu değerlendirilebilecek yarı ıslatmalı sulama (partial root-zone drying) uygulaması ele alınmıştır. Yarı ıslatmalı sulama uygulamasında bitki kök bölgesinin bir yarısı görece olarak sulanırken, geriye kalan diğer yarısı yine görece olarak kuru bırakılmaktadır. Yarı ıslatmalı sulama uygulaması bir kısıntılı sulama uygulaması gibi değerlendirilebilmektedir. Geleneksel kısıntılı sulama uygulamaları ile sulama suyundan önemli oranlarda tasarruf sağlanabilmektedir. Bu çalışma sonucunda, geleneksel kısıntılı sulamadan farklı olarak yarı ıslatmalı sulama uygulaması altında, bitkisel üretimin veriminin daha yüksek olabileceği öngörülebilmektedir.

**Anahtar kelimeler:** Su-Verim İlişkisi, Sulama Randımanı, Bitki Su Tüketimi, Verim.

**PARTIAL ROOT-ZONE DRYING AND CONVENTIONAL DEFICIT IRRIGATION****ABSTRACT**

The share of irrigation in increasing the yield in crop production, among many other factors, is very large. As for all other living things, water is the most basic element in plant cultivation. On the other hand, global warming and the resulting climate change are among the problems that affect life the most in the world. As a result of climate change, drought occurs along with irregularity in the precipitation regime. Since Turkey is located in an arid and semi-arid climate zone, it is significantly affected by drought caused by global warming. The drought has been showing its effects severely in recent years and as a result, there has been a significant agricultural drought. In addition, the water used in crop production is gradually decreasing because priority is given to industrial and urban use of available water. For this reason, applications that can save irrigation water in crop production and have high irrigation efficiency are extremely important. In this case, it is necessary to investigate new irrigation practices that increase yield even without a decrease in yield. In this study, the application of partial root-zone wetting, which can be evaluated as a new method which does not cause any decrease in yield, is discussed. In partial root-zone wetting application, one-half of the plant root zone is watered relatively, while the other half is left relatively dry. The partial root-zone wetting application can be considered a partial irrigation application. Significant savings can be achieved from irrigation water with traditional deficit irrigation practices. As a result of this study, it can be predicted that the yield of crop production may be higher under partial root-wetting irrigation application, unlike traditional deficit irrigation practices.

**Keywords:** Water-Yield Relationship, Irrigation Efficiency, Plant Water Consumption, Yield.

## 1. GİRİŞ

Küresel ısınma sonucu yaşanan iklim değişikliği birçok sorunu beraberinde getirmektedir. Bunların en başında kuraklığın meydana gelmesidir. Sıcaklık artışı, yağışların azalması ve düzensizliği ile meydana gelen kuraklık hayatın tüm alanlarını büyük oranda olumsuz etkilemektedir. Kuraklık özellikle bitkisel üretimde daha sert biçimde etkisini göstermektedir. Çünkü, su ihtiyacı karşılanamayan bitkide önemli oranlarda zararlanma ve büyük miktarlarda verim kaybı yaşanabilmektedir. Bununla birlikte, dünyada 2050 yılında 9.1 milyar olması beklenen nüfusu beslemek ve ihtiyaçlarını karşılamak için küresel gıda üretiminin 2005/07 ile 2050 yılları arasında yaklaşık %70 oranında artması gerektiği bildirilmiştir (FAO, 2009: Slamini ve ark., 2022'den).

Türkiye ve dünyanın birçok yerinde iyi kaliteli suyun varlığı ve erişimi sorunuyla karşı karşıya kalınmaktadır. Slamini ve ark. (2022) bildirdiğine göre FAO (2017), tarımın büyük ölçüde sulamaya bağlı olduğu dünyanın birçok yerinde bitkisel üretim için mevcut suyun yaklaşık %70'inin kullanıldığını belirlemiştir. Türkiye'de de tarım sektörü mevcut kullanılabilir suyun yaklaşık %74.08'ini sulama suyu amaçlı olarak kullanmaktadır (DSİ, 2019). Ancak dünyada gıda üretimi; yüksek verim potansiyeline sahip tohum çeşitleri, iyi ve doğru bir sulama uygulaması, iyi bir bitki besleme programı, hastalık ve haşere kontrolü dahil olmak üzere çeşitli faktörlerin katkısıyla istikrarlı bir şekilde artmaktadır (FAO, 2004: Slamini ve ark., 2022'den). Esasında, yağmurla beslenen bitkisel üretimde, sulama uygulamasıyla verimde iki kat artış sağlanabileceği bildirilmiştir (Sepaskhah ve Ahmadi, 2010: Slamini ve ark., 2022'den). Bu durum sulama uygulamasının bitkisel üretimde verim artışına çarpan etkisi yaptığını ortaya koymaktadır. Bu nedenle sulama uygulaması bitkisel üretim için son derece önemlidir.

Sulama uygulamalarında; (1) sulama zamanı, (2) sulama yöntemi ve (3) sulama suyu miktarı hangi oranda doğru bir şekilde belirlenmişse, sulama yönetimi de aynı oranda başarıyla gerçekleşecektir. Söz konusu üç temel soru/konu için özellikle kurak ve yarı kurak bölgelerde yüksek bir düzeyde başarıya ulaşmak daha da zor olabilecektir. Çünkü, kurak ve yarı kurak bölgelerde yeterli miktarlarda sulama suyu olmayacaktır. Dolayısıyla kısıntılı sulama uygulamaları altında (1) sulama zamanı, (2) sulama yöntemi ve (3) sulama suyu miktarının en doğru bir şekilde belirlenmesi daha zor olabilecektir. Kısıntılı sulama uygulaması da genel olarak bitkinin ihtiyacı olan suyun tam olarak karşılanamaması şeklinde ifade edilebilir.

## **2. GELENEKSEL KISINTILI SULAMA**

Kurak ve yarı kurak iklim bölgeleriyle sulamaya ayrılan suyun az ve yetersiz olduğu koşullarda verimde azalma olmayacak şekilde sulama uygulama stratejileri araştırılmalı ve geliştirilmelidir. Esasında anılan koşullar için kısıntılı sulama uygulaması tanımlanabilir. Sözkonusu kısıntılı sulama uygulamasında bitkinin ihtiyacı olan sulama suyu miktarı belirli oranlarda azaltılır. Geleneksel olarak uygulanan kısıntılı sulama; (1) bitkinin yetişme sezonu boyunca her sulamada sulama suyu miktarının belirli oranda azaltılması, ya da (2) yine bitkinin yetişme sezonu boyunca sulama aralığı arttırılarak sulama uygulama sayısı azaltılması biçiminde olmak üzere iki şekilde gerçekleştirilebilir. Ancak, geleneksel kısıntılı sulama uygulamasında su kullanımının azaltılması mümkün olabilmekte; öte yandan, meyve verimi ve kalitesinde önemli oranda düşmeler meydana gelebilmektedir (Kirda ve ark., 1999). Bu koşullar altında bitkide zararlanmaya yol açmayacak ve ürün veriminde de nispeten azalmaya neden olmayacak yeni sulama uygulamalarının/yönetiminin araştırılması son derece önemli olmaktadır.

Geleneksel kısıntılı sulamaya benzer bir biçimde sulama suyunun azaltılabildiği diğer bir sulama tekniği de “**YARI ISLATMALI SULAMA**” uygulamasıdır.

## **3. YARI ISLATMALI SULAMA**

Yarı ıslatmalı sulama tekniği altında geleneksel sulamalarda uygulanan su miktarı belirli bir oranda azaltılarak su, bitki kök bölgesine verilir. Ancak, yarı ıslatmalı sulama uygulama tekniği altında bitki bölgesinin görece olarak bir yarısı sulanırken yine geriye kalan diğer yarısı görece olarak kuru bırakılır (Kaman, 2002; Kaman, 2007). Yarı ıslatmalı sulama uygulama tekniğinde bitki kök bölgesinin görece olarak sulanan ve kuru bırakılan kısımları belirli sulamalarda yer değiştirilebilir. Diğer bir ifadeyle, örneğin ilk sulamada görece olarak sulanan ve kuru bırakılan kısımlar, bir sonraki sulamada sulama suyu bitkinin kuru (bir önceki sulamada görece olarak sulama suyu uygulanmayan) kısmına verilir ve bir önceki sulamada görece olarak sulanan kısım kuru bırakılır. İlave olarak, tüm yetişme mevsimi boyunca bitki kök bölgesinin bir yarısı görece olarak sulanır ve geriye kalan diğer yarısı yine görece olarak kuru bırakılması şeklinde de yarı ıslatmalı sulama tekniği uygulanabilir (Özbek ve Kaman, 2018; Kaman ve Özbek, 2016; Kaman ve ark., 2022).

Yarı ıslatmalı sulama uygulaması altında bitki kök bölgesinin periyodik olarak yarısının ıslatılmasıyla, bilinen geleneksel kısıntılı sulama uygulamasına kıyasla su kullanım

randımanının daha yüksek olabileceği gösterilmiştir (Chaffey, 2001; Kaman ve ark., 2011). İlave olarak, geleneksel tam sulama uygulamasına kıyasla, yarı ıslatmalı sulama uygulaması altında sulama suyu kullanım randımanının daha yüksek bulunduğu birçok araştırma da mevcuttur (Kirda ve ark., 2004; Kaman ve ark., 2006; Kirda ve ark., 2007; Topcu ve ark., 2007; Kaman ve ark., 2011). Dolayısıyla, yarı ıslatmalı sulama tekniği altında suyun kıt ve pahalı olduğu bölgelerde geleneksel kısıntılı sulamaya benzer şekilde, daha az su uygulayarak, mevcut su kaynaklarından daha etkin bir şekilde yararlanılması amaçlanır (Kang ve ark., 1998).

Slamini ve ark. (2022) yarı ıslatmalı sulama tekniğinin üstünlüklerini aşağıdaki maddelerde verildiği şekilde belirtmiştir:

- Su kullanım randımanını artırdığı tespit edilmiş,
- Verimde önemli bir azalma olmaksızın sulama suyundan %50'ye varan tasarruf sağlandığı bildirilmiş,
- Bitkilerin daha iyi koşullarda kontrollü bir şekilde daha iyi bir büyüme ve kök gelişimi sağladığı ortaya çıkmış,
- Birçok bitki türünün meyve kalitesinde iyileşme belirlenmiş,
- Bitkinin su ve besin elementi alımında gelişme görülmüş.
- Kirleticilerin yer altı sularına sızmasını en az düzeye indirdiği saptanmış,
- Çevre dostu bir teknoloji olarak ifade edilmiş.

Yine, Slamini ve ark. (2022) yarı ıslatmalı sulama tekniğinin eksikliklerini de aşağıdaki maddelerde verildiği şekilde açıklamıştır:

- Sulama ve bitkisel üretimde üst düzey yönetim becerilerine ihtiyaç duyulduğu ifade edilmiş,
- Kötü sulama ve bitkisel üretim yönetiminin, bitki gelişimini olumsuz etkileyeceği ve toprakta tuzlanma riskine yol açabileceği bildirilmiş.

#### **4. SONUÇ VE DEĞERLENDİRME**

Küresel ısınma ve bunun sonucu meydana gelen iklim değişikliği kuraklığa yol açmaktadır. Öte yandan bitkisel üretimde sulama uygulaması çarpan etkisi oluşturduğu bilinen bir gerçektir. Bu koşullar altında, artan dünya nüfusuyla birlikte gıda gereksinimindeki yükseliş birim alanda verimde düşüş olmaksızın, ancak kullanılan sulama suyu miktarını azaltarak bitkisel üretim

yapmak amaçlanmalıdır. Mevcut arařtırmalar sonucu, sulama suyundan tasarruf saęlayabilecek uygulamanın “**Yarı Islatmalı Sulama**” teknięi olduęu ortaya çıkmaktadır. Sonuç olarak, özellikle kurak ve yarı kurak bölgelerde, sulama suyundan kısıntıya gidilmesi durumunda bitkilerin sulanmasında sulama suyu kullanım randımanının yüksek olabileceęi öngörülen aynı zamanda önemli oranlarda verimde azalma olmaksızın uygulanabilecek “**Yarı Islatmalı Sulama**” teknięinin kullanılması önerilir.

**ÖZET**

Afyonkarahisar, 3. Gastronomi şehri olup birçok yöresel ürünü bulundurmaktadır. Bunlardan biri de velensedir. Velense, buğday unundan yapılan bir çeşit makarnadır. Bu makarnanın üretiminde, buğday unu, yumurta ve su karıştırılarak elde edilen hamur oklava ile açılır ve üçgen şeklinde kesilmektedir. Bu çalışmanın amacı, yöresel bir ürün olan velenseyi tanıtmak ve sayısı gün geçtikçe artan çölyak hastalarına raf ömrü uzun ve besleyici kalitesi yüksek yeni bir ürün kazandırmaktır. Bu çalışmada glutensiz olan chia, kinoa ve nohut unu kullanılmıştır. Buğday unundan kontrol örneği hazırlanmıştır. Üretimde bu hammadelerin yanında sıcak su kullanılmıştır. Bunun nedeni nişasta jelatinizasyonunu sağlayarak dağılmayan bir hamur oluşturmaktır. Elde edilen hamurlar açılarak bıçakla kesilmiştir. Kurutma, oda sıcaklığında 1 gün boyunca sürmüştür. Kurutulmuş velenseye pişme süresi, pişme kaybı, su absorpsiyonu ve hacim artışı analizleri yapılmıştır. Glutensiz undan yapılan velense makarnaların pişme kaybı kontrole kıyasla artmış, su absorpsiyonu ve hacim artışı değerleri azalmıştır. Literatürdeki glutensiz makarnalara ait veriler incelendiğinde bu değerlerin kabul edilebilir düzeyde olduğu belirlenmiştir.

**Anahtar kelimeler:** Velense, glutensiz, chia, kinoa, nohut

**GLUTEN-FREE PRODUCTION AND COOKING PROPERTIES OF VELENSE,  
A LOCAL PRODUCT OF AFYONKARAHİSAR****ABSTRACT**

Afyonkarahisar is the 3rd city of gastronomy and has many local products. One of them is velense. Velense is a type of pasta made from wheat flour. In the production of this pasta, the dough obtained by mixing wheat flour, egg and water is rolled out with a rolling pin and cut into triangles. The aim of this study is to introduce velense, a local product, and to provide a new product with a long shelf life and high nutritional quality to celiac patients, the number of which is increasing day by day. In this study, gluten-free chia, quinoa and chickpea flours were used. A control sample was prepared from wheat flour. In addition to these raw materials, hot water was used in production. The reason for this is to form a dough that does not fall apart by providing starch gelatinization. The dough obtained was rolled out and cut with a knife. Drying took place for 1 day at room temperature. Cooking time, cooking loss, water absorption and volume increase analyzes were performed on the dried velense. Cooking loss of velense pasta made from gluten-free flour increased compared to control, and water absorption and volume increase values decreased. When the data of gluten-free pasta in the literature were examined, it was determined that these values were at an acceptable level.

**Keywords:** Velense, gluten-free, chia, quinoa, chickpea

## 1. GİRİŞ

Protein ve enerji kaynağı olarak beslenmemizde büyük bir yeri olan hububat ve hububat ürünleri, bazı kişilerde hastalıklara neden olabilmektedir. Çölyak hastalığı da bunlardan biri olup glutene karşı hassasiyet yüzünden oluşan bir bağırsak emilim bozukluğudur. Genel bir kural olarak çölyak hastalarının buğday, çavdar, arpa, tritikale ve yulaftan kaçınmaları gerekir. Diğer tahıllar (mısır, pirinç, millet ve sorgum gibi) ve tahıl benzerleri (pseudo-tahıllar: amarant, quinoa) güvenilir hammaddeler arasındadır. Glutensiz bir diyet çölyak hastalığının tedavisinde etkin rol oynamaktadır (Anand ve ark., 1978; Campbell, 1982; Janatuinen ve ark., 1995; Luchetti ve DeVincenzi, 1995; Hallert ve ark., 1999).

Bu beş tahılın çölyak hastaları üzerine etkisi ince bağırsakta olmaktadır. İnce bağırsağın epitelyumundaki çıkıntılar (villi) absorplamanın yapılacağı yüzeyi arttırmaları. Buğday ürünleri başta olmak üzere bu tahılların vücuda alınmasıyla villiler kısalmaya başlamakta ve absorplamanın yapılacağı yüzeyin küçülmesiyle absorplanan besin miktarı azalmaktadır. Çölyak hastalığının henüz bilinen bir tedavisi mümkün değildir. Ancak glutensiz bir diyet tedavide etkin rol oynamaktadır. Diyetteki gluten uzaklaştırıldığında ise bağırsak mukozası yeniden düzelmektedir (Lorenz ve Lee, 1977; Anand ve ark., 1978; Luchetti ve DeVincenzi, 1995).

Son yıllarda gıda üreticileri çölyak hastalarının beslenme gereksinimlerini karşılayabilmek için gluten içermeyen gıdaların üretimine yönelmişlerdir. Gluten içermeyen amarant gibi pseudo-tahıllar, mısır unu, pirinç unu, patates unu ve nişastası, soya ve diğer baklagil unları gıda formülasyonlarında bu amaçla kullanılabilir. Ancak bu kezde bu tip gıdalarda gerekli ağ yapının oluşmasını sağlayan gluten fraksiyonunun yerine formülasyona girecek, alışılmalı kaliteyi sağlayan ve aynı zamanda ekonomik olan hammaddelerin aranması gündeme gelmektedir.

Ülkemizde çölyak hastaları genellikle ev yapımı glutensiz gıdalarla beslenmektedir. Bu gıdalar çoğunlukla gluten içermeyen ve protein içeriği açısından buğdaya çok benzeyen pirinç ve mısır kaynaklıdır. Oysa bugün birçok ülkede bu hasta grubu için ekmek, makarna gibi ticari hububat ürünlerine rastlamak mümkündür. Türkiye'de uzun süre ihmal edilen Çölyak hastaları için gıda üretiminde ilk atılımlar günlük tüketimi daha çok olan ekmek üzerine olmuştur. Ekmeğin bayatlama sürecinin kısa olduğu düşünülürse sadece üretimin yapıldığı merkezin yakınındaki çölyaklı bireyler üretilen bu ekmekten faydalanabilmektedir. Bu hastalar için geliştirilen ürünlerin kontrollü koşullarda üretilmesinin gerekliliği başka merkezlerde üretimi

güçleştirmektedir. Buna karşın birçok ülkede çölyak hastaları için makarna, erişte ve bisküvi gibi ticari olarak üretilen diğer bazı gıdalar da mevcuttur.

Glutensiz eriştenin raf ömrünün uzun olması ve kontrollü şekilde bir merkezde üretilerek diğer bölgelere rahatlıkla ulaştırılabilme olanağı ile Çölyaklı bireylerin beslenmesinde iyi bir seçenek oluşturmaktadır. Ancak bu ürünler için formülasyon geliştirilirken asıl hammadde olan buğday ununun tamamen terk edilme zorunluluğu istenilen gluten ağ yapısının yerini tutacak yeni hammadde veya katkıların araştırılmasını zorunlu kılmaktadır. Ancak buğday dışındaki pirinç, mısır, sorgum gibi gluten içermeyen tahıllardan yapılan ürünlerde vizkoelastik bir hamur elde edilememekte ve hamur dağılmaktadır. Mevcut sorunları gidermek amacıyla bu tahıllardan elde edilen unlara ısıtma işlemi uygulanmakta veya çeşitli gıdalar ilave edilmektedir.

Erişte yapımında hammadde olarak pirinç unu kullanıldığında, bir miktar nişasta jelatinizasyonuna ihtiyaç duyulmaktadır. Çünkü pirinç proteini ile buğday gluteni farklı özelliktedir. Elde edilen hamurların reolojik özellikleri farklıdır. Pirinç unundan bütünlük gösteren (kohesif) homojen bir hamur elde edilemez. Buradaki jelatinize nişastanın rolü bağlayıcı ajan olmasıdır. Erişteelerde yüzey jelatinizasyonu oluşturmak için kaynar suya daldırma veya buhar tutma işlemi uygulanmaktadır. Erişteye gam gibi stabilizatörler ve emülsifiye edici ajanlar da eklenebilmektedir. Bu maddelerin kullanım nedeni, eriştede sıkı yapı eldesi, yapışkanlığın azalması ve nişastanın yapıda daha iyi tutulmasını sağlamaktır (Lai, 2001). Bir çalışmada amilotip mısır nişastasası ile mumsu mısır nişastasası kullanılarak bu nişastaların makarna pişme kalitesi üzerine etkisi araştırılmıştır. Amilotip mısır nişastasasının makarnada daha sıkı yapı oluşturduğu, mumsu mısır nişastasasının ise makarnada istenen tekstürü sağlamadığı gözlenmiştir (Dexter ve Matsuo, 1979). Bir çalışmada pirinç makarnasının kalitesi üzerine pirinç özellikleri ve emülsifiye edici ajanların etkisi araştırılmıştır. Çalışmada iki çeşit pirinç unu (yüksek amiloz içerikli pirinç unu, düşük amiloz içerikli pirinç unu) kullanılmıştır. Emülsifiye edici ajan olarak GMS (gliseril monostearat) ve ticari emulgatör (KM3000) kullanılmıştır. Bunun için pirinç unu bir gece suda bekletilerek %40 neme çıkarılmış daha sonra pirinç ununa 85°C'de 10 dakika buharla ısıtma işlemi uygulanmış ve emülsifiye edici ajan ilave edilmiştir. Daha sonra hamura makarna şekli verilip 50°C'de 1 saat ardından da 35°C'de 6 saat süreyle kurutulmuştur. Bu şekilde üretilen makarnaların kalite özellikleri incelenmiştir. GMS, yüksek amiloz içerikli makarnanın pişme özelliklerini geliştirmiş, pişme kaybını düşürüp, pişme ağırlığını artırmıştır. Pirinç makarnasına kurutmadan önce buhar uygulanması da pişme özelliklerini geliştirmiştir. Düşük amiloz içerikli pirinç unundan hazırlanan makarnada ise iyi

sonuç alınmamıştır. GMS katılan makarnanın renginin krem renginde, KM3000 katılan makarnanın renginin ise sarımsı renkte olduğu gözlenmiştir. Bunlara buhar uygulandığında renk koyulaşmıştır. GMS kullanımı makarnada yapışkanlığı da azaltmıştır (Lai, 2001).

Marti et al. (2010), 50°C'de geleneksel ve 115°C'de sıcaklıkta ekstrüzyon pişirmenin pirinç makarnasının kalite parametreleri üzerine etkilerini araştırdı. Bu çalışmada, ekstrüzyon pişirme ile hazırlanan pirinç makarnasının geleneksel yolla üretilen pirinç makarnasından daha düşük pişirme kaybı ve daha yüksek sertlik gösterdiği belirlenmiştir. Yalçın ve Basman (2008a), pirinç unundan glutensiz erişte üretmiş ve bu eriştelerin kalite karakteristikleri üzerine ksantan ve keçiyoynuzu gamının etkisini araştırmıştır. Ksantan gam içeren pirinç eriştesi daha iyi pişirme ve duysal özellikler göstermiştir. Keçiyoynuzu gamı içeren erişte, daha yüksek sertlik değeri göstermiştir. Yalçın ve Basman (2008b) mısır eriştesinde duysal ve pişirme kalitesi üzerine %80 jelatinizasyon seviyesinin daha iyi sonuç verdiğini göstermiştir. Yalçın (2021) karabuğday unundan erişte üretmiş, nişasta oranı arttıkça eriştelerin pişme kalitesinin arttığı belirlenmiştir.

## **2. MATERYAL VE METOT**

### **2.1. Materyal**

Çalışmada kinoa, chia taneleri ve nohut ve buğday unu kullanılmıştır. Bunlar marketten alınmıştır. Taneler, kahve değirmeninde (Bosch) öğütülmüş ve elenmiştir.

### **2.2. Üretim**

100 g una 10 g yumurta 50 ml sıcak su ilave edilmiş ve yoğurma makinasında (Essenso, Türkiye) 5 dak yoğurulmuştur. Elde edilen hamur oklava ile açılmıştır. Açılan hamur üçgen şeklinde kesilmiştir. Oda sıcaklığına 1 gün boyunca kurutulmuştur.

### **2.3. Analiz**

10 g velense örnekleri 100 ml kaynar suda pişirilerek pişme süresi belirlenmiştir. Bu amaçla ısıtıcı kullanılmıştır.

## **3. SONUÇ**

Farklı unlar kullanılarak elde edilen glutensiz velense örnekleri pişerken dağılmamış ve buğday unundan yapılan velense örneğine yakın kalite özellikleri göstermiştir.

**ÖZET**

Afyonkarahisar’da manda yetiştiriciliği oldukça yaygın olduğundan bu durum şehrin yöresel ürünlerine de yansımıştır. Burada manda sütü birçok üründe kullanılmaktadır. Bu çalışmanın amacı besleyici kalitesi yüksek olan manda sütünü inek sütü yerine ve manda kaymağını yağ yerine bisküvi üretiminde kullanmak ve yeni bir ürün geliştirmektir. Bu çalışmada bisküvi üretiminde manda sütü ve yağ yerine 3 farklı oranda manda kaymağı kullanılarak bisküvi üretilmiş ve bu örneklerin ağırlığı, kalınlığı, çapı, yayılma oranı ve duyusal analizi belirlenmiştir. Ayrıca bu örneklerden elde edilen değerler inek sütü ve bitkisel yağ kullanılarak üretilen kontrol örneği ile kıyaslanmıştır. Duyusal analiz bu konuda eğitim almış 10 kişi tarafından gerçekleştirilmiştir. Duyusal analizde görünüm, şekil, lezzet, yapı, kırılma, çiğneme ve genel kabul incelenmiştir. 5 puanlı hedonik test, 1'den (aşırı derecede beğenmeme) 5'e (aşırı derecede beğenme) kadar sıralanmıştır. Panelistlerin verdiği puanların ortalaması alınarak grafik çizilmiştir. Bu grafiğe göre manda sütü ve yağın tümü yerine manda kaymağı (%100) kullanılarak üretilen bisküvi en yüksek puanı almıştır. Bütün örneklerin puanı 3 den yüksek olduğundan hepsi kabul edilebilir düzeydedir.

**Anahtar kelimeler:** Bisküvi, duyusal, kaymak, süt, yağ

**SENSORY CHARACTERISTICS OF BISCUITS PRODUCED USING BUFFALO MILK AND CREAM****ABSTRACT**

Since buffalo breeding is quite common in Afyonkarahisar, this situation is also reflected in the local products of the city. Here, buffalo milk is used in many products. The aim of this study is to use buffalo milk with high nutritional quality instead of cow's milk and buffalo cream instead of fat in the production of biscuits and to develop a new product. In this study, biscuits were produced by using buffalo milk and 3 different ratios of buffalo cream instead of fat, and the weight, thickness, diameter, spread ratio and sensory analysis of these samples were determined. In addition, the values obtained from these samples were compared with the control sample produced using cow's milk and vegetable fat. Sensory analysis was carried out by 10 people trained in this field. In sensory analysis, appearance, shape, flavor, structure, fracture, chewiness and overall acceptance were examined. The hedonic test with 5 point scale ranged from 1 (dislike extremely) to 5 (like extremely). The graph was drawn by taking the average of the scores given by the panelists. According to this graph, the biscuit produced by using buffalo milk and buffalo cream instead of whole fat (100%) got the highest score. Since all samples have a score higher than 3, all of them are at an acceptable level.

**Keywords:** Biscuit, sensory, cream, milk, fat

## 1. GİRİŞ

Manda sütü, enerji açısından yüksek yağ içeriği nedeniyle inek sütüne göre daha değerlidir (Coroian ve ark., 2019). Manda sütü, inek sütüne kıyasla daha yüksek yağ, laktoz, protein (özellikle kazeinler) ve kalsiyum, magnezyum ve inorganik fosfat gibi mineraller içerir (Ahmad ve ark., 2008). Manda sütü, anti-kanserojen olarak kabul edilen ve obezite, damar sertliği ve diyabet gibi sağlık sorunları üzerinde yararlı etkileri olan linolenik asidi daha yüksek oranda içerir (Lopes Oliveira, 2004). Manda sütü daha yüksek viskoziteye, pıhtılaşmaya ve pH'a sahiptir (Ganguli, 1992).

Yağ bisküvilerin tekstür, aroma ve algısından sorumlu olan önemli bir katkıdır (Zoulias ve ark., 2002). Bisküvi üretiminde kullanılan yağ yüksek oranda doymuş yağ asitleri içerdiğinden yapıya katılık vermektedir. Fakat sağlık sorunlarında dolayı bisküvide düşük oranda doymuş yağ istenmektedir (Tarancon ve ark., 2015). Yüksek yağ içeriği obezite, kanser, kolesterol ve kalp rahatsızlıkları gibi hastalıklara neden olmaktadır (Akoh, 1998). Bu sebepten dolayı bisküvide yağ ikame ediciler kullanılabilir. Bisküvide yağ ikame ediciler kullanılabilmektedir.

Sudha ve ark. (2007) yağ ikame edicilerin bisküvi kalitesine etkisini araştırmıştır. Bisküvideki yağ %6, 8, 10 ve 20 oranlarında azaltılmıştır. Bisküvi yağının azaltılması bisküvi testürünü olumsuz yönde etkilemiştir. Bisküvi yağı yerine maltodekstrin kullanıldığında bisküvi tekstürü gelişmiştir. Swanson ve Munsayac (1999) kurabiyeye yağ yerine meyve püresi ilave edince yayılma oranının azaldığını bildirmiştir. Swanson (1998), yağ ikame maddeleri (oatrim, karışım, polidekstroz) ile hazırlanan kurabiyelerin kontrolden daha az kırılabilir ve daha yumuşak olduğunu bildirmiştir. Adair ve ark. (2001) kurabiyeye yağ yerine maş fasulyesi ezmesi katmış, bunun kurabiye yayılmasını azalttığını bildirmiştir. Tarancón ve ark. (2015) bisküvi formülasyonunda doymuş yağ yerine zeytinyağı veya ayçiçek yağı kullanmış ve bisküvilerin duyusal özellikleri üzerindeki etkisi araştırmıştır. Yağ ikamesi, az yağlı bisküvilerde (%10,6) kabul edilebilirlikte azalmaya neden olurken, yüksek yağlı bisküvilerde (%15,6) kabul edilebilirlikte önemli değişikliklere neden olduğu bildirilmiştir. Tüketicilerin %48'i doymuş yağ içeren bisküviyi tercih ederken, %24'ü hem zeytinyağı hem de doymuş yağ içeren bisküvileri ve tüketicilerin %28'i bitkisel yağlı bisküvileri tercih etmiştir. Tarancón ve ark. (2014) zeytinyağı veya ayçiçek yağı içeren bisküvilerin etiket bilgileri sağlıklı algısını artırmış ve daha yüksek hedonik sonuç vermiştir. Biguzzi ve ark. (2014), bisküvilerde şeker ve yağ azaltımının yemek yeme algısı ve beğenisi üzerindeki etkisini araştırmışlardır. Bisküvilerde yağ azaltımının şeker azaltımına göre daha kabul edilebilir olduğu bildirilmiştir. Zoulias ve ark.

(2002) yağın %50'sini karbonhidrat bazlı veya protein bazlı yağ ikame maddeleri ile değiştirdi ve bu değiştirmenin kurabiyelerin tekstürel özellikleri üzerindeki etkisini araştırmıştır. Yağ ikamesi kurabiyelerin sertliğini ve kırılma dayanıklılığını artırmıştır. Yalçın (2017) bisküvideki yağ içeriğini azaltmak için bisküvi formülasyonunda yağ yerine öğütülmüş sarı haşhaş tohumunu kullanmış (%25, %50, %75 veya %100) ve bisküvilerin fiziksel özellikleri ve toplam fenolik içerikleri üzerindeki etkisini incelemiştir. Yağ ikame edici oranı arttıkça bisküvilerin ağırlığı, yayılma oranı ve toplam fenolik madde içeriği artmıştır.

## **2. MATERYAL VE METOT**

### **2.1. Materyal**

Buğday unu, karbonat, tuz, esmer şeker, pudra şekeri, margarin, süt ve kaymak marketten alınmıştır.

### **2.2. Bisküvi Hazırlanışı**

0.6 g karbonat, 0.5 g tuz, 12.8 g pudra şekeri, 4 g esmer şeker, 9.2 ml süt ve 16 g margarin yoğurucuda (Essenso, Türkiye) 3 dak karıştırılır. 40 g un ilave edilerek 1 dak karıştırılır. Kontrol örneği elde edilir. Hamur oklava ile açılık ve kalıp ile yuvarlak şekil verilir. Fırında 205 C de 9 dak. Pişirilir. Diğer örneklerde margarin yerine %25, 50, 75 ve 100 oranında kaymak katılmıştır.

### **2.3. Duyusal analiz**

Duyusal analiz bu konuda eğitim almış 10 kişi tarafından gerçekleştirilmiştir. Duyusal analizde bisküvilerin görünüm, şekil, lezzet, yapı, kırılma, çiğneme ve genel kabul edilebilirlik özellikleri incelenmiştir.

## **3. SONUÇ**

Bisküvide kaymak oranı arttıkça puanlar artmıştır. Sonuçlara göre manda sütü ve yağın tümü yerine manda kaymağı (%100) kullanılarak üretilen bisküvi en yüksek puanı almıştır. Bütün örneklerin puanı 3 den yüksek olduğundan hepsi kabul edilebilir düzeydedir.

**AKSARAY EKOLOJİK KOŞULLARINDA YETİŞTİRİLEN BAZI KURU FASULYE  
GENOTİPLERİNİN KALİTE ÖZELLİKLERİNİN BELİRLENMESİ ÜZERİNE BİR  
ARAŞTIRMA**

**Doç. Dr. Ömer SÖZEN (Orcid ID: 0000-0001-5528-7887)**

Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi

**ÖZET**

Güney Amerika orjinli olan kuru fasulye, insan beslenmesinde içermiş olduğu yüksek protein içeriği ile önemli bir baklagil bitkisidir. Yemelik baklagiller içinde dünyada ekim alanı ve üretim bakımından ilk sırada yer alan kuru fasulyede ülkemizde ekim alanları ve üretim bakımından ise ciddi düşüşler yaşanmaktadır. Yetiştiriciliğini yaptıkları kuru fasulyede çiftçiler için alınacak yüksek verim önemli olsa da son yıllarda üreticiye kalite içeriği yüksek ürünlerin sunulması da önem arz etmeye başlamıştır. Nitekim verimi yüksek çeşitlerin geliştirilmesi yanında kalite içeriği yüksek çeşitlerin de geliştirilmesi ıslah çalışmalarında yer almaya başlamıştır. Yürütülen bu araştırmada 5 adet kuru fasulye çeşidi (Yunus 90, Göynük 98, Önceler 98, Zülbiye, Akman 98) ile Orta Kızılırmak Vadisi'nden toplanılarak saf hat seleksiyon yöntemi ile ileri düzeye kadar getirilmiş 25 adet kuru fasulye genotipi olmak üzere 30 adet kuru fasulye genotipinin 2020 yılında Aksaray ekolojik koşullarında kalite özellikleri (su alma kapasitesi, su alma indeksi, şişme kapasitesi, şişme indeksi, kabuk oranı ve protein oranı) açısından karşılaştırılması amacıyla yürütülmüş olup yürütülen çalışma, tesadüf blokları deneme desenine göre dört tekerrürlü olarak kurulmuştur. Yapılan varyans analizi sonuçlarına göre ele alınan kalite özellikleri içinde şişme kapasitesi ve şişme indeksi hariç tüm özellikler bakımından kuru fasulye genotipleri arasında istatistiksel anlamda önemli farklılıklar belirlenmiştir. Yürütülen çalışmada en yüksek protein oranı %24.87 ile G.237/4 kuru fasulye genotipinde belirlenirken en düşük protein verimi ise %21.55 ile G.215/1 kuru fasulye genotipinde belirlenmiştir.

**A RESEARCH ON THE DETERMINATION OF THE QUALITY  
CHARACTERISTICS OF SOME DRY BEAN GENOTYPES GROWN IN AKSARAY  
ECOLOGICAL CONDITIONS****ABSTRACT**

Dry beans originating from South America is an important legume plant with its high protein content in human nutrition. Among the edible legumes, dry beans, which ranks first in the world in terms of cultivation area and production, are experiencing serious decreases in terms of cultivation areas and production in our country. Although the high yield to be obtained for the farmers in the dry beans they grow is important, it has become important to offer products with high quality content to the producers in recent years. As a matter of fact, in addition to the development of high-yielding varieties, the development of varieties with high quality content has started to take place in breeding studies. In this research, 30 dry beans, including 5 dry bean varieties (Yunus 90, Göynük 98, Önceler 98, Zülbiye, Akman 98) and 25 dry bean genotypes collected from the Middle Kızılırmak Valley and brought to an advanced level by pure line selection method. genotype in Aksaray ecological conditions in 2020 in terms of quality characteristics (water absorption capacity, water absorption index, swelling capacity, swelling index, seed coat ratio and protein ratio). The study was set up in a randomized block design with four replications. According to the results of the analysis of variance, statistically significant differences were determined between the dry bean genotypes in terms of all characteristics except swelling capacity and swelling index among the quality characteristics. In the study carried out, the highest protein rate was determined in the G.237/4 dry bean genotype with 24.87%, while the lowest protein yield was observed in the G.215/1 dry bean genotype with 21.55%.

**Keywords:** Aksaray, Dry bean, Genotype, Quality, Protein

## 1. GİRİŞ

İnsan beslenmesinde, hayvansal proteinler önemli olmasına rağmen gerekli olan hayvansal proteinin sağlanamadığı yerlerde biyolojik olarak tamamlayacak bitkisel proteinlere gerek duyulmaktadır. Ayrıca hayvansal proteinler önemli protein kaynakları olmalarına rağmen yüksek maliyetli olmaları, saklanmalarının zor olması ve çabuk bozulmaları ile bazı bölgelerde insanların et yememeleri gibi bazı nedenler kolay üretilip saklanabilen ve ucuza mal edilebilen bitkisel proteinlerin önemini ortaya çıkarmaktadır.

Dünyanın en geniş üç familyasından birisi olan baklagiller (*Leguminosae*), besin kaynaklarının ve özellikle de enerji, protein, vitamin ve mineral yönünden zengin olması nedeniyle dünyadaki açlığa, yeterli ve dengeli beslenmeye çözüm olarak görülmektedir. Baklagiller diyetel lifler içermekle beraber yemeklik tane baklagiller arasında en fazla kuru fasulyede %28 oranında diyetel lif bulunmaktadır. Kuru fasulyenin lifli yapıda olması sindirimi kolaylaştırır, kabızlık şikâyetlerine iyi gelir. Bu durum diyet listelerinin vazgeçilmezi olmasının yanında vejetaryen beslenmesinde de protein sağladığı için tercih edilir olmuştur.

Baklagiller içerisinde yer alan kuru fasulye, dünyada en fazla ekim alanına sahip ürün olmasının yanı sıra dünyada 126 ülkede yetiştirilmektedir. Daha çok Asya ve Amerika kıtasında yetiştirilen kuru fasulye ekim alanları 1980-2000 yılları arasında 25 milyon ha düzeyinde iken son 20 yılda %33 artış göstererek 33 milyon ha düzeyine ulaşmıştır. Kuru fasulye; 2021 yılı itibariyle yemeklik tane baklagil ekim alanlarının %43.6'sını, üretimin ise %37.3'ünü oluşturmakta olup 2021 yılı itibariyle 33 milyon ha alanda 28.9 milyon ton kuru fasulye üretilmiştir. Buna karşın ülkemizde toplam 24.3 milyon hektar olan tarım alanının yaklaşık 900 bin hektarında yemeklik tane baklagil ekilmekte olup bunun karşılığında yaklaşık 1.25 milyon ton üretim yapılmaktadır. Ülkemizde en fazla ekilen yemeklik tane baklagiller sırasıyla nohut, mercimek, kuru fasulye, bakla, börülce ve bezelye olmuştur (Anonim 2021). 2021 yılı üretim döneminde Türkiye'de kuru fasulye üretimi yaklaşık 102 bin ha alanda gerçekleşmiş olup bu alanların yaklaşık %51'ini İç Anadolu Bölgesi ile %7.4'ünü Doğu Anadolu Bölgesi izlemektedir. Buna karşın üretim bakımından 265 bin ton olarak gerçekleşen Türkiye kuru fasulye üretiminin %65.2'si İç Anadolu Bölgesi'nden karşılanmaktadır (Anonim, 2021).

Kalite içeriği yüksek tane verimini ortaya koymak, yemeklik tane baklagiller içinde yer alan tüm türlerde temel amaç olarak görülmektedir. Bu temel amacı ortaya koyabilmek içinde bölge iklim şartlarına uygun koşullarda agronomik çalışmaları iyi uygulayarak verimi yüksek çeşit/çeşitler yetiştirilmek zorunda olmakla birlikte Aksaray ilini de içine alan İç Anadolu

Bölgesi'nde sertifikalı tohum kullanımının az olduğu buna karşın daha çok yerel popülasyonların kullanıldığı aşikârdır.

Yemelik tane baklagillerde besleme değeri bakımından kalite bileşenleri üç ana başlıkta toplanabilir ki bunlar sırasıyla tüketicinin dikkate aldığı faktörler, besleme değerini olumlu yönde etkileyen faktörler ve besleme değerini olumsuz yönde etkileyen faktörlerdir (Pekşen ve Artık, 2005). Beslenme açısından taşıdığı önem nedeniyle yetiştirildiği bölgelerin iklim ve toprak özelliklerine adapte olabilecek, verimi ve teknolojik özellikleri bakımından daha iyi olan kuru fasulye çeşitlerinin geliştirilip ortaya çıkarılması ülkemiz insanının beslenmesi açısından önem taşımaktadır.

Bu çalışma ile Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş olan kuru fasulye çeşitleri ile TAGEM projesi kapsamında Orta Kızılırmak Vadisi'nden toplanarak ileri düzeye kadar getirilmiş kuru fasulye genotiplerinin kalite parametrelerinin belirlenmesi amaçlanmıştır.

## **2. MATERYAL ve METOT**

Araştırmanın tarla denemeleri, 2020 yılı kuru fasulye vejetasyonu döneminde Aksaray il merkezinde yer alan Koçaş Tarım İşletmesi Müdürlüğü'nün ıslah araştırmaları deneme arazisinde yürütülmüştür. Araştırma yerinin denizden yüksekliği 980 m olup 38° 28' kuzey enlem ve 33° 50' doğu boylam dereceleri arasında yer almaktadır.

**Şekil 1.** Araştırmanın yürütüldüğü deneme arazisi

### **2.1. MATERYAL**

Araştırmada, Kırşehir Ahi Evran Üniversitesi tarafından 2016 yılında TAGEM'e sunulan ve TAGEM/16 /AR-GE/55 kod numarası ile kabul edilen "Orta Kızılırmak Vadisi Yerel Kuru Fasulye Popülasyonlarının Morfolojik ve Moleküler Karakterizasyonu İle Kök Lezyon Nematoduna Karşı Dayanımlı Genotiplerin Belirlenmesi" isimli proje kapsamında 8 ilin (Aksaray, Ankara, Çankırı, Kayseri, Kırıkkale, Kırşehir, Nevşehir, Sivas) ilçe, belde ve

köylerinden toplanarak morfolojik karakterizasyonları ve tanımlamaları gerçekleştirilmiş 661 yerel kuru fasulye alt örneği içinden saf hat seleksiyon yöntemi ile seçilmiş 25 adet yerel kuru fasulye genotipi ile ülkemizde Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş 5 adet kuru fasulye çeşidi olmak üzere 30 adet kuru fasulye genotipi kullanılmıştır. Çalışmada yer alan yerel kuru fasulye genotiplerinin toplandığı il, ilçe ve köylere ait bilgiler ile yine araştırmada kullanılan standart çeşitlere ait bazı bitkisel özellikler Çizelge 1 ve 2’de verilmiştir.

**Çizelge 1.** Yerel kuru fasulye genotiplerinin toplandığı il, ilçe ve köyler

## 2.2. DENEME ALANININ İKLİM ve TOPRAK ÖZELLİKLERİ

### *İklim Özellikleri*

Aksaray ili merkezinde yer alan Koçaş Tarımsal İşletme Müdürlüğünün kuru fasulye yetiştirme dönemine ait uzun yıllar ortalaması (2005-2019) ile araştırmanın yürütüldüğü 2020 yılının meteorolojik değerleri Çizelge 3’de verilmiştir.

**Çizelge 3.** Aksaray iline ait uzun yıllar (2005-2019) ile 2020 yılına ait iklim değerleri

Aylar	Ortalama Sıcaklık (°C)		Toplam Yağış (mm)		Ortalama Nispi Nem (%)	
	2005-2019	2020	2005-2019	2020	2002-2019	2020
Mayıs	16.1	16,8	37.3	43,5	51.4	50.1
Haziran	19.7	21.0	31.4	18.00	47.5	47.3
Temmuz	23.3	21.9	2.9	0	48.9	46.3
Ağustos	23.4	24.6	5.2	0	47.1	44.1
Eylül	19.1	22.1	11.00	8.00	47.3	45.7
Toplam	-	-	87.9	69.5	-	-
Ortalama	20.3	21.3			48.4	46.7

Çizelge 3 incelendiğinde uzun yıllar ortalaması ile 2020 yılına ait aylık sıcaklık ortalamaları arasında aylar bazında büyük bir farkın olmadığı görülmektedir. Uzun yıllar ortalaması en düşük aylık sıcaklık ortalamasının 16.1 °C ile Mayıs ayında, en yüksek aylık sıcaklık ortalamasının ise 23.4 °C ile Ağustos ayında olduğu görülmektedir. 2020 yılına ait deneme periyodunda bu değerler sırasıyla 16.8 °C ile Mayıs ve 24.6 °C ile Ağustos aylarında görülmüştür. Bununla birlikte 2020 yılı aylık toplam yağış değerlerinde Mayıs (43.5 mm) ayı toplam yağış miktarının uzun yıllar ortalamasının üstünde olduğu diğer ayların ise uzun yıllar ortalamasının altında seyrettiği, aylık ortalama nispi nem değerlerine bakıldığında ise uzun yıllar ortalama değerleri ile 2020 yılının birbirine yakın değerler gösterdiği görülmektedir.

### *Toprak özellikleri*

Toprak yüzeyinin temizlenmesiyle açılan “v” şeklindeki çukurdan 5 cm kalınlığında 30 cm’lik toprak deneme arazisini temsil edecek şekilde farklı yerlerden alınarak harmanlanmış ve harmanlanan toprak örneğinden 1.5 kg toprak bir torba içinde Tarım İşletmeleri Genel Müdürlüğü Toprak Analiz Laboratuvarında analiz ettirilmiştir. Deneme arazisinin kimyasal ve fiziksel yapılarına ilişkin toprak özellikleri Çizelge 4’de verilmiştir. Araştırmanın yürütüldüğü deneme arazisinin toprak özellikleri değerlendirildiğinde deneme yeri toprağının hafif alkali, organik maddesinin az, alınabilir fosfor ve potasyum bakımından yeterli, tuz içeriğinin tuzlu ve kireç içeriğinin ise kireçli olduğu belirlenmiştir.

**Çizelge 4.** Deneme yeri toprağına ait fiziksel ve kimyasal özellikleri

Yıllar	Derinlik	pH	Toplam Tuz (%)	Kireç (% CaCO <sub>3</sub> )	Organik Madde (%)	Fosfor (P <sub>2</sub> O <sub>5</sub> )	Potasyum (K <sub>2</sub> O)
2020	0-30 cm	7,83	0,07	15,43	1,01	8,02	163,29

### 2.3. METOT

Araştırmanın yürütüldüğü Koçaş Tarım İşletmesi Müdürlüğüne ait deneme arazisinin ön bitkisi arpa olup arpanın hasadı sonrasında deneme arazisi sonbaharda pullukla sürülerek kış yağmurlarına bırakılmıştır. Ekimler gerçekleştirilmeden önce çalışmanın yürütüldüğü deneme arazisine önce diskaro sokularak yabancı otlardan temizlenmiş ardından rotovator aleti ile ekim için hazırlanmıştır. Yürütülen araştırma, tesadüf blokları deneme deseninde 4 tekerrürlü olacak şekilde kurulmuş olup parseller 5.0 m x 2.0 m= 10.0 m<sup>2</sup> ebatlarına sahiptir. 25 adet yerel kuru fasulye genotipi ile 5 adet standart çeşit olmak üzere toplam 30 adet genotipin parsellere dağıtımını tesadüfi olarak gerçekleştirilmiştir. Denemenin ekimleri 12 Mayıs 2020 tarihinde tavlı toprağına gerçekleştirilmiştir. Ekimler 50 cm sıra aralığında 8-10 cm sıra üzerinde markörle açılan sıralara 3-5 cm derinliğe elle yapılmıştır. Her parsel 4 sıradan oluşmuştur. Yabancı otlarla mücadele etmek üzere ekim sonrası çıkış öncesi aktif maddesi “*pendimethalin*” olan etkili yabancı ot ilacı uygulanmış ve vejetasyon süresince gerekli duyulduğu kadar el çapası yapılmıştır. Denemenin sulama ihtiyacını karşılamak üzere damlama sulama sistemi kurulmuş ve tüm vejetasyon boyunca ihtiyaç duyulduğu dönemlerde sulama gerçekleştirilmiştir.

Deneme alanına ekimle beraber dekara 15 kg DAP (2.7 kg N/da ve 6.9 kg P<sub>2</sub>O<sub>5</sub>/da) gübresi uygulanmıştır. Araştırmanın yürütüldüğü deneme alanındaki genotiplerin hasadı, hasat uygunluğuna ulaştıkları dönem aralığı olan 25 Ağustos - 15 Eylül tarihleri arasında el ile yapılmıştır. Dörder sıradan oluşan her bir genotipten seçilerek hasat edilen bitkiler ayrı ayrı çuvallara konulup etiketlenerek hasat-harman sonrası gerekli ölçümler ve analizler yapılmak üzere Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümüne ait laboratuvara getirilmiştir. Hasat ve harman işlemleri yapıldıktan sonra her bir kuru fasulye genotipine ait 100'er adet tohumda laboratuvar koşullarında su alma kapasitesi (g/tane), su alma indeksi (%), şişme kapasitesi (ml/tane), şişme indeksi (%), kabuk oranı (%) ve protein oranı (%) olmak üzere 6 adet teknolojik parametre değerlendirilmiştir.

Araştırmadan elde edilen deneme sonuçları “JUMP 5.0” istatistik paket programında varyans analizine tabii tutulmuş olup önemlilik gösteren özelliklere ait ortalamaların karşılaştırılmasında “LSD Çoklu Karşılaştırma” testi kullanılmıştır.

### **3. ARAŞTIRMA VE BULGULAR**

#### **3.1. Su Alma Kapasitesi (g/tane)**

Farklı kuru fasulye genotiplerine ait su alma kapasitesi ortalamaları ile istatistik gruplandırmalar Çizelge 5’de verilmiş olup varyans analiz sonuçları değerlendirildiğinde kuru fasulye genotiplerinin su alma kapasitesi arasında ki farklar istatistiksel olarak çok önemli bulunmuştur. Çizelge 5 incelendiğinde kuru fasulye genotiplerine ait su alma kapasitesine ait değerlerin 0.281-0.487 g/tane arasında değişim gösterdiği görülmüş olup G-237/4 genotipinde su alma kapasitesi bakımından en yüksek (0.487 g/tane) değer elde edilmiştir. Bu genotipi sırayla Akman 98 (0.476 g/tane) ve G-277 (0.463 g/tane) genotipleri izlemiştir. G-076 genotipi ise 0.281 g/tane su alma kapasitesi değeri ile tüm genotipler içinde en son sırada yer alırken tüm genotiplerin su alma kapasite ortalamasının ise 0.4079 g/tane olduğu belirlenmiştir. Bu kalite parametresi üzerine yürütülen diğer çalışmalarda Cengiz (2007) 0.168-0.487 g/tane; Kınacı ve ark. (2008) 0.18-0.48 g/tane; Yılmaz ve ark. (2011) 0.14-1.25 g/tane, Özbekmez (2015) 0.146-0.809 g/tane ve Elkoca ve Çınar (2015) 0.179-1.144 g/tane değerlerine ulaşmışlardır. Su alma kapasitesi üzerine elde ettiğimiz bulguların verilen literatürlerle karşılaştırıldığında benzerlik gösterdiği görülmektedir. Su alma kapasitesi çimlenme için çok önemli bir özellik olduğundan üzerinde durulması gereken konuların başında gelmektedir.

**Çizelge 5.** Kuru fasulye genotiplerinin de saptanan teknolojik özelliklere ilişkin ortalama değerler ve oluşan istatistiksel gruplar

### 3.2. Su Alma İndeksi (%)

Su alma indeksi su alma kapasitesi ile birlikte değerlendirilmesi gereken önemli bir özellik olup tohumun suyu ne hızda aldığı çimlenme ve çıkış için önemlidir. Bitkinin toprak içinde uzun süre kalarak zarar görmemesi için bunun bilinmesi ve buna göre agronomik işlemlerin yapılması gerekir. İncelenen bu değer ıslah çalışmalarında kullanılacak bir karakter olarak karşımıza çıkmaktadır. Bu kapsamda farklı kuru fasulye genotiplerine ait su alma indeksi

ortalamaları ile istatistik gruplandırmalar Çizelge 5’de verilmiş olup su alma indeksi (%) değerlerine ilişkin varyans analiz sonuçları değerlendirildiğinde kuru fasulye genotiplerinin su alma kapasitesi arasında ki farklar istatistiksel olarak önemli bulunmuştur ( $P<0.05$ ). Kuru fasulye genotiplerine ait su alma indeksi değerlerinin %0.77-1.24 arasında değişim gösterdiği görülmüş olup ortalama su alma indeks değerinin ise %1.021 olduğu tespit edilmiştir. Önceler 98 genotipi su alma indeks değeri bakımından ilk sırada yer alırken bu genotipi Zülbiye (%1.22), G-237/4 (%1.18) ve Yunus 90 (%1.18) genotipleri izlemiş olup G-205/3 genotipinin ise %0.77 su alma indeks değeri ile tüm genotipler içinde son sırada yer aldığı ortaya konulmuştur. Su alma indeksinin belirlenmesi üzerine yürütülen diğer çalışmalarda da %0.257-1.390 aralığında değerlere ulaşılmış (Doğan ve ark., 2005; Shimelis ve Rakshit, 2005; Cengiz, 2007; Elkoca ve Çınar, 2015 ve Türkmen, 2020) olup çalışmada elde ettiğimiz bulguların yukarıda ifade edilen literatür değerleri ile büyük oranda uyum içerisinde olduğu görülmekle birlikte küçük farklılıklarının ise çeşit ve çevre koşullarının farklılık göstermesinden kaynaklandığı söylenebilir.

### **3.3. Şişme Kapasitesi (ml/tane)**

Şişme kapasitesi tohumun suyu almasıyla tohumun bünyesinde bulunan enzimleri aktive ederek biyolojik faaliyetleri çalıştırması açısından önemlidir. Bu kapsamda farklı kuru fasulye genotiplerine ait şişme kapasitesi ortalamaları ile istatistik gruplandırmalar Çizelge 5’de verilmiştir. Çizelge değerlendirildiğinde kuru fasulye genotiplerinin şişme kapasitesi arasında ki farklar istatistiksel olarak önemli bulunmuştur ( $P<0.05$ ). Çalışmada yer alan kuru fasulye genotiplerine ait şişme kapasite değerlerinin 0.317-0.547 ml/tane arasında değişim gösterdiği tespit edilmiştir. G-079 nolu genotip şişme kapasitesi bakımından tüm genotipler içinde ilk sırada yer alırken bu genotipi G-237/4 (0.538 ml/tane), Akman 98 (0.518 ml/tane) ve G-277 (0.510 ml/tane) genotipleri izlemiştir. G-017/2 nolu genotip ise şişme kapasitesi değeri olan 0.317 ml/tane ile son sırada kendine yer bulurken tüm genotiplere ait şişme kapasite ortalamasının ise 0.427 ml/tane olduğu ortaya konulmuştur. Kuru fasulyede 100 tane ağırlığı, yaş ağırlık ve su alma kapasitesi arasında sıkı bir ilişkinin olduğu, bu değerlerin artması ile birlikte şişme kapasitesinin de arttığı görülmektedir (Atlı ve ark., 1994). Farklı çeşit ve ekolojilere bağlı olarak yürütülen diğer çalışmalarda şişme kapasite değerlerinin 0.05-1.1 ml/tane arasında değiştiği ifade edilmekte (Cengiz (2007); Özçelik ve Sözen (2009); Çiftçi ve ark. (2011) ve Yılmaz ve ark. (2011)) olup şişme kapasitesi üzerine çalışmamızda elde edilen bulgular araştırmacıların elde ettiği bulgular ile benzerlik göstermektedir.

### **3.4. Şişme İndeksi (%)**

Farklı kuru fasulye genotiplerine ait şişme indeksi ortalamaları ile istatistik gruplandırmalar Çizelge 5’de verilmiştir. Çizelge değerlendirildiğinde kuru fasulye genotiplerinin şişme indeksi arasında ki farklar istatistiksel olarak çok önemli bulunmuştur ( $P<0.01$ ). Çalışmada yer alan kuru fasulye genotiplerine ait şişme indeks değerlerinin %1.36-2.40 arasında değişim gösterdiği görülmüştür. Bir standart çeşit olan Akman 98, %2.40 şişme indeksi değeri ile ilk sırada yer alırken bu genotipi sırayla G-079 (%2.34), G-237/4 (%2.32), Önceler 98 (%2.29) ve G-015 (%2.27) izlemiş olup tüm genotiplere ait şişme indeksi ortalamasının ise %1.87 olduğu belirlenmiştir. Bunun yanında G-215/1 nolu genotip ise almış olduğu %1.36 şişme indeksi değeri ile tüm genotipler içinde son sırada yer almıştır. Genel olarak değerlendirildiğinde tüm genotipler için şişme indeksi değerinin yüksek olduğu görülmekle beraber çalışmada yer alan genotiplerin bu özellik bakımından oldukça ümitvar olmaları yürütülecek ıslah çalışmaları için oldukça önemlidir. Bu özellik üzerine yürütülen araştırmalarda Shimelis ve Rakshit (2005) %0.311-1.743; Cengiz (2007) %0.33-1.74; Özçelik ve Sözen (2009) %1.35-2.69; Yılmaz ve ark. (2011) %1.3-2.6; Çiftçi ve ark. (2011) %0.17-1.55 ve Türkmen (2020) %1.78-2.11 şişme indeksi değerlerine ulaşmışlardır. Elde ettiğimiz bulgular araştırmacıların elde ettiği bulgularla benzerlik göstermektedir.

### **3.5. Kabuk Oranı (%)**

Farklı kuru fasulye genotiplerine ait kabuk oranı ortalamaları ile istatistik gruplandırmalar Çizelge 5’de verilmiş olup Çizelge değerlendirildiğinde kuru fasulye genotiplerinin kabuk oranı arasında ki farklar istatistiksel olarak çok önemli bulunmuştur ( $P<0.01$ ). Kuru fasulye genotiplerinden elde edilen kabuk oranı değerleri %6.94-9.41 arasında değişim göstermiş olup en yüksek kabuk oranı değeri Göynük 98 çeşidinden (%9.41) elde edilirken bu genotipi sırayla G-117 (%9.36), G-009 (%9.25) ve G-016/2 (%9.16) nolu genotipler izlemiş olup tüm genotiplere ait şişme indeksi ortalamasının ise %8.274 olduğu belirlenmiştir. Bunun yanında G-219/1 nolu genotip ise almış olduğu %6.94 şişme indeksi değeri ile tüm genotipleri içinde son sırada yer almıştır. Kuru fasulye tanesinde kabuk oranı önemli bir kalite kriteri olup değişen çevre koşullarında farklılıklar gösterebilmektedir. Nitekim bu kalite parametresi üzerine yürütülen diğer çalışmalarda ise Akçin (1974) %7.78-9.77; Bozoğlu ve Gülümser (2000) %8.44-9.16; Sözen (2006) %6.7-17.2 ve Özçelik ve Sözen (2009) %7.01-11.02 değerlerinde kabuk oranlarına ulaşmışlardır. Kabuk oranı üzerine elde ettiğimiz bulgular araştırmacıların elde ettiği bulgularla uyumluluk göstermektedir.

### **3.6. Protein Oranı (%)**

Farklı kuru fasulye genotiplerine ait protein oranı ortalamaları ile istatistik gruplandırmaların verildiği Çizelge 5 değerlendirildiğinde kuru fasulye genotiplerinin protein oranı arasında ki farklar istatistiksel olarak çok önemli bulunmuştur ( $P<0.01$ ). Yürütülen araştırmada ele alınan kuru fasulye genotiplerine ait protein oranı değerlerinin %21.55-24.87 arasında değişim gösterdiği tespit edilmiştir. Protein oranı en yüksek G-237/4 genotipinden elde edilirken bu genotipi bir standart çeşit olan Önceler 98 (%24.73), G-015 (%24.68) ve G-277 (%24.51) nolu genotipler izlemiş olup tüm genotiplere ait protein oranı ortalamasının ise %23.32 olduğu belirlenmiştir. Buna karşın G-215/1 nolu genotipin ise %21.55 protein oranı değeri ile tüm genotipler içinde son sırada yer aldığı görülmüştür. Kuru fasulye genotiplerinin protein oranlarının çeşitli faktörlere bağlı olarak değiştiği ifade edilmekte olup bu faktörlerin başında iklim ve toprak faktörleri ile kültürel uygulamalar ve yetiştirme şartları gelmektedir. Aynı zamanda değişik şartlarda yetiştirilen kuru fasulyelerin protein oranlarının farklı olduğu belirtilmektedir (Önder, 1992). Yürütülen başka bir çalışmada ise Akçin (1998) protein oranının gübreleme, sulama, iklim ve toprak yapısına göre değişiklik gösterdiğini söylemiştir. Protein oranı üzerine yürütülen diğer araştırmalarda Karasu (1988) %22-36; Önder (1992) %20.04-27.12; Yılmaz ve Elmalı (2002) %20.48-23.93; Cengiz (2007) %19.25-23.66; Kahraman (2008) %20.11-28.59; Karaca (2010) %20.78-26.27; Varankaya (2011) %18.57-26.80; Atıcı (2013) %21.11-25.47; Özbekmez (2015) %18.50-26.64 ve Türkmen (2020) %20.41-22.14 değerlerine ulaşmışlardır. Protein oranı üzerine elde ettiğimiz bulgular yukarıda ifade edilen literatürlerle paralellik göstermektedir.

## **4. SONUÇ**

Farklı kuru fasulye genotiplerinin bazı teknolojik parametrelerinin belirlenmesi amacıyla yürütülen araştırma sonucunda su alma indeksi ile şişme kapasitesi hariç bütün teknolojik özellikler bakımından kuru fasulye genotiplerinin arasında %1 düzeyinde önemli farklılıklar bulunmuştur. Araştırma içinde yer alan bu kuru fasulye genotiplerinde ortaya konulan bu farklılıkların genotiplerin genetik özelliklerinin yanında yetiştiriciliği yapılan bölgelerin ekolojik özelliklerinden de kaynaklanabileceği tahmin edilmektedir. Bu bakımdan bir baklagil

bitkisi olan kuru fasulyede çeşit/çeşitler adaylarını tespit edebilmek için yapılacak ıslah çalışmalarında kalite içeriklerine göre aday/adaylar tercih edilirken değişebilecek cansız (abiyotik) faktörlerin de göz önüne alınması zorunludur. Bunun yanında özellikle pişme süresini etkileyen ve kalite özellikleri içinde önemli sayılabilecek kabuk oranı özelliğinin de üzerinde durulması gerekmektedir.

Yürütülen araştırmada birçok kalite özelliklerinden dolayı G-079, G-219/1, G-237/4 ve G-277 nolu kuru fasulye genotiplerinin standart çeşitler dahil olmak üzere tüm genotiplere nazaran öne çıktıkları ortaya konulmuştur. Bu kapsamda kalite özellikleri bakımından öne çıkabilecek yerel kuru fasulye genotiplerinin gen havuzuna alınması büyük önem arz etmektedir.

**ÖZET**

Aksaray ekolojik koşullarında yetiştiriciliği yapılan kuru fasulye çeşit ve hatlarında kalite özellikleri arasındaki ilişkilerin korelasyon ve path analizi şeklinde ortaya konulmasını amaçlayan bu çalışma 2021 yılında kuru fasulye vejetasyonunda 1 yıl süre ile tarla ve laboratuvar koşullarında yürütülmüştür. Yürütülen çalışmada Orta Kızılırmak Vadisi'nden toplanarak saf hat seleksiyon yöntemiyle ileri düzeye kadar getirilmiş 25 adet kuru fasulye hattı ile 5 adet (Zülbiye, Yunus 90, Göynük 98, Önceler 98 ve Akman 98) tescilli kuru fasulye çeşidi olmak üzere 30 adet kuru fasulye genotipi kullanılmıştır. Yürütülen çalışmada korelasyon ve path analizinin ortaya konulması amacıyla incelenen kalite özellikleri olarak su alma kapasitesi (g/tane), su alma indeksi (%), şişme kapasitesi (ml/tane), şişme indeksi (%), kabuk oranı (%), protein oranı (%) ve yüz tane ağırlığı gibi 7 adet kalite özelliği incelenmiştir. Kuru fasulye genotipleri üzerinden yürütülen çalışmada elde edilen sonuçlara göre yüz tane ağırlığı ile şişme indeksi (0.467\*\*) ve kabuk oranı (0.482\*\*) arasında olumlu ve çok önemli ilişkiler tespit edilmiştir. Bunun yanında yine yüz tane ağırlığı ile şişme kapasitesi (0.314\*) ve protein oranı (0.509\*) arasında ise önemli ve olumlu ilişkiler ortaya konulmuştur. Sonuç olarak yürütülen çalışmada protein ve kabuk oranı ile şişme kapasitesinin kuru fasulye bitkisinde önemli kalite ölçütleri olarak değerlendirilmesi ön görülmüştür.

**Anahtar Kelimeler:** Aksaray, kuru fasulye, genotip, korelasyon, path analizi

**A RESEARCH ON THE DETERMINATION OF THE RELATIONSHIPS BETWEEN  
QUALITY PARAMETERS IN SOME DRY BEAN GENOTYPES****ABSTRACT**

This study, which aims to reveal the relationships between quality characteristics of dry bean varieties and lines grown in Aksaray ecological conditions, in the form of correlation and path analysis, was carried out in field and laboratory conditions for 1 year in dry bean vegetation in 2021. In the study, 30 dry bean genotypes, including 25 dry bean lines collected from the Middle Kızılırmak Valley and brought to an advanced level by pure line selection method, and 5 (Zülbiye, Yunus 90, Göynük 98, Önceler 98 and Akman 98) registered dry bean varieties used. In order to reveal the correlation and path analysis in the study carried out, water absorption capacity ( $\text{g grain}^{-1}$ ), water absorption index (%), swelling capacity ( $\text{ml grain}^{-1}$ ), swelling index (%), crust ratio (%), protein ratio (%) and 7 quality characteristics, including 100 grain weight, were examined. According to the results obtained in the study conducted on dry bean genotypes, positive and very important relationships were determined between 100 seed weight and swelling index ( $0.467^{**}$ ) and seed coat ratio ( $0.482^{**}$ ). In addition, significant and positive relationships were found between 100 seed weight and swelling capacity ( $0.314^{*}$ ) and protein ratio ( $0.509^{*}$ ). As a result, in the study carried out, it was foreseen to evaluate the protein and shell ratio and swelling capacity as important quality criteria in the dry bean plant.

**Keywords:** Aksaray, dry bean, genotype, correlation, path analysis

## 1. GİRİŞ

*Leguminosae* familyasının *Phaseolus* cinsinde yer alan kuru fasulye (*Phaseolus vulgaris* L.)  $2n=22$  kromozom sayısına sahip tek yıllık ve kendine döllen bir baklagil bitkisidir (Çiftçi ve ark., 2011). Güney ve Orta Amerika'dan orijin alan kuru fasulye sıcak ve ılıman iklimlere uyum sağlamış olup insan beslenmesinin önemini yanında havadaki serbest azotu toprağa bağlayabilme özelliğinden dolayı ekim alanı her geçen yıl dünyada artış göstermektedir (Şehirli, 1988). Beslenme özelliklerinin yanında son zamanlarda sağlık adına faydaları konusunda dikkatlerin artmasına bağlı olarak dünya ülkeleri kapsamında ihtiyaçları çoğaltmakta olup Birleşmiş Milletler Gıda ve Tarım Örgütü (FAO), sağlığa olan faydalı etkileri, obeziteyi aşağıya çekmek, diyabet, kalp hastalıkları ve kanser gibi önemli hastalıkları önlemek ve bu hastalıkları kontrol altına almak için gerekli olan sağlıklı beslenmenin önemli bir parçası olarak bakliyat tüketimi önerilmektedir. Kuru fasulye, yüksek oranda protein (%18-35) içeriğine sahip olmasının yanında triptofan ve lysine gibi esansiyel aminoasitler bakımından da oldukça yüksek değerlere sahip olup ayrıca vitamin (A, B, C ve D) ve mineral (Ca, P, Fe ve K) maddelerince de zengindirler.

Kuru fasulyenin de içinde bulunduğu yemeklik baklagil tanelerinin insan beslenmesinin yanı sıra taneleri ile hasat sonrası geriye kalan sapları, aynı zamanda hayvan beslenmesinde de kullanılmaktadır. Yürütülen bilimsel çalışmalarda bir ton baklagilin sapında yaklaşık 140 kg protein bulunmasına karşılık bir ton tahıl sapında ise yaklaşık 70 kg protein bulunmaktadır. Ayrıca yemeklik tane baklagiller, toprakta azot fiksasyonunu tedarik edebildikleri gibi toprakta oluşturdukları organik maddelerce zengin kanallarda mikro organizma çalışmasını yüksek derecede hızlandırarak toprak canlılığının kök bölgesinde artmasını sağlayabilmelerinin yanında derin kök kanalları da açarak toprağın sıkışmasını önleyebilirler (Uysal, 2002).

Yemeklik tane baklagiller içinde yaklaşık 34.8 milyon ha ekim alanı ve 27.5 milyon ton üretimi ile dünyada ilk sırada yer alan kuru fasulye ülkemizde ise 102 bin ha ekim alanı ve yaklaşık 280 bin ton üretimi ile nohut ve mercimekten sonra ancak üçüncü sırada yer almaktadır. Dünya ülkelerinde kuru fasulyede verim ortalaması hektara yaklaşık 792 kg iken ülkemizde ise bu değer 2715 kg civarındadır (Anonim, 2020).

Kuru fasulye yetiştiriciliğinde yüksek verim alınmasının yanında besin içerikleri açısından kaliteyi artırmak da temel amaç olup yürütülecek araştırmalarda ortaya konulacak sonuçların pratik uygulamalarda bir anlam ifade edebilmesi için de ortaya konulacak tane verimi ve besin içeriği yüksek kaliteli çeşit/çeşitlerin yetiştiriciler tarafından biliniyor olması da üretimin

devamlılığı bakımından oldukça önemlidir. Yürütülecek ıslah çalışmaları kapsamında gerçekleştirilecek korelasyon ve path analizleri bitki ıslahında kalite gibi özelliklerin yorumlanmasında veya bu özelliklerin doğrudan/dolaylı olarak etkilerinin belirlenmesinde uygulanabilmektedir (Hiltbrunner ve ark., 2007). Tane verimi ile kalite özelliklerinin birbirleri ile doğrudan/dolaylı olacak şekilde etkileri olup bu etkiler içinde doğrudan olanlara korelasyon testi uygulanırken dolaylı olanlara ise path analizi uygulanmaktadır (Karadavut, 2009). Özellikler arasındaki ilişkilerin yönü pozitif (olumlu) ya da negatif (olumsuz) olabildiği gibi doğrudan (direkt) ya da dolaylı etkide söz konusu olabilmektedir (Kakde ve ark., 2005). Aksaray ekolojik koşullarında bazı kuru fasulye genotiplerinin kalite özellikleri arasındaki gerek doğrudan gerekse dolaylı etkilerin belirlenmek istenmesi bu araştırmanın amacını oluşturmaktadır.

## **2. MATERYAL ve METOT**

2020 yılında kuru fasulyenin yetiştiriciliği boyunca Aksaray ili ekolojik koşulları altında yürütülen araştırma Aksaray il merkezinde yer alan Koçaş Tarım İşletmesi Müdürlüğü'nün ıslah araştırmaları deneme arazisinde yürütülmüştür. Araştırma yerinin denizden yüksekliği 980 m olup 38° 28' kuzey enlem ve 33° 50' doğu boylam dereceleri arasında yer almaktadır.

**Şekil 1.** Araştırmanın yürütüldüğü deneme arazisi

Araştırmanın yürütüldüğü arazinin değişik yerlerinden alınarak harmanlanmış toprak örneğinde yapılan analiz sonucuna göre toprağın hafif alkali, organik maddesinin az, alınabilir fosfor ve potasyum bakımından yeterli, tuz içeriğinin tuzlu ve kireç içeriğinin ise kireçli olduğu belirlenmiştir (Çizelge 1).

**Çizelge 1.** Deneme yeri toprağına ait fiziksel ve kimyasal özellikleri

Yıllar	Derinlik	pH	Toplam Tuz (%)	Kireç (% CaCO <sub>3</sub> )	Organik Madde (%)	Fosfor (P <sub>2</sub> O <sub>5</sub> )	Potasyum (K <sub>2</sub> O)
2020	0-30 cm	7,83	0,07	15,43	1,01	8,02	163,29

Aksaray ili merkezinde yer alan Koçaş Tarımsal İşletme Müdürlüğü'nün kuru fasulye yetiştirme dönemine ait uzun yıllar ortalaması (2005-2019) ile araştırmanın yürütüldüğü 2020 yılının meteorolojik değerleri Çizelge 2'de verilmiştir.

**Çizelge 2.** Aksaray iline ait uzun yıllar (2005-2019) ile 2020 yılına ait iklim değerleri

Aylar	Ortalama Sıcaklık (°C)		Toplam Yağış (mm)		Ortalama Nispi Nem (%)	
	2005-2019	2020	2005-2019	2020	2002-2019	2020
Mayıs	16.1	16,8	37.3	43,5	51.4	50.1
Haziran	19.7	21.0	31.4	18.00	47.5	47.3
Temmuz	23.3	21.9	2.9	0	48.9	46.3
Ağustos	23.4	24.6	5.2	0	47.1	44.1
Eylül	19.1	22.1	11.00	8.00	47.3	45.7
Toplam	-	-	87.9	69.5	-	-
Ortalama	20.3	21.3			48.4	46.7

Çizelge 2 incelendiğinde uzun yıllar ortalaması ile 2020 yılına ait aylık sıcaklık ortalamaları arasında aylar bazında büyük bir farkın olmadığı görülmektedir. Uzun yıllar ortalaması en düşük aylık sıcaklık ortalamasının 16.1 °C ile Mayıs ayında, en yüksek aylık sıcaklık ortalamasının ise 23.4 °C ile Ağustos ayında olduğu görülmektedir. 2020 yılına ait deneme periyodunda bu değerler sırasıyla 16.8 °C ile Mayıs ve 24.6 °C ile Ağustos aylarında görülmüştür. Bununla birlikte 2020 yılı aylık toplam yağış değerlerinde Mayıs (43.5 mm) ayı toplam yağış miktarının uzun yıllar ortalamasının üstünde olduğu diğer ayların ise uzun yıllar ortalamasının altında seyrettiği, aylık ortalama nispi nem değerlerine bakıldığında ise uzun yıllar ortalama değerleri ile 2020 yılının birbirine yakın değerler gösterdiği görülmektedir.

Araştırmada, Kırşehir Ahi Evran Üniversitesi tarafından 2016 yılında TAGEM'e sunulan ve TAGEM/16 /AR-GE/55 kod numarası ile kabul edilen "Orta Kızılırmak Vadisi Yerel Kuru Fasulye Popülasyonlarının Morfolojik ve Moleküler Karakterizasyonu İle Kök Lezyon Nematoduna Karşı Dayanıklı Genotiplerin Belirlenmesi" isimli proje kapsamında 8 ilin (Aksaray, Ankara, Çankırı, Kayseri, Kırıkkale, Kırşehir, Nevşehir, Sivas) ilçe, belde ve köylerinden toplanarak morfolojik karakterizasyonları ve tanımlamaları gerçekleştirilmiş 661 yerel kuru fasulye alt örneği içinden saf hat seleksiyon yöntemi ile seçilmiş 25 adet yerel kuru fasulye genotipi ile ülkemizde Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş 5 adet

kuru fasulye çeşidi olmak üzere 30 adet kuru fasulye (Yunus 90, Önceler 98, Göynük 98, Akman 98 ve Zülbiye) genotipi kullanılmıştır. Yürütülen araştırma, tesadüf blokları deneme deseninde 4 tekerrürlü olacak şekilde kurulmuş olup parseller 5.0 m x 2.0 m= 10.0 m<sup>2</sup> ebatlarına sahiptir. 25 adet yerel kuru fasulye genotipi ile 5 adet standart çeşit olmak üzere toplam 30 adet genotipin parsellere dağıtımını tesadüfi olarak gerçekleştirilmiştir. Denemenin ekimleri 12 Mayıs 2020 tarihinde tavlı toprağa gerçekleştirilmiştir. Ekimler 50 cm sıra aralığında 8-10 cm sıra üzerinde markörle açılan sıralara 3-5 cm derinliğe elle yapılmıştır. Her parsel 4 sıradan oluşmuştur. Yabancı otlarla mücadele etmek üzere ekim sonrası çıkış öncesi aktif maddesi “*pendimethalin*” olan etkili yabancı ot ilacı uygulanmış ve vejetasyon süresince gerekli duyulduğu kadar el çapası yapılmıştır. Denemenin sulama ihtiyacını karşılamak üzere damlama sulama sistemi kurulmuş ve tüm vejetasyon boyunca ihtiyaç duyulduğu dönemlerde sulama gerçekleştirilmiştir. Deneme alanına ekimle beraber dekara 15 kg DAP (2.7 kg N/da ve 6.9 kg P<sub>2</sub>O<sub>5</sub>/da) gübresi uygulanmıştır. Araştırmanın yürütüldüğü deneme alanındaki genotiplerin hasadı, hasat olgunluğuna ulaştıkları dönem aralığı olan 25 Ağustos - 15 Eylül tarihleri arasında el ile yapılmıştır. Dörder sıradan oluşan her bir genotipten seçilerek hasat edilen bitkiler ayrı ayrı çuvallara konulup etiketlenerek hasat-harman sonrası gerekli ölçümler ve analizler yapılmak üzere Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümüne ait laboratuvara getirilmiştir. Hasat ve harman işlemleri yapıldıktan sonra her bir kuru fasulye genotipine ait 100'er adet tohumda laboratuvar koşullarında su alma kapasitesi (g/tane), su alma indeksi (%), şişme kapasitesi (ml/tane), şişme indeksi (%), protein oranı (%) ve kabuk oranı (%) gibi teknolojik parametreler değerlendirilmiştir. Araştırma sonucunda elde edilen verilerden değişkenlerin aralarındaki doğrusal ilişkiler için korelasyon analizi ve dolaylı etkiler için ise path analizi yapılmış olup (Düzgüneş ve ark., 1987) bu işlemler JUMP 5.01 istatistik paket programında gerçekleştirilmiştir.

### **3. ARAŞTIRMA VE BULGULAR**

Aksaray ekolojik koşullarında yürütülen araştırmada 25 adet yerel kuru fasulye genotipi ile ülkemizde Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş 5 adet kuru fasulye çeşidi olmak üzere 30 adet kuru fasulye genotipinde ele alınan ve incelenen 7 adet kalite özelliği arasındaki korelasyon katsayıları belirlenerek özellikler arası ilişkilerin yönü ve önemlilik seviyeleri Çizelge 3'de verilmiştir.

**Çizelge 3. Kalite özellikleri arası korelasyon katsayıları**

İncelenen Parametreler	Yüz Tane Ağırlığı	Su Alma Kapasitesi	Su Alma İndeksi	Şişme Kapasitesi	Şişme İndeksi	Kabuk Oranı	Protein Oranı
Yüz Tane Ağırlığı	1.000	0.111	0.139	0.314*	0.467**	0.482**	0.509*
Su Alma Kapasitesi		1.000	0.481**	0.319**	0.476**	0.205	0.281
Su Alma İndeksi			1.000	0.241*	0.173	-0.146*	0.322*
Şişme Kapasitesi				1.000	0.455**	-0.281	0.297
Şişme İndeksi					1.000	-0.327*	0.303**
Kabuk Oranı						1.000	0.407*
Protein Oranı							1.000

Çizelge incelendiğinde yüz tane ağırlığı ile şişme indeksi ( $r=0.467^{**}$ ) ve kabuk oranı ( $r=0.482^{**}$ ) arasında olumlu ve çok önemli ilişkiler tespit edilmiştir. İlişkinin derecesi yüz tane ağırlığının her iki parametreyi çok önemli derecede etkilediği ve yüz tane ağırlığında ortaya konulacak artışların bu iki özellik üzerinde de önemli ve pozitif yönde etki yapabileceğini ortaya koymaktadır. Çiftçi ve Şehirali (1984), 105 genotip ile yürüttükleri çalışmada yüz tane ağırlığı açısından genotipler arasında önemli farklılıklar bulunduğunu ve söz konusu özelliğin bir seçim kriteri olarak dikkate alındığı durumlarda genotiplere göre değişik sonuçlar elde edilebileceğini bildirmişlerdir. Yürütülen çalışmada yine yüz tane ağırlığı ile şişme kapasitesi ( $r=0.314^*$ ) ve protein oranı ( $r=0.509^*$ ) arasında olumlu ve önemli ilişkiler belirlenirken su alma kapasitesi ( $r=0.111$ ) ve su alma indeksi ( $r=0.139$ ) arasında ise sadece olumlu fakat önemsiz ilişkiler tespit edilmiştir.

Su alma kapasitesi ile su alma indeksi ( $r=0.481^{**}$ ), şişme kapasitesi ( $r=0.319^{**}$ ) ve şişme indeksi ( $r=0.476^{**}$ ) arasında çok önemli ve olumlu ilişkiler ortaya konulurken kabuk ( $r=0.205$ ) ve protein oranı ( $r=0.281$ ) ile ise önemsiz ancak olumlu ilişkiler tespit edilmiştir. Aydoğan ve ark. (2020), Konya ekolojik koşullarında bazı kuru fasulye genotiplerinin kalite üzerine etkilerini araştırdıkları çalışmalarında su alma kapasitesi ile şişme kapasitesi ( $0.5466^{**}$ ) ve şişme indeksi arasında ( $0.8661^{**}$ ) çok önemli ve olumlu ilişkiler bulmuşlardır.

Su alma indeksi ile şişme kapasitesi ( $r=0.241^*$ ) ve protein oranı ( $r=0.322^*$ ) arasında önemli ve olumlu ilişkiler ortaya konulurken şişme indeksi ( $r=0.173$ ) ile olumlu fakat önemsiz ilişkiler ortaya konulmuş olup buna karşın kabuk oranı ile ise ( $r=-0.146^*$ ) önemli fakat olumsuz ilişkiler belirlenmiştir. 2014 yılında Polonya'da Bitki Yetiştirme ve İklimlendirme Enstitüsünde 2'si çeşit 22'si değişik ülkelerden getirilmiş yerel kuru fasulye popülasyonu olmak üzere 24 adet kuru fasulye genotipinin kalite parametrelerinin belirlenmesi üzerine yürütülen çalışmada şişme

kapasitesi ile şişme indeksi arasında ( $r=0.044^*$ ) önemli ve pozitif; protein oranı ( $r=0.04$ ) ile önemsiz ve pozitif ilişkiler ortaya konulurken tohum kabuk oranı ( $r=-0.08$ ) ile ise önemsiz fakat negatif bir ilişkinin ortaya konulduğu Boros ve Wawer (2018) tarafından belirtilmiştir. Şişme kapasitesi ile şişme indeksi ( $r=0.455^{**}$ ) arasında çok önemli ve olumlu ilişkiler görülürken protein oranı ile ise ( $r=0.297$ ) önemsiz fakat olumlu ilişkiler belirlenmiştir. Bunun yanında kabuk oranı ile ( $r=-0.281$ ) ise önemsiz fakat olumsuz ilişkiler belirlenmiştir.

Şişme indeksi ile protein oranı ( $r=0.303^{**}$ ) arasında çok önemli ve olumlu ilişkiler belirlenirken kabuk oranı ( $r=-0.327^*$ ) ile olumsuz fakat önemli ilişkiler tespit edilmiştir.

Kabuk oranı tohumların yeterli miktarda su alarak şişmesi yönünde önemli bir özellik olup yürütülen çalışmada kabuk oranı ile protein oranı arasında ( $r=0.407^*$ ) ise önemli ve olumlu ilişkiler ortaya konulmuştur. Dört adet fasulye çeşidinin Akdeniz ekolojik koşullarında verim ve kalite özellikleri üzerindeki etkisinin belirlendiği çalışmada tohumun kabuk oranı ile protein oranı arasında önemsiz fakat olumlu ilişkilerin ortaya koyulduğu Kazai (2019) tarafından rapor edilmiştir.

Yürütülen araştırmada yapılan path analizi sonucunda incelenen parametrelerin negatif katsayıya sahip olmaları o parametrenin negatif yönde, pozitif katsayıya sahip olmaları ise parametrenin pozitif yönde etkileneceğini belirtmektedir. İncelenen kalite özelliklerinin yüz tane ağırlığı üzerine doğrudan ve dolaylı etkileri incelenmiş ve sonuçlar Çizelge 4’de gösterilmiştir.

Çizelge incelendiğinde su alma kapasitesinin yüz tane ağırlığına doğrudan etkisi 0.242 ile pozitif yönlü olurken en yüksek dolaylı etkiyi su alma indeksi üzerinden (0.218) göstermiştir. Etki payları incelendiğinde su alma kapasitesinin yüz tane ağırlığına doğrudan %29.24’lük bir oranla etki ederken en yüksek dolaylı etkiyi su alma indeksinin ardından şişme kapasitesi (%21.55) ile şişme indeksi (%15.56) üzerinden yapmıştır.

Su alma indeksinin yüz tane ağırlığına doğrudan etki katsayısı 0.304 olarak bulunmuş olup etki miktarı %28.56 olarak belirlenmiştir. Su alma indeksi en yüksek dolaylı etkiyi %23.34 ile su alma kapasitesi üzerinden göstermiştir. Bu özelliği ise %16.33 ile şişme kapasitesi üzerinden yapılan dolaylı etki izlemiştir.

Şişme kapasitesinin yüz tane ağırlığı üzerine doğrudan etki katsayısı 0.181 olurken bunun oransal etki miktarı %20.44 olarak belirlenmiştir. Bunun dışındaki dolaylı etkiler de su alma kapasitesi, su alma ve şişme indeksi özellikleri dışında düşük olmuştur. Şişme kapasitesi en yüksek dolaylı etkiyi %28.66 ile su alma kapasitesi üzerinden göstermiş olup bu özelliği su

alma indeksi (%26.53) ve şişme indeksi (%13.31) üzerinden yapılan dolaylı etkiler takip etmiştir.

Şişme indeksi bakımından incelendiğinde doğrudan etki katsayısının 0.164 gibi orta düşük bir katsayıya sahip olduğu görülmüş olup oransal etkisi %18.24 olarak belirlenmiştir. Dolaylı etki bakımından ise en yüksek değerleri su alma kapasitesi (%27.09) ve su alma indeksi (%21.19) özellikleri takip etmiştir. Su alma kapasitesinin artması ya da azalması şişme indeksinin belli bir noktaya kadar artmasına ya da azalmasına neden olmaktadır. Bu nedenle bu özellik her zaman için önemli ve üzerinde çalışılması gereken kalite ögesi olarak değerlendirilmelidir.

Kabuk oranının yüz tane ağırlığına doğrudan etki katsayısı 0.111 ile pozitif yönde olurken en yüksek dolaylı etkiyi şişme indeksi üzerinden (0.241) göstermiştir. Etki payları incelendiğinde kabuk oranının yüz tane ağırlığına doğrudan %9.32'lik bir oranla etki ederken en yüksek dolaylı etkiyi %23.25 ile şişme indeksi, %22.86 ile su alma indeksi ve %21.47 ile şişme kapasitesi özellikleri üzerinden yapmıştır.

Kalite parametreleri içinde en önemli özelliklerden bir tanesi olan protein oranının yüz tane ağırlığı üzerine doğrudan etkisi 0.303 (%30.51) olarak tespit edilirken protein oranı üzerinden yüz tane ağırlığı üzerine kabuk oranı %21.21 ile ilk sırada dolaylı etki göstermiştir. Bu dolaylı etkiyi şişme kapasitesi (%19.41) ve şişme indeksi (%17.04) izlemiştir.

**Çizelge 4. Kalite özelliklerinin yüz tane ağırlığına doğrudan ve dolaylı etkileri ile oranları**

<b>Doğrudan Etki</b>	<b>Dolaylı Etki</b>	<b>P</b>	<b>Etki Oranı (%)</b>	<b>r</b>

#### **4. SONUÇ**

Yürütülen çalışma ile bir baklagil bitkisi olan kuru fasulyede kalite arařtırmaları üzerine etkili olabilecek kalite özelliklerinin çeşitlilik gösterdiği görülmüş olup yürütülecek ıslah arařtırmalarında çeşitlerin geliştirilmesi için kalite özellikleri de baz alınarak başta kuru fasulye olmak üzere baklagil bitkilerinin seleksiyon aşamalarında farklılıklar gösteren ekolojik faktörlerin mutlaka göz önüne alınması gerekmektedir. Kuru fasulyede değerlendirmeye tabi tutulan genotiplerin ıslah aşamalarında önemli sayılabilecek kalite öğeleri içinde yer alan yüz tane ağırlık özelliği başta olmak üzere protein ile tohumların su alım hızlarını artırıp azaltabilen bir özellik olan kabuk oranının da üzerinde durulması büyük önem taşımaktadır. Bu tür ıslah çalışmalarında yalnızca korelasyon katsayıları dikkate alınarak 100 tane ağırlığının ortaya konulmasında tüm kalite özelliklerinin etki oran değerlerini ve bu özelliklerin olumlu yada olumsuz yönlerini tam olarak belirlemek mümkün olmamakla birlikte kuru fasulye üzerine yürütülecek ıslah aşamalarının bir parçası olan seleksiyon çalışmalarında ıslah aşamaları olarak göz önüne alınacak özelliklerin tespit edilmesinde path analizlerinin de daha etkili olduğu bilinmekte olup ayrıca kalite unsurlarının yorumlanmasında 100 tane ağırlığının göz önüne alınmasının yanı sıra hem yüksek hem de pozitif dolaylı etkilerinden dolayı su alma ve şişme kapasitesi özelliklerinin de ortaya konulması gerekliliği belirlenmiştir.

### **ÖZET**

Tarımsal alanlarda tuzluluğun artması toprağın yapısını bozmakta bununla birlikte bitkisel ürün kalitesi ve verimini önemli ölçüde azaltmaktadır. Stres şartlarında beklenmedik şekilde değişiklik üreticiye ve ülke ekonomisine büyük kayıplar vermektedir. Tuz stresi, bitkilerde çeşitli gelişim süreçlerinin yanında morfolojik, hüresel, fizyolojik ve moleküler seviyede pek çok aksaklıklara neden olmaktadır. Topraktaki tuzluluk, su potansiyelindeki değişiklikler nedeniyle bitki su emilimini azaltarak bitkilerde azot alımını da bozabilir. Bitki besin maddeleri arasında bulunan azot (N), bitki büyümesini etkileyen en önemli besin maddelerindendir. Bitkilerin hem morfolojik hem de fizyolojik tepkileri ile gelişmelerini ve büyümelerini manipüle etmek azot ihtiyacına bağlıdır. Bu nedenle, bitkilerin tüm yaşamsal döngülerini tamamlaması için azot ihtiyacı vardır. Azot (N) amino asitler, proteinler ve amidler, kuarterner amonyum birleşikleri ve farklı mekanizmalar yoluyla bitki tuz toleransında yer alan poliaminler gibi birçok bileşiğin hayati bir bileşenidir. Yapılan birçok çalışmada, azot gübre ilavelerinin tuzluluğun bitkiler üzerindeki zararlı etkisini bir dereceye kadar hafiflettiği hipotezini ortaya koymasına karşın, tuzluluk, azot (N) ilişkileri karmaşık bir konu olup henüz açıklık kazanmamıştır. Bu derlemede, genel olarak bitkilerde azotun tuz stresine etkilerine yönelik çalışmalar ele alınmış olup, derlemenin bundan sonra bu konuda çalışacak araştırmacılara toplu bir kaynak olma niteliği sağlaması amaçlanmıştır.

**Anahtar kelimeler:** azot, dayanım, iyon dengesi, tuz stresi

## **SALT STRESS AND NITROGEN IN PLANTS**

### **ABSTRACT**

The increase in salinity in agricultural areas deteriorates the structure of the soil and significantly reduces the quality and yield of plant products. Unexpected changes in stress conditions cause great losses to the producer and the country's economy. Salt stress causes many disruptions at the morphological, cellular, physiological and molecular levels in addition to various developmental processes in plants. Salinity in the soil can also impair nitrogen uptake in plants by reducing plant water absorption due to changes in water potential. Accordingly, Nitrogen (N), a plant nutrient and one of the most important nutrients affecting plant growth determines manipulating both the morphological and physiological responses of plants, as well as their development and growth. Therefore, plants need nitrogen to complete their entire life cycle. Nitrogen (N) is a vital component of many compounds such as amino acids, proteins and amides, quaternary ammonium compounds and polyamines involved in plant salt tolerance through different mechanisms. Although many studies hypothesize that nitrogen fertilizer additions alleviate the detrimental effects of salinity on plants to some extent, the salinity-nitrogen (N) relationships are a complex issue and have not yet been clarified. In this review, studies on the effects of nitrogen on salt stress in plants in general are discussed, and it is aimed to provide a collective resource for researchers who will work on this subject from now on.

**Keywords:** nitrogen, tolerance, ion balance, salt stress

## GİRİŞ

Dünya’da biyotik ve abiyotik stres faktörleri bitki üretimini önemli oranda etkilenmektedir. İklim koşullarının değişimi ve çevresel koşullar nedeniyle Dünya’nın birçok bölgesinde tarımsal üretim üzerine çevresel stres faktörlerinin olumsuz etkisinin artacağı bildirilmektedir (Denby ve Gehring, 2005). Tuz stresi de bu stres faktörlerinden biridir. Toprak tuzluluğu, birçok bitki türünün büyümesini ve verimliliğini olumsuz yönde etkileyen ciddi bir çevre sorunudur (Sevgin ve Uzal, 2020). Tuzluluk, başta kurak ve yarı kurak bölgeler olmak üzere dünyanın hem sulanan hem de sulanmayan topraklarında tarımsal üretimi olumsuz yönde etkilemektedir (Ashraf, 2010). Tuz birikimi, son yıllarda en yakın tarımsal tehditlerden biri haline gelmiştir. Küresel olarak ekili alanların yaklaşık %20’sinin ve sulanan tarım arazilerinin %33’ünün etkilendiği tahmin edilmektedir (Munns ve ark. 2008) ve bu yüzdelerin çeşitli nedenlerle (aşırı buharlaşma, yanlış sulama veya yetersiz yağış gibi) yıllık olarak artması beklenmektedir. Tuzdan etkilenen ekilebilir tarım arazilerinin miktarının 2050 yılına kadar %50’ye ulaşacağını tahmin edilmektedir (Jamil ve ark. 2011). Patates, domates, Pirinç, mısır ve baklagiller gibi tarımsal açıdan önemli birçok ürünün tuzluluğa oldukça duyarlı olduğu düşünüldüğünde çok daha tehlikeli boyutta olacaktır (Muchate ve ark. 2016). Ayrıca, 2050 yılına kadar insan nüfusunun 9 milyarı aşacağını tahmin edilmektedir. Bu da gıda üretimindeki artış talebini %70’e kadar yükseltecektir (Davies ve ark. 2016). Tüm bu tahminler, Dünya’daki insan yaşamının sürdürülebilirliği için artan tarımsal verimliliğin önemini bir kez ortaya koymaktadır.

Bitkilerde genel olarak tuz zararı; yaprak alanında ve sayısında azalma meydana gelmekle birlikte bitkide büyümede yavaşlama şeklinde etkisini göstermektedir. Bitki yaş ve kuru ağırlığında azalma, meyve tat, kalitesinde bozulma ve buna bağlı olarak verimde düşüş tuz stresinin ortaya çıkardığı etkiler arasında yer almaktadır (Ashraf, 2004; Yu ve ark., 2012). Bitkiler yüksek tuzluluk koşullarında, negatif su dengesi nedeniyle veya spesifik iyonların metabolizma üzerindeki etkisi stres yanıtı olarak gelişmelerini ve büyümelerini yavaşlatırlar (Yasar, 2003; Yasar ve ark., 2013). Yüksek tuz konsantrasyonlarında bitki hücrelerinin iyon dengesini bozabilir ve hücrelerdeki Na<sup>+</sup> ve K<sup>+</sup> dağılımlarını etkileyebilir. Tuz stresi altındaki bitkiler için hücrelerde iyon dengesinin yeniden sağlanması gereklidir (Niu ve ark.,1995). Topraktaki tuzluluk, su potansiyelindeki değişiklikler nedeniyle bitki su emilimini azaltarak bitkilerde azot alımını da bozabilir. Tuz stresi altındaki bitkilerin hayatta kalması ve büyümesi iyon taşıma ve dağılımlarında, uyumlu çözünen sentezi ve birikimi gibi adaptif süreçlerin bir

sonucudur. Çözünen maddelerin çoğu, betainler ve amino asitler gibi azot içeren birleşiklerdir, bu sebeple azot metabolizması tuz toleransı için hayati öneme sahiptir (Lauchli ve ark., 2002). Dünya çapında, azot tarım ürünlerinde yoğun olarak kullanılan bir besin maddesidir. (Khan ve ark., 2014;Wajid ve ark., 2015;Hafiz ve ark., 2016; Yousaf ve ark., 2016). Azot, ışığın kesilmesi ve kullanılması, fotosentez için yaprak gölgelik büyümesini oluşturmak için gereklidir (Barraclough ve ark., 2010). Bundan dolayı, mahsuller hem morfolojik hem de fizyolojik tepki için gelişmelerini ve büyümelerini manipüle etmek için azot ihtiyacına bağlıdır (Pavlikova ve ark., 2012). Bu nedenle, tüm yaşamsal döngülerini tamamlamak için azot ihtiyacı vardır (Zahoor ve ark., 2014). Bitki yapraklarındaki renk, klorofilin önemli bir birleşeni olduğu, vejetatif büyümeden sorumlu olduğu için bitkinin azot durumunu doğrudan gösterir (Wiedenfled ve ark., 2009). Çözünebilir azot gübresi, bitkilerin büyümesi sırasında alımı ve asimilasyonu kolaydır (Hooda ve ark., 2000). Atmosferik azotun küçük bir miktarı bitkiye uygun forma dönüştürülür, ancak toprağın fiziksel ve kimyasal özelliklerindeki farklılıklardan dolayı çevresel faktörlere bağlı olarak değişir (Giller ve ark., 2009). Aslında, bitkiler organik ve inorganik azota (nitrat ve amonyak ) ihtiyaç duyarlar, fakat inorganik form bitkiler için hazır formdur. Azot gübresinin diğer biçimleri nitrik, amino asit ve üre vardır (Mokhele ve ark., 2012). Yüksek üretim için düşük girdi maliyetleri ve sürdürülebilir yoğunlaştırma, birçok ülkede agronomistler tarafından yıllardır önerilmiştir. Ayrıca gübrenin kaynağı, uygulama şekli, miktarı ve zamanı, çeşit ve çevre koşulları sebebiyle gübreleme yönetimi zordur (Orcen ve ark., 2013).

Topraktaki tuzluluk, su potansiyelindeki değişiklikler nedeniyle bitki su emilimini azaltarak bitkilerde azot alımını da bozabilir. Yapılan birçok çalışma, örneğin, Abdelgadir ve ark., (2005); Ehltng ve ark. (2007); Zakery-Asl ve ark. (2014), toprak çözeltisinde bulunan tuz iyonlarının ozmotik etkilerinin, su emilimini ve köklere azot dahil olmak üzere besin maddelerinin kütle akışını azalttığını ve ardından bitkiler tarafından alımında belirgin bir azalmaya sebep olduğunu bildirmiştir. Azot alımını sınırlamanın yanı sıra iyonik antagonizma ve azalan su mevcudiyeti ve absorpsiyon, tuzluluk, nispi büyüme oranındaki belirgin bir azalma nedeniyle bitki azot talebini azaltarak azot alımını da kısıtlayabilir (Kafkafi ve Bernstein, 1996). Diğer bazı çalışmalar, örneğin, Touraine ve ark.,(1994) ve Van Hoorn ve dark., (2001), fotosentezdeki azalmaya bağlı olarak bitkilerin nispi büyüme hızındaki tuzluluğun neden olduğu değişikliklerin, bitkilerin iç azot talebini etkilediğini ve böylece azot'un bitki kökleri tarafından alınma oranını belirlediğini bulmuşlardır. Toprağın bitkilere azot katkısı da tuzluluk

stresi altında azalmış, bu da azot fiksasyonu yoluyla biyolojik aktivite ve organik azot'un dönüşümü ile topraktaki mineral azot üretimi üzerindeki tuzluluğun etkilerini göstermektedir. Özetle, tuz iyonları, özellikle  $\text{Na}^+$  ve  $\text{Cl}^-$ , azot ile etkileşime girer, iyon antagonizmi, taşıyıcının inaktivasyonu, sınırlı su absorpsiyonu ve/veya dahili azot talebinde azalma yoluyla alımını azaltır.

Bitkilerde tuzluluğun varlığı, ekinlerin mineral beslenmesine yeni bir karmaşıklık düzeyi ekler. Tuzluluk, azot (N) ilişkileri bahçe bitkilerinde açıkça karmaşıktır. Bitki besin maddeleri arasında bulunan azot (N) bitki büyümesini etkileyen en önemli besin maddelerindendir. Çünkü azot (N) amino asitler, proteinler ve amidler, kuaterner amonyum birleşikleri ve farklı mekanizmalar yoluyla bitki tuz toleransında yer alan poliaminler gibi birçok bileşiğin hayati bir bileşenidir (Kamel, 2012; Rais ve ark., 2013; Zaki, 2016). Azot metabolizmasının yeterli düzeyde düzenlenmesi, bitkinin tuzluluğa toleransı için büyük önem taşımaktadır; ancak aradaki ilişki tuzluluk ve azot metabolizması, tuz stresinin derecesine, bitki türüne, bitki büyüme aşamasına, rizosferdeki azot miktarına, türüne ve biçimine bağlı olarak çok karmaşık bir ağıdır (Munns ve Tester., 2008; Chen ve ark., 2010; Dai ve ark., 2015; Teh ve ark., 2016). Bitkiler tarafından emilen azot toplam mineral besin maddelerinin yaklaşık %80'ini oluşturur (Marschner, 1995). Tuzlu ortamda  $\text{Cl}^-$  nin bitki kısımlarına alım ve yer değiştirme sırasında  $\text{NO}_3^-$  ile rekabet ettiği bilinmektedir. (Abdelgadir ve ark., 2005) ve bundan dolayı bitkide azot birikimi azalabilir. Yapılan başka bir çalışmada  $\text{Cl}^-$  kaynakları ve  $\text{CaCl}_2$  den gelen  $\text{Cl}^-$  nin KCl değil, Cucumismelo ve Solanumlycopersium L. de bitkilerin tarla altında maruz kalabileceği bir aralıkta  $\text{NO}_3^-$  alımını engelleyebileceğini bulmuştur (Kafkafi ve ark., 1992). Yine kurak bölge topraklarında, toprakta nitrat ( $\text{NO}_3$ ) olarak nitrojenin varlığı, bitkilerin alım sisteminde önemli bir tuzluluk görevi olan klorür (Cl) ile antagonistiktir (Marschner, 1995; Mengel ve Kirkby, 2001). Bundan dolayı azot gübreleme, klorür alımını baskılayabilir ve bitkinin tuz stresine karşı toleransını artırabilir. Ayrıca yetersiz nitrojen, tarım topraklarında çoğu zaman büyüme sınırlandıran beslenme stresidir. Sonuç olarak, azot ilavesi, mahsulün tuz stresini olup olmadığını bakılmaksızın, genellikle verimi ve bitki büyümesini artırır.

Aşağıda genel olarak bitkilerde azotun tuz stresine etkilerine yönelik çalışmalar ele alınmıştır; Shen ve ark.,(1994)'da Azot (N) beslenmesinin arpa bitkilerinin tuzluluk koşullarında fotosentez ve su ilişkileri üzerine etkisinin araştırmak için serada saksı denemeleri yapılmıştır. Azot sürgünlerde potasyum (K) içeriği arttırmış sodyum (Na) içeriğini azaltmıştır. Fotosentez hızı yapraklardan eklenen azot ile 0'dan 100 mg N/kg toprakta önemli ölçüde arttı. Yüksek

tuzlu bitkilerin yapraklarında ribuloz 1,5 bifosfatkarboksilazın aktivitesi kontrol bitkilerine göre daha düşük, düşük tuzlu bitkilerin yapraklarında daha yüksek çıkmıştır. Sodyum klorür fotosentez hızı düşürüldü, birim yaprak alanı başına toplam çözünür protein ile önemli ölçüde ilişkiliydi. Azotun her seviyesi, yapraklardaki stoma iletkenliği tuz ile önemli ölçüde azaltılmıştır. Artan azot düzeyi ile yaprakların prolin içeriği artmıştır. Tuzla yapılan işlem görmüş bitkilerin yapraklarında kontrol bitkilerine göre daha yüksek çıkmıştır. Artan azot ile yaprakların ozmotik potansiyeli azalmış ve tuzlu koşullarda yüksek azot bitkilerin turgur basıncı daha yüksek kalmıştır.

Frechilla ve ark.(2001), iki farklı azot besleme kaynağının (amonyum veya nitrat), bezelye bitkilerinin orta düzeyde bir tuzlu su stresine (30 mM NaCl) tepkisi üzerindeki etkisi incelemiştir. Büyümenin, tuzlu su stresi altında azaldığı, ancak nitratla beslenen bitkiler tuzluluğa amonyumla beslenen bitkilerden daha az duyarlı olduğu belirlenmiştir. Bu farklı hassasiyet, esas olarak nitratla beslenen bitkilerde kök büyümesinin daha iyi korunmasından kaynaklandığı üzerinde durulmuştur. Organik azot içeriği, amonyumla beslenen bitkilerin köklerinde önemli ölçüde azalmıştır. Su ilişkileri, tuzlu su stresi altında hafifçe değişmiştir ve bu, nitrojen kaynağından bağımsız olarak karbon asimilasyon oranlarındaki düşüşle ilişkilendirilen stoma iletkenliğinde azalmaya yol açmıştır. Tuzluluk, azot kaynağına bağlı olarak çeşitli besinlerin alınımını farklı şekilde etkilemiştir. Böylece, klorür esas olarak nitratla beslenen bitkilerde, nitratın yerini alarak birikirken, sodyum esas olarak amonyum ile beslenen bitkilerde, özellikle köklerde, amonyum ve potasyum gibi diğer katyonların yerini alarak birikmiştir. Araştırma sonunda azot kaynağının (amonyum veya nitrat), tuzlu su stresine tepkileri etkileyen önemli bir faktör olduğu, bitkilerin amonyum kaynağı kullanıldığında daha duyarlı olduğu sonucuna varılmıştır.

Hindistan’ da yapılan bir başka çalışmada; büyüme ortamına eklenen farklı dozlarda uygulanan azot (N) ve giberellin (GA<sub>3</sub>)’ in, tuz stresinin bitki metabolizması üzerindeki olumsuz etkilerinin hafifletip hafifletmeyeceğini belirlemek için yapılan uygulamalarda, büyüme ve fizyo-biyokimyasal özellikler, sürgün uzunluğu, yaprak alanı, taze ve kuru ağırlık, fotosentez hızı, stoma iletkenliği, malondialdehit konsantrasyonu, elektrolit sızıntısı, toplam klorofil konsantrasyonu, yaprak/azot (N), potasyum (K) ve sodyum (Na) konsantrasyonu ve K/Na oranı NaCl yapılan uygulamalardan etkilenmiştir. Fakat azot ve GA<sub>3</sub>’ ün tek başına ve kombinasyon halinde uygulanmasının, tuz stresinin büyüme ve fizyobiyo kimyasal üzerindeki olumsuz

etkilerini hafifletmede faydalı olduğu, GA<sub>3</sub> ile uygulanan N' nin daha etkili olduğu tespit edilmiştir (Siddiqui ve ark.,2008).

Uygur ve Yetişir (2009)' da Su kabağı anacı (Lagenariasiceraria) üzerine aşılı karpuz [Citrulluslanatus (Thunb.) Matsum ve Nakai] çeşidinin fosfor (p) ve azot (N) alımı, bazı büyüme parametreleri 30 gün boyunca beş farklı tuzlu su koşulu üzerine çalışılmış olup, tuzluluk stresi, elektrik iletkenliği (EC) 0, 4, 5, 8, 12, 16 dS/m olan tuzlu su ile sürekli sulama ile indüklenmiştir. Aşılı karpuzlar aşısız karpuzlara göre daha iyi büyüme göstermiştir. Tuzluluk stresi, sürgünlerde fosfor (P) içeriği iki katta kadar artışa sebep olmuştur. Su kabaklarında aşılı ve aşısız karpuz sürgünlerinin toplam azot (N) alımı kademeli şekilde 8 dS/m tuzluluğun üzerine düşmüştür. Çalışmada, aşılı bitkilerin aşısız karpuz çeşidine göre daha iyi olduğu görüşmüş olup özellikle Lagenaria türü su kabakları, tuzlu koşullarda karpuz için anaç olarak kullanılabilir.

1 yıllık Gül (Rosa spp.) bitkilerine 0, 5, 15, 25, 35, 45, 55, 65 mol/m<sup>3</sup> NaCl ve 7 mol/m<sup>3</sup> NO<sub>3</sub><sup>-</sup> içeren besin solüsyonu uygulanmıştır. NO<sub>3</sub><sup>-</sup> alımı ilk 24 saat boyunca ölçülmüştür. NO<sub>3</sub><sup>-</sup> alımı, besin çözeltisinde NaCl varlığı ile ciddi şekilde inhibe edilmiştir. 5 mol/m<sup>3</sup> NaCl ile karşılaştırıldığında 25, 45 ve 65 mol/m<sup>3</sup> NaCl' de %23, %38 ve %50 azalmıştır. Cl<sup>-</sup> tarafından uygulanan antagonistik etki ile NO<sub>3</sub><sup>-</sup> emilimini inhibe ettiği belirlenmiştir (Massa et al.,2009).

Manzer ve ark. (2010)' da Tuza duyarlı (ev. Chuutki) ve tuza dayanıklı (ev. Radha) Haldal genotiplerinin tuz stresine tepkinin olumsuz etkilerinin üstesinden gelmek için farklı besin uygulama stratejileri üzerine yapmış oldukları çalışmada, büyüme ortamına eklenen farklı azot (N) dozu seviyelerinin tuz stresinin fotosentetik kapasite ve ozmoprotektan ve besinlerin birikimi üzerindeki olumsuz etkilerinin hafifletip hafifletemeyeceğini belirlemek için yaptıkları araştırmada, Tuzluluk stresi koşullarında, azot (N) uygulamasın her iki genotip üzerinde önemli bir iyileştirici etkiye sebep olmuştur. Büyüme özelliklerine taze, kuru ağırlık ve fizyo-biyokimyasal parametrelere yüzde su içeriği, net fotosentez oranı, stoma iletkenliği, toplam klorofil, karbon anhidraz aktivitesi, malondialdehit (MDA), nitrojen (N), potasyum (K) , sodyum (Na) içerikleri, K/Na oranı ve verim özellikleri (bakla/ bitki sayısı, tohum/bakla ve tohum verimi/bitki ). Tuza dayanıklı genotip, tuza duyarlı genotipten 60 mg N kg-1 kumda büyüme, fizyo-biyokimyasal ve verim özellikleri için maksimum değer tespit edilmiştir.

Bybordi ve Ebrahimian, (2011) kanola bitkisinde farklı tuzluluk düzeylerinin (0, 50, 100, 150 ve 200 mM NaCl) nitrat redüktaz, asit fosfataz ve asit fosfataz üzerindeki etkilerini inceledikleri çalışmada kanola yapraklarında alkalın fosfataz aktivitesinin yanı sıra nitrat ve fosfat alımı ve

toplam azot içeriği belirlenmiştir. Nitrat redüktaz aktivitesinin 100 mM NaCl ile muamele edilmiş bitkilerde arttığını, aksine 150 ve 200 mM NaCl' ye maruz kalan bitkilerde kontrollere kıyasla kademeli olarak azalmıştır. Tuzluluk stresi ve nitrat alımına bağlı olarak nitrat redüktaz aktivitesinde azalma ve bunları takip eden toplam azot içeriği aynı anda meydana gelmiştir. Yüksek tuzluluk seviyeleri nedeniyle nitrat redüktaz aktivitesinde, nitrat içeriğinde ve toplam azot içeriğinde azalma, kanolada büyüme ve ekstra biyokütleyi azaltmak için fizyolojik bir yanıt olabildiğine değerlendirilmiştir. Ancak tuzluluk stresinin hem asit fosfataz hem de alkalın fosfataz aktivitesinde artışa neden olduğu görülmüştür. Yapraklardaki fosfat seviyelerinde tuzluluk stresi altında fosfat seviyelerinin önemli ölçüde azaldığı belirlenmiştir. Bu sonuçlar, tuz stresi altında asit fosfataz ve alkalın fosfataz indüksiyonunun fosfor eksikliğinden kaynaklanabileceğini düşündürmüştür.

Doğan (2012), iki hassas (TR-47882, TR-47815), iki toleranslı (TR-68516, TR-55711) ve bir yabancı (PI-899-01) olmak üzere toplam 5 domates genotipi ile yapmış olduğu çalışmada 150 mM NaCl tuz stresi ve zamana bağlı olarak farklı konsantrasyonda yapraktan azot (N) %0.5 ve %1 uygulanmıştır. Uygulama sonrasında toleranslı ve hassas genotiplerinden tuz stresinden farklı oranlarda etkilendiğini bulunmuştur. Antioksidant enzim aktivitelerinden süperoksitdismutaz (SOD: EC 1.15.1.1), askorbatperoksidaz (APX: EC 1.11.1.11), katalaz (CAT: EC 1.11.1.6), glutatyonredüktaz (GR: EC 1.6.4.2)MDA ve klorofil miktarları ölçülmüş, enzim aktiviteleri hassas genotiplerde azalmış, toleranslı genotiplerde ise artmıştır. Enzim aktiviteleri MDA ve klorofil sonuçlarında pozitif yönde desteklenmiştir. Çıkan sonuçlara göre azot uygulamasına bağlı olarak toleranslı genotipler tuz stresinden etkilenmediği, hassas genotipler ise tuz stresinde yüksek oranda etkilenmiştir. Çıkan sonuçlara göre %1.0' lik azot dozunun tuz stresinden korunmada kritik bir rol oynadığı ve toleransı artırıcı bir etki yaptığı sonucuna varılmıştır.

Balliu ve ark. (2015)'nin yaptıkları çalışmada 30 günlük fideler (inoküle edilmemiş ve Arbuscular mikorizal mantarlar ile aşılansmış) ayrı ayrı, besine doymuş vermikülit ile doldurulmuş ve 37 gün boyunca 0, 50 ve 100 mM NaCl' ye maruz bırakılmış plastik kaplara nakledilmiştir. Tuzluluk, aşısız olanlarda yaprak N konsantrasyonunda %40 ve %38, bağıl N alım oranında %49 ve %43, N konsantrasyonunda %34 ve %111, bağıl N alım oranında %27 ve %50 azalmaya neden olmuştur.

Hussien Ibrahim ve ark. (2016)' da Argine, Elnilein, Xumai 30 ve Yang buğday çeşitleri de tuzluluk koşullarında fide çıkışı ve büyümesi üzerindeki azot etkisi ile ilgi Çin'de yapmış oldukları çalışmada; 0, 100, 150 ve 200 mM NaCl çözeltisi ve üç azot (N) dozu gübre seviyeleri (N0=0, N1=105, N2=210 kg N/h). Çıkış yüzdesi ve erken büyüme belirlenmiştir. Çıkış yüzdesi sürgün ve kök uzunluğu, kuru ağırlık, tuz tolerans indeksi, fide canlılık indeksi için tuzluluk ve azot (N) seviyeleri arasında önemli farklılıklara varılmıştır. Elnilein çeşidi diğer çeşitlere göre daha iyi çıkış yüzdesi, sürgün ve kök uzunluğu, kuru ağırlık, tuz tolerans indeksi ve fide canlılık indeksine sahip çıkmıştır. Elnilein çeşidi tuzlu topraklar için tavsiye edilmiştir.

Kanagaraj ve Desingh (2017)'da PAIYUR-1, SVPR-1, TMV-3, TMV-4, TMV-5, VIR-1 ve VIR-2 gibi yedi susam çeşidinde tuz stresinin bazı fizyolojik özellikler üzerindeki etkilerini araştırmak için bir saksı kültürü uygulaması üzerine yaptıkları çalışmada, Farklı tuzluluk (NaCl) konsantrasyonlarında kontrol, 40 mM, 80 mM, 120 mM' deki tüm uygulamalar için, Kontrol ve tuzluluk ile muamele edilmiş bitkilerden 15. gün, 30.gün ve 45. gün genç ve tamamen olgunlaşmış yapraklar alınmıştır. Tüm örnekleme günlerinde yedi susam çeşidinin yapraklarında artan tuzluluk seviyesi ile fotosentez, fotosentetik enzim aktivitesi, yaprak azotu ve ABA içeriğinde azalma oranı daha düşük olduğu tespit edilmiştir. 45. günde, fotosentetik enzim aktivitesinde, yaprak azotunda, ABA içeriğinde 120 mM tuzlulukta TMV-3'te kontrol bitkilerine göre önemli ölçüde daha yüksek artış gözlenirken, 120 mM tuzlulukta PAIYUR-1'de kontrol bitkilerine göre daha düşük artış fark edilmiştir. Fotosentetik enzimlerin, yaprak azotunun, ABA içeriğinin orta düzeyde artışı, kontrol bitkilerine kıyasla 45. günde 120 mM tuzluluk ile VIR-2 çeşidinde izlendi. TMV-3, artan fotosentez hızı ve fotosentetik, yaprak azotu aktiviteleri ile değerlendirildiğinde tuzluluk stresi altında daha yüksek adaptasyon potansiyeli sergilediği ve TMV-4 ve PAIYUR-1'i VIR-1 ile yakından takip etmiştir. VIR-2 çeşidini SVPR-1 ve TMV-5 izledi.

Shao ve ark. (2020) yaptıkları çalışmada, hafif tuz konsantrasyonları (50 mM, 100 mM) altında yıllık çavdar fidelerinin beslenmesinde azot gereksinimindeki değişiklikleri ve bunun altında yatan azaltma mekanizmasını araştırmış, sonuçlar, nispeten düşük bir N seviyesinde (2.0 mM değil 5.0 mM) bitki boyundaki ve biyokütledeki artıştan gözlemlendiği gibi, düşük tuz konsantrasyonunun N gereksinimini azalttığını göstermiştir. Tuz stresi altında, orta derecede düşük N uygulaması, NR (nitrat redüktaz) ve GS (glutamin sentetaz) kodlayan genlerin ekspresyonunu nispeten stabil bir seviyede tutabilmiş, ancak tespit edilen NRT (nitrat taşıyıcı) geninin ekspresyonu üzerinde hiçbir etkisi olmamıştır. 2.0 mM N' uygulanan fideler aynı

zamanda en yüksek CAT ve POD antioksidan enzim aktivitesini ve en düşük MDA içeriğini düşük tuz uygulaması altında göstermişlerdir. Bu sonuçlar, yıllık çavdar fidelerinin hafif tuzla ortamlarda N ihtiyacını azaltabileceğini, orta derecede düşük N uygulamasının ise fotosentezi düzenleyerek, ROS kaynaklı (reaktif oksijen türleri) hasarını hafifleterek ve N metabolizmasını koruyarak büyümelerini destekleyebileceğini gösterdiğine değinilmiştir.

## **SONUÇ**

Yapılan bazı çalışmalarda azot uygulamalarının tuzluluğun bitkiler üzerindeki zararlı etkisini bir dereceye kadar hafiflettiği hipotezini ortaya koymasına karşın, tuzluluk, azot (N) ilişkileri karmaşık bir konu olup henüz açıklık kazanmamıştır. Yukarıda verilen araştırma sonuçlarının birlikte değerlendirilmesi ile azotun bir ya da daha fazla mekanizmayla membranların dayanıklılığına katkıda bulunduğu, onarıcı proteinler ürettiği yada gelişmeyi hızlandırarak özellikle tuz stresi ile alınan toksik iyonları seyrelttiğinden kaynaklı olduğu söylenebilir.

### **ÖZET**

Günümüz hayvancılık işletmelerinde, sürü yönetim programlarının kullanım düzeyine ve hayvan refahı uygulamalarına bağlı olarak hayvanlarda türe özgü normal davranışlar gözlenebilmektedir. Entansif yetiştirme ve taşıma sistemlerinin uygun olmadığı koşullarda ise hayvanlar tepkilerini davranışsal olarak gösterirler. Çok sık görülen bu davranışsal değişiklikler ya da anomaliler arasında; fiziksel yaralanmalar, akut ve kronik strese dayalı oluşan ve bağışıklık sistemini etkileyebilen fizyolojik değişiklikler, döl verimindeki aksaklıklar, bazı metabolizma değişiklikleri ve diğer sağlık sorunları yer almaktadır. Sonuçta istenmeyen bu davranış değişiklikleri işletmelerde kimi zaman verim azalması kimi zaman da ölümle sonuçlanan önemli ekonomik kayıplara yol açabilmektedir. Bu tür sorunların başlıca çözüm yolu çevresel zenginleştirmedir. Çevresel zenginleştirme, türe özgü davranışları gösterme fırsatlarını artıran ve böylece biyolojik işlevlerini ve yaşam kalitelerini iyileştiren fiziksel ya da sosyal yönlerin kullanımı yoluyla kontrol altında tutulan hayvanların mevcut ortamının değiştirilmesi olarak tanımlanır. Çevresel zenginleştirme, hayvanın davranışsal ve fizyolojik zorluklarla başa çıkma yeteneğini artırarak türe özgü davranış şekillerini genişletir. Bir başka deyişle, hayvanlara çevrelerini tanıma ve onunla etkileşim kurmanın yanı sıra duyuş gelişmeyi artırma olanağı verir. Bu durum, anormal davranışların gelişmesini önler. Son olarak da üretim sisteminin ekonomisini iyileştirir. Bunun gerçekleşebilmesi için yapılacak zenginleştirmelerin hayvanın biyolojisini bozmadan, kolay ve ekonomik olması oldukça önemlidir. Hayvanlarda çevresel zenginleştirmenin ya da çevresel zenginleştirmenin birçok çok yolu olmakla birlikte bilimsel olarak kabul edilen beş esas şekli vardır. Bunlar sırasıyla; sosyal, fiziksel, duyuş ve beslenme etmenli zenginleştirmelerdir. Belirtilen her bir etmen, çiftlik hayvanlarının refahına farklı yönlerden katkılar sağlayabilmektedir. Hayvancılık işletmelerinde çevrenin zenginleştirilmesi amacıyla kullanılan alet-ekipmanlar, hayvanların kendilerine özgü davranışları gösterebilmesine, zararlı sosyal davranışlarının ise azaltmasına olanak verir. Böylece özellikle entansif hayvancılıkta hem üretkenliğin hem de refahın artırılması sağlanır. Hayvanlara çevresel zenginleştirme sağlamada güvenlikle ilgili olanların yanı sıra birçok yönden sorunlarla karşılaşmaktadır. Bu çalışmada, çiftlik hayvanlarında çevresel zenginleştirme uygulamaları hayvan refahı yönünden ayrıntılı olarak ele alınmış ve bu uygulamalarda karşılaşılan sorunların çözümüne ilişkin somut öneriler üzerinde durulmuştur.

**Anahtar kelimeler:** Entansif yetiştirme, davranış, sürü yönetimi, barındırma, verim.

## **IMPORTANCE FOR ENVIRONMENTAL ENRICHMENT AND ANIMAL WELFARE OF FARM ANIMALS**

### **ABSTRACT**

Depending on the level of application of herd management programmes and animal welfare procedures in modern livestock farms, species-specific normal behaviours can be seen in animals. In conditions where intensive rearing and transport systems are not suitable, animals show their reactions behaviorally. Species-specific normal behaviours can be observed in animals, depending on how herd management programmes and animal welfare protocols are implemented on contemporary livestock farms. As a result, these undesirable behavioral changes can lead to significant economic losses, sometimes resulting in decreased productivity and sometimes death in livestock farms. The main solution to such problems is environmental enrichment. Environmental enrichment is defined as the alteration of the existing environment of controlled animals using of physical or social aspects that increase their opportunities to display species-specific behaviors and thereby improve their biological function and quality of life. Environmental enrichment expands species-specific patterns of behavior by increasing the animal's ability to cope with behavioral and physiological challenges. In other words, it gives animals the ability to recognize and interact with their environment, as well as increase sensory development. This prevents abnormal behavior from developing. The production system's economy is also improved. It is crucial for this to occur that the modifications be simple to implement, affordable, and don't alter the animal's biology. There are numerous methods for enhancing or improving the environment for animals, but only five are generally recognised by science. These are the social, physical, sensory, and dietary elements, in that order. The welfare of farm animals can be influenced by all of the aforementioned aspects in various ways. farms allow animals to show their unique behaviors and to reduce harmful social behaviors. As a result, especially in intensive animal farms, it is ensured that both productivity and welfare are increased. Other than safety-related issues, problems can arise while giving animals with environmental enrichment. In this study, environmental enrichment techniques for farm animals are thoroughly examined in terms of animal welfare, and specific solutions to the issues raised by these techniques are highlighted.

**Keywords:** Intensive breeding, behavior, herd management, housing, yield.

## **1.GİRİŞ**

Çevresel zenginleştirme ya da iyileştirme, hayvan refahı ve sürdürülebilirliğin önemli bir kısmını oluşturur (Alonso ve ark. 2020). Hayvanlarda yapılacak bu zenginleştirme, aynı zamanda üretim maliyetlerinin azaltılmasının yanı sıra çiftlik hayvanlarında barınak planlanmasında ayrı bir rol oynar. Bir başka deyişle bazı çiftlik hayvanlarında kötü sürü yönetimi ve strese bağlı olarak gözlenen anormal davranışların azaltılmasında önemli bir katkı sağlar (Schütz ve ark. 2020). İşletmelerde çevresel zenginleştirmelerle hayvan sağlığı ile ilgili sorunlar da görece de olsa azalır. Kapalı barınaklarda çevresel zenginleştirmelerin sağlanması, büyük ölçüde artan kamu bilinci ve hayvan refahına yönelik endişe) ve zenginleştirmelerin hayvan refahını iyileştirdiği algısı (Grunert ve ark. 2018) nedeniyle bu yaklaşım giderek daha yaygın hale gelmektedir. Nitekim son yıllarda Avustralya’da onaylı tarım planları (RSPCA Australia, 2021) gibi refah akreditasyon programları tarafından zenginleştirme sağlanmasının düzenlenmesi sağlanmıştır. Hayvancılık işletmelerinde bazı çevresel zenginleştirmenin sağladığı yararlar rağmen, uygulanan kimi zenginleştirme programlarının çok az etkisi olduğu ya da hayvan refahını olumsuz yönde etkileyebileceği gösterilmiştir (Gordon ve Forbes, 2002). "Çevresel zenginleştirme" terimi, ya acıyı önleyen, acı çekmenin ötesinde bir ortam sağlayan (Boissy ve ark. 2007) ya da türe özgü çevreyi ifade eden kaynak veya ortamları tanımlamak için kullanılmıştır. Bununla birlikte, basitçe ifade etmek gerekirse, zenginleştirme terimi hayvansal üretimde bir "zenginleştirme" anlamına gelir (Merriam-Webster, 2021). Bu nedenle, zenginleştirme sağlanmasından sonraki gelişmeler mutlaka ölçülmeli ve doğru bir şekilde değerlendirilmelidir. Bu yaklaşım, zenginleştirmelerin sağlanması yoluyla hayvan refahında sürekli zenginleştirmeleri daha fazla destekler. Bir başka deyişle, hayvanların içinde yaşadığı koşulların toplumsal kabulü ve kalitesi değişse bile, refah anlamında yapılacak zenginleşme, görece olarak kabul edilebilir (Edgar ve ark. 2006). Çevresel zenginleştirme kavramı, hayvan refahında sürekli gelişmelere olanak veren aşamalı bir sürecin sonucunu yansıtır (Dawkins, 2008). Zenginleştirme teriminin bu şekilde yeniden tanımlanması netliği, beklentileri ve sonuçta hayvan refahı adına yapılacak zenginleştirme programlarının etkisini iyileştirecektir. Ayrıca, işletmelerde hayvan refahı zenginleştirme programlarının "etkili" olduğunu kabul edilmeden önce diğer birçok paydaşın da bu konuda yapacağı değerlendirmelerin de dikkate alınmasında yarar vardır. Bu yaklaşım, bir zenginleştirme uygulamasının yalnızca hayvan refahını zenginleştirmesi değil, aynı zamanda hayvancılık endüstrisi için pratik ve ekonomik olması gerektiği önermesine dayanmaktadır. Refah için yapılacak zenginleştirme kriterlerini

karşılamaayan çevresel zenginleştirmeler ya da düzenlemeler, hayvan refahını iyileştirip zenginleştirmedigine bakılmaksızın uygulanmamalıdır Örneğin, bir zenginleştirmenin hayvan refahı üzerinde olumlu bir etkisi olmasına karşılık olası bir atık yönetimi çözümü yoksa (bazı ticari domuz çiftliklerinde saman için durum böyledir), bu zenginleştirmenin uygulanabilirliği söz konusu değildir ve bu nedenle beklenildiği kadar olumlu bir etki oluşturmaz. Ancak, yapılacak bir çevresel zenginleştirme uygulaması, pratikse ve maliyeti düşük, ancak hayvan refahını olumlu yönde etkilemiyorsa, önemli bir zenginleşme ölçütü olarak kabul edilemez (Aguayo-Ulloa ve ark., 2014).

Bu çalışmada, çiftlik hayvanlarında çevresel zenginleştirme uygulamaları hayvan refahı yönünden ayrıntılı olarak ele alınmış ve bu uygulamalarda karşılaşılan sorunların çözümüne ilişkin somut öneriler üzerinde durulmuştur.

### **1.1. Çevresel Zenginleştirme ve Önemi**

Çevresel zenginleştirme beş ayrı alt grupta incelenir (Hemsworth ve Coleman, 2010). Bunlar sırasıyla; sosyal, yetiştirme, fiziksel, duyuşsal ve beslemedir. Bu gruplardan her birinin katkısı ayrı bir öneme sahiptir. Örneğin, sosyal zenginleşme; buzağuların çevrelerindeki stres veya durumlarla daha iyi başa çıkmalarına yardımcı olur (De Paula Vieira ve ark. 2012). Ancak yapılacak fiziksel zenginleştirme ise gerek doğum bölmesinde gerekse gezinme alanı ya da duraklarda daha rahat etmesine olanak verecektir. Her bir kategorinin hayvanın refahına olan katkısını değerlendirirken çok dikkat edilmelidir. Her zenginleştirme parametresi ve buna ait yöntemin altında yatan sistem çok faktörlü olabilir (Costa ve ark. 2019). Yapılacak her zenginleştirme tipinin kısa ya da uzun süreli etkileri olabilir. Bir başka deyişle serbest ağız sütü ya da kolostrum tüketmek, yavrularda yaşamın erken evrelerinde daha iyi gelişmelerine neden olacaktır (Bach, 2012). Her çevresel zenginleştirme yöntemi, üretim döngüsünün farklı aşamalarında değişik düzeylerde katkıda bulunabilir. Bu durum buzağı ve kuzularda gelişmiş bilişsel gelişimin yanı sıra ile sosyal izolasyon sırasında stresin azalması ile yakından ilişkilidir. Refahın zenginleştirilmesinde yer alacak olan her bir uygulamanın hayvanın refahına olan katkısı farklı mekanizmalarla açıklanabilir. Bireysel yetiştirilen buzağı ya da kuzulara oranla çift halinde yetiştirilen hayvanların yaşadığı stresin azalması, hem daha iyi öğrenme yeteneklerine izin veren gelişmiş bilişsel gelişimle hem de yalnızca bir türün varlığıyla açıklanabildiği gibi bazı refah zenginleştirme yöntemleri de belirli bir zaman aralığı ile sınırlıdır (Mandel ve ark. 2016).

## 1.2. Çevresel Zenginleştirmenin Hayvan Refahı Açısından Sonuçları

Çevresel zenginleştirmenin etkili olabilmesi için hayvan refahının da zenginleştirmesi gerekir. Ancak, yapılacak zenginleştirmeler biraz zor olabilir. Hayvan refahını değerlendirmede en uygun yaklaşım üzerine fazlaca tartışılmıştır. Bu tartışmalarda hayvan refahının tek bir göstergesi olmadığı kabul edilmekte, ancak yapılacak değerlendirmede refahı en iyi şekilde gösteren bir yöntem/ölçüt kullanılması ve bu değerlendirmenin basit ama sağlam bir yaklaşımı içermesi gerektiği ifade edilmektedir (Endres ve ark. 2005). Dawkins (2008) hayvan refahının; “Hayvanlar fiziksel olarak sağlıklı mı ve istediklerine sahipler mi?” şeklinde değerlendirilmesini önermiştir. Bu nedenle, uygulanacak belirli bir zenginleştirmenin hayvanı daha sağlıklı yapıp yapmadığı sorgulanmalıdır (Fraser ve ark. 2013). Çevresel zenginleştirmenin hayvan refahı sonuçları üzerindeki etkisini belirlemek için sağlık göstergeleri ile hayvan istekleri birlikte ele alınmalıdır. Konuyla ilgili refah ölçütleri ve buna ilişkin yaklaşımlar Çizelge 1’de verilmiştir

**Çizelge 1.** Hayvan refahına ait göstergeler ve bu ilişkin yaklaşımlar (Fraser ve ark. 2013)

Değerlendirme yaklaşımı	Refah Ölçütleri/Kriterleri
Sağlık ve biyolojik işlevler açısından	-Stres fizyolojisi (TSH, kortizol vb) -Sağlıklı olma durumu (Gelişme, ölüm oranı ya da bağışıklık sistemi) -Yaralar, kesikler
Olumsuz etki durumu	-Olumsuz etki (Korku vb) -Anormal ve saldırganlık, tüy yolma, kuyruk ısırma vb
Olumlu etki durumu	-Pozitif etkiler (Serotonin salgısı vb) -Pozitif mod (Bilişsel önyargı)
Davranışsal gereksinimler	-Yaşama ait davranışlar (yeme, içme vb) -Temel davranışsal gereksinimler -Stresi azaltmak amacıyla yapılan davranışlardaki başarısızlık
Davranışsal istekler	-Fırsatçılığın açığa vuran davranışlar -Fırsat verilmediği halde artan stres yanıtına karşı bir şey yapmak istemeyen hayvanlarda ortaya çıkan davranışlar

Bir çevresel zenginleştirmenin etkili olabilmesi için yapılan uygulamanın mutlaka kolay uygulanabilir olması gerekir. Bir başka deyişle zenginleştirmelerin tüm hayvanlar için erişilebilir olması ve/veya uygun zaman/yaş ve sıklıkta sağlanması gibi bazı özelliklere sahip olması istenir (Hemsworth ve Coleman, 2011). Bu bağlamda çevresel zenginleştirmenin pratikliği ile ilgili olarak dikkate alınması gereken üç ana parametre söz konusudur. Bunlar; i) uygulamada, zenginleştirmeden kaynaklanan doğrudan veya dolaylı atıkların nasıl giderilebileceği, ii) biyogüvenlik riskleri, iii) standart uygulamalarda yaşanan sorunların iyi

irdelenmemesidir (Mateuffel ve ark. 2009). Uygulamaya yönelik bu tür sorunlar, zenginleştirme programlarının oluşturulmasında araştırmacılar ile düzenleyici kurumlar tarafından ayrıntılı olarak ele alınmalıdır.

### **1.3. Çevresel Zenginleştirmedeki Sınırlamalar ve Dikkate Alınması Gereken Hususlar**

Hayvan refahının zenginleştirilmesi için çevresel zenginleştirmenin etkinliğini değerlendirmede, çevre bir kılavuz rolü görür. Ancak bu değerlendirme yaklaşımının çeşitli sınırlamaları vardır. Çevre, hayvanlar arasındaki bireysel farklılıkları hesaba katmaz ve grup düzeyinde refah zenginleştirmelerini amaçlar. Zenginleştirmenin kullanımı ve dolayısıyla etkinliği, bireysel farklılıklarla ya da kazanılan deneyim, mizaç veya genetikteki farklılıklardan kaynaklanır (de Azevedo ve ark. 2007). Sıkışık biçimde barındırılan hayvanların standart ortamlarında sürekli zenginleştirmeler yapıldığından, sosyal normların gelişmesine yardımcı olur (Popescu ve ark. 2013). Bir hayvanın önceki deneyimleri daha sonraki yaşamındaki tepkisi üzerinde bir etkiye sahip olabileceğinden, zenginleştirmenin etkisi, bir hayvanın yaşamı/üretim sistemi boyunca yaşayabileceği tüm barınma koşulları genelinde değerlendirilmelidir (Cardoso ve ark. 2016).

### **1.4. Çevresel Zenginleştirmenin Ekonomik Yönü**

Çevresel zenginleştirme uygulamada ve hayvan refahı üzerinde olumlu sonuçlar göstermesine karşın ekonomik yönüyle de değerlendirilmesi gerekir. Çevresel zenginleştirmenin ekonomik yönü ise, refah sonuçlarının doğası ve zenginleştirme uygulamasının maliyeti ile ilgilidir (Rault, 2012). Zenginleştirme uygulamasının maliyeti yalnızca zenginleşmenin kendisi değil, aynı zamanda işletmenin büyüklüğü, coğrafi konumu ve barınak sistemi üzerinde etkili olup ve dolayısıyla değerlendirmede her bir unsurun dikkate alınması gerekmektedir. Yapılacak yatırımın getirisini, hayvanlarda yaşanacak refah düzeyine yansıtılması göz ardı edilmemelidir. Üretim her zaman hayvan refahındaki zenginleştirmelerle ilişkili olmasa da, fizyolojik stres yanıtının gerek ürün kalitesini gerekse de ürün miktarını etkileyebileceği yaygın olarak kabul edilmektedir (Hemsworth ve Coleman, 2011). Bir hayvanın temel ihtiyaçlarının iyileştirilmesine yol açan zenginleştirmelerin, üretkenlikteki gelişmeler nedeniyle olumlu bir ekonomik getiri elde etme olasılığı uzun vadede de olsa yüksek olacaktır (Young, 2003). Örneğin, işletmede sağlığı zenginleştirmeye yönelik olarak yapılan zenginleştirmeler, artan döl ve süt verimi gibi verim özelliklerini doğrudan etkileyecektir. Bununla birlikte, kârlı bir üretim için, üretkenlikteki zenginleştirme, sağlık-koruma giderlerinin maliyetini dengelemeye yeterli olmalıdır.

Refah gibi hayvanın temel ihtiyaçlarının ötesinde gerçekleştirilen zenginleştirmeler karşısında bir hayvanın olumlu etki göstermesine karşın hayvanın biyolojik işleyişinin “normal” seviyelerin ötesine geçmesi beklenmez. Bu nedenle, yetiştirici desteklenmediği sürece refah zenginleştirmelerini uygulama maliyeti sağlayacağı faydalarından daha yüksek olabilir. Böyle bir yaklaşımın uygulanabilir olması için tüketicilerin bir prim ödemesi gerekebilir (Fraser, 2013). Bununla birlikte, tüketicilerin refah için “temel ihtiyaçlar” ve “temel ihtiyaçların ötesinde” kavramları hakkında bilgi sahibi olup olmadığı veya bunlardan biri veya her ikisi için daha fazla ödemeye istekli olup olmadığı bilinmemektedir. Halkın 'temel ihtiyaçlar' ve 'temel ihtiyaçların ötesinde' algısı ve bu tür ürünler için ödeme yapma istekliliği hakkında daha fazla araştırma yapılması, hayvan refahında bilime dayalı zenginleştirmelerin yapılmasını sağlamak için gereklidir. Zenginleştirmenin üreticiler tarafından uygulaması ekonomik olarak mümkündür (Gonzales ve ark. 2013). Hayvan zenginleştirme uygulamasının ekonomik fayda-maliyet değerlendirmesi, üreticiler için daha geniş faydaları da dikkate almalıdır. Ayrıca etkili zenginleştirmelerin benimsenmesi, tüketicilerin giderek daha fazla değer verdiği tarımsal işletmelerin sosyal lisansını kazanmalarına/sürdürmelerine katkıda bulunabilir. Son olarak, finans kurumları hayvancılık için yatırım kararlarını hayvan refahı gibi sürdürülebilir üretim süreçlerine (Strappini ve ark. 2021) giderek daha fazla dayandırdığından, hayvancılık işletmeleri zenginleştirme uygulamaları için finansmana daha kolay erişim yoluyla ödüllendirilebilir.

## **2. ÇEVRESEL ZENGİNLEŞTİRME UYGULAMALARI**

Avrupa Komisyonu, yasal çerçeveyi basitleştirmek ve hayvan yetiştiricilerinin rekabet gücünü artırmak için bilime dayalı hayvan refahı göstergelerinin kullanılmasını vurgulamaktadır. Hayvan temelli önlemlere dayanan ilk refah değerlendirme protokolleri; çiftlik hayvanları için Welfare Quality® projesi tarafından geliştirilmiştir. Bu proje, hayvan refahının tüm yönlerini kapsamak için gerekli olduğu düşünülen, hayvanların ihtiyaçlarının dört ilke ve on iki kriter ile ilişkili olduğu bir şema geliştirmiştir (Şekil 1). Bu yaklaşım, çiftlik düzeyinde refah değerlendirmesi üzerine gelecekteki araştırmalar için bir temel oluşturmuştur. Bu bağlamda çiftlik hayvanları için barındırma, sürü yönetimi ve besleme açısından çevresel zenginleştirme çalışmaları yapılarak hayvanların yaşam şartları ilgili refah kriterlerine uygun hale getirilmelidir.

Şekil 1. Refah İlkeleri ve Kriterleri (Welfare Quality® Protocol, 2009).

## 2.1. Barındırma Açısından Çevresel Zenginleştirme

Bir hayvancılık işletmesinde barındırılan hayvanın konforu (refahı), temiz, kuru ve hava akımı olmayan bir ortamda bulunması, kendine uygun bir zeminde yürümesi ve yatması, rahat hareket edebileceği kadar bir alana sahip olması, bol ve kaliteli hava soluyabilmesi, yem ve suya kolayca ulaşabilmesi, sağımın uygun alet ve ekipmanla yapılmasını gerektirmektedir. Bu işlevselliği sağlayacak barındırma altyapısı; örneğin bir süt sığırcılığı işletmesinde çeşitli yaş gruplarındaki (buzağı, dana, kuzu, çepiç, vb.) ve farklı statülerdeki (kuruda, sağmal, hasta vb.) hayvanları barındıracak şekilde düzenlenmiş üniteleri içermeli, sığırlar için uygun bir çevre oluşturmalı, insan ve hayvanların güvenliğini sağlamalı, yem ve suya ulaşmayı kolaylaştırmalı, sağım kolay ve temiz yapılmasını sağlamalı, gübreleri zamanında ve kolaylıkla uzaklaştırılabilir, yemin hazırlama ve dağıtımını kolaylaştırmalı, sürü yönetim uygulamalarının (hayvanların yakalanması, sürüden ayrılması, tartılması, aşılanması vb.) kolayca yapılabilmesini sağlamalı, işgücü ihtiyacını en aza indirmeli, oluşacak kirliliğin çevreye vereceği olumsuzlukları en aza indirilecek şekilde kontrolüne imkân vermeli ve ilgili yasal düzenlemelerde istenen koşulları sağlamalıdır (Akman, 2012).

Barındırma yönünden çevresel zenginleştirme için atılacak ilk adım hayvan barınaklarının, türün gereksinimlerine uygun ve hayvan refah ilkelerini sağlayan bir tasarıma sahip olmasıdır (Şekil 2). Bu bağlamda hayvan barınaklarının tasarım hedefleri; sağlıklı çevre koşulları sağlamak, işgücü etkinliğini artırırken ilk yatırım masraflarını düşürmek ve yavru hayvanların gelişimini optimize etmektir. Bu kapsamda hayvanlar açısından en önemli tasarım hedefleri; stresi minimize etmek, temiz kuru ve rahat dinlenme alanları sağlamak, yeterli yeme ve suya sürekli ve kolay ulaşım sağlamak ve özellikle genç hayvanları ekstrem hava koşullarının

etkilerinden korumak şeklinde sıralanmaktadır (Cook ve Nordlund, 2004; Graves ve ark., 2006; Cook ve Nordlund, 2009; Holmes ve ark. 2013).

Şekil 2. Çiftlik hayvanları barınakları

Hayvan barınaklarında gübre yönetimi hayvan sağlığı ve hayvan refahı açısından son derece önemli bir unsurdur. Barınak içinde biriken gübreden yayılan gazlar ve hayvanların gübre ile temas halinde olan vücut bölmelerinde oluşabilecek enfeksiyonlar hayvan sağlığını ve verimini tehdit olumsuz yönde etkilemektedir. Bu yüzden barınak içinde modern bir gübre yönetim sistemi ve altyapısının bulunması şarttır. Gübre yönetiminin ilk aşaması olan gübre toplama işlemi, hidrolik, zincirli veya halatlı sıyırıcı sistemler veya basınçlı su ile yıkama uygulaması ile yapılmaktadır (Şekil 3).

Şekil 3. Gübre toplama sistemleri

## **2.2. Sürü Yönetimi Açısından Çevresel Zenginleştirme**

Sürünün devamını sağlamak, amacıyla, sürü düzeyinde yapılması gereken uygulamalar sürü yönetimi olarak tanımlanmaktadır. Hayvancılık işletmesinin karlı bir üretim yapması, başarılı bir sürü yönetimine bağlı olmaktadır (Akman, 1998). Sürü büyüklüğü, mera alanının genişliği, verimliliği, yetiştiricinin ayırabileceği sermaye, sürü yöneticisi temini, yeteneği ve bilgi durumu, elde edilecek ürünlerin fiyatları ve pazarlama olanakları gibi etmenlere göre belirlenmelidir. Ayrıca yetiştiriciliği yapılan hayvanlar çeşitli yaş grupları (yavru, genç vb.) ve fizyolojik özelliklerine (sağılan, kuruda vb.) göre gruplandırılmalı ve her bir grup uygun alanlarda (barınak içi bölmeler veya ayrı barınaklar) barındırılmalıdır.

Etkin bir sürü yönetimi için yetiştiricilik süresince hastalık ve yaşlılık gibi nedenlerle hayvanların bir bölümünün her yıl ayıklanarak sürüden uzaklaştırılması gerekmektedir. Topallık, ayak bozukluğu, alt ya da üst çenenin kısa olması gibi kalıtsal kusurlar, iki yıl üst üste kısır kalan, doğum yaptığı halde yavrularına iyi bakmayan, yavrusu zayıf doğan ve hızlı gelişmeyen, çabuk kuruya çıkan ve/veya süt verimleri düşük olan, çabuk hastalanan ve düşük yapan, yaşlanan (6-8 yaş) hayvanlar sürüden ayıklanmalıdır. Söz konusu niteliklerdeki hayvanların sürüden ayıklanması ile sürü yenileme oranı yaklaşık %20 olmalıdır (Erdem ve ark., 2021).

## **2.3. Besleme Açısından Çevresel Zenginleştirme**

Yıl boyunca değişen besin gereksinimleriyle birlikte, başarılı bir sürü performansı için çiftlik hayvanlarının düzenli ve dengeli beslemek hayati önem taşımaktadır. Hayvanların besin gereksinimleri, üretim döngüsü boyunca önemli ölçüde değişiklik göstermektedir. En iyi verim performansı ve sağlığı sağlamak için beslemenin hayvan vücudundaki etkilerinin bilinmesi ve göz ardı edilmemesi gerekmektedir. Çiftlik hayvanlarının yıl içerisinde gösterdikleri farklı fizyolojik durumlarına göre doğru miktarda ve türde yem sunmak, kârlı bir yetiştiriciliğin esasıdır. Yavru kayıplarının önlenmesi, süt, et ve döl veriminin artması çiftlik hayvanlarının uygun bir rasyon ile beslenmesine bağlıdır.

Yeni doğan yavrulara annesinde ya da başka anneden mutlaka kolostrum (ağız sütü) sağlanmalıdır. Kolostrum, meme bezinin ilk salgısıdır ve üretimi normal olarak doğumdan önce bazen de hamileliğin son haftalarında başlamaktadır. Kolostrum, yeni doğan hayvanların beslenmesinde yüksek besin içeriği ile iyi bir enerji sağlayan gıda olması, belirli minerallerin (özellikle magnezyum) varlığı nedeniyle laksatif bir etkiye sahip olması ve yoğun miktarda

maternal antikorlar içererek hastalığa karşı bağışıklığın şekillenmesini sağlaması ile oldukça önemli bir besin kaynağıdır.

Yaşamın ilk birkaç haftasında bir yavrunun beslenmesi için ihtiyaç duyduğu tek şey annesinin sütüdür. Bu aşama normalde 5 veya 6 hafta sürer. Yavru, sütle beslenir. Bu süt, annesinden veya diğer annelerden temin edilebilir veya bir süt ikame yemi olabilir. Yavrular doğumdan hemen sonra katı yiyecekleri kemirmeye başlamasına rağmen yaşamının bu aşamasında diğer yem türlerini sindiremezler ancak 4 ila 6 haftalık olduklarında, besin alımlarının %50'sini anne sütü dışındaki kaynaklardan alıyor olabilirler.

Sağmal çiftlik hayvanlarında (koyun, keçi, sığır) beslenme, sütün kalitesini etkileyen önemli bir faktördür. Beslenme, süt yağı ve toplam protein sentezini ve salgılanma oranlarını doğrudan etkiler ve ayrıca mineral ve vitamin konsantrasyonlarını da etkileyebilir. Sağmal hayvanlara verilen aromatik bileşikler veya zehirli maddeler süte geçebilir. Beslenme sütün somatik hücre sayısını ve mikrobiyal konsantrasyonunu da etkileyebilir. Bu nedenle beslenme, sütün pıhtılaşma özellikleri, peynir verimi, olgunlaşma süresi, peynirin muhafaza edilebilirliği ve lezzeti dâhil olmak üzere sütün işleme performansının tüm yönlerini etkilemektedir. Sütteki yağ ve protein miktarını artırmak için rasyonlar hem kalite hem de rumende parçalanabilirlik açısından dengeli bir enerji/protein oranına sahip olarak ayarlanmalıdır. Rasyonlarda minimum lif seviyesi %30-32 NDF olmalıdır. Rasyon lifinin bir kısmı (en az üçte biri), selüloz fermantasyonu ve optimal ruminal pH seviyelerinin devamı için yeterli partikül uzunluğuna (2-3 mm) sahip olmalıdır. Düşük lifli-yüksek konsantre yem içeren yoğun rasyonlar kullanıldığında ruminal pH'daki hızlı değişimleri önlemek için gün boyunca besleme sıklığı arttırılmalıdır. Özellikle rumende kolayca fermente ediliyorsa, idrardaki nitrojen kayıplarını azaltmak için aşırı proteinden kaçınılmalıdır. Süt üre konsantrasyonu (MUN), protein tüketiminin bir göstergesi olarak rutin bir şekilde izlenmelidir. Sütteki somatik hücre ve bakteri sayısını azaltmak için; koyunları mastitise yatkın hale getirebilecek ani rasyon değişikliklerinden kaçınılmalıdır. Meme bezinin doğal bağışıklık cevabını uyarmak için rasyona vitamin A ve vitamin E takviyeleri yapılmalıdır. Kötü tat ve kokuları süte geçebilecek maddeler içeren yem maddelerini koyun ve keçilerin rasyonuna kullanmaktan kaçınılmalıdır. Anormal fermantasyona uğramış silaj gibi fermente yemleri kullanmaktan kaçınılmalıdır (Erdem ve ark., 2022).

### **3. SONUÇ ve ÖNERİLER**

Bu çalışmada, hayvan refahı odaklı çevresel zenginleştirmenin kapsamı ve uygulamaları ayrıntılı olarak incelenmiştir. Çevresel zenginleştirme uygulamalarının yaygınlaştırılması ve hedeflenen başarının sağlanabilmesi için öncelikle hayvansal üretime ilişkin bilimsel esasların, hayvan refahı mevzuatının ve destekleme programlarının geliştirilmesini ve uygulanmasını gerektirmektedir. Zenginleştirme ya da zenginleştirmenin etkisi, amaçtan çok konunun odak noktası olup konuya gerek tür gerekse yaş ve fizyolojik özellik bakımından sistematik yaklaşılmalıdır. Özellikle çevresel zenginleştirmeye ilişkin oluşturulacak ilke ve esasların belirlenmesinde mutlaka uygulanabilir ve ekonomik olmasına dikkat edilmelidir. Hayvansal üretim adına yapılacak bu zenginleştirmenin hayvancılık sektörüne ilgili olmasını sağlamak için araştırmacıların ve düzenleyici kurumların endüstri ile etkileşime girmesini sağlanmalıdır. Sonuç olarak hayvansal üretimde çevresel zenginleştirme adına yapılacak işlerde yer alacak olan tüm paydaşların zenginleştirme uygulamalarının hayvan refahı üzerindeki etkilerini başta tüketiciler olmak üzere herkese iletmesi, zenginleştirmelerin daha iyi anlaşılmasına yardımcı olacaktır.

## **TÜRKİYE’ DE YÜKSEKÖĞRETİMDE TOHUMCULUK EĞİTİMİ**

**Doç. Dr. Burcu TUNCER (Orcid ID: 0000-0002-4402-4536)**

Van Yüzüncü Yıl Üniversitesi, Ziraat Fakültesi, Bahçe Bitkileri Bölümü, Van

**Yüksek Lisans Öğrencisi, Rabia AKBAL (Orcid ID: 0000-0002-2371-7835)**

Van Yüzüncü Yıl Üniversitesi, Fen Bilimleri Enstitüsü, Bahçe Bitkileri Anabilim Dalı, Van

### **ÖZET**

Bitkisel üretimin temelini tohum oluşturmaktadır. Başarılı bir yetiştiricilik, kaliteli tohum kullanmak ve modern tarım tekniklerini devreye sokmakla doğrudan bağlantılıdır. Bu nedenle tohumculukta eğitimin önemi kavranmalı ve eğitim programlarının yaygınlaşmasına ve eğitimde kalitenin artırılmasına gayret gösterilmelidir. Burada sunulan çalışmada, Türkiye’ de yükseköğretimde tohumculuk eğitiminin mevcut durumunun ortaya konulması amaçlanmıştır. Bu amaçla, tohumculuk eğitimi ön lisans, lisans ve lisansüstü düzeyde olmak üzere 3 alt başlık altında değerlendirilmiştir. Her düzeyde (ön lisans, lisans ve lisansüstü) tohumculukla ilgili verilen ders adları, derslerin verildikleri bölüm / anabilim dalı / programlar, derslerin statüleri (seçmeli veya zorunlu), AKTS ve kredi bilgileri (teorik saat + uygulama saat) detaylı olarak sunulmuştur. Türkiye’ de yükseköğretimde tohumculuk eğitimi lisans düzeyinde Ziraat Fakültelerinde, önlisans düzeyinde ise fakülterle bağlı Meslek Yüksekokullarında verilmektedir. Ülkemizde eğitimini sürdürmekte olan 36 adet Ziraat Fakültesinin tümünde tohumculukla ilgili farklı adlarla açılmış dersler verilmektedir. Verilen derslerden % 48’ inin zorunlu, % 48’ ini seçmeli, % 4’ ünün ise seçmeli veya zorunlu statüde olduğu saptanmıştır. Tohumculuk derslerinin % 38’ inin uygulaması bulunurken, % 62’ sinin sadece teorik olarak verildiği saptanmıştır. Lisansüstü düzeyde ise verilen derslerin tamamının seçmeli ders statüsünde olduğu belirlenmiştir. Önlisans düzeyinde ise 84 adet meslek yüksek okulunda tohumculukla ilgili derslerin verildiği saptanmıştır. Derslerinin % 67’ sinin zorunlu, % 33’ ünün ise seçmeli ders statüsünde olduğu, verilen derslerin % 49’ unun uygulamalı, % 51’ inin ise sadece teorik olarak verildiği tespit edilmiştir. Lisans ve lisansüstü düzeyinde tohumculuk eğitiminde Bahçe Bitkileri ve Tarla Bitkileri Bölüm/Anabilim Dallarının ön plana çıktığı, ön lisans düzeyinde ise tohumculukla ilgili derslerin büyük çoğunluğunun Organik Tarım programında verildiği saptanmıştır. Burada sunulan bilgilerin bundan sonraki yükseköğretimde tohumculuk eğitim faaliyetlerinin şekillendirilmesi açısından faydalı olacağı düşünülmektedir.

**Anahtar kelimeler:** Eğitim, lisans, lisansüstü, önlisans, tohum

**SEED EDUCATION AT HIGHER EDUCATION IN TURKEY****ABSTRACT**

Seed is the basis of plant production. Successful crop production is directly related to using quality seeds and using modern agricultural techniques. For this reason, the importance of education in seed cultivation should be understood and efforts should be made to expand education programs and increase the quality of education. In the study presented here, it is aimed to reveal the current situation of seed education at higher education in Turkey. For this purpose, seed education was evaluated under 3 sub-titles as associate, undergraduate, and graduate degree. At each degree (associate, undergraduate, and graduate), the names of the courses related to seed, the departments / programs where the courses are given, the status of the courses (optional or compulsory), ECTS and credit information (theoric hours + practice hours) are presented in detail. Seed education in higher education in Turkey is given at undergraduate level in Agricultural Faculties, and at associate degree level in Vocational Schools affiliated to these faculties. In all of the 36 Agricultural Faculties continuing education in Turkey, courses related to seed growing under different names are given. It has been determined that 48% of the courses given are compulsory, 48% are optional, and 4% are optional or compulsory. It has been determined that 38% of the seed courses have practical hours, while 62% are given only theoretically. It has been determined that all of the courses given at the graduate level are in the status of optional courses. At the associate degree level, it was determined that courses related to seed growing were given in 84 vocational high schools. It has been determined that 67% of the courses are compulsory and 33% are optional courses, 49% of the courses are practically and 51% are given only theoretically. Horticulture and Field Crops Departments are in the first place in seed education at undergraduate and graduate level. At the associate degree level, it was determined that the majority of the courses related to seed growing were given in the Organic Farming program. It is thought that the information presented here will be useful in shaping the seed education activities in higher education.

**Keywords:** Education, undergraduate, graduate, associate degree, seed

## 1. GİRİŞ

Türkiye’ de yükseköğretimde tohumculuk eğitimi, lisans düzeyinde üniversitelerin Ziraat Fakültelerinde, önlisans düzeyinde ise Ziraat Fakülteleri bünyesindeki Meslek Yüksekokullarının ilgili bölümlerinde verilmektedir. Türkiye’de tarım öğretiminin, başlangıcı çok eskilere uzanmaktadır. İlk Tarım Yüksekokulu 1846 yılında İstanbul-Yeşilköy Ayamama Çiftliğinde kurulmuş, ancak çalışmalarını iki yıl sürdürebilmiştir. Daha sonra 1891 yılında Halkalı Yüksek Ziraat Okulu açılmıştır (Demirel ve Doğanay, 2011). Bu okul 1928 yılına kadar eğitim ve öğretimini sürdürerek ziraat mühendisi yetiştirmiştir. Bu okulun kapatılmasıyla meydana gelen boşluğu doldurmak amacıyla 1930 yılında Ankara Yüksek Ziraat Okulu açılmıştır. Alman Ziraat Fakülteleriyle aynı eğitim sistemini benimseyen bu okul daha mezun vermeden üç yıl sonra 30 Ekim 1933’ de Yüksek Ziraat Enstitüsü’ne dönüştürülmüştür. Bu Enstitü daha sonra, 1946 yılında kurulan Ankara Üniversitesi bünyesine 1948 yılında dahil edilerek ülkemizdeki ilk Ziraat Fakültesi kurulmuştur. 1948 yılında kurulan Ankara Üniversitesi Ziraat Fakültesinde ilk tohumculuk eğitimi vermeye başlanmıştır.

1955 yılına kadar Türkiye’de tek Ziraat Fakültesi olarak eğitimini sürdüren Ankara Üniversitesi Ziraat Fakültesini daha sonra sırası ile Ege Üniversitesi (1955), Atatürk Üniversitesi (1957) ve Çukurova Üniversitesi (1973) Ziraat Fakülteleri izlemiştir (Çiftçi, 2016). Ankara Üniversitesi Ziraat Fakültesi desteği ile kurulan bu üniversitelerde de tohumculuk eğitimi benzer şekilde sürdürülmüştür.

Bu çalışmada, Türkiye’ de yükseköğretimde tohumculuk eğitiminin mevcut durumunun ortaya konulması amaçlanmıştır. Burada sunulan bilgilerin yükseköğretimde tohumculuk eğitim faaliyetlerinin şekillendirilmesi açısından faydalı olacağı düşünülmektedir.

## 2. MATERYAL YÖNTEM

Çalışmada, Yükseköğretim kurumlarının bağlı olduğu YÖK kayıtlarından ve üniversitelerin internet sitelerinden yararlanılmıştır. Bu amaçla internet üzerinden yapılan araştırmalar sonucu elde edilen veriler kullanılmıştır (Anonim 2022).

## 3. ARAŞTIRMA BULGULARI

Günümüzde Yükseköğretimde “Tohumculuk Eğitimi” Ön lisans (Meslek Yüksek Okulları), Lisans (Ziraat Fakülteleri) ve Lisansüstü düzeylerde verilmektedir. Bu nedenle burada sunulan bilgiler 3 alt başlık altında değerlendirilmiştir.

### 3.1. Lisans Düzeyinde Tohumculuk Eğitimi

Günümüzde son durum itibarıyla toplam 40 adet Ziraat Fakültesi bulunmaktadır. Bu fakültelerin 4' ünde henüz eğitim verilmemektedir. Ziraat Fakültelerinde tohumculukla ilgili verilen ders adları, derslerin verildikleri bölümler, derslerin statüleri (seçmeli veya zorunlu), AKTS ve kredi bilgileri (teorik saat + uygulama saati) Çizelge 1' de sunulmuştur.

**Çizelge 1.** Ziraat Fakültelerinde lisans düzeyinde tohumculuk eğitimi

BB: Bahçe Bitkileri, TB: Tarla Bitkileri, TBY: Tarımsal Biyoteknoloji, TBT: Tohum Bilimi ve Teknolojisi, BK: Bitki Koruma, TBBB: Toprak Bilimi ve Bitki Besleme, PM: Peyzaj Mimarlığı, ST: Süt Teknolojisi, TE: Tarım Ekonomisi, ZT: Zootekni, TM: Tarım Makinaları, TYS: Tarımsal Yapılar ve Sulama, S: Seçmeli, Z: Zorunlu.

Hali hazırda eğitimini sürdürmekte olan 36 adet Ziraat Fakültesinin tümünde tohumculukla ilgili farklı adlarla açılmış dersler (toplam 126 adet) verilmektedir. Verilen derslerden 61' inin (% 48) zorunlu (Z), 60' inin (% 48) seçmeli (S), 5' inin (% 4) ise seçmeli (S) veya zorunlu (Z) statüde olduğu saptanmıştır (Çizelge 1) (Şekil 1). Bunun yanısıra, 126 adet dersten 48' inin uygulaması (% 38) bulunurken, geriye kalan 78 adet dersin (% 62) sadece teorik olarak verildiği belirlenmiştir (Çizelge 1, Şekil 2).

Ziraat Fakültelerinde lisans düzeyinde tohumculukla ilgili dersler farklı bölümlerde verilmektedir. Tohumculuk dersleri en çok Tarla Bitkileri (59 adet) ve Bahçe Bitkileri (50 adet) Bölümlerinde verilirken, bu bölümleri sırasıyla Bitki Koruma (18 adet), Tarımsal Biyoteknoloji (12 adet), Tohum Bilimi ve Teknolojisi (11 adet), Tarım Ekonomisi (6 adet), Peyzaj Mimarlığı (5 adet), Toprak Bilimi ve Bitki Besleme (4 adet), Zootekni (3 adet), Süt Teknolojisi (1 adet),

Tarım Makinaları (1 adet), Tarımsal Yapılar ve Sulama (1 adet) Bölümlerinin izlediği belirlenmiştir (Çizelge 1, Şekil 3) (Çizelge 1, Şekil 3) (Çizelge 1, Şekil 3).

**Şekil 1.** Lisans düzeyinde tohumculuk derslerinin statüleri

**Şekil 2.** Lisans düzeyinde teorik ve uygulamalı tohumculuk derslerinin dağılımı

**Şekil 3.** Lisans düzeyinde bölümler bazında verilen tohumculuk ders sayıları

### **3.2. Önlisans Düzeyinde Tohumculuk Eğitimi**

Önlisans düzeyinde tohumculukla ilgili dersler meslek yüksek okullarında verilmektedir. Ders adları, derslerin verildikleri programlar, statüleri (seçmeli veya zorunlu), AKTS ve kredi bilgileri (teorik saat + uygulama saat) Çizelge 2’ de verilmiştir.

**Çizelge 2.** Meslek yüksek okullarında önlisans düzeyinde tohumculuk eğitimi

BT: Bahçe Tarımı, OT: Organik Tarım, TAB: Tıbbi ve Aromatik Bitkiler, TABB: Tıbbi ve Aromatik Bitkiler Tohumculuğu, TB: Tarla Bitkileri, S: Seracılık, PSB: Peyzaj ve Süs Bitkileri, TT: Tohumculuk Teknolojisi, Tİ: Tarımsal İşletmecilik, FY: Fidan Yetiştiriciliği, T: Tohumculuk, BK: Bitki Koruma, ÇATY: Çim Alan Tesisi ve Yönetimi, Z: Zorunlu, S: Seçmeli.

Yapılan arařtırmalar sonucunda 51 adet üniversite bünyesinde toplam 84 adet meslek yüksekokulunda tohumculukla ilgili derslerin verildiđi tespit edilmiřtir (Çizelge 2).

Önlisans düzeyinde verilen tohumculuk derslerinin 139' unun zorunlu (Z) (% 67), 69' unun seçmeli (S) (% 33) ders statüsünde olduđu (Şekil 4), verilen 208 adet dersten 102' sinin (% 49) uygulamalı, 106' sının (% 51) ise sadece teorik olarak verildiđi saptanmıřtır (Şekil 5).

Meslek yüksekokullarında önlisans düzeyinde tohumculukla ilgili dersler Bitkisel ve Hayvansal Üretim Bölümlerinin farklı programlarında verilmektedir. Meslek yüksekokullarında tohumculuk dersleri en çok Organik Tarım (41 adet) ve Tıbbi ve Aromatik Bitkiler (26 adet) programlarında verilirken, bu programları sırasıyla Bahçe Tarımı (14 adet), Tohumculuk Teknolojisi (7 adet), Tarla Bitkileri (5 adet), Peyzaj ve Süs Bitkileri (4 adet), 2' Őer adet dersle Tohumculuk ve Tarımsal İřletmecilik programları, 1' er adet dersle Bitki Koruma, Tıbbi ve Aromatik Bitkiler Tohumculuđu, Çim Alan Tesisi ve Yönetimi ile Fidan Yetiřtiriciliđi programları izlemektedir (Çizelge 2, Şekil 6).

Şekil 4. Önlisans düzeyinde tohumculuk derslerinin statüleri

Şekil 5. Önlisans düzeyinde teorik ve uygulamalı tohumculuk derslerinin dağılımı

Şekil 6. Önlisans düzeyinde tohumculuk derslerinin verildiği programlar

### 3.3. Lisansüstü Düzeyinde Tohumculuk Eğitimi

Lisansüstü düzeyde tohumculukla ilgili dersler üniversitelere bağlı Fen Bilimleri Enstitülerinin ilgili anabilim dallarında verilmektedir. Ders adları, derslerin verildikleri anabilim dalları, statüleri (seçmeli veya zorunlu), AKTS ve kredi bilgileri (teorik saat + uygulama saat) Çizelge 3' de verilmiştir.

Çizelge 3’deki verilere göre 32 adet üniversitenin Fen Bilimleri Enstitüsüne bağlı ilgili anabilim dallarında lisansüstü düzeyde tohumculuk eğitiminin verildiği tespit edilmiştir. Tohumculukla ilgili derslerin anabilim dallarına göre dağılımı Şekil 7’de verilmiştir. Tohumculuk derslerinin en çok Tarla Bitkileri (28 adet) ve Bahçe Bitkileri (27 adet) Anabilim Dalında verildiği (Şekil 7), lisansüstü düzeyde verilen derslerin tamamının seçmeli (S) ders statüsünde olduğu belirlenmiştir (Çizelge 3)

Şekil 7. Lisansüstü düzeyinde tohumculuk derslerinin anabilim dallarına göre dağılımı

#### **4. TARTIŞMA VE SONUÇ**

Bu çalışmada, ülkemizdeki yükseköğretimdeki tohumculuk eğitiminin mevcut durumu ortaya konulmaya çalışılmıştır. Yapılan araştırmalar sonucunda, lisans düzeyinde eğitim verilen Ziraat Fakültelerinin (36 adet) tamamında tohumculukla ilgili dersler verildiği saptanmıştır. Günümüze kadar toplam 84 adet meslek yüksek okulunda tohumculukla ilgili derslerin verildiği program olduğu saptanmıştır. Ancak meslek yüksekokullarında farklı adlarla açılmış olan tohumculuk derslerinin (organik tohumculuk ve tıbbi aromatik bitkiler tohumculuğu programları hariç) birçoğunun, ders içerikleri incelendiğinde lisans düzeyinde verilen tek bir tohumculuk derslerine karşılık geldiği görülmüştür. Bu durumun tohumculuk sektörüne bir kazanım sağlamayacağı, gerek meslek yüksek okullarında gerekse Ziraat Fakültelerinde teorik derslerin yanı sıra, uygulamalı derslere de ağırlık verilmesi gerektiği bilinmektedir. Bu nedenle meslek yüksekokullarındaki bu derslerin, ders içerikleri zenginleştirilmeden, derslerin uygulama saatleri artırılmadan farklı adlarla benzer içerikli derslerin açılmasına ihtiyaç bulunmamaktadır.

Ülkemizde ara eleman yetiştirmek amacıyla kurulan ve sayıları hızla artan meslek yüksek okullarında eğitim kalitesini artırabilmek amacıyla sayılarının kontrol altına alınması gerekmektedir. Aynı durum lisans eğitiminin yapıldığı ve sayıları giderek artan Ziraat Fakülteleri için de geçerli olmaktadır. Alt yapıyı iyileştirmeden Ziraat Fakültelerine ve Meslek Yüksek okullarına alınan öğrenci sayılarını artırmakla tohumculuk sektörünün istediği elemanları yetiştirmek maalesef mümkün olamamaktadır. Bunun yanı sıra tarımın her sektöründe olduğu gibi tohumculuk sektörünün de güçlü olabilmesi açısından tohumculukta eğitim kalitesinin artırılması gerekmektedir. Sadece kaliteli öğretim elemanı ile kaliteli eğitim sürdürülemez. Uygulamanın ön plana çıktığı tohumculuk sektöründe alt yapı ve teknik donanım da son derece önemli olmaktadır. Bu nedenle tohumculuk eğitiminde kaliteyi artırabilmek için, gerek Ziraat Fakülteleri gerekse Meslek Yüksek Okullarının alt yapı, öğretim elemanı ve teknik donanımının bir bütün olarak değerlendirilmesi ve güçlendirilmesi gerekmektedir.

### **ÖZET**

Tarım, geçmişten günümüze dünyanın dikkat çeken sektörleri arasındadır. Özellikle nüfusun beslenme ihtiyacının karşılanmasında önemli bir yere sahiptir. Ayrıca tarımın, farklı alanlarda ülke ekonomisine olan katkısı da yadsınamaz. Tarımın; nüfus, işgücü, toplumun beslenmesine olan katkısı, sanayi, milli gelir ve dış ticaret katkısı bulunmaktadır. Ülkelerin dünya piyasalarında rekabet gücünün yüksek olması ihracat potansiyelini artırmaktadır. Bu çalışmanın amacı, Türkiye ihracatında önde gelen bazı tarımsal ürünlerini incelemektir. Araştırmada belirlenen ürünlere ait ikincil veriler incelenmiştir. Bu kapsamda Türkiye'nin ihracatta önde gelen bazı tarım ürünleri ekim alanı, üretim miktarı, verim ve dış ticaret değerleri (ihracat, ithalat) ortaya konularak değerlendirilmiştir. Türkiye ihracatında fındık, üzüm, domates, tütün, kayısı ve incir gibi tarım ürünleri ön plandadır. Türkiye İhracatçılar Meclisi (TİM) verilerine göre 2021 yılı tarım sektörü ihracatı 29 milyar doların üzerindedir. Bu değer Türkiye'nin toplam ihracatının yaklaşık %13'ünün tarımdan elde edildiğini göstermektedir. Tarımsal faaliyetler mikro düzeyde katkısının yanı sıra, makro düzeyde de ülke ekonomisini desteklemektedir. Sadece hammadde olarak değil, tarımsal ürünlere katma değer kazandırılması, mamul ve yarı mamul olarak dünya piyasalarında Türkiye'nin daha fazla yer edinebileceği düşünülmektedir.

**Anahtar kelimeler:** Tarım, Ticaret, İhracat, Ekonomi, Türkiye.

## **SOME LEADING AGRICULTURAL PRODUCTS IN TURKEY'S EXPORT**

### **ABSTRACT**

Agriculture is one of the most notable sectors of the world from the past to the present. In particular, it has an important place in meeting the nutritional needs of population. In addition, the contribution of agriculture to the country's economy in different subjects is also undeniable. It has a support to the population, labor force, nutrition of the society, industry, national income and foreign trade. The high competitiveness of countries increases the export potential in market. The aim of this study is to examine the some leading agricultural products in Turkey's export. In research, secondary data of the determined products were examined. In this context, some of Turkey's leading export products were evaluated by revealing the cultivation area, production amount, yield and foreign trade values (export, import). Products such as hazelnuts, grapes, tomatoes, tobacco, apricots and figs are at the forefront in Turkey's exports. According to the data of Turkish Exporters Assembly (TIM), the export of the agricultural sector is over 29 billion dollars in 2021. This value shows that approximately 13% of Turkey's total exports are obtained from agriculture. Agricultural activities not only contribute to the micro level, but also support the country's economy at the macro level. It is necessary to add value to agricultural products, not only as raw materials. It is thought that Turkey could gain more space as finished and semi-finished products in world markets.

**Keywords:** Agriculture, Trade, Export, Economy, Turkey.

## **GİRİŞ**

Tarım, bitkisel ve hayvansal üretimin iç içe olduğu bir sektördür. Dünya'nın en stratejik sektörleri arasında olup, insan ve hayvan beslenmesinde önemli bir yere sahiptir. Bu sebeple tarım, ekonomi ve kalkınma bakımından vazgeçilmezdir. Uzundumlu (2012) tarım; ülke ekonomisini nüfus, işgücü, dış ticaret, sanayi, milli gelir ve toplum beslenmesine katkı gibi değişik şekillerde desteklemektedir.

Türkiye, konumu itibariyle, elverişli iklim koşulları ve toprak yapısına sahip tarımsal faaliyetlere uygun bir ülkedir. Ancak tüm dünyada arazi, kıt olan üretim faktörleri arasında olduğundan, artırılması mümkün değildir. Artan nüfusun ihtiyaçlarının giderilmesi ve gıdaya olan talebin karşılanması bakımından tarımda verimliliğin artırılması ve ülkeler arası yapılan ticaretin geliştirilmesi önemlidir.

Ülkelerin aynı anda ya da tek başlarına tüm gıdaları üretmeleri mümkün olmadığından, dış ticaretin önemi her geçen gün artmaktadır. Dış ticaret kapsamında ithalat ve ihracat kavramları ön plana çıkmaktadır. İhracat (dışsatım), ülkelerin kendi sınırları içerisinde ürettikleri malları diğer ülkelere satması; ithalat (dışalım) ise yurt dışında üretilen ürünlerin bir başka ülke tarafından satın alınmasıdır. Ayrıca ihracat ve ithalat değerleri arasında oluşan farklar ise dış ticaret açığı ya da fazlası yaratarak kendini göstermektedir. Bir ülkenin yaptığı ihracat, ithalattan fazla olduğunda dış ticaret fazlası ortaya çıkarken; ithalatın ihracattan fazla olduğunda ise dış ticaret açığı meydana gelmektedir. Türkiye'nin son 10 yıllık verilerine göre ihracat, yıllar itibariyle dalgalı bir seyir izlemektedir (Koşar, 2018). Bu nedenle küresel ölçekte yaşanan finansal krizler, gelişmiş ve gelişmekte olan ülkelerin büyüme modellerine dikkat çekmiştir (Mohan, 2009). Türkiye ekonomisi, küresel finansal krizin etkisiyle; 2009 yılında %4.7 oranında küçülürken, 2010-2019 yılları arasında ise yıllık ortalama %5.8 oranında büyüme göstermiştir. Türkiye'nin kriz döneminde uluslararası piyasalarda rekabet gücünü arttırması, bir taraftan ihracat hacmini yükseltirken diğer yandan da yeni dış pazarlara açılarak pazar çeşitliliğini genişletmesini sağlamıştır. Türkiye İstatistik Kurumu (TÜİK) 2020 yılı verilerine göre, Türkiye 2017 yılında 157 milyar dolar, 2018 yılında 168 milyar dolar, 2019 yılında ise 172 milyar dolar ihracat hacmine ulaşmıştır. Ayrıca Türkiye İhracatçıları Meclisi 2020 yılı verilerine göre, Türkiye'nin 2017, 2018 ve 2019 yıllarında ihracat yaptığı ülke sayısı sırasıyla 210, 214 ve 226'ya ulaşmıştır. 10 milyon dolar üzerinde ihracat yapılan ülke sayısı 2017 yılında 155'e, 2018 yılında 170'e, 2019 yılında ise 175'e yükselmiştir. Türkiye son yıllarda ihracatı ve ihracat yaptığı ülke sayısını arttırmış olsa da bugün gelinen noktada toplam

ihracatı istenilen seviyede değildir. Küresel Covid-19 salgını sonrası ülkelerin ihracat pazarlarının yapısında yeni oluşum beklenmektedir (Bolat ve Kaplan, 2021). İhracatın artırılması ve sürdürülebilir olması için ihracatta ürün ve pazar çeşitliliği önemli konular arasındadır. Bu kapsamda yapılan birçok makroekonomik çalışma bulunmaktadır. Kösekahyaoğlu (2007); Doğan ve Soyyiğit Kaya (2011) Gümrük Birliği Anlaşması'nın Türkiye'nin ihracatında ürün ve ülke çeşitliliğini arttırdığını; Çınar ve Göksel (2010) Türkiye'nin ihracattaki büyümesi, ürün çeşitlendirmesinin sektör ihracatını istikrarlı hale getirdiğini; Dalgıç ve Fazlıoğlu (2015) uluslararası ticaretteki ürün ve ülke çeşitlenmesinin, ihracatçı firmaların sermaye yoğunluklarının ürün/ülke çeşitlendirmesinde önemli bir faktör olduğunu; Ateş ve Seymen (2019) Türkiye'nin imzaladığı serbest ticaret anlaşmalarının yeni ihracat pazarları kazandırarak, Türkiye'nin ihracatında ülke çeşitlendirmesi yarattığını ortaya koymuştur.

Bu çalışmanın amacı, Türkiye ihracatında önde gelen tarımsal ürünleri inceleyerek yıllar itibariyle değişimini ve gelişimini ortaya koymaktır.

## **MATERYAL VE YÖNTEM**

Araştırmanın ana materyalini FAO veri tabanından elde edilen ikincil veriler oluşturmaktadır. Araştırmada; Türkiye'nin tarımsal ihracatında önde gelen fındık, üzüm, tütün, domates, kayısı ve incir gibi ürünler incelenmiş olup, bu ürünlerin yıllar itibariyle değişimi ve gelişimi değerlendirilmiştir. Bu kapsamda ürünlere ait üretim (ekim alanı, üretim miktarı, verim) ve dış ticaret değerleri (ihracat miktarı, ihracat değeri, ithalat miktarı, ithalat değeri) incelenerek Türkiye açısından önemi değerlendirilmiştir. Verilerin yıllar itibariyle değişiminin belirlenmesinde basit indeks yöntemi kullanılmış olup, belirtilen ürünlerin son yıllardaki durumu ile gelişimi rakam ve yüzde olarak yorumlanmıştır.

## **BULGULAR**

Araştırma kapsamında; Türkiye'de fındık, üzüm, tütün, domates, kayısı ve incir gibi ürünlerin mevcut potansiyelini ortaya koyan üretim (ekim alanı, üretim miktarı ve verim) ve dış ticaret değerlerinin (ihracat-ithalat miktarı ve değerleri) yıllar itibariyle değişimi tablo olarak verilmiştir.

### 1. Fındık

Türkiye’de fındık üretim değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte önemli oranda artış söz konusudur. FAO verilerine göre, 2011 yılında 429 955 ha olan ekim alanı, 2020 yılında 734 538 ha olarak gerçekleşerek, son 10 yılda %71 oranında artış göstermiştir. Fındık üretim miktarı 2011-2020 yılları arasında %55 oranında artmış olup, 2020 yılında 665 000 tona ulaşmıştır. Fındık verimi ise 2020 yılında %9 azalarak 91 kg/da olarak gerçekleşmiştir (Tablo 1). Fındık üretim miktarındaki artış üzerinde ekim alanı etkili olmakla birlikte, üretim miktarının ekim alanı ile aynı oranda artmadığı görülmektedir. Bu durumun belirtilen yıllar arasında iklim vb. sebeplerden kaynaklanan verim azalmasından olduğu düşünülmektedir.

**Tablo 1.** Türkiye’de fındık üretiminin yıllar itibariyle değişimi

Yıl	Ekim alanı (ha)	İndeks (2011=100)	Üretim miktarı (ton)	İndeks (2011=100)	Verim (kg/da)	İndeks (2011=100)
2011	429955	100	430000	100	100	100
2012	422765	98	660000	153	156	156
2013	422501	98	549000	128	130	130
2014	423261	98	450000	105	106	106
2015	434119	101	646000	150	149	149

2018	728381	169	515000	120	71	71
2019	734409	171	776046	180	106	106
2020	734538	171	665000	155	91	91

**Kaynak:** FAO, 2022

Türkiye’nin fındık dış ticaret değerleri incelendiğinde, ihracat miktarı ve ihracat değerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, önemli oranda bir azalma söz konusudur. Fındık ihracat miktarında 2011-2020 yılı verilerinde göre %36 oranında azalma olduğu görülmüştür. 2011 yılında 559 ton olan ihracat miktarı, 2020 yılında 359 tona gerilemiştir. Buna bağlı olarak fındık ihracat değerleri de %35 azalarak, 2020 yılında 1 238 000 dolar olarak gerçekleşmiştir. Yıllar itibariyle ithalat miktarında ve ithalat değerlerinde gözle görülür bir değişim olmamakla birlikte, ithalat yok denecek kadar azdır (Tablo 2).

**Tablo 2.** Türkiye fındık dış ticaretinin yıllar itibariyle değişimi

Yıl	İhracat miktarı (ton)	İndeks (2011=100)	İhracat değeri (bin \$)	İndeks (2011=100)	İthalat miktarı (ton)	İthalat değeri (bin \$)
2011	559	100	1899	100	0	0
2012	1488	266	4457	235	0	0
2013	1067	191	3387	178	33	93

2020	359	64	1238	65	0	0

**Kaynak:** FAO, 2022

Türkiye’de kabuklu fındık fiyatında (₺/kg) son yıllarda artış görülmekle birlikte; fındık fiyatı 2020 yılında ₺23.35, 2021 yılında ₺25.29, 2022 yılında ₺34.89 olarak belirlenmiştir (Anonymous, 2022b). 2022/23 kabuklu fındık alım fiyatları ili ve cinsine göre farklılık göstermekle birlikte, %50 sağlam iç esasına göre tüm türlere ait fiyat ortalaması ₺50.5 olarak belirlenmiştir (TMO, 2022).

## 2. Üzüm

Türkiye’de üzüm üretim değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, 2011-2020 yılları arasında ekim alanında bir miktar azalma, üretim miktarında ise pek bir değişim görülmemiştir. FAO verilerine göre, 2011 yılında 472 545 ha olan ekim alanı, 2020 yılında 400 998 ha olarak gerçekleşerek, son 10 yılda %15 oranında bir azalma göstermiştir. Üzüm üretim miktarı 2011-2020 yılları arasında %2 oranında azalarak, 2020 yılında 4 208 908 tona gerilemiştir. Üzüm verimi ise, 2020 yılında %15 artarak 1.050 kg/da olarak gerçekleşmiştir (Tablo 3). Üzüm ekim alanlarındaki azalışın etkisi üretim miktarı üzerinde etkili olsa da, verimdeki artış ile birlikte üretim miktarına etkisi pek hissedilmemiştir.

**Tablo 3.** Türkiye’de üzüm üretiminin yıllar itibariyle değişimi

Yıl	Ekim Alanı (ha)	İndeks (2011=100)	Üretim miktarı (ton)	İndeks (2011=100)	Verim (kg/da)	İndeks (2011=100)
2011	472545	100	4296351	100	0.909	100
2012	462296	98	4234305	99	0.916	101
2013	468792	99	4011409	93	0.856	94

Kaynak: FAO, 2022

Türkiye üzüm dış ticaret değerlerinde 2011-2020 yılları arasında, yıllar itibariyle dalgalanmalar görülmekle birlikte önemli oranda bir azalma olduğu belirlenmiştir. Üzüm ihracat miktarı 2011 yılında 239 577 ton olarak gerçekleşirken, 2020 yılında 212 309 tona gerileyerek %11 oranında azalmış olup, ihracat değeri 157 876 000 dolar olarak gerçekleşmiştir. Belirtilen yıllar arasında üzüm ithalat miktarında ve değerinde de önemli ölçüde azalmalar mevcuttur (Tablo 4).

**Tablo 4.** Türkiye üzüm dış ticaretinin yıllar itibariyle değişimi

Yıl	İhracat miktarı (ton)	İndeks (2011=100)	İhracat değeri (bin \$)	İndeks (2011=100)	İthalat miktarı (ton)	İndeks (2011=100)	İthalat değeri (bin \$)	İndeks (2011=100)
2011	239577	100	175325	100	771	100	829	100
2012	209525	87	162688	93	861	112	783	94
2013	203286	85	187624	107	705	91	637	77
2014	257804	108	201682	115	598	78	577	70
2015	175189	73	141408	81	1099	143	950	115
2016	173156	72	104735	60	794	103	706	85
2017	277743	116	195392	111	450	58	363	44

2019	205705	86	150103	86	458	59	451	54
2020	212309	89	157876	90	306	40	249	30

Kaynak: FAO, 2022

Üzüm, yetiştirme yöntemine ve cinsine göre hâl fiyatları da değişiklik göstermektedir. Türkiye’de 2022 yılında geleneksel (konvensiyonel) yöntemle yetiştirilen üzümün ortalama fiyatı ₺7.21 iken, iyi tarım ile yetiştirilen üzüm ise ortalama ₺9.01 olarak satışa sunulmaktadır (Anonymous, 2022a).

### 3. Tütün

Türkiye’de tütün üretim değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, ekim alanında bir miktar azalma olsa da, üretim ve verim değerlerinde önemli oranda artış söz konusudur. FAO verilerine göre, 2011 yılında 76 658 ha olan ekim alanı, 2020 yılında 74 959 ha olarak gerçekleşerek, son 10 yılda %2 oranında azalış göstermiştir. Tütün üretim miktarı 2011-2020 yılları arasında %68 oranında artarak, 2020 yılında 76 540 tona ulaşmıştır. Tütün verimi ise 2020 yılında %36 artarak 80.5 kg/da olarak gerçekleşmiştir (Tablo 5). Tütün ekim alanlardaki azalışa rağmen verimdeki artışın, üretim miktarı üzerinde önemli rol oynadığı düşünülmektedir.

**Tablo 5.** Türkiye’de tütün üretiminin yıllar itibariyle değişimi

Yıl	Ekim alanı (ha)	İndeks (2011=100)	Üretim miktarı (ton)	İndeks (2011=100)	Verim (kg/da)	İndeks (2011=100)
2011	76658	100	45435	100	59.3	100
2012	107698	140	73285	161	68.1	115
2013	133073	174	93158	205	70.0	118
2014	99262	129	74696	164	75.3	127
2015	105868	138	75000	165	70.8	120

2018	93503	122	75276	166	80.5	136
2019	81035	106	70000	154	94.1	159
2020	74959	98	76540	168	80.5	136

**Kaynak:** FAO, 2022

Türkiye’de tütün dış ticaret değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, ihracat miktarı ve değeri önemli oranda azalırken, ithalat miktarı ve değerinde ciddi oranda artış olduğu görülmektedir. Tütün ihracat miktarı 2011-2020 yılı verilerine göre, 2011 yılında 68 031 tondan, 2020 yılında 48 243 tona gerileyerek %29 oranında azalmıştır. Tütün ihracat değerleri de ihracat miktarına paralel olarak %28 oranında azalmış olup, 2020 yılında 267 542 000 dolar gerçekleşmiştir. Tütünün ithalat miktarı ise ihracatın aksine neredeyse 2 katına çıkarak 2020 yılında 93 829 tona yükselmiştir. İthalat değeri ise belirtilen yıllar arasında %45 artarak, 431 668 000 dolar gerçekleşmiştir (Tablo 6). İthalat değerindeki artışın ithalat miktarı kadar artmamış olması, ürün fiyatlarında yıllar itibariyle önemli bir değişim yaşanmadığını göstermektedir.

**Tablo 6.** Türkiye tütün dış ticaretinin yıllar itibariyle değişimi

Yıl	İhracat miktarı (ton)	İndeks (2011=100)	İhracat değeri (bin \$)	İndeks (2011=100)	İthalat miktarı (ton)	İndeks (2011=100)	İthalat değeri (bin \$)	İndeks (2011=100)
2011	68031	100	369464	100	48672	100	297879	100

2020	48243	71	267542	72	93829	193	431668	145

Kaynak: FAO, 2022

Türkiye'nin tütün ihracatı 2021 yılında ise 52 042 tonun üzerinde olup, yaklaşık 258 milyon \$ değere sahiptir. En fazla tütün ihracatının yapıldığı ülkeler ABD, Belçika, Endonezya, Polonya ve Rusya gibi ülkelerdir (Anonymous, 2022c).

#### 4. Domates

Türkiye'nin domates üretiminde belirtilen yıllar arasında önemli bir artış görülse de, ekim alanının değişmediği görülmektedir. 2011 yılında 181 018 ha olan ekim alanı, 2020 yılında 181 879 ha olarak gerçekleşerek, son 10 yılda önemli bir değişime sahip değildir. Domates üretim miktarı 2011-2020 yılları arasında %20 oranında artarak, 2020 yılında 13 204 015 tona ulaşmıştır. Domates verimi ise 2020 yılında %19 artarak 7 260 kg/da olarak gerçekleşmiştir (Tablo 7). Ekim alanının değişmemiş olmasına rağmen, domates üretim miktarındaki artış üzerinde verimin etkili olduğu anlaşılmaktadır.

**Tablo 7.** Türkiye'de domates üretiminin yıllar itibariyle değişimi

Yıl	Ekim alanı (ha)	İndeks (2011=100)	Üretim miktarı (ton)	İndeks (2011=100)	Verim (kg/da)	İndeks (2011=100)

Türkiye domates dış ticaret değerleri yıllar itibariyle dalgalanmalar görülmekle birlikte; ihracat miktarı ve değerinde azalma, ithalat miktar ve değerinde çok ciddi bir artış söz konusudur. Domates ihracat miktarı 2011-2020 yılı verilerine göre, 2011 yılında 576 573 ton olarak gerçekleşirken, 2020 yılında %11 oranında azalarak 513 835 tona gerilemiştir. Domates ihracatında elde edilen değerler de ihracat miktarındaki azalışa bağlı %28 oranında düşüş göstererek, 2020 yılında 310 058 000 dolar gerçekleşmiştir. Domatesin ithalat miktarı ve değeri ise son yıllarda önemli ölçüde artmıştır. 2011 yılında 681 ton olan ithalat miktarı altı katının üzerine çıkarak 2020 yılında 4184 tona yükselmiş olup, domates ithalat değeri ise 4 346 000 dolar olarak gerçekleşmiştir (Tablo 8).

**Tablo 8.** Türkiye domates dış ticaretinin yıllar itibariyle değişimi

Domates yetiştirme yöntemine ve domatesin türüne göre hâl fiyatları da değişiklik göstermektedir. Türkiye’de 2022 yılında geleneksel (konvensiyonel) yöntemle yetiştirilen tüm domates türlerinin toplamına ait ortalama fiyat ₺9.49 olarak belirlenirken, iyi tarım ile yetiştirilen domates ortalama fiyatı ₺11.86 ve organik olarak yetiştirilen domates ise ortalama ₺15.53 olarak satılmaktadır (Anonymous, 2022a).

### **5. Kayısı**

Türkiye’de kayısı üretim değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, önemli oranda artış söz konusudur. FAO 2022 yılı verilerine göre, 2011 yılında 112 079 ha olan ekim alanı, 2020 yılında 132 748 ha olarak gerçekleşerek, son 10 yılda %18 oranında artış göstermiştir. Kayısı üretim miktarı 2011-2020 yılları arasında %28 oranında artarak, 2020 yılında 833 398 tona ulaşmıştır. Kayısı verimi ise 2020 yılında %8 oranda artarak 628 kg/da

olarak gerçekleşmiştir (Tablo 9). Kayısı üretim miktarındaki artış üzerinde ekim alanındaki artış etkili olmakla birlikte, verimde yaşanan artışın da etkili görülmüştür.

**Tablo 9.** Türkiye’de kayısı üretiminin yıllar itibariyle değişimi

Yıl	Ekim alanı (ha)	İndeks (2011=100)	Üretim miktarı (ton)	İndeks (2011=100)	Verim (kg/da)	İndeks (2011=100)
2011	112079	100	650000	100	580	100

**Kaynak:** FAO, 2022

Türkiye’de kayısı dış ticaret değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte önemli oranda artış söz konusudur. FAO 2022 yılı verilerine göre, 2011 yılında 28 489 ton olan ihracat miktarı 2020 yılında iki katının üzerine çıkarak 64 694 tona yükselmiş olup, ihracat değeri de %92 artarak 55 627 000 dolar seviyesinde gerçekleşmiştir. Kayısı ithalat miktarı ise; belirtilen yıllar arasında 9 tondan 129 tona yükselerek önemli oranda artış göstermiştir. İthalat miktarına bağlı olarak ithalat değerinde de önemli ölçüde artış olduğu belirlenmiştir (Tablo 10).

**Tablo 10.** Türkiye kayısı dış ticaretinin yıllar itibariyle değişimi

Yıl	İhracat miktarı (ton)	İndeks (2011=100)	İhracat değeri (bin \$)	İndeks (2011=100)	İthalat miktarı (ton)	İndeks (2011=100)	İthalat değeri (bin \$)	İndeks (2011=100)
2011	28489	100	28936	100	9	100	7	100
2012	56302	198	41613	144	47	522	55	786

Kayısı fiyatı; yetiştirme yöntemine, kayısının cinsine ve yetiştirildiği ile bağlı olarak değişiklik göstermektedir. Türkiye hâl fiyatlarına göre, 2022 yılında geleneksel (konvensiyonel) yöntemle yetiştirilen kayısının ortalama fiyatı ₺11.54 olarak belirlenirken, iyi tarım ile yetiştirilen kayısı yaklaşık ₺13.00 olarak satışa sunulmaktadır (Anonymous, 2022a).

### 6. İncir

Türkiye’de incir üretim değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, önemli oranda artış söz konusudur. FAO 2022 yılı verilerine göre, 2011 yılında 48 530 ha olan ekim alanı, 2020 yılında 53 694 ha olarak gerçekleşerek, son 10 yılda %11 oranında artış göstermiştir. İncir üretim miktarı 2011-2020 yılları arasında %23 oranında artarak, 2020 yılında 32 0000 tona ulaşmıştır. İncir verimi ise ekim alanında olduğu gibi 2020 yılında %11 oranda artarak 596 kg/da olarak gerçekleşmiştir. İncir üretim miktarındaki artış üzerinde ekim alanındaki artış etkili olmakla birlikte, verimde yaşanan artışın da etkisinin olduğu görülmektedir (Tablo 11).

**Tablo 11.** Türkiye’de incir üretiminin yıllar itibariyle değişimi

Yıl	Ekim Alanı (Ha)	İndeks (2011=100)	Üretim Miktarı (ton)	İndeks (2011=100)	Verim	İndeks (2011=100)
					(kg/da)	
2011	48530	100	260508	100	537	100
2012	49175	101	274535	105	558	104

Türkiye kuru incir dış ticaret değerlerinde de yıllar itibariyle dalgalanmalar görülmekle birlikte önemli oranda artış görülmektedir. FAO 2022 yılı verilerine göre, 2011 yılında 44 821 ton olan ihracat miktarı, 2020 yılında neredeyse iki katının üzerine çıkarak 88 509 tona yükselmiştir. İncirin ihracat değeri, 2020 yılında %94 oranında artarak 293 372 000 dolar olarak gerçekleşmiştir. Kuru incir ithalat miktarı ise; belirtilen yıllar arasında 1130 tondan 1700 tona yükselerek önemli oranda artış göstermiştir (Tablo 12). İthalat miktarına bağlı olarak ithalat değerinde de önemli ölçüde artış olduğu belirlenmiştir.

**Tablo 12.** Türkiye kuru incir dış ticaretinin yıllar itibariyle değişimi

Yıl	İhracat miktarı (ton)	İndeks (2011=100)	İhracat değeri (bin \$)	İndeks (2011=100)	İthalat miktarı (ton)	İndeks (2011=100)	İthalat değeri (bin \$)	İndeks (2011=100)

**Kaynak:** FAO, 2022

İncir fiyatı; yetiştirme yöntemine, incirin cinsine ve yetiştirildiği ile bağlı olarak değişiklik göstermektedir. Türkiye hâl fiyatlarına göre, 2022 yılında geleneksel (konvansiyonel) yöntemle yetiştirilen incirin ortalama fiyatı ₺16.58 olarak belirlenirken, iyi tarım ile yetiştirilen incir yaklaşık ₺27.45 olarak satışa sunulmaktadır (Anonymous, 2022a).

## SONUÇ VE ÖNERİLER

Ülkelerin dünya piyasalarında rekabet gücünün yüksek olması ihracat potansiyeli üzerinde etkili olmaktadır. Dolayısıyla Türkiye ihracatında; fındık, üzüm, domates, tütün, kayısı ve incir gibi ürünler ön plana çıkmaktadır. Türkiye'nin toplam ihracatının yaklaşık %13'ü tarımdan elde edilmektedir. Tarımsal faaliyetler mikro düzeyde katkısının yanı sıra, makro düzeyde de ülke ekonomisini desteklemektedir.

✓ Türkiye'de fındık üretim değerlerine bakıldığında; ekim alanında %71 oranında, üretim miktarında %55 oranında önemli ölçüde artış olduğu; fındık veriminde ise %9 oranında bir azalma olduğu saptanmıştır. Fındık dış ticaretinde ise 2011-2020 yılları arasında pek değişmediği ve hatta son 10 yılda gerilediği anlaşılmaktadır.

✓ Üzüm üretim değerlerine göre; ekim alanında %15, üretim miktarında %2 oranında bir azalma; verimde ise bunların aksine %15 oranında artış bir artış söz konudur. Üzüm dış ticaretinde ise, belirtilen yıllar arasında ihracat miktarında ve ihracat değerlerinde yaklaşık %10 oranda azalış olduğu görülürken, ithalat miktarında da ciddi oranda bir azalma olduğu belirlenmiştir.

✓ Tütün üretim değerlerine göre; ekim alanı %2 azalırken; üretim miktarı %68, verimde ise %36 oranında bir artış söz konusudur. Türkiye’de tütün dış ticaret değerlerinde ise ihracat miktarı ve değeri önemli oranda azalırken, ithalat miktarı ve değerinde ciddi oranda artış olduğu görülmektedir.

✓ Domates değerlerine göre; Türkiye’nin ekim alanında bir değişim görülmezken; üretim miktarında %20, verimde ise %9 oranında bir artış söz konusudur. Domates dış ticaret verilerinde de tütünde olduğu gibi ihracat miktar ve değerlerindeki azalma, ithalat değerlerinde artış olduğu belirlenmiştir.

✓ Kayısı değerlerine göre; ekim alanı %18, üretim miktarı %28, verim ise %8 oranında artış göstermiştir. Kayısı dış ticaretinde ise hem ihracat hem de ithalat değerlerinde önemli artışlar olduğu saptanmıştır.

✓ İncir değerlerine göre; ekim alanı %11, üretim miktarı %23, verim ise %11 oranında artış göstermiştir. İncir dış ticaretinde ise ihracat miktar ve ihracat değerleri neredeyse iki katına çıkmış olup, ithalat miktar ve ithalat değerlerinde de yaklaşık %50’nin üzerinde bir artış olduğu görülmüştür.

Sonuç olarak; Türkiye ihracatında önde gelen tarımsal ürünlerin son 10 yılda önemli ölçüde değişim gösterdiği belirlenmiştir. İhracatın sürdürülebilir olması, farklı ürünlere yönelik ihracatın yapılması için ihracat çeşitliliği ve ihracata teşvik dünya dış ticaretinde önemlidir. Ayrıca elde edilen bulgulara göre, organik olarak ve iyi tarım yöntemi kullanarak yetiştirilen ürünlerin, konvensiyonel tarım yöntemi ile yetiştirilen ürünlere göre daha yüksek fiyata alıcı bulunduğu anlaşılmaktadır.

### **ÖZET**

Kivi insan sağlığı bakımından oldukça faydalıdır. Besin değeri yüksek lezzetli ve egzotik bir meyvedir. Son yıllarda kivi, dünyada üretim ve pazarlama bakımından dikkat çeken ürünler arasındadır. İklim ve toprak koşullarının elverişli olduğu bölgelerde, verim ve ürün fiyatlarının yüksek olmasından dolayı üreticiler tarafından tercih edilen bir üründür. Bu çalışmanın amacı küresel ekonomide kivinın mevcut potansiyelini ve geleceğini değerlendirmektir. Kivi, dünyada yaklaşık 250 000 hektar alanda, 4 milyon tonun üzerinde bir üretim miktarına sahiptir. Verim değeri ise 1600 kilogramın üzerindedir. Dünyada en fazla sırasıyla Asya, Avrupa ve Okyanusya kıtasında üretilmektedir. Ancak Okyanusya'nın kivi verimi diğerlerine göre oldukça yüksektir. Dünyada kivi üretiminde Çin, İtalya, Yeni Zelanda önde gelen ülkelerdir. Üretimde 1. sırada olan Çin, kivi üretiminin yaklaşık %50'sini tek başına gerçekleştirmektedir. Türkiye ise 2019 yılı verilerine göre yaklaşık 64 bin ton kivi üretimi ile dünyada 7. sırada yer almaktadır. Türkiye'nin toplam ağaç sayısı 2 milyonun üzerinde olup, verimi ise ağaç başına yaklaşık 40 kg'dır. Kivi dış ticaret bakımından da önemlidir. Dünyada 2018 yılında yaklaşık 6.5 milyar dolarlık bir işlem hacmine sahiptir. Yaklaşık 3.1 milyar dolar ihracat değeri bulunmaktadır. Yeni Zelanda, İtalya, Belçika ve Şili en fazla kivi ihracatı yapan ülkelerdir. Son yıllarda dünyada artış gösteren kivi alanları, Türkiye'de de artış göstermiştir. Yetiştirme koşulları itibarıyla kivinın yaklaşık %55'i Karadeniz Bölgesi'ndedir. Ancak Türkiye'de en fazla kivi üretimi Yalova'da gerçekleştirilmektedir. 2019 yılı verilerine göre yaklaşık 490 bin ağaç sayısına sahip olan bu ilin, 25 bin tona yakın üretimi vardır. Kivi üretiminin yaygınlaştırılması, üretici gelirin katkı sağlar. Ayrıca kivinın dünya genelinde üretim, pazarlama gibi farklı alanlarda ekonomik katkılar sunmaya devam edeceği düşünülmektedir.

**Anahtar kelimeler:** Kivi, Üretim, Pazarlama, Ticaret, Dünya.

## **THE PLACE OF KIWI IN THE WORLD AND TURKISH ECONOMY**

### **ABSTRACT**

Kiwi is very beneficial for human health. It is a delicious and exotic fruit with high nutritional value. In recent years, it is among the products that attract attention in terms of production and marketing in the world. It is a product preferred by farmers in regions where climate and soil conditions are favorable. High price and high product yield are effective in the preference of farmers. The aim of this study is to evaluate the current potential and future of kiwi in the global economy. It has a production amount of over 4 million tons in approximately 250,000 hectares of land in the world. Its yield value is over 1600 kilograms. It is produced mostly in Asia, Europe and Oceania continents in the world, respectively. However, the kiwi yield of Oceania is quite high compared to the others. China, Italy and New Zealand are the leading countries in kiwi production in the world. China, which is in the 1st place in production, realizes approximately 50% of kiwi production alone. Turkey, on the other hand, ranks 7th in kiwi production according to 2019 data. In 2019, approximately 64 thousand tons of kiwi has been produced in Turkey. The total number of trees in Turkey is over 2 million, and the yield is approximately 40 kg per tree. Kiwi is also important in terms of foreign trade. In 2018, it has a transaction volume of approximately 6.5 billion dollars in the World. It has an export value of approximately 3.1 billion dollars. New Zealand, Italy, Belgium and Chile are the countries that export the most kiwi. Kiwi areas, which have increased in the world in recent years, have also increased in Turkey. In terms of growing conditions, approximately 55% of the kiwi is in the Black Sea Region. However, the most kiwi production in Turkey is carried out in Yalova. According to 2019 data, Yalova has approximately 490 thousand trees, and 25 thousand tons of production. Expanding kiwi production in Turkey contributes to the income of farmers. In addition, it is thought that it will continue to make economic contributions in different fields such as production and marketing throughout the world.

**Keywords:** Kiwi, Production, Marketing, Trade, World.

## GİRİŞ

Kivi (*Actinidia deliciosa*) Doğu ve Güney Çin’de doğal olarak yetişen ve son yıllarda üretiminde ve tüketiminde önemli artışlar olan asma benzeri odunsu bir bitkidir (Samancı, 1990). Kivi meyvelerinin yeşilimsi kahverengi, kendine has hoş bir tadı ve lezzeti vardır. Vitamin ve mineraller bakımından oldukça zengin ve düşük kalorili bir meyvedir (Anonymous, 2003). Kuru madde içeriği yüksek olan kivi (Minchin ve ark., 2010), temel olarak glukoz ve fruktozdan meydana gelmekte olup, yüksek potasyum içeriğine sahiptir. Elma ve armuttan 10 kat daha fazla C vitamini içeren, antioksidan ve lif içeriği yüksek bir üründür (Ekşi ve Özen Türkmen, 2012). Kivi meyve ve bileşiminde en önemli ve dikkat çekici unsur C vitamini içeriğidir. Bu unsur, kivi meyvesine değer katan ve aranan bir meyve olmasını sağlamaktadır. Kivi meyvesinin 100 gramında, ortalama 100-400mg C vitamini bulunur (Akbaş ve ark., 2012). Sağlık meyvesi olarak bilenen kivi, besin değerinin yanı sıra, tıpta kullanımı da söz konusudur. Çin’de yapılan analizlerde, meyve suyunda bulunan bazı maddelerin kansere neden olan faktörleri önlediği ortaya çıkmıştır. Yine bazı tıbbi içeceklerle birlikte kullanıldığında astım, öksürük, ve nefes açıcı özelliklere sahip olduğu bildirilmiştir (Mortan, 1987). Kivi çok besleyici ve biyoaktif bileşenler bakımından zengin bir meyve olduğundan dolayı kivi; kolestrol, romatizma, sindirim sistemi gibi sağlık sorunlarının tedavisinde de kullanılmaktadır (Petilica ve ark., 2015). Ancak; bazı kimyasal ve fiziksel özelliklerinin olgunluk periyoduna göre değişim gösterdiği (Cangi ve ark., 2011), kivinın içerdiği vitamin ve mineral maddelerin yüksek olması, antioksidan, antikanserijen, antimutajenik ve antimikrobiyal etkilerinin anlaşılmasıyla son yıllarda üretiminde hızlı bir artış söz konusudur (Yazıcı ve ark., 2016).

Kivi, taze tüketiminin yanında salata, pasta, marmelat yapımında kullanıldığı gibi (Eriş,1989), meyvesinden çok farklı şekillerde fayda sağlanmaktadır. Ayrıca gıda sanayiinde, pasta, tatlı, ve içki yapımında da kullanılmaktadır. Bu şekilde tüketimi yaygınlaşan kivide, üretim ve kalite sıkıntısı yaşanması pazarlamada ciddi sorundur (Yazıcı ve ark., 2016).

Dünya’da Yeni Zelanda ile başlayan kivi üretimi, 1970’li yıllardan sonra İtalya, Şili, Fransa, Yunanistan ve Japonya gibi ülkelerde yaygınlaşırken, Türkiye’de 1988 yılında yapılan adaptasyon çalışmalarıyla başlamış olup; Karadeniz, Marmara ve Ege Bölgeleri’nde rahatlıkla kivi yetiştirilebileceği belirlenmiştir. Kivi kışları ılık, yazları ise sıcak ve nemli bir iklime gereksinim duymaktadır. Büyüme ve gelişme döneminde 20-25 °C sıcaklığa ve 16 saat ışıklandırma ihtiyacı olup, vejetasyon döneminde düzenli olarak ortalama 800-1.400 mm yağış alan bölgelerde rahatlıkla yetiştirilebilmektedir (Anonymous, 2016). Ayrıca yüksek rakımlarda,

meyvelerin fiziksel özelliklerine ait değerlerinde genel olarak bir azalmanın meydana gelmesinden dolayı düşük rakımlı yerlerin yüksek rakımlı yerlere göre daha fazla tercih edilmesi tavsiye edilebilir (Bostan ve Günay, 2014). Detaylı yapılan araştırmalarla birlikte, Doğu Karadeniz Bölgesi'nin bitkinin ekolojik isteklerini karşılması bakımından diğer bölgelere göre daha uygun olduğu belirlenmiştir (Samancı, 1990). Türkiye'de, özellikle Doğu Karadeniz Bölgesi'nde yetiştirilerek, yörede çay ve fındıktan sonra ikinci ürün haline gelmektedir. Bölgedeki çiftçilere ek gelir sağlarken ülke ekonomisine de katkısını sürdürmektedir (Kubal ve ark., 2017). Kivi çeşitlerinde, ürünün yüksek fiyatla ve daha geniş yelpazede pazara sunumu açısından meyve kalitesi önemlidir. Kivinin pazarlanma aşamasında meyve iriliği, sertliği, meyve eti ve kabuk rengi, depolama gibi sorunlar ön plana çıkmaktadır. Bu kapsamda meyve kalitesinin artırılarak ürün kayıplarının azaltılması ve kivi ihracatının artırılması hedeflenmektedir (Balıkçı ve ark., 2021). Dünya'da ve Türkiye'de kivi üretimi yeni üretici ülkelerin katılımı ve tüketici taleplerinin artışına bağlı olarak giderek artmaktadır (Uzundumlu ve ark., 2018).

Günümüzde kivi adaptasyon yeteneği iyi olduğundan, ekim alanı ve üretim miktarı bakımından hem dünya hem de Türkiye için önemli bir üründür (Bostan ve Günay, 2014). Kivi yetiştiriciliğine uygun ekolojilere sahip ülkelere biri olan Türkiye'de de kivi üretimi gün geçtikçe artmaktadır. Üreticiler ve tüketiciler tarafından rağbet gören kivi, Türk damak zevkine uygun ve genellikle taze olarak tüketilmektedir. Özellikle yüksek besin içeriği sebebiyle yetiştiriciliğine olan ilgi artarken yeni kivi bahçeleri tesis edilmektedir (Zenginbal ve Özcan, 2005). Kivi, son 30-50 yılda üretimi ve tüketimi hızla artan meyve türlerindedir. Geniş adaptasyon yeteneği, bitki ve meyve özellikleri, kolay depolanması, yüksek fiyatla alıcı bulması, üretimindeki artış sağlamıştır (Akbaş ve ark., 2012). Dünya'da en fazla ve en yaygın yetiştirilen çeşit Hayward olup; meyve eti parlak yeşil, orta şekerli, bol sulu, uzun süre depolanabilen bir kivi çeşididir (Uzundumlu ve ark., 2018). Türkiye'de kivi üretiminin neredeyse tamamı Hayward çeşidi ile gerçekleştirilmektedir (Petilica ve ark., 2015).

Bu çalışmanın amacı küresel ekonomide kivinin mevcut potansiyelini ve geleceğini değerlendirmektir. Bu kapsamda dünya ve Türkiye'deki kivi üretim ve dış ticaret değerleri (ekim alanı, üretim miktarları, verim, ihracat miktarı, ihracat değeri, ithalat miktarı, ithalat değeri) incelenmiştir.

## MATERYAL VE YÖNTEM

Araştırmanın ana materyalini TÜİK, FAO gibi veri tabanlarından elde edilen ikincil veriler oluşturmaktadır. Araştırma kapsamında dünya kivi üretimi kıtalara ve ülkelere göre incelenmiş olup, kivinin yıllar itibariyle gelişimi değerlendirilmiştir. Ayrıca Türkiye'nin kivi üretim değerleri (ekim alanı, üretim miktarı ve verim) ve dış ticaret değerlerindeki (ihracat miktarı, ihracat değeri, ithalat miktarı, ithalat değeri) değişim, tablolar aracılığıyla yorumlanmıştır. Verilerin yıllar itibariyle değişimini ortaya koymak amacıyla basit indeks yöntemi kullanılmış olup, ürünlerin son yıllardaki durumu incelenerek Türkiye açısından önemi değerlendirilmiştir.

## BULGULAR

### 1. Dünyada Kivinin Durumu

Türkiye'nin kivi üretim değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, ekim alanı, üretim ve verimde önemli oranda artış söz konusudur. FAO verilerine göre 2000 yılında 127 033 ha olan ekim alanı, 2019 yılında 268 788 ha olarak gerçekleşerek 2 katının üzerine çıkmıştır. Kivi üretim miktarı 2000-2019 yılları arasında 2,5 katının üzerine çıkarak 4.348.011 tona ulaşmıştır. Kivi verimi ise belirtilen yıllarda %9 artarak 2019 yılında 1.618kg/da olarak gerçekleşmiştir (Tablo 1). Kivi üretim miktarındaki artış üzerinde verim bir miktar etkili olsa da, daha çok ekim alanındaki artışın etkili olduğu görülmektedir.

**Tablo 1.** Dünya kivi verilerinin değişimi (hasat edilen alan, üretim miktarı ve verim)

Yıl	Alan (ha)	İndeks (2000=100)	Üretim miktarı (ton)	İndeks (2000=100)	Verim (kg/da)	İndeks (2000=100)
2000	127.033	100	1.888.255	100	1.486	100
2005	146.424	115	2.339.791	124	1.598	108
2010	172.280	136	2.837.310	150	1.647	111
2015	263.032	207	4.061.076	215	1.544	104
2016	274.717	216	4.244.808	225	1.545	104
2017	246.406	194	3.938.640	209	1.598	108
2018	260.283	205	4.190.771	222	1.610	108
2019	268.788	212	4.348.011	230	1.618	109

**Kaynak:** FAO, 2021

Dünya'da en fazla kivi üreten kıtalar sırasıyla Asya, Avrupa ve Okyanusya'dır. Asya kıtası 2.639.064 ton üretim miktarına sahip olmakla birlikte, 200.000 hektarın üzerinde ekim alanı bulunmaktadır. Ancak, Avrupa ve Okyanusya kıtalarında ise ekim alanı fazla olmamasına rağmen verim değeri oldukça yüksektir. Özellikle Okyanusya kıtasında, 3.714 kg/da verim ile

birlikte 15.099 ha alandan 560.720 ton ürün elde edilmektedir. 2000-2019 yılları arasında belirtilen kıtalarda ekim alanında önemli artış olduğu görülmektedir. Ancak Okyanusya kıtası veriminde de önemli artışlar söz konusudur. Okyanusya üretim miktarındaki artışın ekim alanındaki artış ve verim birlikte etkili olmaktadır. Asya ve Avrupa kıtalarında ise verimde pek bir değişim görülmemiştir. Bu kıtaların üretim miktarı üzerinde daha çok ekim alanlarındaki artışın etkili olduğu düşünülmektedir. Kıtalara göre, dünya fazla kivi üretiminin yıllar itibariyle değişimi Tablo 2’de verilmiştir.

**Tablo 2.** Dünyada en fazla kivi üreten kıtalar

Yıl	Asya			Avrupa			Okyanusya		
	Alan (ha)	Üretim miktarı (ton)	Verim (kg/da)	Alan (ha)	Üretim miktarı (ton)	Verim (kg/da)	Alan (ha)	Üretim miktarı (ton)	Verim (kg/da)
2000	76.903	958.475	1.246	27.614	516.543	1.871	12.584	266.638	2.119
2005	93.148	1.244.915	1.337	32.538	588.736	1.809	12.301	322.222	2.620
2010	109.877	1.497.321	1.363	36.488	628.542	1.723	13.284	437.116	3.291

Dünyada kivi üretiminde önde gelen ülkeler (ilk 10) başta Çin olmak üzere, Yeni Zelanda, İtalya, İran ve Yunanistan olarak sıralanmaktadır. Çin 182 566 ha ekim alanı ve 2 196 727 ton üretim miktarı ile dünya kivi üretiminde birinci sırada yer alırken, Türkiye 2019 yılı verilerine göre dünya kivi üretiminde 7. sıradadır. Verim bakımından ise 3.741 kg/da ile Yeni Zelanda’nın ilk sırada olduğu görülmektedir (Tablo 3).

**Tablo 3.** Kivi üretiminde önde gelen ülkeler (ilk 10)

Sıra	Ülkeler	Alan (ha)	Üretim miktarı* (ton)	Verim (kg/da)
1.	Çin	182.566	2.196.727	1.203
2.	Yeni Zelanda	14.922	558.191	3.741
3.	İtalya	25.080	524.490	2.091
4.	İran	12.773	344.189	2.695
5.	Yunanistan	10.290	285.860	2.778
6.	Şili	7.595	177.206	2.333
<b>7.</b>	<b>Türkiye</b>	<b>3.067</b>	<b>63.798</b>	<b>2.080</b>
8.	Fransa	3.810	55.830	1.465
9.	ABD	1.780	46.720	2.625

\* 2019 yılı üretim miktarına göre sıralanmıştır.

## 2. Türkiye’de Kivinin Durumu

Türkiye’nin kivi üretim değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, ekim alanı, üretim ve verim değerlerinde önemli oranda artış söz konusudur. FAO 2022 yılı verilerine göre, 2010 yılında 1719 ha olan ekim alanı, 2020 yılında 3261 ha olarak gerçekleşerek son 10 yılda %90 oranında artış göstermiştir. Kivi üretim miktarı 2010-2020 yılları arasında 2,5 katının üzerine çıkarak 73 745 tona ulaşmıştır. Kivi verimi ise belirtilen yıllarda %46 artarak 2020 yılında 2.261 kg/da olarak gerçekleşmiştir (Tablo 4). Verim ve ekim alanındaki artış kivi üretim miktarı üzerinde etkili olmuştur.

**Tablo 4.** Türkiye kivi verilerinin değişimi (hasat edilen alan, üretim miktarı ve verim)

Yıl	Alan (ha)	İndeks (2010=100)	Üretim miktarı (ton)	İndeks (2010=100)	Verim (kg/da)	İndeks (2010=100)
2010	1719	100	26554	100	1.545	100
2015	2411	140	41640	157	1.727	112
2016	2487	145	43950	166	1.767	114
2017	2744	160	56164	212	2.047	132

Türkiye kivi dış ticaret değerlerinde yıllar itibariyle dalgalanmalar görülmekle birlikte, kivi ihracat miktarı ve ihracat değerinde önemli bir artış, ithalat miktarı ve ithalat değerinde ise azalma olduğu görülmektedir. Kivi dış ticaretinin 2010-2020 yılı arasındaki değişimine bakıldığında, 2010 yılında 61 ton olan ihracat miktarı 2020 yılında 4872 tona yükselerek, 2020 yılında 4 163 000 dolar ihracat değeri gerçekleşmiştir. Belirtilen yıllar arasında gerçekleşen ithalat miktarı ise 2020 yılında %69 oranda azalarak 2299 tona gerilemiştir (Tablo 5). Tarım ve Orman Bakanlığı verilerine göre Türkiye, 2020 yılında en fazla kivi ihracatını Lübnan, Rusya, Libya, Gürcistan ve Romanya gibi ülkelere yaparken; ithalatının ise neredeyse %80'i İran'dır (Anonymous, 2021).

**Tablo 5.** Türkiye kivi dış ticaret verilerinin değişimi

Yıl	İhracat miktarı (ton)	İndeks (2010=100)	İhracat değeri (bin \$)	İndeks (2010=100)	İthalat miktarı (ton)	İndeks (2010=100)	İthalat değeri (bin \$)	İndeks (2010=100)
2010	61	100	63	100	7308	100	2353	100
2015	301	493	200	317	3754	51	2896	123
2016	345	566	203	322	4721	65	3981	169

**Kaynak:** FAO, 2022

Türkiye'de 2022 yılı kivi'nin hâl fiyatları, yetiştiricilik şekline göre farklılık göstermektedir. Geleneksel (konvensiyonel) yöntemle yetiştirilen kivi'nin ortalama fiyatının ₺9.38 olduğu, iyi tarım yöntemi ile yetiştirilen kivi'nin ise ortalama fiyatı ₺15.72 olarak belirlenmiştir (Anonymous, 2022). Üretimi artırmak amacıyla Türkiye'de kivide verilen destekleme miktarı 2020 yılında mazot desteği 15 ₺/da, gübre desteği 8 ₺/da olarak ödenmiştir. Organik tarım ve iyi tarım uygulamaları desteği ise 2. kategori ürünler arasında yer alan kivi için ürün sertifikası bireysel 40 ₺/da, ürün sertifikası üretici grubuna ait grup sertifikasyonu için 20 ₺/da olarak belirlenmiştir (Anonymous, 2021).

## SONUÇ VE ÖNERİLER

Ülkelerin dünya piyasalarında rekabet gücünün yüksek olması ihracat potansiyeli üzerinde etkili olmakla birlikte, Türkiye ihracatında kivi ürünü ön plandadır. Tarımsal faaliyetler mikro düzeyde katkısının yanı sıra, makro düzeyde de ülke ekonomisini desteklemektedir. Dünyada kivi üretiminde önde gelen ülkeler başta Çin olmak üzere, Yeni Zelanda, İtalya, İran ve

Yunanistan'dır. Türkiye 2019 yılı verilerine göre dünya kivi üretiminde 7. sıradadır. Verim bakımından ise 3.747 kg/da ile dünyada Yeni Zelanda'nın ilk sıradadır. Türkiye'nin kivi verilerinde 2000-2020 yılları arasında önemli artış olduğu ve ülke ekonomisine katkı sağladığı anlaşılmaktadır. Kivi üretiminin artırılmasına yönelik yetiştiricilerin bilgilendirilmesiyle, üretim desteklemesinin artırılması ve üreticilerin bilinçlendirilmesi sağlanmalıdır.

**TÜRKİYE’DE TÜKETİCİ FİYAT ENDEKSİ (TÜFE) İLE ÜRETİCİ FİYAT ENDEKSİ (ÜFE) ARASINDAKİ İLİŞKİNİN AMPİRİK ANALİZİ**

**Prof. Dr. Utku ALTUNÖZ (Orcid ID: 0000-0002-0232-3108)**  
Sinop Üniversitesi

**ÖZET**

En önemli makro ekonomik göstergelerden biri olan enflasyon alınan birçok ekonomik kararda ve uygulanan ekonomi politikalarında doğrudan etkilidir. Bu doğrultuda TÜFE ve ÜFE arasındaki ilişkinin analizi amaçlanmaktadır. Çalışmada, 2006:01-2021:5 dönemi arasında, TÜFE ile ÜFE ilişkisi ARDL sınır testi yaklaşımıyla araştırılmıştır. Elde edilen sonuçlara göre sadece ÜFE’den TÜFE’ye doğru hem kısa hem de uzun dönem ilişkisi belirlenmiştir. Elde edilen sonuçlara göre Türkiye’de enflasyonun maliyet kaynaklı olduğu söylenebilir.

**Anahtar Kelimeler:** ÜFE, TÜFE, ARDL

**EMPIRICAL ANALYSIS OF THE RELATIONSHIP BETWEEN CONSUMER  
PRICE INDEX (CPI) IN TURKEY AND PRODUCER PRICE INDEX (PPI)****ABSTRACT**

Inflation, which is one of the most important macroeconomic indicators, is directly effective in many economic decisions and economic policies. In this direction, it is aimed to analyze the relationship between the CPI and the PPI in Turkey. In the study, between the period of 2006:01-2021:5, the relationship between CPI and PPI was investigated with the ARDL limit test approach. Accordingly, both short-term and long-term relationships from PPI to CPI were determined. According to the results obtained, it can be said that inflation in Turkey is caused by costs.

**Keywords:** PPI, CPI, ARDL

## GİRİŞ

Fiyatlar genel seviyesinin ve maliyetlerin artması sonucunda ortaya çıkan enflasyonist ortamda tüm fiyat ve maliyetler aynı aynı oranda değişmemektedir. Çoğu zaman fiyatlar maliyetlerden gecikmeli olarak değişmektedir. Bu durumun ölçülmesinde kullanılan indekslerin başlıcaları ÜFE ve TÜFE 'dir. ÜFE, üretici fiyatlarındaki değişimlerin takibi bakımından son derece önemli bir indeksken TÜFE üretilen mal ve hizmetler piyasasında oluşan değişimlerin anlaşılmasında yardımcı olmaktadır. Artan enflasyon toplumsal yaşam üzerinde de farklı maliyetlere sebebiyet vermektedir.

Türkiye ekonomisinde uzun yıllardır görülen enflasyon olgusu birçok makroekonomik göstergelerdeki bozulmaların kaynağı olarak kabul edilmektedir. Enflasyona sebebiyet veren etmenlerin temelini talep ve maliyet artışı ile sosyo-ekonomik yapıdan kaynaklanan yapısal nedenlerden oluşturmaktadır. ÜFE ile TÜFE arasındaki ilişkinin bilinmesi enflasyonun kaynağı olarak alınacak önlemlerin daha etkili olmasını sağlayacaktır

### ÜFE-TÜFE İlişkisinin Teorik Altyapısı

ÜFE ve TÜFE arasındaki temel ilişki ve nedensellik ilişkisi iktisat alanında farklı görüşlerde karşımıza çıkmaktadır. Makro ekonomik performansın genelde üretimdeki artış oranı, enflasyon ve işsizlik oranıyla ölçüldüğü göz önünde tutulduğunda enflasyon oranını genel olarak eşitlik (1) ile gösterilmektedir (Dornbusch and Fischer, 1998: 477).

$$\pi = P - P_{-1}/P_{-1} \quad (1)$$

Eşitlik (1) e göre sabit ve cari yıl fiyat endeksleri arasındaki ilişki analiz edilmektedir. Teorik anlamda enflasyon esas olarak talepteki artışın olması gerekenden fazla olmasından veya maliyet artışlarından kaynaklanmaktadır (Tarı vd.,2012: 2). Teorik ve ampirik literatürde, ÜFE ile TÜFE ilişkisi arasında nedensellik ilişkisi bakımından dört temel görüşe rastlanmaktadır. İlk görüşe göre ÜFE'de cari dönemde ortaya çıkan bir farklılığın gelecekte TÜFE'yi de etkileyeceği şeklindedir (Saraç ve Karagöz, 2010: 222). Bu duruma neden olan etmen, toptan satışların perakende satışlardan, dolayısıyla da üretimin tüketimden önce gerçekleşmesi ve TÜFE'deki değişimin üretimi tüketime bağlayan kanalla tüketici fiyatlarına aktarılmasıdır (Guthrie, 1982). Bu bağlamda ekonomik yapıda hammadde, nakliye, enerji işgücü için ödenen ücret gibi girdilerin fiyatlarında oluşan artışlar üretim zincirinden dolayı bir şekilde fiyatlara, dolayısıyla da TÜFE'ye yansımaktadır. Bu ilk görüşe karşı geliştirilen ikinci görüş ilk görüşün tam tersini savunmakta olup tüketici fiyatlarının üretici fiyatları üzerinde etkili olduğu konusunda teorik sebepler sunmaktadır. Bu iki görüşün yanında her iki yaklaşımı da doğrulayan

üçüncü görüşte üretici-tüketici fiyatları arasında bir geri besleme ilişkisinin mevcut olduğu iddia edilmektedir (Cushing ve McGarvey:1990 ; Kwon ve Koo: 2009). Öte yandan ÜFE ile TÜFE arasında istatistiksel bir ilişkinin bulunmasının gerekli olmadığını öne süren dördüncü bir görüşe rastlanmaktadır. Söz konusu görüşte iki endeksin hesaplanması farklı temel kitlelere ait farklı örneklemelerden ulaşılan fiyatlara dayalı olacak şekilde gerçekleştirilmektedir (Saraç ve Karagöz,2010: 230). Hammadde, ara malı ve nihai mal fiyatlarındaki değişim ÜFE'yi etkilerken TÜFE yalnızca nihai fiyatlardan etkilenmektedir. Tüm bu tartışmalar altında TÜFE ve ÜFE geçişkenliği enflasyon sürecinin yorumlanmasında, enflasyonun maliyet yada talep kaynaklı olduğunun belirlenmesinde önem arz etmektedir. Bu bağlamda endeksler arasındaki nedensellik ilişkisinin yanında endeks hareketlerindeki değişimleri ve endeksler arası geçişkenlik mekanizmasının önemlidir. Uygulanacak enflasyonla mücadele politikaları ise, TÜFE ile ÜFE arasındaki geçişkenlik mekanizmasının doğru belirlenmesini gerekli kılmaktadır.

Literatürde endeksler arası girişkenlik de nedensellik ilişkisinde olduğu gibi farklı görüşler mevcuttur. Genel kabul görüşlerden biri üretimde kullanılan her bir işgücü maliyeti ve maddelerin maliyetindeki artış öncelikle üretici fiyatlarını etkileyecek ve bu etki, bir süre sonra doğrudan tüketici fiyatlarına yansıtacaktır. Diğer bir görüşe göre beklentilerden veya gelir artışından kaynaklanan talep enflasyonu ilk olarak tüketici fiyatlarını, sonrasında üretici fiyatlarını etkileyecektir (Erdem ve Yamak, 2014:10). Bu iki görüşü göz önüne alarak kabul edilen üçüncü bir görüşe göre maliyet ve fiyatların belirlenmesinde faydalanılan yararlanılan enflasyon oranı olan TÜFE ve ÜFE pozitif ilişki içinde olmakta ve birbiri yerine kullanılmaktadır. Bu nedenle TÜFE ve ÜFE'nin benzer bir hareketlilik içerisinde bulunması beklenmektedir.

**Grafik 1: TÜFE-ÜFE Etkileşimi (2003-2021)**  
**Kaynak:TÜİK**

Grafik 1’de Türkiye’de 2003-2021 yılları arasındaki TÜFE-ÜFE etkileşimi izlenebilmektedir. Grafikte dikkat çeken nokta 2004 yılı sonuna kadar her iki endeksin aynı şekilde hareket etmesi ve 2004 yılından sonra endekslerin seyrinde farklılaşmanın meydana gelmesidir. Bunun temel nedeni iki endeks arasındaki girişkenlikte meydana gelen değişimlerdir.

## LİTERATÜR

Kwon ve Koo (2009) ABD ekonomisi için ÜFE ile TÜFE arasındaki geçişkenlik ilişkisini 1985-2001 yılları için analiz ettikleri çalışmalarında Toda ve Yamamoto yöntemini tercih etmişlerdir. Elde edilen sonuçlar ÜFE ve TÜFE arasında karşılıklı nedenselliğin varlığına ulaşmışlardır. Ayrıca 2002-2008 yılları için üretici fiyatlarından tüketici fiyatlarına doğru fiyat geçişkenlik tespit edilmiştir. Abdioğlu ve Korkmaz (2012) ÜFE ile TÜFE arasındaki nedensellik ilişkisini 2003-2012 dönemi için analiz ettikleri çalışmalarında hem toplam endeksleri hem de alt endeksleri kullanmışlardır. Analiz sonucunda ÜFE ile TÜFE arasında çift taraflı nedensellik ilişkisine ulaşmışlardır. Alt sektörlerde ise konut ve giyim için TÜFE’den ÜFE’ye doğru nedensellik ilişkisi olduğu belirlenmiştir. Bu sonuç Türkiye’de fiyat artışlarının daha çok talep yönlü nedenlerden dolayı olduğunu ifade etmektedir.

Saatçioğlu ve Karaca (2016) Türkiye’de TÜFE ile ÜFE endeksleri arasındaki nedensellik ilişkisini 2005-2016 yılları için analiz ettikleri çalışmalarında ÜFE’den TÜFE’ye nedensellik ilişkisinin varlığına ulaşmışlardır. Yamaçlı ve Saatçi (2016), Türkiye’de ÜFE ile TÜFE ilişkisini 2004-2015 yılları için analiz ettiği çalışmalarında ARDL yöntemini kullanmış ve ÜFE

oranlarının TÜFE oranlarını açıklayan temel değişken olduğu sonucuna ulaşmışlardır. Elde edilen bulgulara göre TÜFE’de kalıcı düşüş sağlanabilmesi için ÜFE’deki artışı önlemeye yönelik politikaların geliştirilmesi gerekliliği dile getirilmiştir. Terzi ve Tütüncü (2017) Türkiye ekonomisi için ÜFE ve TÜFE endeksi ilişkisini inceledikleri çalışmalarında kısa ve uzun dönemlerde çift yönlü nedensellik ilişkisinin varlığına ulaşmışlardır. Saatçioğlu ve Karaca (2017) Türkiye ekonomisi için ÜFE\_TÜFE ilişkisini 2005-2016 yılları için analiz ettikleri çalışmalarında Granger nedensellik testinden yararlanmışlardır. Ulaşılan sonuca göre ÜFE’den TÜFE’ye doğru tek yönlü nedensellik ilişkisi olduğu anlaşılmıştır. Öner (2018) Türkiye’de ÜFE ile TÜFE ilişkisini 2004-2016 yılları için Granger nedensellik testi ile incelediği çalışmasında TÜFE’den ÜFE’ye tek yönlü nedensellik ilişkisine ulaşmıştır. Koçak (2021), TÜFE, ÜFE ve tarım ÜFE’si arasındaki ilişkileri Türkiye ekonomisi için 2011-2020 yıllarını kapsayacak şekilde analiz ettiği çalışmasında nedensellik ve eş bütünleşme analizlerini kullanmıştır. Ulaşılan sonuçlara göre değişkenler arasında eş bütünleşme ve çift taraflı kısa vadeli nedensellik ilişkisinin varlığına ulaşmıştır. Çelik (2021), Türkiye’de ÜFE, kur, petrol, dış borç, ve doğalgaz fiyatları ile politika faizinin TÜFE’ye etkisini eş bütünleşme ve nedensellik analizleri ile incelediği çalışmasında 2008-2019 dönemleri için değişkenler arasında uzun dönemli pozitif bir eş bütünleşme ilişkisine ulaşmıştır. Ayrıca ÜFE’den TÜFE’ye tek yönlü nedensellik ilişkisi mevcuttur. Oral ve Eştürk (2022), Türkiye’de ÜFE ile gıda TÜFE etkisini 2006-2021 dönemleri için analiz ettikleri çalışmalarında NARDL yöntemini kullanmışlar ve uzun dönemli eşbütünleşme ilişkisinin varlığına ulaşmışlardır. Ayrıca sonuçlara göre ÜFE’nin pozitif şokları TÜFE’de %0.33, negatif şokları ise %0.92 artışa neden olmaktadır. Şanlı (2022)Türkiye’de ÜFE ve TÜFE endeks etkileşimini 2005-2021 yılları için ARDL eş bütünleşme ve Granger nedensellik analizleri ile test ettiği çalışmasında endeksler arasında güçlü bir eş bütünleşme ilişkisinin varlığına ulaşılmıştır. Nedensellik analizi sonuçlarına göre ise ÜFE’den TÜFE’ye doğru tek yönlü bir nedensellik ilişkisine ulaşılmıştır.

### **Ampirik Analiz**

Türkiye’de ÜFE-TÜFE ilişkisi Çalışmada hem TÜFE ile ÜFE arasındaki uzun dönem ilişkisi hem de nedensellik ilişkisi analiz edilecektir. Analiz 2006:01-2021:5 dönemini kapsamaktadır. Kullanılacak değişkenler, semboller ve elde edilen kaynaklar Tablo 1’de izlenebilmektedir.

**Tablo 1:** Değişkenleri Kaynakları ve Kısaltmaları

Değişken	Kısaltması	Kaynak
Tüketici Fiyat Endeksi	TÜFE	TÜİK
Üretici Fiyat Endeksi	ÜFE	TÜİK

Analizde değişen varyans ve kısmen de otokorelasyon olasılıklarına karşı değişkenler doğal logaritmaları alınarak analize dahil edilmişlerdir. Ayrıca değişkenlerin aylık olmasından dolayı mevsim etkisinden arındırılmak amacıyla Tramo-Seats yöntemi kullanılmıştır. Ekonometrik analize geçilmeden önce sahte regresyon sorununun araştırılması amacı ile değişkenlere geleneksel Augmented Dickey Fuller (ADF) birim kök testi ve kırılmalara izin veren Lee ve Strazicich (2003) testi uygulanacaktır. ADF testi eşitlik (2) ve (3)'deki şekilde ifade edilmektedir (Dickey ve Fuller,1981:1960);

$$\Delta X_t = \mu + BX_{t-1} + \sum_{i=1}^k \varphi \Delta X_{t-i} + u_t \quad (1)$$

$$\Delta X_t = \mu + \alpha + BX_{t-1} + \sum_{i=1}^k \varphi \Delta X_{t-i} + trend + u_t \quad (2)$$

Eşitlik (1) ve (2)'de test edilen ADF birim kök analizinde sıfır hipotez “seri birim kök içermektedir” ve alternatif hipotez “seri birim kök içermemektedir” şeklindedir. ADF birim kök testi sonuçları Tablo 2’de izlenebilmektedir.

**Tablo 2:** ADF Birim Kök Test Sonuçları

Değişkenler	Düzyey	1. fark	Kritik Değer (1%)
ÜFE	-2,12(7)	-3,28 (6)*	-5.31
TÜFE	-6,97(1)*	-	-4,90

Not:\* %1 seviyesinde istatistiksel olarak anlamlılığı ifade etmektedir. Akaike Bilgi Kriteri (AIC) ile ulaşılan optimal gecikme uzunlukları parantez içinde sunulmuştur.

Tablo 2’ye göre değişkenlerden sadece TÜFE değişkeni seviyede durağan çıkarken ÜFE değişkeni birinci farkta durağandır. İki farklı model kullanılarak gerçekleştirilen Lee ve Strazicich birim kök testinin ilk modeli eşitlik (4) de izlenebilmektedir (Lee ve Strazicich ,2003:144).

$$Y_t = \vartheta' Z_t + \varepsilon_t \text{ ve } \varepsilon_t = \beta \varepsilon_{t-1} + e_t \quad (4)$$

(4) numaralı eşitlikte  $Z_t$  içsel değişken vektörünü,  $\varepsilon_t$  hata terimini ifade etmektedir. Bir kırılmalı A modelinde  $D_t, t \geq T_B + 1$  şartında 1, farklı bir durumda ise 0 değerini alan kukla (dummy) değişkeni simgelemek şartıyla (2) no’lu denklem için;

$Z_t = (1, t, D_{1t})$  şeklindedir. Kırılma tarihi  $T_B$  ile gösterilmektedir. Ortalamada iki kırılmaya imkân veren birim kök testi için Model A,  $D_{jt} = 1; j = 1, 2$  olduğu durumda

$D_t, t \geq T_{Bj} + 1$  iken 1, söz konusu durum haricinde 0 değerini alan kukla (dummy) değişkeni gösteren (4) no'lu denklemde

$Z_t = (1, t, D_{1t}, DT_t)$  olmaktadır.

Sabit ve trendde iki kırılmaya izin veren CC modelini elde etmek için  $j=1, 2$  olacak şekilde  $DT_{tj}, t \geq T_{Bj} + 1$  iken  $t-T_{Bj}$  farklı şartlarda 0 değerini alan kukla değişkeni ifade etmek suretiyle  $Z_t$  yerine  $Z_t = (1, t, D_{1t}, D_{2t}, DT_{1t}, DT_{2t})$  konulmaktadır (Altunöz ve Büklü, 2019:51). Ulaşılan brim kök testi sonuçları Tablo 7'de sunulmuştur.

**Tablo 7:** Lee-Strazicich Birim Kök Testi Sonuçları (Düzeyde)

Değişkenler	A Modeli		C Modeli	
	t – istatistiği	Kırılma Tarihleri	t – istatistiği	Kırılma Tarihleri
TÜFE	-2.11 (k=10)	2009, 2018	-3,77 (k=5)	2009 2019
ÜFE	-2.35 (k=10)	2018, 2018	-3,25 (k=14)	2009, 2019

**Not:** Model A: -4.011 (1%), -3.410 (5%), -3.409 (10%), ii) Model C: -6.981(1%), -5.881 (5%), -5.331 (10%).

Tablo 7'deki sonuçlarda değişkenin ortalamasında meydana gelen kırılma A modeli ile ifade edilirken hem ortalamasında hem de eğiliminde kırılma olduğu C modeli ile ifade etmektedir.  $k_{max}$ , 14 olarak belirlenmiştir. Gerek A gerekse C modeline ait sonuçlara göre TÜFE ve ÜFE değişkenlerinde reddedilememektedir. Kırılma tarihleri küresel kriz ve ABD ile yaşanan Rahip krizi neticesindeki kur şokunu gösteren tarihler olarak anlamlıdır.

Değişkenlerin eş bütünleşik olup olmadığının küçük örneklemler için daha uygun olduğu ve uygun gecikmenin belirlenmesinde esneklik sağladığı ileri sürülen Pesaran, Shin ve Smith (2001)'in ARDL sınır testi yaklaşımının kullanılması önerilmektedir (Fosu vd., 2006:2079 ) Sınır testi yaklaşımında değişkenler arasında eşbütünleşme ilişkisinin belirlenebilmesi için öncelikle (5) ve (6) no'lu modeller oluşturulmuştur.

#### Model 1

$$\Delta T\ddot{U}FE = \beta_0 + \sum_{i=1}^{p-1} \alpha_{1i} \Delta(T\ddot{U}FE)_{t-1} + \sum_{i=0}^{q-1} \sigma \Delta(\ddot{U}FE)_{t-1} + \theta T\ddot{U}FE_{t-1} + \theta \ddot{U}FE_{t-1} + \varepsilon_t \quad (5)$$

#### Model 2

$$\Delta \ddot{U}FE = \beta_0 + \sum_{i=1}^{p-1} \alpha_{1i} \Delta(\ddot{U}FE)_{t-1} + \sum_{i=0}^{q-1} \sigma \Delta(T\ddot{U}FE)_{t-1} + \theta \ddot{U}FE_{t-1} + \theta T\ddot{U}FE_{t-1} + \varepsilon_t \quad (6)$$

Eşitlik (5) ve (6)'ya ait modellerle alakalı eş bütünleşme analizlerinde AIC bilgi kriterlerine göre her iki model için 2 gecikme göz önünde bulundurulmuştur. Ulaşılan sonuçlar Tablo 8'de izlenebilmektedir.

**Tablo 8: Eş Bütünleşme Testi Sonuçları**

<b>Model 1</b>			
<b>Bağımsız Değişken Sayısı</b>	<b>F St.</b>	<b>Kritik Değer (%1)</b>	
		<b>Alt Sınır</b>	<b>Üst Sınır</b>
1	7,191	4,04	4,78
<b>Model 2</b>			
<b>Bağımsız Değişken Sayısı</b>	<b>F St.</b>	<b>Kritik Değer (%1)</b>	
		<b>Alt Sınır</b>	<b>Üst Sınır</b>
1	3,971	4,04	4,78

Peseran vd.(20019 tarafından oluşturulan değerlerden elde edilen kritik değerlerle f istatistik değerleri karşılaştırıldığında model 1 için f değeri üst sınırın üzerinde olması nedeni ile eş bütünleşme ilişkisinin varlığına ulaşılmış olup aynı durum model 2 için söz konusu değildir. Genel olarak her iki test düşünüldüğünde değişkenler arasında eş bütünleşmenin var olduğu anlaşılmıştır. Bu bilgiler doğrultusunda değişkenler arasındaki uzun dönemli ilişkiler eşitlik (7) ile analiz edilecektir.

$$TÜFE_t = \beta_0 + \sum_{i=1}^{p-1} \alpha_{1i}(TÜFE_{t-1}) + \sum_{i=0}^{q-1} \delta_{1i}(ÜFE_{t-1}) + u_t \quad (7)$$

Eşitlik (4)'e ait uzun dönem tahmin sonuçları Tablo 9'da izlenebilmektedir.

**Tablo 9: ARDL (3,1) Uzun Dönem Tahmin Sonuçları**

<b>Değişkenler</b>	<b>Katsayılar</b>	<b>Standar Hatalar</b>	<b>t istatistikleri</b>	<b>Olasılık Değerleri</b>
$TÜFE_{t-1}$	1,440	0,333	22,189	0,00*
$TÜFE_{t-2}$	-0,188	0,022	-9,19	0,00*
$TÜFE_{t-3}$	-0,244	0,018	-7,10	0,00*
$ÜFE$	0,511	0,024	11,019	0,00*
$ÜFE_{t-1}$	0,311	0,038	11,617	0,00*
C	2213	4198	4,019	0,00*
<b>Teşhis Testleri</b>				
Breusch-Godfrey Otokorelasyon Testi F -İstatistik Değeri=1511 (0.046)				
White Değişen Varyans Testi F -İstatistik Değeri=6.104 (0.009)				
$R^2= 0.94$ , F İstatistiği = 286 (0.000)				
<b>Uzun Dönem Katsayıları</b>				
<b>Değişkenler</b>	<b>Katsayılar</b>	<b>Standart Hatalar</b>	<b>t istatistikleri</b>	<b>Olasılık Değerleri</b>
$ÜFE$	1,41	0,011	8,99	0,00*
C	22312	2110	9,15	0,12

**Not:** C, sabit terimi ifade etmektedir. Teşhis testlerinde olasılık değerleri parantez içinde ifade edilmiştir. \*, %1 seviyesinde anlamlılığı ifade etmektedir.

Tablo 9’da ulaşılan uzun dönemli tahmin sonuçlarına göre üretici fiyat endeksinde meydana gelen %1’lik bir artış tüketici fiyat endeksini uzun dönemde %1,41 arttırmaktadır. Tabloda dikkat çekici nokta  $UFE$  değişkeninin  $UFE_{T-1}$  de gücünü düşürüyor olmasıdır. Uzun dönem sonuçlarının ardından kısa dönem için kullanılacak model eşitlik (8)’de izlenebilmektedir.

$$\Delta T\dot{U}FE = \beta_0 + \beta_1 ECT_{t-1} + \sum_{i=1}^{p-1} a_{1i}(T\dot{U}FE)_{t-1} + \sum_{i=0}^{q-1} \theta_{2i}(T\dot{U}FE)_{t-1} + \varepsilon_t \quad (8)$$

Eşitlik (8)’e ait kısa dönem tahmin sonuçları Tablo 10’da izlenebilmektedir.

**Tablo 10:** ARDL (3,1) Kısa Dönem Tahmin Sonuçları

Değişkenler	Katsayılar	Standart Hata	t istatistiği	Olasılık
$\Delta T\dot{U}FE_{t-1}$	0,20	0,021	6,191	0,01**
$\Delta UFE_{t-1}$	0,33	0,030	10,01	0,00*
$\Delta \beta_0$	415	671,8	7,811	0,00*
$ECT_{t-1}$	0,20	0,017	1,011	0,03**
<b>Teşhis Testleri</b>				
Breusch-Godfrey Otokorelasyon Testi F -İstatistik Değeri=1511 (0.046)				
White Değişen Varyans Testi F -İstatistik Değeri=6.104 (0.009)				
$R^2 = 0.94$ , F İstatistiği = 286 (0.000)				

Tablo 10’da izlenen kısa dönem sonuçlarına göre cari dönemde ÜFE, TÜFE’yi pozitif yönde etkilemektedir. Hata düzetme katsayısının 0 ile 1 arasında ve negatif bir değer alması beklenir. Elde edilen 0,20 beklentiler dahilinde ve istatistiksel olarak anlamlıdır. Bu sonuç kısa dönemli dengesizliklerin 5 dönem içinde uzun dönem dengesine ulaşacağını ifade etmektedir.

Analizin son bölümünde aynı dereceden bütünleşik olmayan değişkenler için Toda-Yamamoto (1995) nedensellik analizi kullanılmıştır. Bu bağlamda VAR modeline ait optimal gecikme uzunluğunun belirlenmesi amacıyla Schwarz (SC) , Akaike (AIC), ve Hannan-Quinn (HQ) bilgi kriterleri kullanılmış ve 2 olarak belirlenmiş olup tablo 12’de izlenebilmektedir.

**Tablo 12:** VAR Modelinde Optimum Gecikme Uzunluğunun Belirlenmesi

Lag	AIC	SC	HQ
1	-7,312	-7,008	-8,007
2	<b>-8,781*</b>	<b>-7,101*</b>	<b>-9,177*</b>
3	-8,100	-6,370	-7,012
4	-8,346	-6,332	-8,388

Bir sonraki aşamada genişletilmiş VAR(3) modeli (dmax=1) ‘in (maksimum bütünleşme derecesi) en uygun gecikme uzunluğuna ilave edilerek oluşturulmuştur. Genişletilmiş VAR(3) modeli ile ulaşılan sonuçlar tablo 13’de izlenebilmektedir.

**Tablo 13:** Toda-Yamamoto Nedensellik Analizi Sonuçları

	$m = 2, d_{\max} = 1$	Ki Kare İstatistiği	Olasılık
ÜFE, TÜFE'nin nedenidir.	3	4,122	0.00***
TÜFE, ÜFE'nin nedenidir.	3	4,514	0.91

Not: \*\*\*,\*\* ve \* sırasıyla %1, %5 ve %10 seviyesinde anlamlılığı ifade etmektedir.

Tablo 13'te sunulan nedensellik analizi sonuçlarına göre ÜFE, TÜFE'nin nedenidir. ( %1 düzeyinde istatistiksel olarak anlamlıdır). Fakat TÜFE, ÜFE'nin nedenidir hipotezi istatistiksel olarak anlamsız çıkmış olup söz konusu yönde bir nedensellik tespit edilememiştir. Sonuçlar; teorik beklentilerle uyumlu olarak ÜFE'deki değişimin bir gecikmeyle tTÜFE'yi etkilemektedir. Nedensellik analizine için yapılan değişen varyans ve oto korelasyon sonuçları Tablo 14'de izlenebilmektedir.

**Tablo 18:** Otokorelasyon ve Değişen Varyans Testi Sonuçları

<i>Larange Çarpanı (LM) Otokorelasyon Testi</i>		
<i>Gecikme Uzunluğu</i>	<i>LM Test İstatistiği</i>	<i>Olasılık Değeri</i>
2	3,224	0,311
<i>White Değişen Varyans Testi</i>		
<i>Gecikme Uzunluğu</i>	<i>Test İstatistiği</i>	<i>Olasılık Değeri</i>
2	11,108	0,231

Tablo 18 sonuçlarına göre göre 2 gecikme ile gerçekleştirilen VAR analizinde değişen varyans ve otokorelasyon olmadığı anlaşılmaktadır.

## SONUÇ

Ülke ekonomilerinde TÜFE ve ÜFE arasındaki eş bütünleşme ve nedensellik ilişkisinin varlığının mevcudiyeti üretici ve tüketici fiyatlarının birbirine geçişken olduğunu ve bu geçişkenlikte hangi değişkenin diğerinin nedeni olduğunun ifade eder. Özellikle Covid salgını ile ülkelerin en öncelikli çözülmesi gereken sorunu haline gelen enflasyonla mücadelede TÜFE-ÜFE ilişkisinin anlaşılması sorunun çözülmesi ve politika geliştirilmesi açısından önem arz etmektedir. Ulaşılan sonuçlara göre uzun dönemli tahmin sonuçlarına göre üretici fiyat endeksinde meydana gelen %1'lik bir artış tüketici fiyat endeksinin uzun dönemde %1,41 arttırmaktadır. kısa dönem sonuçlarına göre cari dönemde ÜFE, TÜFE'yi pozitif yönde etkilemektedir. Hata düzetme katsayısının 0 ile 1 arasında ve negatif bir değer alması beklenir.

Elde edilen 0,20 beklentiler dahilinde ve istatistiksel olarak anlamlıdır. Bu sonuç kısa dönemli dengesizliklerin 5 dönem içinde uzun dönem dengesine ulaşacağını ifade etmektedir. Nedensellik analizi sonuçlarına göre ÜFE, TÜFE'nin nedenidir. Teorik altyapıyla uyumlu olarak incelenen dönem için toptan eşya fiyat indekslerindeki bir değişim bir gecikmeyle tüketici fiyatlarını etkilemektedir.

**Arş. Gör. Ayşe Nida KURT**

Muş Alparslan Üniversitesi, Uygulamalı Bilimler Fakültesi, Bitkisel Üretim ve Teknolojileri Bölümü

### **ÖZET**

Yem bitkileri ekolojik istekler açısından çok seçici olmayan, protein ve karbonhidrat içerikleri dengeli kaliteli ve ucuz kaba yem kaynaklarıdır. Yem bitkileri içerisinde dünyanın hemen hemen her yerinde yetişme alanı bulabilen, Dünya’da ve Türkiye’de yem bitkileri içerisinde en fazla yetiştiriciliği yapılan yonca uzun ömürlü çok yıllık bir bitkidir. Geniş uyum yeteneği, yüksek ot verimi ve besleme değeri, uzun ömürlülüğü, biçim sayısının yüksekliği gibi özellikleri ile yem bitkileri arasında çok önemli bir yer almaktadır. Yonca tarımında biyotik ve abiyotik birçok etmen büyük ölçülerde ekonomik kayıplar meydana getirmektedir. Bu biyotik etmenlerden birisi olan Yonca hortumlu böceği, *Hypera postica* (Gyllenhal, 1813) yonca üretim alanlarının başlıca zararlıları arasındadır. Yonca tarımınca önemli ekonomik kayıplara neden olan zararlının biyolojisi, tanımlanması uygun mücadelenin başlatılmasında büyük önem arz etmektedir. Bu çalışmada, zararlının biyolojik yaşam döngüsü, şeker pancarındaki zarar semptomları ve ekonomik zarar eşiği altında tutmak için uygun mücadele yöntemleri incelenmiştir.

**Anahtar Kelimeler:** Yonca hortumlu böceği, *Hypera postica*, yonca zararlıları

**BIOLOGICAL LIFE CYCLE AND CONTROL OF THE CLOVER PEST****ABSTRACT**

Forage crops are low-quality and inexpensive roughage sources that are not very selective in terms of ecological demands and whose protein and carbohydrate contents are balanced. Alfalfa is a long-lived perennial plant that can be grown in almost every part of the world among forage crops and is the most cultivated among forage crops in the world and in Turkey. It has a very important place among forage crops with its wide adaptability, high forage yield and nutritional value, longevity, high number of forms. Many biotic and abiotic factors in alfalfa cultivation cause economic losses to a large extent. Alfalfa proboscis beetle, *Hypera postica* (Gyllenhal, 1813), which is one of these biotic factors, is among the main pests of alfalfa growing areas. The biology and identification of the pest, which causes significant economic losses in alfalfa cultivation, is of great importance in initiating appropriate control. In this study, the biological life cycle of the pest, the damage symptoms in sugar beet and the appropriate control methods to keep it under the economic damage threshold were examined.

**Keywords:** Alfalfa proboscis beetle, *Hypera postica*, clover pests

## **1. GİRİŞ**

Bitkisel ve hayvansal üretimin insanoğlunun yaşamını sürdürmesindeki önemi tartışılmaz bir gerçektir. Her ikisinde bir bütünün ayrılmaz unsurlarıdır. Hayvan beslenmesinde en çok üretimi yapılan bitkilerin başında yonca (*Medicago sativa* L.) gelmektedir. Anavatanı Asya; İran, Türkmenistan ve çevresi (Bolton, 1962) olan yonca, baklagiller (Fabaceae) ailesinde yer alan, derin ve güçlü kök sistemine sahip, çok yıllık önemli bir yem bitkisidir (Davis, 1978). Ülkemizde de geniş alanlarda yetiştirilmektedir (Erişen, 2005). Yonca sahip olduğu derin kök sistemi sayesinde toprağın havalanmasını ve gevşemesini sağlamakta, erozyonun kontrol edilmesine önemli katkıda bulunarak doğayı korumaktadır. Yem bitkileri içerisinde en yüksek besin değerine sahip olan yonca, besicilikte et ve süt verimini %30'lara kadar arttırabilmekte ve ayrıca silo ve pelet yemi olarak da kullanılabilir (Manga, 1978). Yonca meraların kuruduğu yaz aylarında yeşilliğini devam ettirdiği için böceklerin beslenmesinde cazip bir bitki olmaktadır (Tan, 2018). Yem bitkilerinin kraliçesi olarak da adlandırılan yonca, tarımı yapılan tüm yem bitkilerinden daha yüksek bir yem değerine sahiptir. Protein miktarı yüksek olan yoncanın, kuru ve yeşil otu hayvanlar için besleyici olup, vitaminlerce zengindir. Yonca, toprak yüzeyini örtücü bir bitki, yeşil gübre ve toprak ıslah edici olarak da ekilebilir. Yonca aynı zamanda köklerini fazla derinlere indirerek buradaki su ve besin maddelerinden kolayca faydalanabilen bir bitkidir. Köklerindeki yumrucuklar ile toprağa fazla miktarda azot bağlayıp, kendisinden sonra ekilecek olan yüzeysel köklü bitkiler için organik maddece ve azotça zengin, su tutma kapasitesi iyi bir tarla toprağı bırakır (Anonim, 1999). Ayrıca, çevredeki biçilmiş yonca anız saplarının içerisinde de yumurtalara rastlanılmıştır. Talwar (2015) bu dönemin ekim ve kasım aylarında havaların yumuşamasıyla gerçekleştiğini bildirmiştir. Dowdy (1984), Stark ve ark. (1993) ve DeGooyer ve ark. (1996) ise, *H. postica* erginlerinin yazlamalarından sonra ekim ve kasım aylarında yonca tarlasında görüldüğü ve çok sayıda yumurta bıraktıklarını bildirmiştir.

## **2. YONCA HORTUMLU BÖCEĞİ BİYOLOJİSİ**

Yonca hortumlu böceğı kışı, ergin halde, yonca tarlalarında veya kenarlarında bitki artıkları bitki kökleri civarında, toprak yarı ve çatlaklarında geçirir. İklimle bağı olarak mart ayının ikinci yarısından itibaren erginler tarlada görülmeye başlar. Yumurtalarını bitki fonolojisi ile ilgili olarak başlangıçta kuru saplar içinde, yeşil gövdelere, yaprak sapının bitki gövdesi ile birleştiği yerlere, yaprak saplarına ve sürgün uçlarına açtıkları delikten içeriye 1-29 adet olarak

bırakırlar. Bir dişi ortalama 1100 yumurta bırakır. Yumurtalar 2-3 haftada açılır. Larvalar 2-3 gün sap içinde beslendikten sonra yaprak ve tepe tomurcuklarına dağılırlar. İlk 2 larva dönemini tomurcuk içlerinde beslenerek geçirirler, üçüncü ve dördüncü larva dönemlerinde bitki üzerinde açıkta beslenirler. Tarlada kokon içindeki ilk pupaların görülmesi Mayıs ayı ortalarına rastlar. Yeni erginler yaz sıcaklıkları başına kadar beslenir. Daha sonra yazlamaya çekilirler. Sonbaharda tekrar hareketlenerek tarlalarda görülürler. Havalarda soğumaya başlaması ile kışlamak üzere toprağa girerler. Yılda bir döl verirler.

**Şekil 1.** Yonca hortumlu böceği ergin ve larvasının genel görünümü.

### **3. YONCA HORTUMLU BÖCEĞİ ZARARI**

Ergin zararı, larva zararına göre daha az olup, erginler genellikle yaprağın orta damarı hariç yan damarları, yaprak ayasını ve sürgün uçlarını yerler. Larva zararı önemlidir. İlk iki dönem larvalar sürgün uçları ve yaprak koltukları arasında beslenirler. Tomurcuk ve sürgün ucu yediklerinden bitki gelişmesi yavaşlar. Son iki dönem larva yaprakları dıştan kemirerek yer, sadece orta damar veya yan damarlar kalır. Larva zararı daima bitkilerin üst kısımlarından başlar, aşağıya doğru devam eder. Asıl zarar birinci biçime kadar olan zamandır. Larva yoğunluğu fazla ise zarar gören yaprakların kuruması sonucu tarla boz, gümüşü bir görünüm kazanır. Sulama imkanı kısıtlı ve az biçimde yapılan yerlerde ekonomik önemi büyüktür. Türkiye'de bütün bölgelerde zararlı olmaktadır.

Şekil 2. Yonca hortumlu böceği larva zararı.

### SONUÇ VE ÖNERİLER

Yonca kuvvetli ve sık yetiştirilmelidir. Böyle tarlalarda güneş ışıkları toprağa ulaşmadığından yumurta ve larva gelişimi yavaşlamaktadır. Sulama, tarla sıcaklığını birkaç gün süre ile azaltmaktadır. Bu nedenle, biçimden bir hafta önce yapılan sulama, larva gelişmesini yavaşlatacak ve pupa olmasını geciktirecektir. Biçimden 7-10 gün sonrasına kadar su vermemek ile de toprak yüzeyine dökülen larvaların doğrudan güneş ışığı etkisinde kalmaları ve büyük oranda ölmeleri sağlanmış olur. Yonca hortumlu böceği birinci biçime kadar olan ürüne zarar verir. Bu nedenle biçimi 10-15 gün evvel yapmak etkili bir yöntemdir. Biçimi yapılan yoncaların, tarladan hemen kaldırılarak, bir başka yerde kurutulmaya bırakılmasının faydası büyüktür. Böylece, kuruyan yoncaları terk eden larvalar, beslenecek konukçu bulamaz. *H. postica*, yumurtalarını sonbahar ve ilkbahar aylarında iki seferde bıraktığı, ilkbaharda ilk görülen larvaların sonbaharda bırakılan yumurtalara ait olduğu belirlenmiştir. Bu yumurtalardan ilkbaharda çıkış yapan larvaların bitkinin genç döneminde daha fazla zarar yaptığı bu yüzden, sonbaharda biçim ya da otlatma yapılmasının ilkbahar larva popülasyonunu azaltacağı düşünülmektedir. Aynı şekilde, ilkbaharda bırakılan yumurtaların bir kısmı ve henüz ergin döneme girmemiş olan larvaların mayıs sonu-haziran ayı başlarında yapılan biçimle zarar gördüğü bildirilmiştir (Gözüaçık ve ark., 2019).

**Doç. Dr. İbrahim DEMİRKALE (Orcid ID: 0000-0002-0074-2309)**

Çukurova Üniversitesi, Su Ürünleri Fakültesi, Su Ürünleri Yetiştiriciliği Bölümü, Adana

### **ÖZET**

Blokchain (Blok zinciri), bir bilgisayar ağının düğümleri arasında paylaşılan dağıtılmış bir veri tabanıdır. Bir veri tabanı olarak, bir blok zinciri, bilgileri elektronik olarak dijital biçimde saklar. Blok zincirleri en iyi, güvenli ve merkezi olmayan bir işlem kaydını tutmak için Bitcoin gibi kripto para sistemlerindeki önemli rolleriyle bilinir. Blok zincirindeki yenilik, bir veri kaydının aslına uygunluğunu ve güvenliğini garanti etmesi ve güvenilir bir üçüncü tarafa ihtiyaç duymadan güven oluşturmalarıdır. Bugün blockchain, deniz ürünleri için uzun ve karmaşık üretim döngülerini belgelemek ve kritik gözetim zincirini izlemek, kıyı, liman, işleme ve son Pazar gibi konuları dikkate alarak analiz yapmak suretiyle ticari olarak sahtekârlıkla mücadele etmektedir. Bunlar, balıkçılık ürünleri hasat, aktarma, karaya çıkarma ve işlemeden nihai tüketici pazarına kadar ulusal ve uluslararası tedarik zincirlerinden geçtiği için çok önemlidir. Ülkenin her bölümü, yerinde olması gereken genel kontrol öğelerini gerektirir, bunlar genellikle izlenebilirlik, izleme ve veri toplama için temel oluşturur ve tüketicilerin deniz ürünlerine tam olarak güvenmesini sağlar. Su ürünleri yetiştiriciliği, dünya çapında en çok ticareti yapılan gıda gruplarından biri haline gelirken dünya çapında milyonlarca insanın geçimini sağlamaktadır. Gelişmekte olan ülkelerde ihracatın büyüme hızı, küreselleşme ve dünya ekonomisinin teknolojik gelişmelerle birlikte dönüşmesi nedeniyle son on yılda çok hızlı bir artış göstermiştir. Küresel balık stoklarının neredeyse üçte birinin aşırı kullanımıyla, su ürünleri yetiştiriciliği ve balıkçılığın ekolojik ayak izi, sürdürülebilir tedarik zincirinin dengesine dikkat çekmektedir.

**Anahtar Kelimeler:** Blokchain, Su Ürünleri Sektörü, Kalite Yönetimi, Gıda Güvenliği

**APPLICATION OF BLOCKCHAIN TECHNOLOGY IN FISHERIES AND  
AQUACULTURE PRODUCTION SECTOR****ABSTRACT**

Blockchain is a distributed database shared among the nodes of a computer network. As a database, a blockchain stores information electronically in digital form. Blockchains are best known for their important role in cryptocurrencies like Bitcoin to keep a secure and decentralized record of transactions. Blockchain innovation is that it guarantees the fidelity and security of a data record and establishes trust without the need for a trusted third party. Today, blockchain combats commercial fraud by documenting long and complex production cycles for seafood and monitoring critical chain of custody, analyzing by considering coastal, port, processing, and end-market. These are crucial as fishery products pass through national and international supply chains, from harvesting, transshipment, landing, and processing to the final consumer market. Every part of the country requires general control elements that must be in place, often forming the basis for traceability, tracking and data collection, and ensuring consumers have complete confidence in seafood. Aquaculture has become one of the most traded food groups worldwide and provides a livelihood for millions of people around the world. The growth rate of exports in developing countries has increased rapidly in the last ten years due to globalization and the transformation of the world economy with technological developments. With almost one-third of global fish stocks being overused, the ecological footprint of aquaculture and fisheries highlights the balance of the sustainable supply chain.

**Keywords:** Blockchain, Aquaculture Industry, Quality Management, Food Safety

## **GİRİŞ**

Blockchain, "internetin kazandırdığı değer" (FAO ve ITU, 2019) olarak adlandırılmıştır ve en basit ifadeyle, "değeri" olduğu düşünülen herhangi bir şeyle bağlantılı "işlemleri işleme, doğrulama ve yetkilendirme mekanizmaları" ile dijital, dağıtılmış bir "varlık ve işlem defteridir" (Hammerich, 2018; FAO ve ITU, 2019 ; Kochupillai, 2019). Blockchain Tipik bir veritabanı ile bir blok zinciri arasındaki temel farklardan biri, verilerin nasıl yapılandırıldığıdır. Bir blok zinciri, bilgi kümelerini tutan bloklar olarak bilinen gruplar halinde bilgileri bir araya toplar. Blokların belirli depolama kapasiteleri vardır ve doldurulduklarında kapatılır ve önceden doldurulmuş bloğa bağlanarak blok zinciri olarak bilinen bir veri zinciri oluşturur. Yeni eklenen bloğu takip eden tüm yeni bilgiler, doldurulduktan sonra zincire eklenecek olan yeni oluşturulmuş bir bloğa derlenir. Bir veritabanı genellikle verilerini tablolar halinde yapılandırırken, bir blok zinciri, adından da anlaşılacağı gibi, verilerini birbirine dizilmiş parçalar (bloklar) halinde yapılandırır. Bu veri yapısı, merkezi olmayan bir yapıda uygulandığında, doğası gereği geri döndürülemez bir veri zaman çizelgesi oluşturur. Bir blok doldurulduğunda taşınabilir ve bu zaman çizelgesinin bir parçası olur. Zincirdeki her bloğa, zincire eklendiğinde kesin bir zaman damgası verilir (Anonim 2022a ).

Blockchain ayrıca, fikri mülkiyet rejimleri gibi mevcut düzenlemeler tarafından en uygun şekilde teşvik edilmeyen faaliyetleri ve iş modellerini teşvik etmenin bir yolu olarak giderek daha fazla tanınmaktadır ( Kochupillai ve ark, 2019 ). Bu faaliyetler ve iş modelleri, örneğin, sosyal, ekonomik ve çevresel sürdürülebilirliği destekleyen, demokratik ve şeffaf karar almayı artıran ve toplumun daha yoksul ve marjinal kesimlerinin de adil kalkınmasına ve zenginleşmesine izin verenleri içerir. Dezavantajlı piyasa katılımcılarının bu teknoloji sayesinde bir nevi 'masaya oturabilecekleri' söylenmiştir ( Hammerich, 2018 ). Bu, "güven, kanun ve yaptırım" "bilgisayar koduna" dış kaynak sağlayan akıllı sözleşmeler ve "kripto yönetim" ile gerçekleştirilir (Chapron 2017 ). Karmaşık bir teknoloji olmakla birlikte, büyük ölçüde mevcut ve iyi bilinen birkaç mekanizmanın birleşimidir. Özellikle, yazılım sistemlerini (özellikle merkezi olmayan, dağıtılmış ve eşler arası sistemler) bütünlüklerini, şeffaflıklarını ve değişmezliklerini koruyacak şekilde uygulama yöntemlerinin bir kombinasyonudur; bir veri depolama ve iletim yöntemi ve bunun üzerine yeni uygulamaların (dağıtılmış uygulamalar veya dApp'ler (merkeziyetsiz uygulamalar) ve akıllı sözleşmeler) oluşturulmasına izin veren programlanabilir bir platformdur ( Drescher 2017 ; Finck 2019, ).

### **Su Ürünleri Yetiştiriciliğinde Blok Zinciri ve İzlenebilirlik Gereksinimi**

Günümüzde Su ürünleri yetiştiriciliği ve balık ürünleri, dünya çapında en çok ticareti yapılan gıda maddeleri haline gelirken dünya çapında milyonlarca insanın geçim kaynağı olmuştur. Gelişmekte olan ülkelerde ihracatın büyüme hızı, küreselleşme ve dünya ekonomisinin teknolojik gelişmelerle birlikte dönüşmesi nedeniyle son on yılda hızlı bir artış göstermiştir. Küresel stokların neredeyse üçte birinin aşırı kullanımıyla, su ürünleri yetiştiriciliği ve balıkçılığın ekolojik ayak izi, sürdürülebilir tedarik zincirinin dengesine dikkat çekmektedir.

Son yapılan tahminler gerçekleşirken, küresel su ürünleri yetiştiriciliği yörüngesi sabit kalmış ve 2019'da öngörülen somon, tilapia, levrek ve çipura üretimi ile ilgili beklentiler tamamen karşılanmıştır. 2016'da küresel balık Üretim 171 milyon tona yakinken, Gıda ve Tarım Örgütü (FAO) 2030 yılına kadar küresel tüketimin yüzde 20 daha yüksek olacağını tahmin etmektedir. Hem gelişmiş hem de gelişmekte olan ülkelerde donmuş balık talebindeki hızlı artış, okyanus endüstrisinin sürdürülebilirliğini sağlamak için kalite ve izlenebilir veri konularının ele alınmasını kritik hale getirmektedir.

2019 yılında, Norveç deniz ürünleri işletmeleri derneği (Sjømatbedriftene) ve IBM tarafından ortaklaşa düzenlenen Aqua Nor'da özel bir seminerde Blockchain, okyanus endüstrilerinin değer zincirini güvence altına alma olasılıklarını tartışmıştır. Balıkçılıkta blockchain teknolojisini uygulamak için şu üç özel nedenden bahsedilmektedir (Anonim 2022b)

1. Güvenlik – endüstri ve tüketiciler, satın aldıkları balığın doğru tür olduğundan kesinlikle emin olmalıdır. Çoğu su ürünleri şirketi sürdürülebilir çiftçiliğe büyük yatırım yapar ve kalitesiz ürünlerin satılması riskini alamaz.
2. Pazar talepleri – Büyük perakendeciler ve süpermarket zincirleri menşe kanıtı talep eder.
3. İzlenebilirlik – hem gıda perakendecileri hem de tüketiciler izlenebilirlik ve yeterli bilgi talep etmektedir.

Bu konuda ilk adımlar 2018 yılında ABD Ticaret Bakanlığı tarafından atılmıştır. Bu plana göre karideslerin yetiştirildiği yerden ABD'ye girişine kadar yerel bir izlenebilirlik programı oluşturulmuştur. Bu program (SIMP) ve izlenebilirlik sistemi, ithal edilen deniz ürünleri için ilgili düzenleyiciler ve icra makamları arasında uygun veri toplama, paylaşma ve analizini kolaylaştırmıştır; bu, yasadışı, düzenlemeye tabi olmayan ve bildirilmeyen (IUU) balıkçılık ve deniz ürünleri sahtekarlığını ele almak için önemli bir adım olmuştur (Anonim 2022 b).

Bugün, blockchain, sahtekarlıkla mücadele etmek, deniz ürünleri için uzun ve karmaşık üretim döngülerini belgelemek ve kritik gözetim zincirini izlemek, 'durumları' (bayrak, kıyı, liman, işleme ve son pazar) dikkate alarak analiz yapmak için ticari olarak mevcuttur. Bunlar, balıkçılık ürünleri hasat, aktarma, karaya çıkarma ve işlemeden nihai tüketici pazarına kadar ulusal ve uluslararası tedarik zincirlerinden geçtiği için çok önemlidir. Eyaletin her bölümü, yerinde olması gereken genel kontrol öğelerini gerektirir, bunlar genellikle izlenebilirlik izleme ve veri toplama için temel oluşturur ve tüketicilerin deniz ürünlerine tam olarak güvenmesini sağlar (Şekil 1).

### **Blockchain deniz ürünleri sahtekârlığıyla nasıl mücadele ediyor?**

Gıda dolandırıcılığı son yıllarda %60 arttı ve deniz ürünleri endüstrisi özellikle sert darbe aldı. Somon, ton balığı ve pisi balığı, restoran ve market hikayelerinde yaygın olarak yanlış etiketlenen çeşitlerden sadece birkaçıdır. Yeni bir blockchain ağı, deniz ürünlerini yakalama noktasından mutfağa kadar takip ederek dolandırıcılığı ortadan kaldırmayı amaçlıyor.

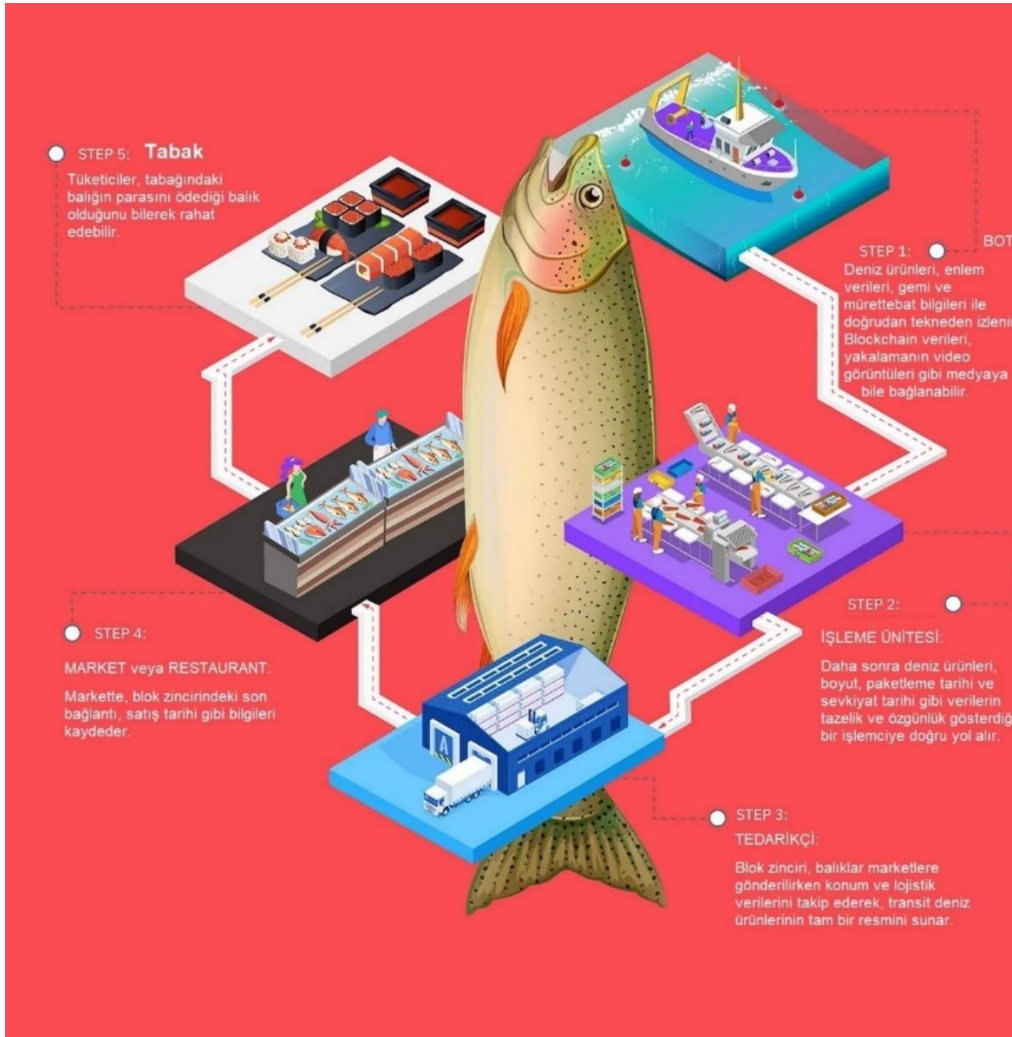

Step 1 Bot. deniz ürünleri, enlem verileri, gemi ve mürettebat bilgileri ile doğrudan tekneden izlenir. Blockchain verileri, yakalamanın video görüntüleri gibi medyaya bile bağlanabilir.

Step 2. İşlemci: Daha sonra deniz ürünleri, boyut, paketlenme tarihi ve sevkiyat tarihi gibi verilerin tazelik ve özgünlük gösterdiği bir işlemciye doğru yol alır.

Step 3. Tedarikçi: Blok zinciri, balıklar marketlere gönderilirken konum ve lojistik verilerini takip ederek, transit deniz ürünlerinin tam bir resmini sunar.

Step 4. Market veya restoran: Markette, blok zincirindeki son bağlantı, satış tarihi gibi bilgileri kaydeder.

Step 5. Tabak: Tüketiciler, tabağındaki balığın parasını ödediği balık olduğunu bilerek rahat edebilir.

Şekil 1 Blockchain deniz ürünleri sahtekarlığıyla nasıl mücadele ediyor? (Anonim 2022c)

## Su Ürünleri Yetiştiriciliğinde Blockchain için İlk Ulaşılabilir Kilometre Taşları Şunlardır (Şekil 2):

Şekil 2. Su Ürünleri sektöründe Blockchain uygulamasının adımları (Anonim 2022b).

FAO, projeler arasında blok zincirinin başarılı bir şekilde uygulanması için birkaç yaygın faktörden bahseder. Bu faktörler şunları içerir:

- Bunların çoğu yalnızca yüksek değerli balık türleri olarak kabul edilir (ton balığı ve deniz levreği gibi türler yüksek değerli ürünlerdir).
- Bu akuakültür şirketlerinin bir arada var olan dijital ve fiziksel yöntemler arasında doğrudan bir bağlantısı vardır, bu bağlantı ya tek tek balıkların etiketlenmesi ya da yakalama verilerinin birimlerinin kaydedilmesi için başka yollarla tanımlanmıştır.
- Projelerin çoğu, aktörlerin bilindiği ve izlenebilir olduğu nispeten kısa ve açıkça tanımlanmış veya dikey olarak entegre değer zincirlerine sahiptir.
- Verilerin değişmezliği ve güvenli veri paylaşımı, bu deniz ürünleri şirketleri tarafından blok zincirinin benimsenmesinin ana faktörleridir.
- Ürün ambalajında QR kodların kullanıldığı uygulama, kullanılabilirliği nedeniyle tercih edilmektedir.

#### **Su Ürünleri projelerinde Blockchain Uygulaması için gerçeklik kontrolü:**

Her proje blok zinciri çözümleri için farklı teknoloji kullanırken, ortaya çıkan birkaç aşılabilir zorluktan söz edilir, FAO analizi aşağıdakileri temsil etmektedir (Anonim 2022b).

- İnsan girdisine dayalıdır – projelerin çoğu, muhtemelen kurcalanmaya açık olan balık verilerinin insan girdisine dayanmaktadır.
- Balıkların manuel olarak markalanması ve etiketlenmesi – fiziksel balık markaları/etiketleri nakliye sırasında kaybolabilir veya hasar görebilir ve hatta kurcalanabilir.
- Özel ve konsorsiyum blok zinciri platformlarının doğrulanabilirliği - mimarileri ve tasarımlarıyla bu blok zincirleri halka açık değildir, işlemleri bağımsız olarak doğrulamak zor görünmektedir.
- Karmaşık deniz ürünleri değer zinciri senaryoları denenmemiştir – birkaç aktörün bilinmediği gerçek dünyadaki karmaşık deniz ürünleri değer zincirlerinden kaynaklanan belirsizlik henüz dikkate alınmamıştır.

#### **Su Ürünleri Endüstrisini Zorlayıcı Faktörler**

- Çevre düzenlemelerinin sıkılaştırılması
- Sosyal, çevresel ve ekolojik sürdürülebilirlik konusunda ihmal edilebilir şeffaflık
- Gıda güvenliği ve güvenlik de dahil olmak üzere çok-sınırlı Tedarik zinciri yönetimi, su ürünleri talebini etkileyen başlıca endişelerden bazılarıdır.
- Müşteriler dahil tüm paydaşlar için bilgiye erişim eksikliği,

- Büyük veri ve veri analitiği kullanılarak eyleme dönüştürülebilir içgörüler oluşturmak için gerçek zamanlı verilerin bulunmaması,
- Doğrulanmış bilgiler ve tanımlanmış veri noktaları ile deniz ürünlerinin çapadan çatala izlenebilirliği.

#### Gerçek Zamanlı Blockchain Projeleri Örnekleri

Denizlerin korunması için şeffaf kaynak kullanımı, plastikten kaynaklanan kirliliğin azaltılması, denizde köleliğin azaltılması ve sürdürülebilir balıkçılık yönetimi de dahil olmak üzere bir dizi hizmet ve endüstri için blok zinciri giderek daha fazla kullanılmaktadır. Balık ve çiftçi koruma operasyonlarına yönelik artan kamu güvensizliği ve deniz ürünlerinin menşei artıyor. Balık çiftçilerini blok zinciri çözümleriyle bütünleştirmeye ve çevresel etki, yem, büyüme ve balık sağlığı hakkında özel veriler toplamaya odaklanıyor, çünkü bunlar balıkları sürdürülebilir bir şekilde yetiştirirken kilit faktörler olarak katkıda bulunuyor.

Yabani deniz ürünleri değer zinciri göz önüne alındığında, Tuna, diğer emtiaların yanı sıra Şili deniz levrekleri ve çiftlik karidesleri de dahil olmak üzere, blok zincirinde izlenen en yaygın deniz ürünleridir. FAO tarafından yakın zamanda yapılan bir araştırma, dünya çapında uygulanan blok zinciri projeleri için türlerin, kullanılan teknolojinin ve etkinin temel bulgularıyla birlikte verileri toplamıştır.

Deniz ürünleri değer zincirlerindeki en eski pilot projelerden biri, 2016 yılında Endonezya'daki Project Provenance Ltd (Provenance) tarafından sarı yüzgeçli ton balığı filetosu ve konserve için ton balığına odaklanmıştı. Bunu 2017 yılında WWF-Yeni Zelanda, ConsenSys, Sea Quest, TraSeable Solutions Fiji için başka bir proje izlemiştir. 2018 yılında, Nauru Anlaşma Ofisi Taraflarının (PNAO) ton balığı pazarı geliştirme şirketi ve Tayland'da bir hizmet olarak blok zinciri (BaaS) platformu olan Atato, gırgırda konserve amaçlı yakalanan ton balıklarını izlemek için ilk büyük ölçekli blok zinciri girişimini hayata geçirmişlerdir. Bu girişim, Marine Stewardship Council (MSC) özel sertifikasyonunun gözetim zinciri (CoC) gereksinimlerini kamu malı haline getirmiştir. Son zamanlarda Fishcoin gibi şirketler, sürdürülebilir deniz ürünleri üretimine doğru ilerlemelerini hızlandırmak için BM Gıda Programı'nın SKH 2 Savunuculuk Merkezi ile ortaklık kurmuştur. Şirket, her tür deniz ürünü için avlama verilerinin yakalanmasını ve iletilmesini teşvik ederek, merkezi olmayan defter teknolojisini kullanarak veri toplamayı iyileştirmeyi teklif etmektedir. Ayrıca Endonezya'daki Bumble Bee Foods, ürün ambalajına QR kodları uygulayarak Yellowfin orkinos ("Adil Ticaret" sertifikalı) için SAP blockchain kullanımına geçmiştir. Ayrıca, Sustainable Shrimp Partnership Ecuador şirketi,

IBM Food Trust'ı kullanmaktadır böylelikle, Ekvador'daki karides çiftlikleri ve ürünleriyle ilgili tüm verilere dünya çapındaki perakendeciler erişebilmektedirler (Anonim 2022b).

### **Ülkemizde Gıda Güvenliği İçin Blockchain Teknolojisi Kullanılıyor**

İzlenebilir Güvenli Gıda Platformu ile birlikte tarım sektöründe blockchain teknolojisini kullanan ilk Türk firmasının HEKTAŞ olduğu belirtilmektedir, “Blockchain teknolojisiyle tarım sektöründeki paydaşlar tedarik zincirindeki her bir ürünün topraktan sofraya kadarki yolculuğunun tüm aşamalarını, kullanılan tüm girdiyi ve üretici tarafından yapılan uygulamaları izleyebilmektedir. Blockchain teknolojisindeki bilgilerin değiştirilemez olması da tüketicilerin doğru bilgiye ulaşımını garanti etmektedir (Anonim 2022d). Ülkemizde İzlenebilir Güvenli Gıda Platformu ve yeni iş birlikleriyle ilgili olarak özel bazı kuruluşların yöneticileri; “kendi kurumlarının güvencesi altında yüksek teknoloji kullanarak akıllı seralarda üretilen, izlenebilir ürünlerini ilk olarak CarrefourSA’da tüketiciyle buluşturduklarını ifade etmişlerdir. Bu proje ile üreticilerin daha verimli üretim yapmalarına yönelik yapay zekâ destekli akıllı tarım teknolojileri üzerine sistemler geliştirirken, gıda güvenliğine dikkat çekerek, tüketicilerin tarımsal okuryazarlığını arttırmak amacıyla, blockchain teknolojisini de kullanmaktadırlar. Platform ayrıca, üretim yapılan seralardaki mahsullerin gelişimleri ve olası olumsuz durumları sensörler aracılığıyla uzaktan takip etmeyi, hızlı ve doğru müdahale ile verim kaybının önüne geçmeyi de sağlamaktadır. Böylece üreticilerin olumsuz koşullardan minimum düzeyde etkilenmeleri sağlanarak, menfaatleri korunurken, sürdürülebilir tarımsal üretim konusunda da önemli adımlar atılmasına imkân sunmaktadır. Özellikle tarımda ayrı bir önemi olan bu yeni teknolojinin ülkemizde yaygınlaştırılması için çalışmaların sürdürülmesi gereklidir.

### **Dünya çapında Gıda Tedarik Zincirinde Blockchain Kaynaklı Teknolojik Uygulamalar**

Gıda tedarik zinciri; girdi tedariki, üretim, hasat, işleme, nakliye, pazarlama, dağıtım ve perakende birimlerini bir bütün olarak kapsamaktadır. Bu zamana kadar, tarımsal gıda ürünlerinin üretiminden tüketici pazarlarına kadar bütün tedarik zinciriyle ilişkili menşei, izlenebilirlik ve riskler hakkındaki bilgiler kısıtlıydı ve kontrol edilebilmesi sınırlıydı ancak Blockchain teknolojisinin gıda sektöründeki uygulamaları ile bu konuların üstesinden gelinmektedir. Bu noktada en önemli gelişmelerden bir tanesi de tüketicilerin akıllı telefonlarında yer alan uygulamalar aracılığıyla, mağazadan tedariki gerçekleştirilecek olan organik tavuklar, Sicilya portakalları ve limonları etiket kısımlarında yer alan QR kodu ile gerekli olan bütün bilgilere kısa süre içerisinde ulaşabilmeyi mümkün kılmaktadır (Anonim 2018a). Avustralya, Fiji ve Yeni Zelanda'daki Dünya Vahşi Yaşam Fonu ( WWF) teknolojik

şirketler ile beraber gerçekleştirdiği bir çalışmada ton balıklarının avlama ve işleme endüstrisinde, pasifik adalarda karşılaşılan yasa dışı olarak yürütülen orkinos avcılığına karşı çıkmak amacıyla Blockchain teknolojisi kullanarak örnek bir projeye imza atmıştır. Bu sayede balık ve türevlerinde QR kodu kullanılarak balığın kökeni belirlenebilmektedir (Anonim 2018b). Teknolojik şirketler IBM Blockchain teknolojisini kullanarak, tedarikçilerden temin edilen birçok ürünü ( meyve, sebze, et ve süt ürünleri ) hızlı bir şekilde izleme olanağına sahiptirler. Ayrıca gıda kaynaklı hastalıkları ve insan güvenliğini tehdit eden unsurların kaynağı kısa sürede belirlenebilmektedir. Sürdürülebilir ekonomik model sayesinde ürünlerin geri dönüşümü mümkün olmakta ve tedarik zincirinde oluşabilecek aksaklıklar önlenmektedir (Anonim 2018c, Chang ve ark., 2019).

#### **Gıda Sektöründeki Blockchain Teknolojisinin Faydaları**

Blockchain teknolojisi performans ölçümlerinde önemli tedarik zinciri iyileştirme potansiyeline sahiptir. Geleneksel gıda tedarik zincirinde ürünlerin üretimi ve satışına ilişkin veriler dizilere ayrılmıştır. Tedarik zinciri katılımcılarının, merkezi veri tabanlarında orjinal olarak saklanan bilgilerin erişilebilirliği, diğer katılımcılarla daha fazla iletişim kurulmasını sağlamaktadır (Montecchi,ve ark., 2019) Blockchain teknolojisi, tedarik zincirinin üyeleri sistemde yer alan kayıtlı bilgileri tahrif edemediği için manüplasyon riskini azaltmaktadır. Blockchain teknolojisi mikro sensörlerin kullanımı sayesinde ürünlerin sıcaklığını, nemini ve diğer kritik kalite faktörlerinin ölçülmesinde muazzam fayda sağlamaktadır. Bu faktör neticesinde taze gıdaların, kalite standartlarının eş zamanlı olarak kontrol edilebilmesini sağlamakta ve ürünlerin güvenliğini, kalitesini ve raf ömrünün arttırılabilmesini sağlamaktadır (Sander,ve ark.(2018).

Sayısal verilerin kayıt altına alınması, tasarruf ve israf edilen gıda miktarının belirlenebilmesi neticesinde döngüsel ekonomik modeli oluşturulabilmektedir. Hileli ve kontamine olabilecek gıda ürünlerinin varlığı kısa sürede belirlenebilmekte ve oluşabilecek tehlikeler önlenmektedir. Tüketiciler, satın aldıkları ürünlerle ilgili menşelerin dışında güvence talep etmektedirler. Bu noktada ürünün dijital ortamda sahip olduğu bilgiler tüketiciler ile hızlı bir şekilde paylaşmakta ve tüketicilerin arzu ettikleri güvence bu noktada karşılanmaktadır (Tse, ve ark.,2018) (Şekil 3).

Şekil 3. Blockchain teknolojisi ile oluşturulmuş bir tarımsal tedarik zinciri (Tripoli ve Schmidhuber, 2018 ve Güçlü 2020).

### Akıllı Sözleşme Nedir?

Akıllı sözleşmeler blockchain teknolojisinin ayrılmaz bir parçasıdır. İşlemleri otomatik olarak yürütür ve bilgileri insan müdahalesi olmadan büyük deftere kaydederler.

Akıllı sözleşmelerin koşulları, ađın üyeleri tarafından üzerinde anlaşmaya varılmış koşullardır. Bunlar, taraflar arasında güven ve verimlilik oluşturmanın önemli bir unsurudur. Akıllı sözleşmeler evrak işlerini ortadan kaldırır, süreci basitleştirir, zaman ve para tasarrufu sađlar (Anonim 2022 c)

## SONUÇ

Blockchain, tüm tarımsal üretim sektörlerinde sürdürülebilirliğe doğru ilerleyen dünyada, birincil protein kaynaklarından biri olan deniz ürünleri, sadece pazar payını artırmakla kalmayıp, yeni pazarlar açabilir, işbirliklerini artırabilir ve çevresel, sosyal ve ekolojik sürdürülebilirlik için izlenebilirlik ve şeffaflık sağlayabilir. Ayrıca, merkezi olmayan bir veri tabanı kanıt işlevi görebilir ve kaynak yönetimini iyileştirebilir. Su ürünleri yetiştiriciliği ve balıkçılıkta blockchain, hareket işleme süresini azaltarak gıda üreticileri, hükümetler, perakendeciler, sertifikasyon kuruluşları ve tüketiciler arasında bir güvenilirlik ve güven ilişkisi geliştirmiştir.

Ancak halen söz verilmesine rağmen, balık ve su tedarik zincirinin küresel varlığını kabul eden, ölçekte test edilen, verimli bir şekilde kabul edilebilir ve işleyen pazar tabanlı çözümlerin eksikliği vardır. Dijital İzlenebilirlik kaçınılmazdır ve doğal olarak sektörü alt üst etmektedir. Diğer tarımsal endüstrilerle karşılaştırıldığında, su ürünleri yetiştiriciliği ve balıkçılık bu konuyu geç benimseyen bir sektör olmuştur. Bugün bile kapsamlı kayıtmakta, ancak izlenebilirliğe öncelik verilmemiş ve şirketler bilgi paylaşımı konusunda isteksiz kalmışlardır. Teknolojiden tam potansiyeliyle yararlanılmazsa, veri kalitesi endüstri genelinde zarar görecektir ve daha ciddi sonuçlara yol açacaktır. Bu nedenle üretici kurumların bu konuda gereken yatırımları yaparak tam anlamıyla uygulamaya geçmeleri tüm sektör bileşenlerinin yararına olacaktır.

**Doç. Dr. İbrahim DEMİRKALE (Orcid ID: 0000-0002-0074-2309)**

Çukurova Üniversitesi, Su Ürünleri Fakültesi, Su Ürünleri Yetiştiriciliği Bölümü, Adana

**Arş. Gör. Ece EVLİYAĞLU (Orcid ID: 0000-0003-3578-7336)**

Çukurova Üniversitesi, Su Ürünleri Fakültesi, Su Ürünleri Yetiştiriciliği Bölümü, Adana

### **ÖZET**

Su ürünleri yetiştiriciliği, balık, kabuklu deniz ürünleri ve su bitkilerinin belli bir zaman dilimi içinde belli bir yatırımla birçok teknik faktör gözetilerek yapılan ekonomik bir üretim faaliyetidir. Temel olarak bahsedilen bu sucul canlıların refahları gözetilerek Pazar boyuna kadar yetiştirilir ve sonunda hasat edilir. Günümüzde dünyanın en hızlı büyüyen sektörleri arasındadır. Üretim performansı ve kalitesi, gıda miktarı ve periyodikliği, sıcaklık, yaşam döngüsü ve kullanılan suyun özellikleri gibi farklı faktörlerin kombinasyonuna bağlıdır. Son dönemlerde talebin artmasıyla birlikte üretim miktarlarının artması ve endüstrinin gelişmesi, birçok teknolojik sistemin kullanımı ile gerçekleşmektedir. Bu teknolojik sistemler sahip oldukları sensörler ve iletişim ağı ile gelişmiş veri analizlerini içeren programlar yardımıyla üretimi ve kaliteyi istenilen seviyelere çıkartmıştır. Yapılan ölçümler ve toplanan veriler aracılığıyla neredeyse tüm kontrol sağlanarak gerçeğe çok yakın seviyelerde tahminler üretilerek, hem kaynakların daha verimli kullanılması sağlanmakta hem de olası hastalık ve risklerden çok daha az etkilenilmektedir. Dijital veri toplama ve işleme sayesinde işletmeler hem daha kolay kontrol edilmekte hem de daha şeffaf bir üretim prosesi takip etmektedirler. Üretici dijitalleştikçe piyasadaki rekabete katılma gücü elde etmekte bunla birlikte Blockchain teknolojisi dâhil birçok uygulamaya uyumlu hale gelmektedir.

**Anahtar Kelimeler:** Dijitalleşme, Su Ürünleri yetiştiriciliği, Teknoloji, Üretim Kontrolü, Üretim Yönetimi

## **DIGITALISATION IN AQUACULTURE MANAGEMENT**

### **ABSTRACT**

Aquaculture is an economic production activity of fish, shellfish, and aquatic plants with a certain investment in a certain period, taking into account many technical factors. These aquatic species are grown until the market and finally harvested, taking into account the welfare of these aquatic species. It is among the fastest-growing industries in the world today. Production performance and quality depend on a combination of different factors, such as the quantity and periodicity of food, temperature, life cycle, and characteristics of the water used. With the increase in demand in recent times, the increase in production amounts and the development of the industry are realized with the use of many technological systems. These technological systems have increased the production and quality to the desired levels with the help of their sensors and communication network and programs containing advanced data analysis. To make the production and post-production quality management safer, the consumer and the seller have the opportunity to work with a safer product, thanks to the monitoring studies carried out to monitor the production and supply. Thus, while the producer can prove how high quality his production is, it is ensured that the consumer gets away from their concerns and possible misinformation. In addition, although digital technology requires an investment at first, it also has the effect of reducing the production cost over a long period. Because it is getting harder to find a high-quality workforce day by day and the need for personnel decreases as the digitalization infrastructure increases due to the possibility of success in production parallel to the success of the personnel. By providing almost all control through the measurements and data collected, estimates are produced at very close levels to reality, thus ensuring more efficient use of resources and much less exposure to possible diseases and risks. Thanks to digital data collection and processing, businesses are both easier to control and follow a more transparent production process. As the manufacturer digitizes, it gains the power to participate in the competition in the market, and it also becomes compatible with many applications, including Blockchain technology.

**Keywords:** Digitalisation, Aquaculture, Technology, Production Control, Production management

## **GİRİŞ**

Dijitalleşme veya sayısallaşma, ulaşılabilir bilgilerin herhangi bir bilgisayar tarafından okunabilecek şekilde dijital ortama aktarılması sürecine verilen addır. Özellikle mühendisler çeşitli fiziki görüntüleri bilgisayara aktarıp çalışmalar yapmak için kullanırlar. Dijitalleşmenin üzerinde mutabık kalınan tek bir tanımı olmamasına rağmen, genellikle dijitalleşme ve dijital dönüşüm ile yer değiştirirken, her terim farklı bir bakış açısını kapsar (Alsufyani,ve Gill., 2022).. Dijitalleştirme teknik yönü kapsarken, dijitalleşme hem sosyal hem de teknik yönleri kapsar (Bockschecker ve ark., 2018)

İlk dönemlerde elde edilen veriler analog olarak kaydedilirken günümüzde artık dijital olarak elde edilerek depolanmaktadır. Bilgi saklayabilmenin en önemli kazancı, geçmiş bilgilerin fiziksel bir formatta olması gerektiğidir. Bundan dolayı bilginin yerel olduğu ve aynı zamanda imha edilebileceği anlamına da gelir. Dijitalleşme, bu sorunu büyük bir ölçüde çözmektedir, çünkü neredeyse tüm bilgilerin kopyalanmasına izin verir ve aynı bilgiyi birden fazla yerde saklama olanağı sağlar. Bu arada, dijitalleştirme çok sık, bilgi kaybını önler. Aynı zamanda, kâğıt gibi büyük hacimli depolama zorunluluğunu büyük oranda gereksiz kılar (Anonim 2022a <https://scientu.net/dijitallesme1/>). Dijitalleşme sadece bilginin depolanabileceği ve kullanılabilmesi şeklini değiştirmekle kalmaz, aynı zamanda gözlem olanaklarını da genişletir ki bu konu en çok bilim alanında kullanım olanağı bulmaktadır. Dijitalleşmenin ortaya çıkması için iki ön koşul gereklidir:

- dijital altyapı
- insanların dijital yeterliliği

Dijital altyapı, dijital programların ve ekipmanların kullanılmasını olanaklı kılar. Sayısallaştırma, bilgi sunmak ve bilgi ile ilgilenmek için günümüzde en modern bir yoldur.

Su ürünleri üretim sektöründe tahmin programlarının kullanımı yetiştiriciliğin modernleştirilmesine de yardımcı olmaktadır. Bu programlar “Sürdürülebilirlik ve balık yetiştiriciliğinde verimliliği” bir sonraki seviyeye taşımaktadır (Anonim 2022b).

Su ürünleri yetiştiriciliğinde verilerin artan değerini ve tahmine dayalı tahmin yazılımının deniz çiftçiliğinin çehresini nasıl değiştirdiğini bu yazıda görmek mümkün. Birçok kişi hava durumu ile ilgili tahminleri duymuştur, ancak muhtemelen balık yetiştiriciliği bağlamında değil. Su ürünleri yetiştiriciliğinde tahmine dayalı analitik nasıl çalışmaktadır? Prensipler aslında aynı: Gelecekte meydana gelme olasılığını tahmin etmek için geçmişte bir hastalık oluşumu veya zehirli bir alg oluşumu gibi faktörlere bakılması gerekmektedir. Uygulamada, balık çiftlikleri

için tahminler oluşturulabilmektedir. Örneğin, yakın zamanda Kuzey Avrupa'da somonda bulunan ve üretim sırasında çiftlikler arasında bulaşabilen ve somon büyümesini sınırlayan bir hastalık olan Pankreas Hastalığı (PD) için özel bir kurum tarafından bir tahmin geliştirmiştir (Anonim 2022b) . Bu hastalığın gelişimini tahmin etmek için, PD'nin geçmişteki gelişimini hangi faktörlerin (deniz sıcaklığı, bir çiftliğe giden tekne sayısı vb.) etkilediğini belirlemek için veri toplanmakta ve daha sonra, aralarındaki ilişkileri değerlendirmek için bu faktörler üzerinde algoritmalar çalıştırılmaktadır. Bu ilişkilere dayanarak, bilgisayar yakın gelecekte PD geliştirme olasılığının düşük, orta veya yüksek olduğunu tahmin edebilir ve bu da balık çiftliği operatörlerinin PD'yi önlemek için hasat, besleme veya temizlik gibi çiftlik faaliyetlerini yönetmelerine olanak tanımaktadır. Esasen, bu teknoloji çiftçilere, balıklarının refahını nasıl en üst düzeye çıkaracakları ve koruyacakları konusunda gelecekte en etkili kararları vermeleri için geçmiş olayları bir araç olarak kullanma olanağı sağlar (Anonymous 2022 b).

Su ürünleri üretim alanında hangi konularda dijitalleşmenin gündemde olduğuna bakmak konun daha iyi anlaşılmasına yardımcı olabilir.

Hava tahminleri konusunda

Su kalite unsurlarının ölçüm, kayıt ve dengelemede

Yemleme-besleme konularında

Genel görüntüleme, Koruma ve kontrol konularında

Balık sayma- boylama ve ölçümleri konularında

Hastalıklarla mücadele konusunda

Rutin günlük kayıt ve düzen konularında

Kalite yönetimi, Blockchain teknolojisi uygulamasında,

yoğun olarak dijital veriler kullanılmaktadır. Dijital verilerin toplanmasının yanı sıra depolanmasıyla uzun zamana dayalı yapılan operasyonlar ile ilgili geçmişe dönük bilgiler incelenebilirken olası bir olağan dışı olayla karşılaşıldığında sebep sonuç ilişkisinin incelenmesi adına da bu verilerden ciddi bir biçimde yararlanılmaktadır.

Doğru veri üretmek yetiştiricilik uygulamasının artık çok önemli bir parçası haline gelmiştir. Kesintisiz seviyede sürekli veri toplanması, verilerin transferi ve depolanması, yorumlanması ve aksiyon alınması konusu günümüz üretimini daha da yükseklerle çıkartmaktadır.

Şekil 1. Üretimde sahada pek çok noktada dijital teknolojiden destek alınmaktadır.

Yetiştiricilikte dijitalleşme konusunu ele alırken birkaç farklı süreçte bu konuyu incelemek ayrıntıların daha belirginleşmesi için daha yararlı olacaktır.

### **Üretim Sürecinde Dijitalleşme**

Üretimde nerede yapıldığına göre kullanılan ve yardım alınan ekipmanlar farklılık gösterebilir. Karasal ünitelerde denizel ünitelerde hareketli ortamlarda, su içinde ve su dışında olmak üzere farklı alanlarda farklı sistemlerden yararlanmak olasıdır.

### **Karasal ve Denizel Ünitelerde Kullanılan Dijital Ekipmanlar**

Tanklarda, beton havuzlarda, iç ünitelerde, depolarda kullanılan ölçüm ve kontrol ekipmanları bunlara örnek verilebilir (Şekil 2). Bir merkezi beyin tarafından kablolu ya da kablosuz olarak bir ölçüm sensörü yardımıyla verileri alır ve sisteme iletir. Sistem merkezde bu verileri işler ve normal programla karşılaştırarak aksiyonu belirler. Verileri hem kendi değerlendirebilir hem de ilgili verilmiş adreslere yollayabilir (mail ya da sms yardımıyla). Zaman zaman sistem hemen uyarı yapmak için siren yardımıyla uyarıcı olabilir. Günlük ve anlık olguları veri haline getirerek depolar. Operasyon çok uzaklardan dahi takip edilerek bilgi sahibi olunabilir.

Şekil 2. Havuzlarda Dijital olarak kontrol edilen yem üniteleri

**Şekil 3.** Program destekli bir üretim ünitesinde Oksijen ve sıcaklık seviyesi kontrolleri

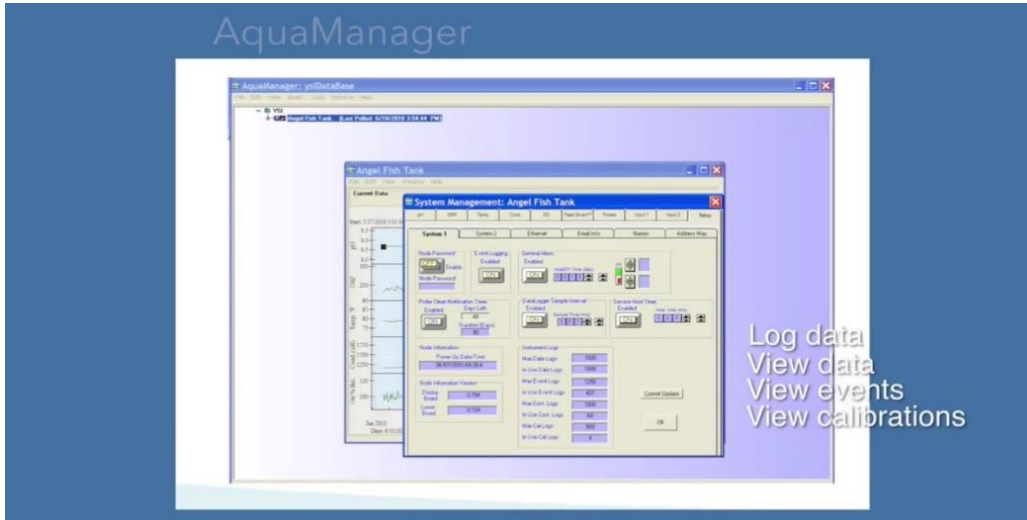

**Şekil 4** Bir Üretim sisteminde Su kalite kontrol ölçümlerinin dijital olarak sağlanması

Şekil 5. Bir Üretim ünitesinde kontrol panelleri

Şekil 6. Üretim sisteminde kullanılan Program ara yüzlerinden birisi

Şekil 7. Üretim sisteminde otomatik ve dijital olarak yapılan kontrol işlemleri

Şekil 8. Kafes Üretim sistemlerinde kullanılan yemleme ünitesinin izleme program bölümü

Şekil 9. Açık deniz kafes sistemlerinde dijital olarak kontrol edilen yemleme sistemleri

Yetiştiricilik çiftliklerinde günlük ve hatta anlık olarak yapılması gerekli tüm ölçümler ve değerlendirmeler dijital ölçüm araçları ile otomatik olarak yapılmakta ve veriler bir derleyici ile toplanarak değerlendirilmektedir. Yapılan ölçümlerin ışığı altında su sıcaklığı, sudaki çözülmüş oksijen seviyesi, tuzluluk değeri, dalga ve rüzgar derecesi, suyun ph seviyesi gibi birçok değişken değerlendirilerek otomatik yemliklerin kullanımında alt yapı bilgileri sağlamaktadır. Yemleme bu verilerin durumuna göre yapılmaktadır. Ayrıca yapılan gözlemlerle balıkların sağlık durumları ve iştahları değerlendirilerek verilecek yem miktarına karar verilmektedir. Bu uygulamalar yardımıyla yem uygun zamanda ve uygun miktarlarda balıklara verilmiş oluyor ki bu da yemin çok rasyonel kullanılmasına olanak sağlamaktadır (Şekil 8 ve 9).

Gün içinde operasyon sırasında balıkların boy ve ağırlıkla ilgili verileri dijital olarak ölçümlenebilmekte ve böylece verilen yemden ne kadar yararlanabildikleri hakkında ciddi bir bilgi edinilmektedir (Şekil 10 a, b ve c). Tüm üretilen veriler sistemlerde saklanabildiği gibi uydu (bulut) aracılıkları ile merkezi bir sisteme de depo edilebilmektedir (Şekil 11).

**Şekil 10 a.** Üretim sistemlerinde kullanılan dijital boylama ekipmanları

Şekil 10 b ve c. Üretim sistemlerinde kullanılan dijital boylama ekipmanları

Şekil 11. Tüm Ekipman kolayca bir buluta bağlanarak verileri aktarabilmekte ve depolayabilmektedir.

### **Sonuç olarak dijitalleşme balık refahına tam olarak nasıl yardımcı olabilir?**

Balık sağlığını nasıl etkileyebileceğini anlamak için öncelikle balık sağlığının genel olarak nasıl korunduğunu anlamak önemlidir. Esasen, bir balığın sağlığı 3 ana alana bağlıdır:

1. Hastalık/patojen varlığı
2. Çevre (örneğin okyanus akıntıları, sıcaklıklar ve tuzluluk)
3. Balığın kendisi (örneğin genetik, aldığı yem ve genel sağlık durumu)

Bu bölgelerdeki koşullar ideal seviyelerinin çok dışına çıktığında bir balık hastalanabilir veya ölebilir. Bir örnek vermek gerekirse, su sıcaklığı biraz fazla sıcaksa ve sudaki zararlı bakterilerde bir artış varsa, o zaman balığı bir kafesten diğerine hastalanmadan veya ölmeden önce balığın dayanabileceği kritik eşiğin üzerindeyken (genellikle balık zarar görmeden) taşımak gibi bir hareket yeterli olabilir. Tahmin modelleri, bu faktörler arasındaki ilişkileri ve balıkları nasıl etkilediğini anlayarak, balık çiftçilerinin balık sağlığına yönelik zorlukları veya tehditleri daha erken görmelerine yardımcı olur. Balıklar zaten savunmasız bir durumda olduğunda sonuçlarla uğraşmak yerine, balıkları sağlıklı tutmak için önleyici tedbirler alma fırsatı verir.

Balık çiftçileri bu analizlerin bir kısmını zaten kafalarında yapıyorlar ve yılların tecrübesiyle çok iyi başarabiliyorlar. Ancak insan zihninin bu kadar çok faktörü ve bunlar arasındaki ilişkileri yönetebilme konusunda sınırlar vardır. İşte burada bilgisayarlar ve veri bilimi teknikleri devreye girmektedir. Bir çiftçinin bilgisi ile birleştiğinde, balıklara mümkün olan en iyi yaşam koşullarını sağlamak için çok daha güçlü bir analitik araç sağlamaktadır.

Dijitalleşme üretimin ötesinde tüketim sürecinde de yine sektöre destek sağlamaktadır. Üretimin ilk aşamasından satış aşamasının sonuna dek üretilen ürünün izlenebilmesi hem üreticiye hem tüketiciye hem de yöneticiye büyük olanak ve kolaylıklar sağlayabilmekte ve kalite yönetiminde eşsiz değerler sağlayabilmektedir. Örneğin ülkemizde de kullanılmaya başlanan programlar yardımıyla kurumlar satılan tüm su ürünlerinin üretim öykülerini tüketicileriyle anlık olarak paylaşabilmektedir (Şekil 12, 13 ve 14).

Lojistik ve tedarik zinciri verileri, ortalama ve taşıma şekli ve teslimat süresi hakkında da bilgiler içerir. Farklı sensör taramaları, kimyasal ve biyokimyasal bileşenler, lojistik ve dağıtım sırasında gıda ürünlerinin gerçek raf ömrünü, mikrobiyolojik stabilitesini veya meyve ve sebzelerin olgunluğunu tahmin etmek için kullanılır. Lojistik ve tedarik zinciri verileri, ortalama ve taşıma şekli ve teslimat süresi hakkında da bilgiler içerir. Farklı sensör taramaları, radyo frekansı tanımlama (RFID), akıllı etiketler (yakın alan iletişimi (NFC), QR kodları) ve barkod teknolojileri, ürünleri tüketici deneyimini geliştiren hizmetlere bağlamak ve gıda tüketimi israfını en aza indirecek çözümler sunmak için kullanılır. Ayrıca tüketiciler, besin bileşimi, alerjenler, menşee ve özgünlük ile ilgili ürün bilgilerini talep ederken, tüketim kalıpları aracılığıyla perakendeciler ve gıda şirketleri için de değerli bilgiler üretirler (Zeb ve ark., 2021).

Şekil 12 ve 13. Ürün bilgisinin veri sistemine kaydı ve QR kod uygulaması ile takibi

Şekil 14. Markette alışveriş sırasında mobil telefonlar yardımıyla okutulan QR kod uygulaması

### **Dijitalleşmede karşılaşılan zorluklar ve sorunlar**

Gıda bileşimi verileri, ulusal gıda alışkanlıkları ve tüketim kalıpları hakkında bilgi sağlamalıdır. Bu tür veriler, karşılaştırılabilir ve güvenilir verilerle sonuçlanan uluslararası yönergelerle oluşturulmalıdır. Bu veriler aynı zamanda çok sayıda yüksek oranda tüketilen gıdaların ve bunların ana bileşenlerinin temsilcisi olmalıdır. Bununla birlikte, gıda bileşimi verilerinin çoğu taze gıdalara dayanırken, işlenmiş ve zenginleştirilmiş gıdalara ilişkin bilgiler eksiktir. Ayrıca, ulusal gıda bileşimi veri tabanlarının çoğu eksik, modası geçmiş ve doğru veri sağlamaz (Zeb ve ark.,2021). Diğer taraftan, birçok gelişmekte olan ve bazı gelişmiş ülkeler hala kendi ulusal veri setlerinden yoksundur ve komşu ülkelere veri ödünç almaktadır. Bununla birlikte, bazı ülkeler gıda bileşimi verilerinin önemini dikkate almamakta ve gıda verilerinin toplanması konusunda gönüllü olarak çalışan kurumları desteklemeye yönelik politikaları bulunmamaktadır (FAO, 2017a). Tüm bu faktörler üretilen verinin kalitesini olumsuz etkilemekte ve veri uyum sürecini zorlaştırmaktadır.

### **SONUÇ**

Bu çalışma son yıllarda ciddi bir büyüme sağlayarak önümüzdeki dönemlerde dijitalleşme sağlayarak daha da büyüyeceği kanısını uyandıran su ürünleri yetiştiricilik sektörünün gelmiş olduğu noktayı işaret ederken, bu alanda sahip olduğu avantajları ve karşılaştığı zorlukları incelerken bunlar için ileride neler yapılabileceği konusunda fikirler vermeye çalışmaktadır. Bu alanda yapılacak çok çalışma ve uygulanacak çok sonuç vardır.

**ÖZET**

Dünyada olduğu gibi ülkemizde de genç nüfusumuzun önemli sorunlarından biri yetersiz ve dengesiz beslenmedir. Sağlık Bilimleri Fakültesi öğrencileri arasından randomize olarak 173 Kadın, 47 Erkek olmak üzere toplam 220 öğrenci (n=220) ile gerçekleştirilen bu araştırmada öğrencilerin beslenme alışkanlıkları ve Akdeniz diyetine uyumluluk skorlarının (KIDMED) belirlenmesi amaçlanmıştır. Araştırma sonucunda Akdeniz Diyeti Kalite İndeksi dağılımlarının erkek ve kadın öğrenciler arasında cinsiyet, yaşanan yer, BKİ ve ara öğün dağılımına göre istatistiksel olarak anlamlı bir farklılık göstermediği tespit edildi. Ana öğün dağılımına göre 3 ve üzeri ana öğün yapan grupta Akdeniz diyet kalitesi düşük olanların oranı (%27,37) iken 1-2 ana öğün yapanların Akdeniz diyet kalitesi düşük olanların oranı (% 45,6) olarak tespit edildi. Ana öğün sayısının artması Akdeniz diyeti kalite düzeyini de yükselttiği tespit edildi (p=0,011). Katılımcıların (% 50,9)' u günde iki ana öğünle beslendiği belirlenmiştir. Sonuçlarımız beslenme alışkanlığının, gelişme evresinde olan bireyler için oldukça yetersiz olduğunu göstermektedir.

**ADHERENCE OF NUTRITIONAL HABITS OF UNIVERSITY STUDENTS TO THE MEDITERRANEAN DIET****ABSTRACT**

The main problem of the young population in the world as in our country is poor and unbalanced nutrition. In this study, which was conducted with a total of 220 students (n=220), 173 female and 47 male, randomly among the students of the Faculty of Health Sciences, it was aimed to determine the nutritional habits of the students and the compatibility scores of the Mediterranean diet (KIDMED). As a result of the research, it was determined that the distribution of the Mediterranean Diet Quality Index did not show a statistically significant difference between male and female students according to gender, place of residence, BMI and snack distribution. According to the main meal distribution, the percentage of those who have 3 or more main meals in the Mediterranean diet is (27,37%), while the ratio of those who have 1-2 main meals to those with low Mediterranean diet quality is (45,6%). It was determined that the increase in the number of main meals increased the quality level of the Mediterranean diet (p=0.011). It was observed that 50.9% of the participants were fed with two main meal a day. It can be said that the eating habits are quite inadequate for individuals who are in the developmental stage.

**Keywords :** Mediterranean Diet , Adherence to Mediterranean Diet, Nutrition, University Student.

## GİRİŞ

Doğumdan itibaren hızlı bir gelişme ve büyüme sürecine giren vücudumuzun artmış olan metabolizma hızına bağlı olarak besin ve enerji ihtiyacı da artar. Yaş, cinsiyet, fiziksel aktivite, mevcut hastalıklar ve genetik yapı gibi faktörler besin ihtiyacını belirleyen en önemli faktörlerdir. Gelişim evresinde olan gençler için gerekli enerji ve besin ihtiyacı erişkine kıyasla doğal olarak daha fazladır.<sup>1</sup> Dünyada olduğu gibi ülkemizde de yetersiz ve dengesiz beslenme önemli bir sorun haline gelmiştir. Beslenme sorunlarının en fazla görüldüğü önemli gruplardan biri de üniversite öğrencileridir. Bu gruptaki bireyler yaşam tarzları üzerinde her zamankinden daha fazla özgürlük ve kontrole sahiptir. Bu geçiş dönemi, hem sağlıklı yaşam tarzı davranışları oluşturmak için uygun bir zaman hem de sağlıklı yaşam davranışlarını etkileyen faktörlerin belirlenmesi için daha fazla dikkat gerektiren bir dönemdir.<sup>2</sup> Üniversite öğrencilerinin sosyalleşmesiyle birlikte zamanlarının çoğu dışarıda geçmektedir. Dışarıda yaşam, öğrencilerin öğün atlamasına ya da tek tip besin tüketmesine neden olmaktadır. Ailesinden uzak yaşayanlarda bu problem daha da belirginleşmekte; besin seçimleri, besin ögesi alımları ve fiziksel aktivite düzeyleri etkilenmektedir.<sup>3</sup> Değişen beslenme davranışları bireylerin zihinsel ve fiziksel durumunu dolayısıyla okul performansını da etkileyebilmektedir. Çalışmalar, üniversite öğrencilerinin beslenme alışkanlıkları ile demografik ve antropometrik özellikler arasında bir bağlantı olduğunu göstermiştir. Araştırmalar, üniversite öğrencilerinin genellikle sağlıksız beslenme alışkanlıklarına sahip olduğunu göstermektedir. Öğrenciler günlük olarak daha az meyve ve sebze yeme, daha yüksek yağlı, kalorili yiyecek alımı eğilimindedir.<sup>4</sup> Bu tür sağlıksız beslenme alışkanlıkları ileriki yaşlarda kronik hastalıklara zemin hazırlamaktadır. Epidemiyolojik çalışmalarda Akdeniz’de kıyısı bulunan ülkelerin kronik hastalık oranı ile morbiditenin diğer ülkelere göre düşük, ortalama yaşam süresinin yüksek olduğu bildirilmiştir. Akdeniz diyetinin karakteristik özelliklerini kırmızı et ve ürünlerinin tüketiminin düşük, kümes hayvanlarının tüketiminin küçük porsiyonlarda, kuru baklagiller, tahıl, kabuklu yemişlerin, sebze ve meyve tüketiminin yüksek, balık ve şarap tüketiminin ılımlı yüksek ayrıca yüksek zeytinyağı tüketimi oluşturur. Kardiyovasküler hastalık riskinin balık, sebze ve meyve, tam tahıl kaynakları ve kuru baklagiller tüketimi ile azaldığı yapılan çalışmalarla ortaya konulmuştur.<sup>5</sup> Akdeniz diyeti, kanserin başlamasını ve ilerlemesini potansiyel olarak önleyen lifleri ve düşük omega-6-omega-3 yağ asidi gibi diyet bileşenlerini içerir.<sup>6</sup> Sağlıklı beslenme tek besine dayalı beslenmeye uygun değildir, besin gruplarındaki çeşitlilik sağlıklı beslenmenin temelini oluşturmaktadır. Akdeniz diyeti, sürdürülebilir diyetlere çok kültürlü bir

yaklaşım kullanarak yerli veya yerel gıda sistemlerini kullanma fırsatı sunar. Aynı zamanda geleneksel gıda ve kültür bilgisinin korunması sorununu da gündeme getirir. Akdeniz diyeti Amerikan Diyabet Birliği (ADA) raporunda fazla ve çeşitli besin ögesi içeriğine sahip, sağlıklı yaşam kurallarına uygun olduğu belirtilmektedir.<sup>7</sup>

Beslenme alışkanlıklarının oluştuğu üniversite dönemi önemli bir aşamadır. Bu aşamada kişiyi kaliteli, sürdürülebilir ve sağlıklı olan Akdeniz diyetiyle tanıştırmak, yaşam niteliklerini arttırmak gerekmektedir. Bu çalışmada, sağlık bilimleri fakültesi öğrencilerinin, beslenme alışkanlıkları incelenerek, Akdeniz diyetine uyumlarının belirlenmesi amaçlanmıştır.

### **MATERYAL VE METOT**

Çalışmanın örneklemini Biruni Üniversitesinde öğrenim görmekte olan 173 kadın, 47 erkek olmak üzere toplam 220 gönüllü öğrenci oluşturmuştur. Öğrencilerin yaş ortalaması  $21,7 \pm 1,4$  yıldır (19-29 yaş). Randomize olarak katılımcılarla yüz yüze görüşmelerde, genel beslenme özelliklerini belirlemeye yönelik bir soru kağıdı ve Akdeniz diyetine uyumlarının belirlenmesinde “Akdeniz Diyeti Uyumluluk İndeksi (KIDMED)” anketi uygulanmıştır.<sup>8</sup> Toplam 16 sorudan oluşan anketin 12’si olumlu, 4’ü olumsuz sorulardır. Olumlu sorulara evet cevabı verenler +1, olumsuz sorulara evet cevabı verenler ise -1 puan almakta ve bu puanların toplanması ile değerlendirme sonunda 0-12 arasında değişen puanlar elde edilmektedir. Sonrasında ise bu puanlar;

- (1)  $\geq 8$  puan optimal Akdeniz diyeti (iyi),
- (2) 4-7 arası puan Akdeniz diyetine uygunluğunun geliştirilmesi gerektiği (orta),
- (3)  $\leq 3$  puan ise çok düşük beslenme kalitesi (düşük) olarak puanlanmaktadır.<sup>8</sup>

Öğrencilerin antropometrik ölçümleri; bel/kalça ölçümleri esnemeyen mezura kullanılarak yöntemine uygun şekilde araştırmacılar tarafından yapılmıştır. Vücut ağırlığı ölçümleri 100 gram hassasiyet kapasitesi olan, taşınabilir CVS DN-126 elektronik baskül ile alınmıştır. Boy uzunluğu için standart stadiometre kullanılmıştır. Vücut ağırlığının (kg) boy uzunluğunun karesine ( $m^2$ ) bölünmesi ile beden kütle indeksi (BKİ) hesaplanmıştır.

### **Verilerin İstatiksel Olarak Değerlendirilmesi**

Kategorik değişkenler için frekans, yüzde (%) değerleri verilmiştir. Sürekli değişkenler için ortalama ( $\bar{x}$ ) standart sapma (S), medyan, minimum ve maksimum değerleri verilmiştir. Sürekli değişkenlerin normal dağılım sınaması Kolmogorov Smirnov testi ile yapıldı. Sürekli değişkenlerin güvenilirlik sınaması için Kr 20 güvenilirlik analizi yapıldı. Kategorik

değişkenler arası ilişkiler için Ki-kare analizi ile yapılmıştır. Uygun olan durumlarda kategorik değişkenler Fisher Freeman Halton Testi ile değerlendirildi. Normal dağılım varsayımını gerçekleştirilmeyen değişkenlerde, bağımsız iki grup karşılaştırmasında Mann Whitney U testi, İki den fazla grup karşılaştırmalarında ise Kruskal Wallis H testi kullanıldı. Normal dağılım varsayımını sağlamayan değişkenler arası korelasyonel ilişkileri tespit etmek için Spearman korelasyon analizi kullanıldı.

Analizler SPSS 5 (Statistical Package for the Social Sciences) paket programı ile yapıldı, en düşük önemlilik düzeyi  $P < 0,05$  istatistiksel olarak anlamlı kabul edildi.

### **BULGULAR VE TARTIŞMA**

Katılımcıların beslenme alışkanlıklarına ilişkin bilgilerin dağılımı değerlendirildiğinde (Tablo 1), (% 50,9)'nun günde iki ana öğünle beslendiği görülmüş olup bu beslenme alışkanlığının gelişme evresinde olan bireyler için yetersiz olduğu söylenebilir. Bireylerin (% 40,3)'nün günde bir ara öğünle beslendiği bunun da bireysel enerji ihtiyacına göre yetersiz olduğu görülmektedir. Öğrencilerin (% 89,5)'inin öğün atladığı, (% 56,8)'inin öğün atlama nedeninin zaman yetersizliğinden kaynaklandığı bu alışkanlığın da üniversite öğrencileri arasında yaygın olduğu ve (% 65,9)'unun ara öğün yapma alışkanlığının olduğu belirlendi. Çalışmaya katılan bireylerin çoğunluğunun öğle öğününü, sonrasında ise en fazla sabah öğününü atladıkları, iki öğünü atlayanların çoğunluğunun en fazla öğle öğününü ve ara öğünleri atladıkları tespit edilirken, iki öğün atlayan en az bireyin akşam öğünü ile ara öğünleri atladıkları tespit edildi. Türkiye genelinde yapılan çalışmalarda da bireylerin en az bir öğün atladıkları belirtilmektedir.<sup>9-12</sup> Dalgıç'ın çalışmasında öğrencilerin en fazla kahvaltı ve öğle öğününü atladıkları saptanmıştır.<sup>9</sup> Aynı çalışmada öğün atlama nedeni olarak zamansızlık olarak belirtilmiştir.<sup>9</sup> Türkiye Beslenme ve Sağlık Araştırması sonuçlarına göre öğün atlama nedeni 'canı istemiyor' olarak verilmektedir.<sup>10</sup> Çalışmaya katılan bireylerin (%33)'nün ikindi ve (26,8)'nin de gece ara öğün yaptığı saptanmıştır.

**Tablo 1: Beslenme Alışkanlıklarına İlişkin Bilgilerin Dağılımı**

Çalışmaya katılan bireylerin yaş ortalaması  $21,7\pm 1,4$  yıl olarak bulundu. Dalgıç'ın üniversite öğrencileri ile gerçekleştirdiği çalışmasında da katılımcıların yaş ortalaması  $21,08\pm 2,05$  yıl olduğu saptanmıştır.<sup>9</sup> Antropometrik ölçümlerinin analizleri incelendiğinde (Tablo 2); Bireylerin bel çevrelerinin ortalama 72,5cm, boy uzunluklarının ortalama 167,4cm, vücut ağırlıklarının ortalama 62,1kg olduğu görüldü. Ortalama BKİ' leri  $18,4\text{kg/m}^2$  olarak düşük düzeyde bulundu. Beden kitle indeksinin  $18,4\text{kg/m}^2$  olması katılımcıların Dünya Sağlık Örgütü'nün (WHO) BKİ sınıflamasına göre zayıf sınıfta olduğunu göstermektedir.<sup>13</sup>

**Tablo 2.** Bireylerin Yaş ve Antropometrik Ölçümlerinin Ortalama ( $\pm$ S) Değerleri

	(n=20) $\bar{X} \pm$ Medyan. (Alt-Üst)	S.S.
Yaş	$21,7\pm 1,4$ 22- (19-29)	
Boy Uzunluğu (cm)	$167,4\pm 8,58$ 167- (144-193)	
Vücut Ağırlığı (kg)	$62,13\pm 13,38$ 59- (40-111)	
BKİ ( $\text{kg/m}^2$ )	$18,48\pm 3,4$ 17,79- (13,03-30)	
Bel Çevresi (cm)	$72,57\pm 13,2$ 69,5- (50-115)	

Ana öğün ve ara öğün dağılımına göre Akdeniz diyeti uyum indeksinin dağılımı incelendiğinde (Tablo 3) ana öğün dağılımına göre Akdeniz diyeti kalite indeksi dağılımının istatistiksel olarak anlamlı bir farklılık gösterdiği tespit edildi ( $p=0,011$ ). Üç ve üzeri ana öğün yapan grupta Akdeniz diyet kalitesi düşük olanların oranı %27,37 iken 1-2 ana öğün yapanların Akdeniz diyet kalitesi düşük olanların oranı %45,6 olarak tespit edilmiştir. Üç ve üzeri öğün ile beslenen grupta Akdeniz diyeti kalitesi düşük olanların oranı, 1-2 ana öğün yapanlara göre daha düşüktür. Üç ve üzeri ana öğün yapan grupta Akdeniz diyeti kalitesi iyi olan bireylerin oranı (%18,95), 1-2 öğün yapan gruba (%9,60) göre daha yüksek olduğu tespit edildi. Ana öğün sayısının artması Akdeniz diyeti kalitesi düzeyini arttırmaktadır. Ara öğün dağılımına göre Akdeniz diyeti kalite indeksi dağılımının istatistiksel olarak anlamlı bir farklılık göstermediği tespit edildi. ( $p=0,532$ ). Ara öğün dağılımına göre Akdeniz diyeti kalite indeksi dağılımının birbirine benzer olduğu tespit edildi.

**Tablo 3.** Ana öğün ve Ara Öğün Dağılımına Göre Akdeniz Diyeti Kalite İndeksinin Dağılımı

Ana öğün sayısı ile antropometrik veriler Student t testi kullanılarak karşılaştırıldı (Tablo 4). Ara öğün sayısı ile antropometrik verileri de ANNOVA testi kullanılarak karşılaştırıldı (Tablo 5). Antropometrik ölçümler ile öğünler arasında anlamlı bir ilişki bulunmadı. Çalışmalarda öğün atlama ve düzensiz öğün yapma alışkanlıklarının sık görüldüğü ve bu durumun özellikle obeziteye neden olabildiği bildirilmektedir.<sup>10</sup>

**Tablo 4.** Ana Öğün Sayıları ile Antropometrik Özellikler Arasındaki İlişki

## SONUÇ VE ÖNERİLER

Üniversite öğrencilerinin beslenme alışkanlıklarının Akdeniz diyeti ile uyumunu belirlemek amacıyla yapılan çalışmamızda;

Katılımcı bireylerin Akdeniz diyeti kalite indeksi ile BKİ düzeyi arasında istatistiksel olarak anlamlı bir ilişki tespit edilmemekle birlikte, BKİ'nin 18,4 olması katılımcıların Dünya Sağlık Örgütü'nün (WHO) BKİ sınıflamasına göre zayıf sınıfta olduğunu göstermektedir. Öğün atlamanın ve ev dışı beslenmenin Akdeniz diyetine uyumda risk faktörü olabileceğini düşündürmektedir. Üniversite öğrencilerinin Akdeniz diyetine uyumlu olarak beslenmesi yönünde teşvik edilmesi,

En fazla atlanan öğünün sabah kahvaltısı ve öğle yemeği olması sebebiyle kahvaltının ve öğle yemeğinin öneminin anlatılması, öğün atlamadan beslenme alışkanlığının kazandırılması.

Okul kantinlerinde sağlıklı besinlerin satılmasının desteklenmesi, fast food gibi hazır gıdaların satılmasının engellenmesi, önerilmektedir.

Üniversite öğrenciliği dönemi, özellikle yetişkin dönemde beslenme ilişkili hastalıkların ortaya çıkmasını önleyebilme açısından önemli bir dönemdir. Bu dönemde kazandırılacak sağlıklı beslenme alışkanlıkları ile birçok hastalık önlenilebilecektir. Bu amaca yönelik farkındalık yaratacak eğitim programlarının düzenlenmesi öngörülmelidir.

### **SUMMARY**

Structural and functional disorders in tissues due to different reasons can be defined as wounds. In every tissue, there is a process of regaining the old structure and function of the wounds, which occurs at a speed that varies depending on the internal dynamics of the living things, although not completely. This process is called wound healing. Wounds can be examined under two main headings, acute and chronic, according to their healing processes. Acute wounds can be defined as wounds that occur in tissues that have a rapid healing process, usually exposed to processes such as traumatization, surgery or burns. Chronic wounds, on the other hand, are defined in the literature as wounds that have difficulties in the healing process, do not show any signs of healing in the four-week period, or in which the healing process cannot be completed at the end of the six- to eight-week period. Factors such as arterial insufficiency, venous ulcers, diabetes or secondary to pressure can be counted in the emergence of chronic wounds. Based on our literature and clinical observations and experiences, we aimed to provide information about wound healing and its effective factors.

## **YARA İYİLEŞMESİ VE ETKİLİ FAKTÖRLER**

### **ÖZET**

Dokularda farklı nedenlere bağlı ortaya çıkan yapısal ve işlevsel bozukluklar yara olarak tanımlanabilir. Her dokuda canlıların kendi iç dinamiklerine bağlı farklılıklar gösteren hızda meydana gelen, yaraların yeniden eski yapı ve işlevine tam olarak olmasa da kavuşma süreci yaşanır. Yaşanan bu sürece yara iyileşmesi adı verilir. Yaralar iyileşme süreçlerine göre akut ve kronik olmak üzere iki ana başlık altında incelenebilir. Akut yaralar, hızlı iyileşme sürecine sahip genellikle travmatizasyon, cerrahi ya da yanık gibi süreçlere maruz kalan dokularda meydana gelen yaralar olarak tanımlanabilir. Kronik yaralar ise iyileşme sürecinde zorluklar yaşanan, dört haftalık süreçte iyileşme belirtisi göstermeyen ya da altı ila sekiz haftalık sürecin sonunda iyileşme sürecinin tamamlanamadığı yaralar olarak literatürde tanımlanmaktadır. Kronik yaraların ortaya çıkmasında hastanın arteriyal yetmezlik, venöz ülser, hastanın diyabetik oluşu ya da basınca sekonder meydana gelmesi gibi faktörler sayılabilir. Literatür ve klinik gözlem ve tecrübelerimizden hareketle yara iyileşmesi ve etkili faktörleri hakkında bilgi vermeyi amaçladık.

## **GİRİŞ**

Yara, dokularda farklı nedenlere bağlı ortaya çıkan yapısal ve işlevsel bozukluklar olarak ya da patolojik sebepli dokudaki bütünlüğün kaybı olarak tanımlanabilir. Yara iyileşmesi çok sayıda farklı hücre tipiyle kompleks şekilde etkileşime giren mediyatörlerle gelişen bir süreçtir(1). Birbiri takip eden aşamalar sonucunda, nonspesifik bağ dokusu olan skar oluşumuyla çoğu zaman tamamlanır(2). Nonspesifik bir bağ dokusu olan skarın oluşumuyla, doku bütünlüğünü sağlar. Ancak skarla oluşan yeni dokunun enerji absorbe etme ve gerilme gücü önceki sağlıklı dokuya göre daha düşüktür(1,2). Sağlıklı dokularda yara iyileşmesi normal, sıralı ve zamanlamaya uygun olarak gerçekleşip tam iyileşme sağlanmasıyla tamamlanır. Yaralar iyileşme süreçlerine göre akut ve kronik olmak üzere iki ana başlık altında incelenebilir. Akut yaralar, hızlı iyileşme sürecine sahip genellikle travmatizasyon, cerrahi ya da yanık gibi süreçlere maruz kalan dokularda meydana gelen yaralar olarak tanımlanabilir. Kronik yaralar ise iyileşme sürecinde zorluklar yaşanan, dört haftalık süreçte iyileşme belirtisi göstermeyen ya da altı ila sekiz haftalık sürecin sonunda iyileşme sürecinin tamamlanamadığı yaralar olarak tanımlanır (3). Yara iyileşmesi üç farklı aşamaya ayrılmıştır: inflamasyon, proliferasyon ve yeniden şekillenme.

### **A)İnflamasyon Fazı**

Vücudun inflamatuvar hücrelerinin aktivasyonu ile başlayan bu faz, hemostazın sağlanması ve inflamasyon ile karakterizedir. Zedelenme ile ortaya çıkan kollajen, inflamatuvar fazı tetikleyerek pıhtılaşma kaskadını başlatır. Yaralanma sonrası, 4 ila 6. günler arasında gelişen bu fazda; meydana gelen zedelenmeyi müteakip öncelikle hücre zarlarından tromboksan A2 ve prostaglandin 2- $\alpha$ 'yı serbest bırakılır. Sekrete edilen maddeler güçlü vazokonstriktör etkisiyle hemostazın ilk aşamasında önemli rol oynar. Trombin trombositler, fibronektin ve kollajen' den oluşan pıhtı da hem hemostazı sağlamada hem de sitokinleri ve growth faktörlerini serbest bırakarak inflamatuvar cevabı başlatmakta etki eder(4). Fibrin pıhtısıyla birlikte, yara yerine gelen fibroblastlar, monositler ve nötrofil hücreleri onarım için adeta bir iskele görevi görmesinin yanısıra sitokin ve growth faktörlerinin dokuda konsantre edilmesini sağlarlar (4,5).

### **Proliferasyon Fazı**

Geçici matriksle beraber damarlanma ve epitelin geliştiği faz olan bu aşama genellikle zedelenme sonrası 4. ile 15. günler arasındadır. Bu fazın başlangıcında epitelin onarımı ilk başlayan aktivasyondur. Dokunun bazal membranı çatı işlevi görür. İntakt olduğu zedelenmelerde epitelizasyon fizyolojik süreçte üste doğru gelişip ilerleyerek epitel kaybını

giderir. Bu durumda epiteldeki onarım 3 gün içerisinde sağlanabilir. Bazal membran yokluğunda, endotelial hücre göçü sonrasında granülasyon doku oluşumuyla yara iyileşmesi gelişir. Bu aşamada granülasyon için gerekli hücre ve mediatörlerde eksiklik yada zedelenme bölgesine gelmemesi iyileşmeyen kronik bir yara vakası ile sonuçlanır(6).

### **Matürasyon ve Remodeling**

Klinisyen açısından; dayanıklılık ve fonksiyonların yeniden kazanılmasının göstergesi olarak kabul edilen son faz en önemli aşama olarak kabul edilir. Süresi 8. Gün - 1. Yıl dır (4). Kollajen organize şekilde birikir. Hastaların matriks birikimi her ne sebeple olsun sorunlu ise oluşan yaranın onarım gücünde eksiklik gelişir. Aksine artmış kollajen sentezi ve birikimi olursa bu sefer hipertrofik bir yara dokusu yahut keloid oluşacaktır(6).

### **Yaraların Değerlendirilmesi**

Oluşan yaranın ilk değerlendirilmesinde; yaranın vasfı ne şekilde olduğu türü, akut ya da kronik oluşu enfeksiyonun eşlik edip etmediğinin belirlenmesi büyük önem taşır. Travmaya yahut sistemik bir hastalığa bağlı etioloji belirlendikten sonra takip edilecek sürecin tayin edilmesi gerekir. Mevcut zedelenme değerlendirilmesinde öncelikle iyi bir anamnez alınması müteakibinde inspeksiyon ve muayene aşamaları sonucu etiyolojik sebebin netleştirilmesi, yaklaşım ve tedavide yol göstericidir.

Kesik vafında yaralanmalar; çoğunlukla keskin kenarlı cisimlerin deriye teması sonucu gelişirler ve en sık görülen yaralanmalardır(7). Kesici cisimlerle dokuda oluşan yaralanmalar, massif kanama ve dolayısıyla hayati tehlikeye haiz olmakla beraber keskin kenarlı olmaları sayesinde doğru yapılan cerrahi müdahaleyle kapatıldıklarında, doku bütünlüğü daha iyi sağlanır.

Penetre edici ya da ateşli silahlar vasıtasıyla gelişen yaralanmalarda ise; temas yerinde aldatıcı olarak kısıtlı görünen harabiyetin çok daha fazlasının derin dokularda olması çoğu zaman muhtemeldir. Bu yaralarda boyutlarının saptanması büyük önem arz eder. Bu amaçla kimi klinisyenler steril bir sonda vasıtasıyla penetrasyon derinliğinin ölçülmesini benimsemişlerse de uygulamada çeşitli sorunlara yol açma potansiyelinden dolayı biz steril şartlarda derin eksplorasyonla değerlendirilmesi görüşünü paylaşmaktayız.

Vahşi hayvanlar yada yüksek enerjili iş yahut trafik kazaları sonucu oluşan kopma; avulziyon türü yaralara doku kaybı ve yeniden kanlanmanın sağlanabilmesi sorunu rekonstrüksiyonu ciddi şekilde olumsuz etkiler. Bu yaralanmalarda enfeksiyon kontaminasyonu ve nekroz sıklıkla görülmektedir.

Dünya çapında bildirilen en yaygın yaralanmalar arasında olan yanık yarası, termik, kimyasal veya elektrik etkileri ile oluşabilir. Amerika Birleşik Devletleri'nde, her yıl tıbbi bakım gerektiren 500.000 yanık vakası olduğu bildirilmiştir (8). Bu tür yaralar geniş bir alanı kaplıyorsa, çoğunlukla yoğun protein kaybı nedeniyle sistemik etkiler ortaya çıkar. Bu tür yaralarda sıklıkla sekonder enfeksiyon bulunur, bu da böyle yaraların sağaltımını ilave olarak etkiler(7). Yanığın ciddiyetine bağlı olarak, yaralanma patofizyolojisi, lokal doku hasarından hızla yaşamı tehdit edebilen karmaşık bir sistemik yanıt kadar değişir(7,8).

İskemi, reperfüzyon hasarıyla oluşan reaksiyonlar; dokularda tahrip oluşturan proteinlerin salgılanmasına yol açar.

Bu durum iyileşme süreçlerinin tamamen bozulmasına yahut iyileşme sürecinin gecikmesine neden olabilir. Subklinik bakteriyel kontaminasyonu, tekrarlayıcı fizik travma ve yabancı cisim reaksiyonları da bu etkilere yol açarak yara kronikleşmesine yol açabilir(2,9). Kronikleşme ve akut olarak, iyileşme süresine göre de yaralar sınıflandırılabilir(2,9).

#### **A) Akut Yaralar**

Düzenli organize olup ciddi müdahale olmaksızın küre yönelik progres izleyen, iyileşme süresi çoğunlukla gün 5-10 günde olup 30 güne kadar iyileşen, sonuç olarak restorasyonu anatomik ve fonksiyonel olarak normal olarak neticelenen yaralardır(1,3).

#### **B) Kronik Yaralar**

Normal süreç ve aşamalar içinde iyileşmenin sağlanıp rekonstrüksiyonun zamanında sağlanmadığı yaralardır. İyileşme süreci uzun ve eksiktir. İyileşme fazlarını olumsuz etkileyen iskemi, inflamasyonu ya da metabolik bozukluklar gibi faktörler söz konusu olabilir(10).

İyileşmenin bozulmasında; yara iyileşme basamaklarında ya da içeriklerinde duraklama ya da bozulma olduğu düşünülmektedir(11). İyileşme sırasında yaranın çeşitli alanları farklı fazda olabilir. Yara alanlarında heterojen süreçler gelişebilir. Senkronizasyonun bozulması doğal iyileşmeyi bozar. Fenotipik olarak kronik yaradaki bazı hücreler değişken gelişim seyredebilir. Örneğin, kronik yaraların sınırındaki keratinositlerinin migrasyonunun bozulduğu ve böylece yara kapanmasının geciktiği bilinmektedir(11). Bunun sebebinin hücre migrasyon faktörlerine cevapsız olmaları olabilir. Diyabetik ülserlerdeki fibroblastların TGF-beta ya da diğer büyüme faktörlerine karşı dirençli olduğu gösterilmiştir(11,12).

#### **Venöz Ülser Yaraları**

İleri dereceli kronik venöz yetmezlik hastalarında oluşur. Venöz staz sonucu dokuda biriken inflamatuvar sistem elemanları aktive olup, artan permabilityle vasküler duvardan doku içinde

inflamatuvar süreç başlatır(13). İnflamatuvar yanıtın artışıyla başlayan reaksiyonlar endotel hasarı, lökosit aktivasyonu, plateletlerin agregasyonu, cilt oksijenasyonunda düşme, lipodermatosklerozis, hiperpigmentasyon, egzama, cilt de atrofi ve sonuçta yara oluşumunu gerçekleştirir (14).

Resim.1,2,3; Venöz Staz, Venöz Ülser, Yetmezlikle genişleyen venöz damar Doppler USG görüntüsü

### **Etiyoloji**

- Derin veya ileri düzeyde yüzeyel venlerde yetersizlik
- Geçirilmiş DVT ve posttromboflebitik sendrom
- Majör cerrahi girişim
- Tütün kullanımı
- Tromboanjinitis Obliterans
- Vaskülitler
- Damar yapısında kollajen yetersizliği
- Obesite
- Hiperkolesterolemi, hiperlipdemi
- Travma
- Romatoid artrit
- Tümör, ven tromboz, ,
- İleri yaş
- Osteomyelit
- Yanıklar
- Kontrolsüz diyabet mellitus
- Multiple sklerozis, pleji, parezi, parapleji
- Hematolojik koagülasyon bozukluklar sıklıkla etkilidir (15,16,17).

Alt ekstremitte venöz ülserlerin%60-80 arası venöz kaynaklı olmakla birlikte kadınlarda daha fazla görülmekte olup, %45-60'ının da neden venöz hipertansiyon bağlı gelişen venöz yetmezliktir(14,18).

### **Tanı**

Anamnez, fizik muayene ile ön tanıda venöz ülser yarası olarak mütalaa edilen hastalarda renkli Doppler ultrasonografi ile kesinleştirilir.

### **Tedavi**

- A) Konservatif tedavi
  - Venotonik medikasyon
  - Yara bakımı
  - Ayak elevasyonu
  - Yaşam tarzı değişiklikleri; günlük 1 saat tempolu yürüyüş
- B) Kompresyon tedavisi
  - Varis çorabı
  - Bandaj
  - Pnömatik sistemle kompresyon sağlayan cihazlar.
- C) Ablasyon
  - Termokoagülasyon
    - Radyofrekans
    - Lazer
  - Embolizasyon
  - Skleroterapi
- D) Cerrahi Tedavi
  - Yüksek ligasyon
  - Stripping
  - Pake eksizyonu

Kronik venöz yetmezliğin değerlendirilmesinde; hastalığın klinik, etiyolojik, anatomik ve fizyopatolojik İngilizce baş harflerinden köken alınarak dizayn edilen evrelendirme ölçeği olan CEAP sınıflaması kullanılmaktadır. Hastalığın klinik evresini göstermesi dışında yanında, hangi etiyolojik neden sonrasında oluştuğunu ifade etmektedir. Bir kalsifikasyon olarak 1994'de İlk kez bir uygulanmaya başlanmış, 2004'de yeniden düzenlenen şekliyle yaygın kabul görmüştür(18). Venöz yara pansumanları için çok sayıda yeni yara örtüsü kullanıma girmiştir.

Bununla beraber bizim venöz yara pansumanında uygulamamız, enfeksiyonların tedavisi akut dönemde steril spançlı serum fizyolojikle pansuman enfekte ve ölü dokunun debritlemesi ve etkene yönelik tedavinin gerçekleştirilmesi şeklindedir. Venöz ülserde en etkin tedavi 4 katlı bandajla kompresyondur. Ancak periferik arter hastalığı olasılığına yönelik uygulama öncesi dikkatli anamnez ve klinik muayene gereklidir. Zira kimi hastalarda venöz ve arteriyel hastalık beraber bulunmakta olup yetersiz arteriyel dolaşım kolaylıkla gözden kaçabilir.

### **Arteriyel Ülser Yaraları**

Alt ekstremitelerde daha sık olmak üzere ateroskleroz nedenli periferik vasküler hastalık (PAH)'ın sonucu olarak görülebilmektedir. Klinik olarak PAH genellikle Fontaine sınıflamasına göre değerlendirilir.

- Stage I: Asemptomatik
- Stage II: Klodikasyon ağrısı
- Stage IIA: 200 metreden daha uzun mesafede klodikasyon
- Stage IIB: 200 metreden daha kısa mesafede klodikasyon
- Stage III: İstirahat ağrısı
- Stage IV: Ayakta nekroz ve gangren

PAH'm ileri evrelerinde, ülser ve gangrenler görülür. İstirahat ağrısı veya ülser varlığı "kritik bacak iskemisi" olup sıklıkla ivedi cerrahi revaskülarizasyonu gerekli kılar (19). PAH'a bağlı ülserler genellikle bası bölgelerinde, parmaklar, kemik çıkıntıları üzerinde, tibia kenarı ve uç bölgelerde oluşur. Ülser vasfı çoğu zaman zımba ile delinmiş gibi sınırlanmış olup tabanı genellikle kuru ve nekrotiktir(19,20).

### **Arteriyel Ülser etiyojisi**

1. Atherosklerotik stenotik nedenli
  - Sigara kullanım
  - Tromboanjitis Obliterans
  - Obezite
  - Kronik böbrek yetmezliği
  - Diabetes mellitus
  - İleri yaş
  - Hiperlipdemi
2. Vaskülitler
3. Fonksiyonel hastalıklar

- Skleroderma
- Raynaud fenomeni

### **Tanı**

Vakalarda; anamnez, inspeksiyon yanı sıra fizik muayenede, nabızların değerlendirilmesi önemli yer tutar. Pedal, popliteal ve femoral arter nabızların mukayeseli olarak manuel muayenesi esastır. Kronik iskemik ekstremitelerde; deri ve tırnaklar atrofik kıllar dökülmüş soluk ve soğukluk görülür. Tanı alt ekstremitelerde renkli Doppler tetkiki ile kesinleştirilir. En sık ayak bileğinin proksimaline yerleşen saf venöz ülserlerin aksine, arteriyel ülserler kısmen ayak bileğinin distalinde bulunur, çünkü kısmen azalmış kan dolaşımı vasküler ağacın distalinde en büyük etkiye sahiptir(21). İskemik bir yaranın tabanı genellikle kanamaz. Yüzey sarımsı, kahverengimsi, gri veya siyah, genellikle nekrotik bir yüzeye sahiptir ve genellikle herhangi bir granülasyon dokusu içermez. Yara derin olabilir, "delinmiş" görünebilir (21).

Resim.4,5,6;Kritik iskemik ayak,arteriyo-venöz yetmezlikli yatak yarası,vasküler tromboz dopler görüntüsü

Arteriyel yetmezlik kökenli olmakla beraber çeşitli yaraların farklı özellikleri mevcuttur. Bası yaralarına (dekübit) lokal iskemi neden olur.(Resim5) (13) . Artmış doku basıncı, kılcıl damarları ve arteriyelleri sıkıştırıp yerel kan perfüzyonunun azalmasına neden olur. Uzun süreli yara oluşumuna yol açabilir(22,23).

Tromboanjitit obliterans, küçük ve orta büyüklükteki arter ve damarların inflamatuvar, segmental oblitere edici bir hastalıdır. Tipik anjiyografik değişiklikler, Arterlerde fokal kalınlaşmalar ve alt ekstremitelerde tirbuşon benzeri, küçük kalibreli kollateraller anjiyografik görüntüleridir. Tütün kullanan 25-40 yaş arası erkeklerde sık görülür. Vakalarda HLA-A9 ve HLA-B5 ile ilişkili genetik yapı görülmüştür (24).

Diabetes mellitus, periferik aterosklerotik hastalık gelişimi için önemli bir risk faktörüdür ve kritik iskemisi olan hastaların %30-40'ında bulunur(25). Diyabetik nöropatinin klinik belirtilerinden biri olan diyabetik ayak; diyabetik nöropati ve farklı derecelerde periferik vasküler hastalık ile ilişkili ülserasyon, enfeksiyon ve/veya kangren gibi ayaktaki yapısal veya fonksiyonel değişiklikler olarak tanımlanır(26). Nöropatik ülserler genellikle ayak tabanlarında, tabanlardaki basınç noktalarında, ayak parmaklarında ve malleollerde lokalizedir(27). Diyabetik ayakta önce ağrı ve sıcaklık duyumunda bir azalma ve daha sonra titreşim hassasiyetinde ve yüzeysel dokunuşta bir azalma ile tanımlanır(28). Sonuç olarak, DF hastaları normal durumlarda ağırlı mekanik, kimyasal veya termal uyarınları hissedemeyebilirler(28). Süreç sonunda, Charcot osteoartropatisi ve ülser komplikasyonları ve gelişir.

### **Tedavi**

Yaraya yol açan primer sebep ortaya konup tedavi edilmesi temel yaklaşımdır. Yaradan kaynaklanan septik bir durum olmadıkça nekrotik ve fibrin dokuları içeren cansız dokuların debridmanı revaskülerizasyon sonrasında yapılmalıdır. Revaskülerizasyon gerçekleştirilene kadar ülser veya gangrenöz dokular kuru vaziyette tutulmalıdır(29). İskemik alanının yeniden kanlandırılmasını müteakip canlı dokulara kadar ulaşılan debridman yapılmalı nekrotik ve cansız doku derbide edilmelidir. Yaraların enfeksiyona karşı korunması esas olup aralıklı pansuman ve gerekirse antibiyotik kullanılmalıdır.

### **Pansumanlarında kullanılan yara örtüleri aktif pasif olmak üzere ikiye ayrılır.**

➤ Aktif kapamada Vakum yardımcı kapama (VAC) ile yapılan negatif basınçlı yara tedavisi kullanılır. VAK'ın etki mekanizması ile ilgili olarak çeşitli çalışmalar yapılmıştır. Lokal kan akımını ve hücre proliferasyonunu artırdığı, yara yüzeyindeki enfeksiyonu ve zararlı enzimleri uzaklaştırdığı, kollajen dizilimini düzenleyerek yara iyileşmesini ve granülasyon dokusu oluşumunu hızlandırdığı bildirilmiş, aynı zamanda negatif basınç sağlayarak yara yerinde kontraksiyona neden olarak yarada küçülmeye neden olduğu gösterilmiştir(30,31).

➤ Pasif kapama: Geleneksel pansumanlarda genellikle minimum eksüda ile temiz, kuru yaralar için endikedir. Gazlı bez, tiftik, sıvalar, bandajlar ve pamuk yünü, yaralara mekanik koruma sağlamak için pansuman olarak kullanılmıştır. Gazlı bez ıslandığında yaraya yapışma eğilimi gösterir ve çıkarılması acı verici olabilir. Hidrokolloid, köpük, kompozit, hidrofiber, transparan, alginat, hidrojel veya antibakteriyel örtüler günümüzde kullanılan modern yara örtü çeşitleridir(32).

**ÖZET**

Gebelik dönemi neslin devamı niteliğinde olup kadınların anne rolüne geçtiği bir dönemdir. Gebelik bir kadının hayatında fiziksel, biyolojik değişimlerin yaşandığı ve ruhsal hayatına etki eden bir süreci kapsamaktadır. Aleksitimik özellik gösteren birey, duyguları isimlendirememek ve ifade edememek, birbirinden ayırtıramamak veya farkında olmaksızın yaşamak şeklinde duygularını anlamada ve düzenlemede zorluklar yaşamaktadır. Bu durum gebeliğin ruhsal etkileri ile birleştiğinde kadınlarda sosyal izolasyona kadar giden sürece neden olabilir. Bu çalışma, gebelerde aleksitimi düzeyini belirlemek ve ilişkili faktörleri saptamak amacıyla yapılmıştır. Tanımlayıcı ve kesitsel tipte gerçekleştirilen çalışmaya 469 gebe dahil edilmiştir. Veriler gebe tanılama formu ve Toronto Aleksitimi Ölçeği ile elde edilmiştir. Gebelerin yaş ortalaması 28.03±5.51 yıl olup, gebelik haftası ortalaması 23.49±10.25'tir. Katılımcıların; %36.9'u lise ve üzeri eğitim düzeyine sahip, %13.4'ü çalışmakta, %2.1'inin kronik fiziksel bir hastalığı bulunmakta, %18.4'ünün gebelik sayısı dört ve üzerinde, %4.3'ü halen sigara kullanmakta ve %24.7'sinde gebelik planlı değildir. Gebelerin Toronto Aleksitimi Ölçeği toplam puan ortalaması 56.79±10.71 olup %29'unun aleksitimik özellik gösterdiği tespit edilmiştir. Bununla birlikte gebelerin Toronto Aleksitimi Ölçeği alt boyutu olan duyguları tanımada güçlük alt boyutu toplam puan ortalamasının 17.45±4.73; duygularını söze dökmeye güçlük alt boyut toplam puan ortalamasının 14.20±3.06 ve dışa dönük düşünme alt boyut toplam puan ortalamasının 25.12±5.10 olduğu belirlenmiştir. Çalışmada yaş, eğitim, çalışma durumu, kronik fiziksel hastalık varlığı, sigara kullanımı, evlilik yaşı ve gebelik haftası ile aleksitimi düzeyi arasında ilişki bulunmamıştır ( $p>0.05$ ). Bununla birlikte planlı gebelik durumu ile aleksitimi düzeyi arasında ilişki olduğu, gebeliği planlı olmayanların aleksitimi düzeyinin daha yüksek olduğu belirlenmiştir ( $p<0.05$ ). Gebelik döneminde ortaya çıkabilecek herhangi bir ruhsal durum bozukluğunun erken dönemde tanınmasında sağlık profesyonellerine büyük sorumluluk düşmektedir. Aleksitimik özellik gösteren ya da aleksitimi açısından riskli olan gebelerin kendilerini ifade etmeleri için rahat bir ortam sağlanmalı ve fırsat tanınmalıdır.

**Anahtar kelimeler:** Gebe, aleksitimi, duygu

**ALEXITHIMIA LEVEL AND RELATED FACTORS IN PREGNANCY****ABSTRACT**

The pregnancy period is a continuation of the generation and is a period in which women pass the role of mother. Pregnancy covers a process in which physical and biological changes are experienced in a woman's life and affects her spiritual life. Individuals with alexithymia have difficulties in understanding and regulating their emotions, such as not being able to name and express emotions, not being able to distinguish their emotions from each other, or living their emotions unconsciously. When this situation is combined with the psychological effects of pregnancy, it can lead to social isolation in women. This study was carried out to determine the level of alexithymia and related factors in pregnant women. A descriptive and cross-sectional study included 469 pregnant women. The data were obtained with the pregnant diagnosis form and the Toronto Alexithymia Scale. The mean age of the pregnant women was  $28.03 \pm 5.51$  years and the mean week of gestation was  $23.49 \pm 10.25$ . 36.9% of the pregnant women have a high school or higher education level and 13.4% are working. 2.1% of the participants have a chronic physical disease and 4.3% are still smokers. 18.4% of the pregnant women had four or more pregnancies, and 24.7% stated that the pregnancy was not planned. Total Toronto Alexithymia Scale mean score of the pregnant women was  $56.79 \pm 10.71$ , and 29% of them were found to have alexithymic features. On the other hand, when the Toronto Alexithymia Scale sub-dimension total score averages of pregnant women were examined; difficulty identifying feelings  $17.45 \pm 4.73$ ; difficulty in verbalizing their feelings  $14.20 \pm 3.06$ ; e externally oriented thinking  $25.12 \pm 5.10$ . In the study, no relationship was found between age, education status, employment status, presence of chronic physical disease, smoking, marriage age, gestational week and alexithymia level ( $p > 0.05$ ). On the other hand, it was determined that there was a relationship between planned pregnancy and alexithymia level, and those whose pregnancy was not planned had a higher alexithymia level ( $p < 0.05$ ). Health professionals have a great responsibility in the early recognition of any mental state disorder that may occur during pregnancy. A comfortable environment should be provided and an opportunity should be provided for pregnant women who have alexithymia or who are at risk for alexithymia to express themselves.

**Keywords:** Pregnant, alexithymia, emotion

## **GİRİŞ**

Gebelik, kadınlar için biyo-psikososyal dengenin, aile ve iş rollerinin değiştiği, yeni sorumlulukların edinildiği ve yeni role uyumun sağlandığı bir kriz dönemi olabilmektedir (Özşahin ve ark., 2018). Gebelik sadece anneyi değil aynı zamanda fetüsün sağlığını da etkileyen bir süreçtir. Annenin gebelik sürecinde yaşadığı ruhsal sorunlar fetüsü etkilemekte, anne-bebek arasındaki bağlanma ilişkisini bozmakta ve doğum sonrası dönemde de annenin var olan kapasitesinden ödün vererek bakım verme isteğine zarar vermektedir (Yar ve Yılmaz, 2021). Gebelikte mevcut psikiyatrik semptomlarda alevlenme görülebilenken, ilk psikiyatrik semptomlar gebelik sırasında da ortaya çıkabilmektedir (Sönmez ve ark., 2020).

Latince kökenli bir kelime olan ve “duygulara söz bulamamak” anlamına gelen aleksitimi (Motan ve Gençöz, 2007), bireyin duyguları tanımlama ve anlama yetersizliğidir (Stojanov ve Stojanov, 2020). Aleksitimik özellik gösteren birey, duyguları ifade edememek, birbirinden ayırtıramamak veya farkında olmaksızın yaşamak şeklinde duygularını anlamada ve düzenlemede zorluklar yaşamaktadır (Motan ve Gençöz, 2007; Kuluoğlu ve ark., 2013). Aleksitimik bireyler, fiziksel hastalık belirtileri olarak duygusal uyarılmalarını yanlış yorumlama eğilimi göstererek tuhaf hastalık davranışı gösterebilmektedir (Bodini et al., 2008). Ayrıca aleksitimi, bireylerin kendi kendilerini algılama, davranış kontrolü ve başka bireylerle iletişimde olumsuz etkilere neden olabilmektedir (Prochnow et al., 2011). Bu nedenle gebelik gibi yeni yaşam döngüsünün ortaya çıktığı dönemde, bireylerde aleksitimi düzeylerinin ve ilişkili faktörlerin belirlenmesi önemlidir.

## **YÖNTEM**

### **Araştırmanın Amacı ve Tipi**

Araştırma gebe kadınlarda aleksitimi düzeyini belirlemek ve ilişkili faktörleri saptamak amacıyla tanımlayıcı ve kesitsel dizaynda yapılmıştır.

### **Araştırmanın Evren ve Örneklemi**

Araştırmanın evrenini; Sivas merkezinde yer alan Sivas Numune Hastanesi Kadın Doğum Polikliniği'ne başvuran gebe olan kadınlar oluşturmuştur. Örneklemeye ise Mart-Haziran 2022 tarihleri arasında araştırma kriterlerine uyan 469 gebe dahil edilmiştir. Araştırma kriterleri; okur- yazar, gebe ve 18 yaş ve üzerinde olma, sözel iletişim kurabilmede sorunu olmama, bipolar hastalık, yeme bozuklukları veya diğer önemli psikolojik / psikiyatrik hastalık tanısı almama ve antidepresan ilaç kullanmama şeklinde belirlenmiştir.

### **Veri Toplama Araçları**

Veriler kişisel bilgi formu ve Toronto Aleksitimi Ölçeği ile toplanmıştır. Kişisel bilgi formunda, gebelerin yaşı, eğitim durumu, çalışma durumu, kronik fiziksel hastalık varlığı, evlilik süresi, evlilik yaşı, gebelik haftası ve gebelik sayısı gibi bilgileri içeren 16 soru yer almaktadır.

Toronto Aleksitimi Ölçeği (TAÖ-20), Bagby ve arkadaşları tarafından geliştirilmiş olup Türkiye’de geçerlilik ve güvenilirliği Güleç ve arkadaşları (2009) tarafından yapılmıştır. Ölçek, 5’li likert tipinde ve 20 maddeden oluşmaktadır. Ölçeğin, duygularını tanımada güçlük, duyguları söze dökmede güçlük ve dışa-dönük düşünme alt boyutları vardır. Duygularını Tanımada Güçlük alt boyutu, yedi maddeden oluşmakta olup duyguları belirleme ve onları duygusal uyarılmaya eşlik eden bedensel duyumlardan ayırt etmede güçlük şeklinde tanımlanır. Duyguların başkalarına aktarılmasında güçlük şeklinde tanımlanan Duyguları Söze Dökmede Güçlük alt boyutu beş maddeden oluşmaktadır. Dışa Dönük Düşünme alt boyutu, sekiz maddeden oluşmakta ve dışadönük bilişsel bir yapının varlığı, içedönük düşünme ve imgelem gücünün zayıflığı olarak tanımlanmaktadır. Bireyden, her madde için “Hiçbir zaman”, “Nadiren”, “Bazen”, “Sık sık” ve “Her zaman” seçeneklerinden kendisine en uygun olanını işaretlemesi istenir. Ölçeğin kesme puanı 61 olarak bulunmuştur. Toronto Aleksitimi Ölçeği toplam puanından 61’in üstünde alanlar aleksitimik olarak değerlendirilirler. Yüksek puanlar yüksek aleksitimik seviyeyi gösterir (Güleç ve ark., 2009). Bu çalışmada alt boyutların Cronbach Alpha değeri sırasıyla duygularını tanımada güçlük için 0.79, duyguları söze dökmede güçlük için 0.83 ve dışa-dönük düşünme için 0.80 olarak saptanmıştır.

### **Verilerin Toplanması**

Veriler, araştırmacılar tarafından gebelerle yüz yüze görüşülerek elde edilmiştir. Araştırmacı gebelere araştırma hakkında sözel olarak bilgi vermiş, gebelerin sözel ve yazılı onamlarını aldıktan sonra, araştırmayı kabul edenlere anket formlarını uygulamıştır. Anketlerin uygulanması ortalama 20 dakika sürmüştür.

### **Verilerin Değerlendirilmesi**

Veriler SPSS 22.0 programında analiz edilmiştir. İstatistiksel değerlendirmede yüzdellik, ortalama, student t testi, tek yönlü ANOVA, Mann Whitney U testi ve Pearson korelasyon katsayısı kullanılmıştır. İstatistiksel anlamlılık  $p < 0.05$  olarak değerlendirilmiştir.

## BULGULAR

Gebelerin yaş ortalaması 28.03±5.51 yıl olup, gebelik haftası ortalaması 23.49±10.25'tir. Katılımcıların; %36.9'u lise ve üzeri eğitim düzeyine sahip, %13.4'ü çalışmakta, %2.1'inin kronik fiziksel bir hastalığı bulunmakta, %18.4'ünün gebelik sayısı dört ve üzerinde, %4.3'ü halen sigara kullanmakta ve %24.7'sinde gebelik planlı değildir (Tablo 1).

## TARTIŞMA

Aleksitimi; duyguların ayarlanmasını, konsantrasyonunu, işlenmesini ve bilişsel-duygusal bilgilerin değerlendirilmesini bozan bir bozukluktur. Bu nedenle aleksitimik özellik gösteren bireyler bilişsel-duygusal değişimlerini yönetemezler ve gerektiği gibi baş edemezler (Nekouei ve ark., 2014). Bu çalışmada, gebelerde aleksitimi düzeyi ve ilişkili faktörler incelenmiştir. Ancak literatürde sınırlı sayıda araştırma olması nedeniyle bulgular kadın popülasyonu ile yapılan başka çalışmalarla tartışılmıştır.

Çalışmada gebe kadınların Toronto Aleksitimi Ölçeği puan ortalaması 56.79±10.71 olup yaklaşık üçte birinin aleksitimik özellik gösterdiği tespit edilmiştir. Literatürde benzer çalışma bulunmamaktadır. Bununla birlikte 65 yaş üzeri kadınlarla yapılan bir çalışmada, katılımcıların aynı ölçekten alınan puan ortalaması 50.28±9.51 olarak bulunmuştur (Yiğitbaş, 2017). Bu çalışma, gebelerde aleksitiminin yaygın olabileceğini göstermesi açısından önemlidir.

Çalışmada, gebelerin yaşı, eğitim durumu, çalışma durumu, kronik fiziksel hastalık varlığı, sigara kullanımını, evlilik yaşı ve gebelik haftası ile aleksitimi düzeyi arasında ilişki bulunmazken, planlı gebelik durumunun aleksitimi düzeyi ile ilişki olduğu, gebeliği planlı

olmayanların aleksitimi düzeyinin daha yüksek olduğu belirlenmiştir. Bir çalışmada, gebeliğini isteyen kadınların Toronto Aleksitimi Ölçeği puan ortalamasının  $65.04 \pm 11.83$ , gebeliğini istemeyen kadınların puan ortalamasının ise  $65.37 \pm 11.15$  bulunduğu ve gruplar arasında istatistiksel olarak anlamlı bir farklılık olmadığı tespit edilmiştir (Sönmez ve ark., 2020). Literatür çalışması ile farklılık gösteren çalışma bulgusu, bu konuda daha fazla çalışmaya ihtiyaç olduğunu göstermektedir.

## **SONUÇ**

Çalışmada; aleksitiminin gebelerde yaygın görüldüğü ve planlı gebelik durumunun aleksitimi düzeyi ile ilişkili olduğu tespit edilmiştir. Sağlık profesyonellerine, gebelik döneminde ortaya çıkabilecek herhangi bir ruhsal durum bozukluğunun erken dönemde tanınmasında büyük sorumluluk düşmekte olup psikolojik açıdan gebelerin kendilerini ifade etmeleri için rahat bir ortam sağlanmalı ve fırsat tanınmalıdır.

**GESTASYONEL DİYABETLİ GEBELERİN DİSTRES DURUMLARI VE  
ETKİLEYEN FAKTÖRLERİN BELİRLENMESİ**

**Doç. Dr. Feride TAŞKIN YILMAZ (Orcid ID: 0000-0003-0568-5902)**  
Sakarya Uygulamalı Bilimler Üniversitesi, Sağlık Bilimleri Fakültesi, Sakarya

**Doç. Dr. Gülbahtiyar Demirel (Orcid ID: 0000-0003-2258-7757)**  
Sivas Cumhuriyet Üniversitesi, Sağlık Bilimleri Fakültesi, Sivas

**ÖZET**

Gestasyonel diabetes mellitus (GDM), ilk kez gebelikte tanısı konulan ya da gebelik sürecinde ortaya çıkan, herhangi bir derecedeki glukoz intoleransıdır. GDM'nin anne ve bebek sağlığı üzerine olumsuz etkileri vardır. Anne ve bebek sağlığının korunması yanı sıra sağlıklı bir toplum geliştirmek için GDM'nin dikkatle ele alınması gerekmektedir. Gebelik, herhangi bir sağlık problemi yaşanmadığı durumda bile stresli ve kompleks bir süreçtir. GDM gibi yüksek riskli gebelikte görülme olasılığı artan distresin de değerlendirilmesi, gebelere verilen sağlık hizmetlerinin verimliliği ve etkinliği açısından önem taşımaktadır. Bu çalışma, GDM olan gebelerin distres durumlarını ve etkileyen faktörleri belirlemek amacıyla yapılmıştır. Tanımlayıcı ve kesitsel tipte gerçekleştirilen çalışmaya 112 gestasyonel diyabetli kadın dahil edilmiştir. Veriler tanılama formu ve Tilburg Gebelikte Distres Ölçeği ile elde edilmiştir. Gebelerin; yaş ortalaması 32.31±5.87 yıl olup %58'i lise mezunu, %29.5'i çalışmakta, %37.5'inin ikinci gebeliği ve %24.1'i GDM hakkında sağlık profesyonellerinden eğitim aldığını belirtmiştir. GDM'li gebelerin Tilburg Gebelikte Distres Ölçeği toplam puan ortalaması 25.05±4.83 olup, %29.5'i distres açısından risk altındadır. Ölçeğin alt boyutu olan olumsuz duygulanım için toplam puan ortalaması 18.07±3.68 ve eş katılımı için toplam puan ortalaması 6.98±2.94'tür. GDM'li gebelerin yaş, eğitim, çalışma durumu, gebelik, düşük ve ölü doğum yapma sayısı ile distres düzeyi arasında ilişki bulunmamıştır ( $p>0.05$ ). Bununla birlikte GDM hakkında eğitim alma durumu ile distres düzeyi arasında ilişki olduğu, eğitim alanların distres düzeyinin daha düşük olduğu belirlenmiştir ( $p<0.05$ ). Ebe ve hemşirelerin risk altındaki gebelerin belirlemede ve uygun girişimlerin yapılmasında önemli rolleri bulunmaktadır. Özellikle GDM olan gebelerde uygun eğitim ve danışmanlık hizmetlerinin yaygınlaştırılması, distresin etkilerinin azaltılması açısından önemlidir.

**Anahtar kelimeler:** Gebe, gestasyonel diyabet, distres

**DETERMINATION OF STRESS AND AFFECTING FACTORS OF PREGNANCY  
WITH GESTATIONAL DIABETES****ABSTRACT**

Gestational diabetes mellitus (GDM) is any degree of glucose intolerance that is first diagnosed during pregnancy or that occurs during pregnancy. GDM has adverse effects on maternal and infant health. GDM needs to be handled carefully in order to protect maternal and infant health as well as to develop a healthy society. Pregnancy is a stressful and complex process even in the absence of any health problems. Evaluation of distress, which is more likely to be seen in high-risk pregnancy, such as GDM, is important in terms of the efficiency and effectiveness of health services provided to pregnant women. This study was carried out to determine the distress and affecting factors of pregnant women with GDM. A descriptive and cross-sectional study included 112 women with gestational diabetes. Data were obtained with the diagnostic form and the Tilburg Pregnancy Distress Scale. The mean age of the pregnant women is  $32.31 \pm 5.87$  years, 58% of them are high school graduates and 29.5% are working. 37.5% of the women had their second pregnancy, and 24.1% stated that they received training from health professionals about GDM. The Tilburg Distress in Pregnancy Scale mean total score of pregnant women with GDM is  $25.05 \pm 4.83$  and 29.5% of them are at risk for distress. The total mean score for negative affect, which is the sub-dimension of the scale, is  $18.07 \pm 3.68$  and the total mean score for spousal involvement is  $6.98 \pm 2.94$ . There was no relationship between the age, age, education level, employment status, number of pregnancies, number of miscarriages, stillbirth and distress level of pregnant women with GDM ( $p > 0.05$ ). On the other hand, it was determined that there was a relationship between the level of education about GDM and the level of distress, and those who received training about GDM had a lower level of distress ( $p < 0.05$ ). Midwives and nurses have important roles in identifying pregnant women at risk and in making appropriate interventions. Dissemination of appropriate education and counseling services, especially in pregnant women with GDM, is important in terms of reducing the effects of distress.

**Keywords:** Pregnant, gestational diabetes, distress

## **GİRİŞ**

Gestasyonel diyabet (GDM), ilk kez gebelik sırasında saptanan değişik derecelerde glikoz tolerans bozukluğu olarak tanımlanmaktadır (Oğuz, 2016). Gebeliğin en sık metabolik hastalığı olan GDM, farklı toplumlarda farklı sıklıklarda görülmekle beraber ortalama %3-5 sıklıkla seyretmektedir (Aksu ve Yurtsev, 2009; Sterne, Logan and Palmer, 2011). GDM'nin anne ve bebek sağlığı üzerine olumsuz etkileri vardır. Maternal olarak; preeklamsi, sezaryen-müdehaleli doğum, tip II diabet, böbrek-idrar yolu- vajinal enfeksiyonlar, metabolik sorunlar, diabetik vaskülopatilerin ilerlemesi, gebeliğin ilk 7 haftası spontan abortus, preterm eylem, polihidroamnios, doğum travmaları, postpartum endometrit, yara yeri enfeksiyonu gelişmesi ve maternal mortalite riskine neden olur (Abebe ve ark., 2017; Şen ve ark, 2008). Anne ve bebek sağlığının korunması yanı sıra sağlıklı bir toplum geliştirmek için GDM'nin dikkatle ele alınması, bu alanda kanıta dayalı uygulamaların benimsenmesi ve bu alanda daha fazla bilimsel çalışmanın yapılması gereklidir (İlgen ve Koçak, 2019).

Gebelik, kadının görünüşünden sosyal statüsüne kadar yaşamında birçok değişime neden olan bir deneyimdir. Birçok kadın gebelikte meydana gelen bu değişikliklere kolaylıkla adaptasyon sağlar. Ancak bazı kadınlar gebelikte meydana gelen fizyolojik, psikolojik ve sosyal değişikliklere uyumda zorlanır, sonuçta fizyolojik ya da psikolojik sorunlar ortaya çıkar (Dündar ve ark, 2019). Bu sorunların çoğu psikolojik distres le ilgilidir (Çapık ve ark, 2015). Gebeliğe özgü psikolojik distres, fetüsün sağlığına, gebeliğe bağlı fiziksel semptomlara, doğum eylemine, postpartum döneme ve bebeğin sağlığına yönelik maternal korku ve endişeleri ifade etmektedir (Simsek Kucukkelepce et al, 2022). Anneye veya bebeğe ait sorunlar nedeniyle yüksek riskli gebeliklerde kadınların stres düzeyi daha da artmaktadır (Gözüyeşil ve Düzgün, 2021). GDM gibi yüksek riskli gebelikte görülme olasılığı artan distresin de değerlendirilmesi, gebelere verilen sağlık hizmetlerinin verimliliği ve etkinliği açısından önem taşımaktadır. Bu nedenle kadın sağlığı hemşireleri ve ebeler tarafından GDM olan gebelerde psikolojik distres gelişmesini etkileyen faktörlerin belirlenmesi, erkenden tanınması ve baş etme yöntemlerinin geliştirilmesi, prenatal ve postpartum komplikasyonların önlenmesi için üzerinde önemle durulması gereken bir durumdur (Simsek Kucukkelepce et al, 2022).

## **YÖNTEM**

### **Araştırmanın Amacı ve Tipi**

Araştırma, GDM olan gebelerin distres durumlarını ve etkileyen faktörleri belirlemek amacıyla tanımlayıcı ve kesitsel dizaynda yapılmıştır.

### **Araştırmanın Evren ve Örneklemi**

Araştırmanın evrenini; Sivas Cumhuriyet Üniversitesi Tıp Fakültesi Hastanesi Kadın Doğum polikliniğine başvuran ve GDM olan kadınlar oluşturmuştur. Örneklem ise Nisan-Ağustos 2022 tarihleri arasında araştırma kriterlerine uyan 112 GDM’li gebe dahil edilmiştir. Araştırma kriterleri, 18 yaş ve üzeri olmak, GDM tanısı alma, sözel iletişim kurabilmede sorunu olmamaktır.

### **Veri Toplama Araçları**

Veriler tanılama formu ve Tilburg Gebelikte Distres Ölçeği ile toplanmıştır. Tanılama formunda, gebelerin yaşı, eğitim durumu, çalışma durumu, gebelik sayısı, önceki gebeliklerinde GDM gelişme durumu, birinci derece yakınlarında diyabet varlığı gibi kişisel, gebelik ve hastalığa özgü bilgileri içeren 20 soru yer almaktadır.

Tilburg Gebelikte Distres Ölçeği, Pop ve ark.’nın (2011) tarafından, gebelikteki distresin belirlenmesi amacıyla geliştirilmiştir. Ölçeğin Türkçe geçerlilik- güvenirlilik çalışması Çapık ve Pasinlioğlu (2015) tarafından yapılmıştır. Ölçek toplam 16 maddeden oluşmaktadır. Ölçeğin her bir maddesi “çok sık” (0 puan), “oldukça sık” (1 puan), “ara sıra” (2 puan), “nadiren veya hiç” (3 puan) arasında değişen 4’lü likert tipi şeklinde derecelendirilmiştir. “Olumsuz Duygulanım” ve “Eş Katılımı” olmak üzere iki alt boyutu bulunmaktadır. “Olumsuz Duygulanım” alt boyutu, 11 maddeden oluşmaktadır. Bu maddeler 3,5,6,7,9,10,11,12,13,14 ve 16. maddelerdir. Bu alt boyuttan alınabilecek en düşük puan 0, en yüksek puan 33’tür. “Eş Katılımı” alt boyutu, 5 maddeden oluşmaktadır. Bu maddeler 1,2,4,8 ve 15. maddelerdir. Bu alt boyuttan alınabilecek en düşük puan 0, en yüksek puan 15’tir. Ölçekteki 3,5,6,7,9,10,11,12,13,14 ve 16. maddeler ters kodlanmaktadır. Ölçeğin toplamından alınabilecek en düşük puan 0, en yüksek puan 48’tir. Ölçek, 12 hafta ve üzeri gebeliği olanlara uygulanmaktadır. Ölçeğin kesme noktası bulunmakta ve toplam puanın 28 ve üzerinde olması distres (depresyon, anksiyete, stres) açısından risk altında olan gebelerin tanılanmasını sağlamaktadır. Ölçeğin geçerlilik-güvenirlilik çalışmasında Cronbach Alfa değeri 0.83 olarak bulunmuştur (Çapık ve Pasinlioğlu, 2015). Bu çalışmada ölçeğin Cronbach Alpha değeri 0.80 olarak saptanmıştır.

### **Verilerin Toplanması**

Veriler, arařtırmacılar tarafından gebelerle yüz yüze görüşülerek elde edilmiştir. Arařtırmacı gebelere arařtırma hakkında sözel olarak bilgi vermiş, gebelerin sözel ve yazılı onamlarını aldıktan sonra, arařtırmayı kabul edenlere anket formlarını uygulamıştır. Anketlerin uygulanması ortalama 20 dakika sürmüştür.

### **Verilerin Deęerlendirilmesi**

Veriler SPSS 22.0 programında analiz edilmiştir. Verilerin normallięi Kolmogorov- Smirnov testi ile deęerlendirilmiştir. İstatistiksel deęerlendirmede yüzdellik, ortalama ile birlikte, veriler parametrik şartları sağlamadığı için (verilerin dağılımı homejen olmadığı için) bağımsız iki grup için Mann Whitney U testi ve Kruskal-Wallis test, ilişkinin belirlenmesinde Spearman korelasyon katsayısı kullanılmıştır. İstatistiksel anlamlılık  $p<0.05$  olarak deęerlendirilmiştir.

### **BULGULAR**

Gebelerin yaş ortalaması  $32.31\pm 5.87$  yıl olup %58'i lise mezunu, %29.5'i çalışmakta, %37.5'inin ikinci gebelięi ve %24.1'i GDM hakkında saęlık profesyonellerinden eğitim aldığını belirtmiştir (Tablo 1)

## TARTIŞMA VE SONUÇ

Gebelik döneminde kadının bedeninde meydana gelen değişimler çoğunlukla pozitif olarak karşılanır, hatta kendisi ve eşinde bir gurur yaratır. Fakat bunun aksine bazı kadınlarda bu değişiklikler olumsuz bir beden imajı yaratabilir. Gebelerin ruhsal durumu ve yaşantısı distrese neden olabileceği gibi, gebelikteki yaşananlar da distrese neden olabilir (Yıldız Çiltaş ve Köse Tuncer, 2019). Gebelik döneminde yaşanan psikolojik distresin, fetüsün ve gebenin iyilik halini

olumsuz yönde etkilemesine doğum komplikasyonlarına ve postpartum dönemde depresyon gelişmesine neden olduğu belirtilmektedir (Simsek Kucukkelepce et al, 2022).

Çalışmada, GDM'lu gebelerin Tilburg Gebelikte Distres Ölçeği'nden alınabilecek minimum ve maksimum puan aralıkları göz önüne alındığında, puan ortalamasına (25.05±4.83) göre distres düzeyinin orta düzeyde olduğu ve yaklaşık üçte birinin (%29.5) distres açısından risk altında olduğu belirlenmiştir. Çalışma bulgusu literatür ile benzerlik göstermektedir (Çapık ve ark, 2015). Yüksek riskli gebelerle yapılan başka bir çalışmada da, gebelerin yarısından fazlasının distres yaşadığı belirlenmiştir (Gözüyeşil ve Düzgün, 2021). Bu çalışmaların aksine, başka bir çalışmada, gebelerin Tilburg Gebelikte Distres Ölçeği'nden puan ortalaması 13.48±8.6 olup, %9.6'sının distres yaşadığı saptanmıştır (Dündar ve ark, 2019). Çalışma bulgusu, GDM olan gebelerin distres açısından ele alınması gerekliliğini ortaya koymaktadır.

Çalışmada, GDM'lu gebelerin yaş, eğitim, çalışma durumu, gebelik, düşük ve ölü doğum yapma sayısı ile distres düzeyi arasında ilişki bulunmazken GDM eğitimi alanların distres düzeyinin daha düşük olduğu belirlenmiştir. Literatürde GDM gebelerde distres düzeyini inceleyen çalışma bulunmamaktadır. Bununla birlikte gebelerle yapılan başka çalışmalarda farklı bulgular elde edilmiştir. Örneğin Çapık ve ark. (2015) çalışmasında, yaş ile distres düzeyi arasında negatif yönlü ilişki olduğu, eğitim düzeyi üniversite ve üzeri olan gebelerin distres düzeyinin daha düşük olduğu, ilk gebeliği olanların distres düzeyinin daha yüksek olduğu tespit edilmiştir. Başka bir çalışmada, 26 yaş ve üzeri gebelerin 20-25 yaş arası gebelere göre, ilköğretim mezunu gebelerin, üniversite mezunu olan gebelere göre daha fazla distres yaşadığı saptanmıştır (Simsek Kucukkelepce et al, 2022). Buna rağmen, riskli gebelik tanısı almış gebelerle yapılan bir çalışmada da, gebelerin yaşı ve gebelik sayıları gibi değişkenlerinin distres düzeyi ile ilişkili olmadığı belirlenmiştir (Gözüyeşil ve Düzgün, 2021). Başka bir çalışmada, gebeliğin plansız ve/veya istenmeyen gebelik olması, yaşayan çocuk sayısı ve gebelik sayısı ile distres düzeyi arasında ilişki olmadığı, buna rağmen, gebeliğin farklı trimesterinde olması, düşük yapma, gravida, gebelikte sorun yaşama durumu ile distres düzeyi arasında ilişki olduğu saptanmıştır (Dündar ve ark, 2019). Çalışma bulgusu, literatür ile farklılık göstermekle birlikte, elde edilen bulgular, çalışma popülasyonunun farklılığından kaynaklanmış olabilir

Bu çalışmada, GDM'lu gebelerin distres düzeylerinin orta düzeyde olduğu buna rağmen yaklaşık üçte birinin distres yaşadığı belirlenmiştir. Ayrıca hastalığı hakkında eğitim alanların distres düzeyinin düşük olduğu tespit edilmiştir. Ebe ve hemşirelerin risk altındaki gebelerin belirlemede ve uygun girişimlerin yapılmasında önemli rolleri bulunmaktadır. Özellikle GDM olan gebelerde uygun eğitim ve danışmanlık hizmetlerinin yaygınlaştırılması, distresin etkilerinin azaltılması açısından önemlidir.

**ÖZET**

Günümüzde kadınlar, ekonomik zorunluluklar, kendisi ve ailesi için daha iyi bir gelecek sağlamak, daha üretken olmak, kariyerinde ilerlemek, yaşam standartlarını yükseltmek, toplumda itibar kazanmak gibi bir dizi nedenden çalışma hayatına yönelmektedir. Öte yandan, bu nedenlerle çalışmaya ihtiyaç hisseden veya çalışmayı arzu eden bir çok kadın, toplumda çalışan kadına yönelik olumsuz tutumların etkisiyle çalışmaktan vazgeçmekte veya çalışmayı tercih etseler bile bu tutumların etkisiyle pek çok alanda zorluklar yaşayabilmektedirler. Ülkemizde ve uluslararası alanda yapılan araştırmaların daha çok annenin çalışmasının aileye ve çocuğa yansımaları üzerinde durmakta, ya da annelerin çalışma hayatı ve aile hayatı arasındaki ilişkiyi vurgulamaktadır. Bu bilgiler ışığında; araştırmada yetişkin bireylerin annelerin çalışmasına yönelik tutumlarının çeşitli sosyo-demografik değişkenlere göre incelenmesi amaçlanmıştır. Bu çalışma tanımlayıcı tipte tasarlanmış nicel bir araştırmadır. Veri toplama yöntemi olarak araştırmacılar tarafından hazırlanan “Soru Formu” kullanılmıştır. Rastgele örneklem seçilerek gönüllü olan kitleye ulaşmak hedeflenmekte olup araştırmacılar tarafından Google üzerinden çevrimiçi ölçek formu hazırlanarak oluşturulan link çalışma kapsamına alınan yetişkin bireylere gönderilerek veriler toplanmıştır. Çalışmada sosyo-demografik bilgi formu, “Annelerin Çalışmasına Yönelik Tutum Ölçeği” kullanılmıştır. Araştırma sonucunda elde edilen veriler SPSS istatistik programında analiz edilmiştir. Sosyo-demografik özellikler için tanımlayıcı istatistik analizler (frekans, yüzde, ortalama, standart sapma vb), bağımlı ve bağımsız değişkenler arasındaki farklılıkların incelenmesinde ikili karşılaştırmalar t-test, ikiden fazla grubun karşılaştırmasında ise ANOVA kullanılmıştır. Araştırma sonucunda; çalışma kapsamına alınan yetişkinlerin annelerin çalışmasına yönelik ortalamasının üzerinde bir tutuma sahip olduğu, tutumların da cinsiyet ve yaş değişkenlerine göre anlamlı farklılık gösterdiği belirlenmiştir. Araştırmacıların gelecekte çalışmalarını bu değişkenlerin başka boyutlarını da göz önüne alarak düzenlemelerinin konuyla ilgili daha fazla çalışma yapılmasının kadının çalışmasına yönelik tutum ve diğer değişkenler arasındaki ilişkilerin daha iyi anlaşılması bakımından faydalı olacağı düşünülmektedir.

**Anahtar Kelimeler:** Çalışan anne, kadın, tutum

**COMPARISON OF ATTITUDES TOWARDS WORKING MOTHERS WITH SOME SOCIO-DEMOGRAPHIC CHARACTERISTICS****ABSTRACT**

Today, women turn to working life for a number of reasons such as economic obligations, providing a better future for themselves and their families, being more productive, advancing in their careers, raising their living standards, and gaining prestige in the society. On the other hand, many women who need or desire to work for these reasons give up working due to negative attitudes towards women working in the society, or even if they prefer to work, they may experience difficulties in many areas due to these attitudes. The research carried out in our country and internationally reflects more on the work of the mother to the family and the child, it focuses on emphasizes the relationship between the working life of mothers and family life. In the light of this information; in this study, it was aimed to examine the attitudes of adult individuals attitudes towards mothers' work according to various socio-demographic variables. This study is a quantitative research designed in descriptive type. The "Question Form" prepared by the researchers was used as the data collection method. It is aimed to reach the volunteer population by choosing a random sample, and the data was collected by sending the link created by the researchers to the adult individuals included in the study by preparing an online scale form on Google. In the study, a socio-demographic information form, the "The Scale of Attitudes Towards Working Mother" was used. The data obtained as a result of the research were analyzed in the SPSS statistical program. Descriptive statistical analyzes (frequency, percentage, mean, standard deviation, etc.) were used for socio-demographic characteristics, paired comparisons t-test was used to analyze the differences between dependent and independent variables, and ANOVA was used for the comparison of more than two groups. As a result of the research; it has been determined that the adults included in the study have an above-average attitude towards mothers' work, and attitudes differ significantly according to gender and age variables. Future studies of researchers to determine these variables taking into account other dimensions of the regulations attitude towards mothers work and other useful for better understanding the relationships between variables is thought to be.

**Keywords:** Working mother, women, attitudes

## 1.GİRİŞ

Kadın, içinde bulunduğu toplumun ekonomik, demografik ve sosyal ilerlemesini hızlandırabilen bir potansiyeldir. İş hayatında kadın, yalnızca öz gereksinimleri için değil, aynı zamanda genel refahı ve itibarı için de kariyer inşa etmektedir. Betz ve Fitzgerald'e göre (1987) kadınların kariyer seçimleri büyük ölçüde ev ve aile sorumluluklarından etkilenir. Sosyal sınıf, evlilikle gelen tutumlar, finansal kaynaklar, eğitim seviyesi, çekirdek ailenin kültürel değerleri meslek seçimini etkiler. Diğer bir bakışla seçilen meslek, kadının ev ve aile sorumluluklarından etkilenen faktör olmak yerine etkileyici bir faktör de olabilir.

Günümüzde kadınlar çocukluğundan bu yana ailesinin ve kendisinin gayretiyle bir meslek edinir ve çalışma hayatına atılır. Çalışan kadının icra etmekte olduğu mesleki kariyer, zamanla onun yaşam biçimi haline gelir ve önemli kararlarına yön vermeye başlar. Evlilik ve çocuk ile yeni bir kimlik kazanır, “çalışan kadın”dan “çalışan anne”ye dönüşür. Çalışan annelerin çalışma nedenlerinin başında ekonomik sebeplerin geldiği bilinmektedir. Daha sonrasında annelerin aldıkları eğitim doğrultusunda çalışma yaşamında yer aldıkları, bunun bilinçli bir seçimden ziyade zaten olması gereken doğal bir süreç şeklinde ilerlediği yönünde ortak bir görüş olduğu belirlenmiştir (Beyenal, 2019).

Kadınlara yönelik genel görüş ise, yerleşik hayata ve tarımsal üretime geçilmesiyle birlikte toplum yapısının kompleksleştiği ve işbölümünün arttığı; bu esnada da kadınların özel alana itilerek ücretsiz eviçi emek grubu olarak kodlandığı yönündedir (Sever, 2015). Toplumun geniş kesiminde kadın işgücüne yönelik geleneksel bakış tarzının halen kabul gördüğü gözlenmektedir. Toplumun ve kadının kendisine biçtiği öncelikli rol “eş ve anne” ve bunun doğal sonucu olarak “ev kadını”dır (Minibaş, 1998). Evin rutin işleri, iyi akraba ve komşu ilişkileri kurmak, gelecek nesilleri yetiştirme sorumluluğu da bu öncelikli rollerin devamı niteliğindedir. Bunların yanında koruyuculuk, çocuğa güven duygusu kazandırma ve topluma uyumlu bir kişilik geliştirme görevleri de ön plandadır (Demiriz ve Öğretir, 2007).

Hem iş hem eş hem de annelik rollerini birlikte yürütebilen kadınların çalışma hayatına katılmalarının olumlu etkileri olacağı savunulmaktadır. Ancak iş hayatını hiç deneyimlememiş veya uzak kalmış kadın aynı zamanda toplumsal hayatın birçok alanından da soyut ve kopuk kalmaktadır. Dolayısıyla kendini güçsüz ve günlük yaşamını etkileyecek kararların alımında etkisiz hissedebilmektedir (Adaman ve Keyder, 2006). Kısmi veya tam zamanlı fark etmeksizin iş yaşamında bir kadın ise ailesine, topluma ve nihayetinde kendisine maddi gelirin yanında manevi gelir de sağladığının farkındadır. Oluşan bu kendine ve topluma yetebilme duygusu

çalışan anneyi, iş yaşamında olduğu gibi aile yaşamında da daha etkin bir konumda tutacaktır. Yaklaşık son on beş yılda aktif iş hayatında bulunan kadınların yanı sıra çalışan annelerin sayısının da arttığı gözlemlenmiştir. Anneliğe adanmış bir hayat yerine ne annelikten ne de çalışma hayatından vazgeçen kadınların yoğun annelik ideolojisini aşınmaya uğratması ile annelik ideolojisi, yeni bir dengeye doğru ilerlemeye başlamıştır (Kılıç, 2019).

Annelik üzerine ortaya atılan farklı fikirler zamanla birtakım yeni tutumlar yaratır. Tutumlar, olumlu olduğunda destekleyici ve motive edici olmakla beraber, olumsuz olduğunda da suçlayıcı ve cezalandırıcı olabilmektedir (Aydın vd, 2017). Özellikle evlilik ve annelik söz konusu olduğunda tutumların daha çok olumsuz yönde olduğu, çalışan eş ve anne olarak geleneksel eş ve anne rollerinin daha ön plana çıkması gerektiği yönündedir (Özçatal, 2019). Günümüzde ekonomik gereklilikler ve kişisel tatmin olma ihtiyacı annenin çocuğu küçük yaştan itibaren çalışmasını normal kılmaktadır. Bu da annelik ve alışılan kadın rollerinin çatışmasına neden olarak suçluluk duygusu ve strese yol açmaktadır (akt. Ağaçhan, 2019). Çalışma hayatı ve ev ödevleri arasında sıkışıp kalan anne strese girer. Stresle baş etmede zorlandığında ise bu durumu evdekilere yansıtabilir. Birçok anne de, suçluluk duygusundan kurtulmak ve gündelik programını organize etmek için kendi normunu oluşturmaktadır. Aileden aileye, anneden anneye değişebilen kendi düzenine uygun çözümler aramaktadır.

Özek (2011)'e göre yaş arttıkça ev ve işte annenin taşıdığı sorumlulukların artması, yaşadığı olumsuz olayların birikiminin sonucunda iş stresiyle başa çıkma becerisinin azalması ve kendini daha fazla tükenmiş hissetmesi çalışan annelere yönelik olumsuz tutumları tetiklemektedir. ‘Her şeyi kusursuz yapmaya çalışan kadın, en çok kendisine eksik kalmıştır.’ sözünü Mehdiyev, (2019) iş, eş, çocuk üçgeninde kalmış anneyi vurgulayarak annenin tüm aile bireylerinin hayatına yetişmesine karşın kendisine yetişememesine dikkat çekmiştir.

Mehdiyev (2019) yine kadınlar için oldukça önemli bir noktaya değinmiştir: “Mesele çocuk büyütme değil insan yetiştirme” ise eğer şüphesiz ki bu konunun öznesi çocuk ancak başkahramanı kadındır” Çünkü çevremizdeki şu an her kadın, ya anne ya da anne adaydır. Haliyle önce kadın sonra da anne olarak yeni nesilleri şekillendirmeye devam eder. Gücünün el verdiğince çocuğuna en iyisini sunmaya çalışır. Çalışan bir anne, çocuğu için zaman zaman izin kullanma, işe ara verme veya bırakma kararı alabilir. Bu kararı almasında genellikle çocuğun bakımı etkili olsa da amaç, aslında çocuğu güçlü bir anne-çocuk bağı ile yetiştirmektir. Kadınlar çalışma hayatında çoğunlukla erkeklerle aynı sorumlulukları alsalar da çocuk bakımı söz konusu olduğunda ise geleneksel roller ve kültürel yaklaşımların da etkisiyle sorumluluk

anneye düşer (Nomaguchi vd., 2005). Yakın zamanda baba figürüne karşı tutum, toplumsal cinsiyet rollerinin etkisiyle de değişmeye başlamıştır. Anne-baba olarak çocuğun sorumluluklarını birlikte üstlenen bir anlayış evrilmiştir. Gerek annenin içgüdüsel kodları gerek toplumun kalıp yargıları ise anneyi çocuk bakımı konusunda her zaman babanın bir adım önde konumlandırmıştır ve vicdani yük yine anneye atfedilmiştir.

Cüceloğlu (2003) anne çocuk bağının, çocuk bakımdan daha kritik öneme sahip olduğunu şu sözlerle ifade etmiştir: “Çocuğuyla iyi bir iletişimde olan anne çocuğa güven ve huzur sağlar. Çocuk kendini içtenlikle ifade eder ve bu sayede de anne çocuğunu daha iyi tanır ve anlar” (akt. Ağaçhan, 2019).

Anne-çocuk arasında duygusal ve psikososyal gelişimin yanında bebeğin doğduğu ortam ve hayat standartlarını oluşturan sosyoekonomik ve sosyodemografik özellikler de çevrenin anneye bakış açısını ve tutumunu belirleyici etmenlerdendir. İnsanlar yaş, cinsiyet, meslek, medeni durum, çocuk sahibi olma ya da olmama gibi etmenlerle çalışan annelere yönelik tutum benimseyebilmektedir.

## **2. BULGULAR VE ARAŞTIRMALAR**

### **Materyal ve Yöntem**

#### **Araştırma Deseni**

Bu çalışma; annelerin çalışmasına yönelik tutumların ve bu tutumları etkileyen faktörlerin belirlenmesi amacıyla tanımlayıcı olarak yapılmıştır.

#### **Çalışma grubu ve katılımcılar**

Araştırmanın çalışma grubunu 18-65 yaş aralığındaki yetişkin bireyler oluşturmuştur. Araştırmaya katılmayı kabul eden ve ulaşılabilen 226 yetişkin veri toplama formunu doldurmuştur. Katılımcıların demografik bilgilerine ilişkin dağılımları Tablo 1’de gösterilmiştir.

**Tablo 1.** Katılımcıların sosyo-demografik özelliklerine göre dağılımı (N=226)

Değişken	n	%	Değişken	n	%
<b>Cinsiyet</b>			<b>Eğitim düzeyi</b>		
Kadın	146	64,6	Ortaokul	2	0,8
Erkek	80	35,4	Lise	18	8,0
<b>Yaş</b>			Üniversite ve üzeri	206	91,2
18-27	85	37,6	<b>Aile Yapısı</b>		
28-37	38	16,8	Çekirdek	188	83,2
38-47	52	23,0	Geniş	18	8,0
48-57	51	22,6	Ayrılmış	9	4,0
<b>Medeni Durum</b>			Yalnız	11	4,8
Evli	123	54,4	<b>Çocuk Sayısı</b>		
Bekar	103	45,6	1	44	19,5
<b>Meslek</b>			2	60	26,5
Çalışmıyor	69	30,5	3	28	12,4
Kamu personeli	89	39,4	Çocuğum yok	94	41,6
İşçi	17	7,5			
Emekli	18	8,0			
Serbest meslek	33	14,6			

Tablo 1 incelendiğinde; araştırma örnekleminin %64,6’sını kadınlar, %35,4’ünü ise erkekler oluşturmaktadır. Araştırma kapsamına alınan yetişkinlerin %37,6’sı 18-27 yaş aralığında olup yarısından fazlası (%54,4) evlidir. Araştırmaya alınanlar arasında; kamu personeli (%39,4), üniversite ve üzerinde eğitim gören (%91,2), çekirdek aile yapısına sahip olanlar (%83,2) ve çocuğu olmadığını belirtenler (%41,6) ilk sırada yer almaktadır.

### Veri Toplama Araçları

Araştırmanın verileri, 15 Eylül-15 Ekim 2022 tarihleri arasında araştırmacılar tarafından hazırlanan anket formu Google Form aracılığıyla çevrim içi elde edilmiştir. Katılımcılara çalışma hakkında bilgi verilmiş olup araştırmanın amacı, araştırmadan elde edilen bilgilerin bilimsel amaçlar dışında kullanılmayacağı, bilimsel etik kuralları çerçevesinde gizlilik içinde değerlendirileceği ve başka bir amaçla kullanılmayacağı belirtilmiştir. Araştırmaya katılımda gönüllülük esas alınmıştır.

Bu araştırmada veri toplama araçları olarak, araştırmacılar tarafından geliştirilen Kişisel Bilgi Formu ve “Annelerin Çalışmasına Yönelik Tutumlar Ölçeği” kullanılmıştır.

**Kişisel Bilgi Formu:** Kişisel Bilgi Formu araştırmaya katılanların; cinsiyet, yaş, medeni durum, meslek, eğitim düzeyi, aile yapısı, sahip olduğu çocuk sayısı gibi sosyo demografik özellikleri hakkında bilgi edinmek amacıyla araştırmacılar tarafından hazırlanmış bir formdur.

“**Annelerin Çalışmasına Yönelik Tutum Ölçeği**”: Aydın ve arkadaşları (2017) tarafından geliştirilen ölçek çalışan annelere yönelik tutumların değerlendirilmesini amaçlayan 21 maddeden oluşan likert tipte (1= kesinlikle katılmıyorum, 2=katılmıyorum, 3=kararsızım, 4=katılıyorum 5=kesinlikle katılıyorum) bir ölçektir. Ölçek; Önyargı/Stigma, Özerklik/Bağımsızlık, Aile ve Sosyal Uyum ile Annelik Becerileri olmak üzere 4 faktörlü bir yapıya sahiptir. Ölçekten alınabilecek en düşük puan 21, en yüksek puan 105 olup, ölçekten alınan yüksek puanlar annelerin çalışmasına yönelik olumlu tutumlara sahip olduğunu göstermektedir.

### **Verilerin Analizi**

Verilerin analizinde SPSS 22 programı kullanılmıştır. Annelerin çalışmasına yönelik tutumların ve bu tutumları etkileyen faktörlerin belirlenmesi amacıyla yapılan çalışmada, verilerin normal dağılıma uygunluğunun belirlenmesi amacıyla çarpıklık ve basıklık değerleri hesaplanmıştır. Annelerin çalışmasına yönelik tutum ölçeği toplam puanına ilişkin çarpıklık (.543) ve basıklık (.195) katsayılarının -1 ile +1 aralığında yer aldıkları görülmüştür (Tabachnick ve Fidell, 2013). Elde edilen sonuçlar dağılımların normal kabul edilebilecek sınırlarda olduğunu gösterdiğinden, ortalamaların karşılaştırılması amacıyla İlişkisiz Örneklemeler İçin Tek Faktörlü Varyans (ANOVA) ve t-testi analizinden yararlanılmıştır.

### **BULGULAR**

Annelerin çalışmasına yönelik tutumların (n=226) **sosyo-demografik özelliklere göre** değerlendirilmesi amacıyla yapılan çalışmadan elde edilen sonuçlar aşağıda yer almaktadır.

**Tablo 2.** Katılımcıların Annelerin Çalışmasına Yönelik Tutum Ölçeği'nden aldıkları puanlara ilişkin ortalama, standart sapma, minimum ve maksimum değerleri

Ölçek (n=180)	Ortalama	SD	Min.	Mak.
<b>Annelerin Çalışmasına Yönelik tutum</b>	57.89	8.19	41.00	84.00
<i>Önyargı/Stigma</i>	10.05	3.45	5.00	21.00
<i>Özerklik/Bağımsızlık</i>	18.40	4.62	10.00	25.00
<i>Aile ve Sosyal Uyum</i>	18.59	3.83	12.00	30.00
<i>Annelik Becerileri</i>	10.83	3.56	5.00	23.00

Analiz sonuçlarına göre araştırma kapsamına alınan yetişkinlerin (n=226) Annelerin çalışmasına Yönelik Tutum ölçeğine ilişkin puan ortalamaları 57.89 (SD=8.19) olup, katılımcıların annelerin çalışmasına yönelik tutumları olumlu düzeydedir.

**Tablo 3.** Annelerin çalışmasına yönelik tutumların çeşitli değişkenler açısından analiz sonuçları

Analiz sonuçlarına göre, cinsiyet önyargı/stigma ( $t= 3.959, p<.05$ ) alt boyutunda anlamlı farklılık oluşturmaktadır. Erkeklerin annelerin çalışmasına yönelik önyargısı kadınlardan daha fazladır. Katılımcıların yaşı özerklik/bağımsızlık ( $F= 2.827, p<.05$ ) alt boyutunda anlamlı farklılık oluşturmaktadır. 48-57 yaş aralığındaki katılımcıların bağımsızlık düzeyi ( $17.17\pm 4.51$ ) en düşük, 28-37 yaş arasındakilerin ( $19.94\pm 4.77$ ) en fazladır. Aynı şekilde medeni durum aile ve sosyal uyum alt boyutunda ( $t= .121, p<.05$ ) anlamlı bir farklılık oluşturmakta olup evli olanların aile ve sosyal uyum puanları daha yüksektir.

Araştırmaya alınanların eğitim düzeyleri ile annelerin çalışmasına yönelik ölçeği alt boyutları arasında anlamlı bir farklılık bulunmamaktadır. Buna karşın üniversite ve üzeri eğitim alanların ön yargıları ( $9.94\pm 3.42$ ) ve annelik becerileri ( $10.67\pm 3.54$ ) en düşük bulunmuştur. Araştırmaya katılanların meslekleri ile önyargı/stigma ( $t= 3.232, p<.05$ ) alt boyutunu arasında anlamlı bir farklılık belirlenmiştir. Buna göre emekli katılımcıların önyargı puanları ( $8.88\pm 2.47$ ) daha yüksek olarak belirlenmiştir.

Çalışma kapsamına alınan katılımcıların aile yapıları ile annelerin çalışmasına yönelik ölçek alt boyutlarında anlamlı bir farklılık tespit edilmemiştir. Yalnız yaşayan katılımcıların önyargı puanları ( $9.72\pm 4.00$ ) diğer aile yapısına sahip katılımcılardan daha düşüktür. Özerklik ( $18.11\pm 5.08$ ) ile aile ve sosyal uyum ( $17.11\pm 3.55$ ) alt boyutunda ayrılmış olan kişilerin puanları, annelik becerileri alt boyutunda ( $10.71\pm 3.60$ ) ise çekirdek ailede yaşayanların puanları daha düşüktür. Araştırmaya katılanların sahip oldukları çocuk sayıları annelerin çalışmasına yönelik ölçek alt boyutlarında anlamlı bir farklılık tespit edilmemiştir. Çocuğu olmayan katılımcıların önyargı puanları ( $9.68\pm 3.83$ ) diğer katılımcılardan daha düşüktür. Özerklik ( $17.56\pm 4.48$ ) ve annelik becerileri alt boyutunda ( $10.38\pm 3.49$ ) iki çocuğa sahip olanların, aile ve sosyal uyum alt boyutunda üç çocuğa sahip olanların puanları daha düşüktür.

## **ARAŞTIRMALAR**

Amerika'da yapılan bir araştırmaya göre annelerin yoğun annelik ideolojisine uygun inançlara sahip oldukları ve çocuk sahibi olmayı kutsal, iyi gibi olumlu kavramlarla tanımladıkları ortaya çıkmıştır (Hays, 1996).

Ekonomik Kalkınma İşbirliği Örgütü (Organisation for Economic Co-operation and Development)'nin 2018 yılında yayınladığı raporda, 0-14 yaş arası en az bir çocuk sahibi olan kadınların işgücüne katılım oranı 2004 yılında % 21 iken 2013 yılında 9 puan artışla % 30 oranına ulaşmıştır. Ek olarak kadınların annelik ve çalışma hayatını bir arada yürütmeyi tercih

oranları artış eğilimine girmiştir ve özellikle yüksek eğitim seviyesine sahip kadınlarda bu oran(% 65,5) çok daha yüksektir(OECD, 2018a.).

Türkiye İstatistik Kurumu'nun araştırmasına göre, okuryazar olmayan kadınların işgücüne katılım oranı %12,4, lise altı eğitilmiş kadınların işgücüne katılım oranı %24,1, lise mezunu kadınların işgücüne katılım oranı %29,9, mesleki veya teknik lise mezunu kadınların işgücüne katılım oranı %37,0 iken yükseköğretim mezunu kadınların işgücüne katılım oranı %65,6 oldu(TÜİK, 2021).

Ulutaş (1999)'ın yapmış olduğu araştırmada, annenin iş saatlerinin düzensiz olması, sürekli seyahat etmesi, tehlikeli işlerde çalışması, evde geçirilen vaktin az olması ve gece nöbetlere gitmesi çocuğun ailesine karşı kaygı duymasına neden olur. Bu nedenle çalışan annenin çocuğu ile sınırlı olan vaktini nitelikli geçirmesi önem arz etmektedir.

### **3.SONUÇ**

#### **Tartışma**

Bu çalışmada Türkiye genelinde annelerin çalışmasına yönelik tutumların bazı sosyodemografik özelliklere göre karşılaştırması yapılmıştır. Yöneltilen sorular bazında değerlendirildiğinde; "Çalışmak, anneleri yaşam karşısında daha güçlü yapar" sorusuna katılımcıların %85,9'u olumlu yanıt vermiştir. Araştırmanın girişinde değindiğimiz çalışma hayatına atılan annenin kendine ve topluma yetebilme duygusu özgüven yaratır. Bu sayede anne, yaşamın zorluklarıyla daha kolay mücadele eder ve toplumun gözünde olumlu bir tutuma sahip olur.

"Çalışan anneler çocuklarına yeterli vakit ayıramaz" öncülünde ise kadın katılımcıların çoğunlukla işaretlediği "kesinlikle katılmıyorum" ve "katılmıyorum" yanıtları %53 iken erkek katılımcıların çoğunlukta işaretlediği "kesinlikle katılıyorum" ve "katılıyorum" yanıtları %31 ve "kararsızım" seçeneğini işaretleyenlerin oranı %16'dır. Kadınlar ve erkeklerin bu hususta zıt fikirlere sahip olduğu sonucuna ulaşılmıştır. "Çalışan annelerin çocukları sık hastalanır" sorusuna verilen cevaplarda ise %79 olumsuz ifadelerin yer aldığı seçenekler işaretlenmiştir. Dolayısıyla hem kadın hem erkek katılımcılar, çocuğun sık hastalanmasının annenin çalışmasıyla ilgili olmadığı konusunda hemfikirdir.

Ülkemizde kadının çalışmasına etki eden faktörleri inceleyen çalışmalar gözden geçirildiğinde; eğitim eksikliği, kocanın yaklaşımı, çocuk bakımı ve ev işlerinin önemli olduğu gözlenmektedir (Kuzgun ve Sevim, 2004). Araştırmada elde edilen bulgulara göre erkeklerin kadınlara göre

annelerin çalışmasına yönelik önyargıları daha fazla olması bu çalışmalarını destekler niteliktedir. Bulgulardan ulaştığımız diğer bir sonuç ise genç ve bekar erkek katılımcıların bağımsızlık düzeyi en yüksek, aile-sosyal uyum değişkeni en düşüktür. Ek olarak aynı yaş grubunun kadın katılımcılarla beraber çalışan annelere ön yargısı en düşüktür. Çalışmanın genelinde genç ve çocuk sahibi olmayan bireylerin annelerin çalışmasına oldukça pozitif yaklaştığı tespit edilmiştir. Evli ve çocuk sahibi katılımcıların ise aile sosyal uyum değişkeni en düşük puanı, 3 çocuk ve daha fazlası olan aileler almıştır. Çalışma hayatı, ev ve çocukları organize edemediğini hissettiği durumlarda annenin stres düzeyinin artması olasıdır. Bu stres ev ve aile ilişkilerine yansiyabilir. Üye sayısı fazla olan ailelerin etkileşim gücü de fazla olduğu için uyum problemlerinin daha sık yaşanması öngörülmektedir.

### **ÖNERİLER**

- Çalışan annelere yönelik önyargılı tutumun giderilmesi için toplumun her yaş grubuna yönelik bilgilendirme çalışmaları ve seminerler düzenlenmeli,
- Özel sektörde çalışanlar için iş ve aile hayatını uyumlulaştırmaya yönelik doğum izni, ebeveynlik izni ve kısmi süreli çalışma olanakları sunulabilir,
- Açık iletişimin olduğu ve olumlu eleştirilerin de yapılabileceği bir iş ortamı sağlanabilir,
- Okul öncesi eğitim kurumlarda erken çocuk bakım hizmetleri genişletilebilir,
- Kreş ve okul öncesi yuvaların çocuğun aile ve aile büyükleriyle daha dinamik bir iletişim kurulabilir,
- Aile danışmanlığı hizmeti toplumda bilinçlendirilebilir ve yaygınlaştırılabilir,
- Günümüz şartları kadınları iş hayatına atılmaya teşvik etmekte ve kadın istihdamının artmasıyla toplumsal hayat da değişmektedir. Toplumun norm ve devletin politikaları bu gelişimlere yönelik adımlar atarsa mutlu bireyler, aileler, toplumları oluşturabilir.

## **6 YAŞ ALTINDAKİ ÇOCUKLARDA EV KAZALARININ İNCELENMESİ**

**Uzm. Dr. Mehmet Emin PARLAK (Orcid ID: 0000-0002-3115-6812)**  
Kahta Devlet Hastanesi, Çocuk Sağlığı ve Hastalıkları Bölümü, Kahta, Adıyaman

### **ÖZET**

Çocuklar erken yaşlarda henüz gelişimlerini tamamlamadıkları için, ev içinde kazalara ve travmalara yatkındır, bu yüzden ebeveynlerin dikkatli olması ve çocukları kazalara karşı korumaları gerekmektedir. Bu çalışmamızda 6 yaş altındaki çocuklarda ev kazalarının sıklığını ve kaza çeşidini araştırmayı amaçlamaktayız. Araştırma Kahta devlet hastanesinde çocuk polikliniğine başvuran 100 anne ile yapılmıştır. İstatiksel analiz SPSS kullanılarak yapılmıştır. Araştırmada her 10 çocuktan birinin ev kazasına marus kaldığı ve ev içinde en sık düşmelere bağlı olarak basit yaralanmalar olduğu görülmüştür. Kazaları arttıran en önemli neden çocuk sayısının fazla olması olarak görülmüştür. Bu çalışmamızın sonucunda ailelerin ev kazaları hakkında bilgilendirilmesi gerektiği, özellikle 6 yaş altında çocuğu olan annelerin her poliklinik başvurusunda eğitilmesi gerektiğini görmekteyiz. Ev kazaları önemli bir halk sağlığı sorunu ve bilgilendirme ile bu kazalar en aza düşürülebilir.

**Anahtar kelimeler:** Ev kazaları, çocuklarda ev kazaları, ev kazalarında önlem

**INVESTIGATION OF HOME ACCIDENTS IN CHILDREN UNDER 6 YEARS OLD****ABSTRACT**

Since children have not completed their development at an early age, they are prone to accidents and traumas at home, so parents need to be careful and protect their children against accidents. In this study, we aim to investigate the frequency and type of home accidents in children under the age of 6 years. The research was conducted with 100 mothers who applied to the pediatric outpatient clinic in Kahta state hospital. Statistical analysis was performed using SPSS. In the study, it was observed that one out of every 10 children suffered from a home accident and the most common injuries were simple injuries due to falls. The most important reason increasing the accidents was seen as the high number of children. As a result of this study, we see that families should be informed about home accidents, especially mothers with children under the age of 6 should be educated at each polyclinic application. Home accidents are an important public health problem and these accidents can be minimized by informing the parents.

**Keywords:** Home accidents, home accidents in children, prevention in home accidents

## **GİRİŞ**

Dünya Sağlık Örgütü'ne göre; Aniden ve kişinin dışında, plansız bir şekilde meydana gelen, fiziksel ve ruhsal zarara yol açan durumlar 'kaza' olarak tanımlanmaktadır. Yaralanma, “insan vücudunun fizyolojik tolerans eşiğini aşan miktarlarda enerjiye aniden maruz kalması veya bir veya daha fazla hayati unsurun eksikliğinden kaynaklanan fiziksel hasar” olarak tanımlanmaktadır. Yaralanmalar, ölüm ve sakatlığın önde gelen nedenleri arasındadır. Tüm yaralanma türlerinin ortak temel nedenleri, sosyoekonomik ve çevresel belirleyicileri vardır. Kasıtsız yaralanmaların başında trafik kazaları, boğulma, zehirlenme, yanıklar ve düşme gelmektedir (1). Çocukların yaşadığı istenmeyen yaralanmalar da önemli bir küresel sağlık sorunudur. Kazalarda önemli bir yere sahip olan ev yaralanmaları, bir evde (çocuk odası, oturma odası, mutfak, banyo vb.) veya ona ait bir ortamda (bahçe, garaj vb.) meydana gelen olaylar olarak tanımlanabilir (2). Ev kazaları tüm yaş gruplarında meydana gelebilir, ancak çocuklar ve yaşlılar bu kazalara karşı daha hassastır. Çocuklar kendilerini kazalardan koruyacak zihinsel ve fiziksel düzeyde değildir. 0-6 yaş arası çocuklar, dünyalarını keşfetme istekleri nedeniyle merak duygusuna sahiptirler. Gelişimsel olarak kendilerini koruyamadıkları için yaralanmaya yol açabilecek eylemleri değerlendiremezler (3). Çocuklar yaralanmaya karşı özellikle savunmasızdır ve yaralanmayı önlemek için özel ilgiye ihtiyaçları vardır. Bu nedenle yaralanmaları önlemek ve güvenli bir yaşam alanı sağlamak için koruyucu önlemler almak yetişkinlerin sorumluluğundadır. Yaralanmalar ve şiddet, tüm ülkelerde başlıca ölüm ve hastalık yükü nedenidir; ancak, ülkeler arasında veya içinde eşit olarak dağılmamıştır. Bazı insanlar doğdukları, büyüdükleri, çalıştıkları, yaşadıkları ve yaşlandıkları koşullara bağlı olarak diğerlerinden daha savunmasızdır. Çocukların yetersiz yetişkin gözetimi, yoksulluk gibi sağlığın geniş toplumsal belirleyicileri; Güvenli olmayan barınma, alkole, uyuşturucuya, ateşli silahlara, bıçaklara ve böcek ilaçlarına kolay erişim, çocuklar için kaza riskini artıran faktörlerdir. Çocuklar erken yaşlarda henüz gelişimlerini tamamlamadıkları için, ev içinde kazalara ve travmalara yatkındır, bu yüzden ebeveynlerin dikkatli olması ve çocukları kazalara karşı korumaları gerekmektedir(4). Bu çalışmamızda 6 yaş altındaki çocuklarda ev kazalarının sıklığını ve kaza çeşidini araştırmayı amaçlamaktayız.

## **ARAŞTIRMA VE BULGULAR**

Araştırma kesitsel ve betimsel bir çalışmadır. Araştırma, Adıyaman ili Kahta ilçesinde 2021 yılında gerçekleştirilmiştir. Araştırmanın evrenini Kahta Devlet Hastanesi polikliniğine

başvuran 0-6 yaş arası çocukları olan ebeveynler oluşturmuştur. Çalışmaya %95 güven düzeyi ve 0,05 hata payı ile 100 anne dahil edilmiştir. Veri toplama aracı olan anket formu kullanılmış ve veriler yüz yüze görüşme yoluyla toplanmıştır. Katılımcılardan onam formu alındı.

Araştırmaya %30'u anne, %69'u baba ve %1'i bakıcı olmak üzere 100 kişi katılmıştır. Annelerin yaş ortalaması  $30 \pm 5$ , babaların yaş ortalaması  $35 \pm 5$  idi. Annelerin %28'i yükseköğretim mezunu, babaların %40'ı lise mezunudur. Annelerin %28'i çalışıyor. Ailelerin %32'sinin 2 çocuğu varken, çocukların %55'i 2-5 yaş arasındadır. Araştırmaya katılan ailelerin %45'i apartmanda yaşamaktadır. Çocukların birincil bakım verenleri %65 anne, %18, akraba ve %12 bakıcıdır. Ev kazası geçiren çocukların sıklığı %11'dir. Ev kazası geçirenlerin ortalama kaza sayısı 2'dir. En sık evde (%44) salonda ve annesi olmayan bakıcıların yanında (%60) ev kazası geçirildi. En sık rastlanan kaza türü (%38) ev eşyalarının üzerinden kayarak veya takılarak düşmektedir. Bu kazalar sonucunda 7 çocuk yatarak tedavi gördü ve ortalama 5 gün tedavi gördü.

1 yaş grubunda en sık ev kazası yüksekten düşme, 2-3 ve 4 yaş grubunda en sık ev kazası kayarak veya tökezleyerek düşme, 5 yaşındaki grup tökezleyerek veya kayarak ve bir şeylere çarparak düşüyor. 6 yaş grubunda en sık ev kazası kesici ve delici alet yaralanmaları nedeni ile oluyor. Yüksekten düşme, tökezleme ve düşme, cisimlere çarpma, elektrik çarpması, sıcak su ile yanma vakalarının ortalama görülme yaşı 2 ile 3 yıl arasında değişirken; boğulma, düşme tehlikesi için 4 ile 6 yaş arası daha sık görülmektedir.

## **TARTIŞMA**

İnsan yaşamının ilk altı yılı çocukların oldukça aktif olduğu bir dönem olarak kabul edilir. Bu dönem meydana gelen ev kazaları ve buna bağlı yaralanmalar için önemlidir. Çalışmamızda ev kazası geçiren çocukların sıklığı %11 idi. Türkiye'de yapılan çalışmalarda annelerin bildirdiği ev kazası oranları sırasıyla %15 ile %70 arasında değişmektedir (5,6,7). Çalışmamızda ev kazaları en sık (%44) oturma odasında meydana geldi. Benzer şekilde diğer çalışmalarda da en fazla kaza oturma odası ve mutfakta meydana gelmiştir. Ev kazalarının en çok oturma odası, oturma odası veya mutfakta meydana gelmesinin nedeni, ailelerin zamanlarının çoğunu burada geçirmeleri olabilir. Oturma odası, ebeveynler için bir dinlenme yeri ve aynı zamanda çocuklar için bir oyun ve eğlence alanıdır. Çeşitli aktiviteler için kullanıldığından çocuklar için kaza alanı olmaktadır(8,9).

En sık rastlanan kaza türü (%38) ev eşyalarının üzerinden kayarak veya takılarak düşmektedir. Benzer şekilde başka çalışmalarda da en sık görülen kaza tipinin düşme olduğu saptanmıştır (10,11). Ev kazalarının çocukların yaşlarına göre dağılımı incelendiğinde en sık düşmeler 1 yaş grubunda yüksekte düşme, 2, 3 ve 4 yaş gruplarında takılıp kayarak düşme, düşerek cisimlere çarpma olarak sıralanıyor. 5 - 6 yaş grubunda ise kesici ve delici aletlerle yaralanma idi. Düşme, çarpma, elektrik çarpması ve yanık kazalarının ortalama görülme yaşı 2 ila 3 yaş arasında iken, boğulma tehlikesi, büyük nesnenin düşme ve kesilme yaşları ortalama 4 ila 6 yaş arasındadır.

## **SONUÇ**

Ev kazaları önlenabilir durumlardır. Anneler ve diğer tüm bakıcılar özel gruplardır. Verilebilecek her türlü bilgiye açıktırlar. Çocukları her türlü riskten korumak ve sağlıklarını iyileştirmek için önlemleri öğrenmek ve uygulamak konusunda savunmasız gruplardır. Bu, önlenabilir sağlık sorunları olan ev kazaları hakkında farkındalık yaratmak için bir fırsattır. Annelerin düşme başta olmak üzere tüm ev kazaları konusunda sağlık, eğitim kurumları ve iletişim kanalları aracılığıyla bilgilendirilmesi öncelikli sağlık hedefleri arasında yer almalıdır.

### **ÖZET**

*Ginkgo Biloba L.* terapötik etkinliğe sahip birçok biyoaktif bileşen içeren ve en yaygın kullanılan doğal tıbbi bitkilerden biridir. *G. biloba* yaprak ekstresi, serebrovasküler ve periferik vasküler yetmezliğin yanı sıra demans ve Alzheimer hastalıklarında da kullanılmaktadır. Standardize *G. biloba* ekstresi üzerine yapılan çok sayıda araştırmada ekstresi içeriğinin yaklaşık %24 flavonol glikozit (%22-%27) ve %6 terpen lakton (%2.6-% 3.2 biolabid, %2.8-%3.4 Ginkgolid A, Ginkgolid B, Ginkgolid C, Ginkgolid J) olduğu yönündedir. Özellikle fenolik asitler, flavonoidler ve polifenollerin, insan metabolizmasında oluşan serbest radikalleri temizleyerek, ateroskleroz, diyabet ve kardiyovasküler hastalıklar gibi birçok hastalığa yol açan oksidatif hasarı azalttığı bilinmektedir. *G. biloba* ekstresi ve *G. biloba* ekstresi içeren farmasötiklerde fenolik bileşik kompozisyonunu belirlemeye yönelik farklı çalışmalar olmakla birlikte *G. biloba* ekstresinin antioksidan aktivitesinin belirlenmesine yönelik yapılan çalışma sayısı tatmin edici değildir. Bu nedenle çalışmada *G. biloba* ekstresinin antioksidan aktivitesi DPPH (2,2-Difenil -1-pikrilhidrazil) ve CUPRAC (bakır iyonu indirgeme) antioksidan kapasitesi yöntemleri kullanılarak belirlendi. Yapılan antioksidan testleri sonucunda *G. biloba* ekstresinin antioksidan kapasite sonuçları DPPH yöntemi için IC<sub>50</sub> 0.33 µg/mL, CUPRAC yöntemi için 0.53 mmol Trolox/g örnek olarak belirlendi.

**Anahtar kelimeler:** *Ginkgo Biloba L.*, antioksidan, DPPH, CUPRAC

**COMPARATIVE ANTIOXIDANT ACTIVITY STUDIES ON *GINKGO BILOBA L.*  
EXTRACT****ABSTRACT**

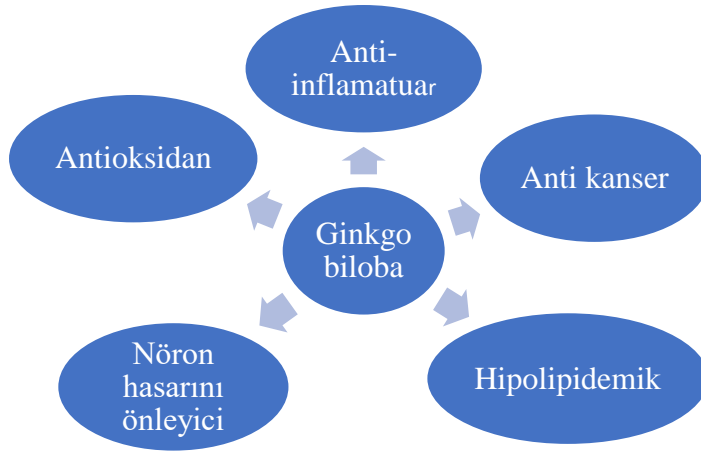

*Ginkgo Biloba L.* is one of the most widely used natural medicinal plants, containing many bioactive components with therapeutic efficacy. *G. biloba* leaf extract is used in cerebrovascular and peripheral vascular insufficiency and dementia and Alzheimer's disease. In many studies on standardized *G. Biloba* extract, approximately 24% flavonol glycoside (22%-27%) and 6% terpene lactone (2.6%-3.2% bilobalide, 2.8%-3.4% Ginkgolide A, Ginkgolide B, Ginkgolide C, Ginkgolide J). Especially phenolic acids, flavonoids, and polyphenols are known to reduce oxidative damage that causes many diseases, such as atherosclerosis, diabetes, and cardiovascular diseases, by scavenging free radicals formed in human metabolism. Although there are different studies to determine the phenolic compound composition in pharmaceuticals containing *G. biloba* extract and *G. biloba extract*, the number of studies to determine the antioxidant activity of *G. biloba* extract is not satisfactory. Therefore, in this study, the antioxidant activity of *G. biloba* extract was determined using DPPH (2,2-Diphenyl-1-picrylhydrazyl) and CUPRAC (cupric reducing antioxidant capacity) methods. As a result of the antioxidant tests, the antioxidant capacity results of *G. biloba* extract were determined as IC<sub>50</sub> 0.33 µg/mL for the DPPH method and 0.53 mmol Trolox/g sample for the CUPRAC method.

**Keywords:** *Ginkgo Biloba L.*, antioxidant, DPPH, CUPRAC

## 1. GİRİŞ

Ginkgoaceae familyasının üyesi olan *Ginkgo biloba* L. çok yaygın kullanılan doğal tıbbi bitkilerden biridir. Bu bitkinin tıbbi kullanımına dair ilk kayıtlar 16. Yüzyıla kadar uzanmaktadır. Günümüzde de standardize *G. biloba* ekstraktını içeren farmasötikler başta kulak çınlaması [1], kognitif bozukluk ve Alzheimer [2], retinal [3], kardiyovasküler [4], iskemi serebrovasküler [5], periferik vasküler [6] ve diyabetik nefropati [7] tedavisinde kullanılmaktadır.

Farmakolojik çalışmalar, *G. biloba*'nın anti-inflamatuar, antioksidan, anti kanser, nöron hasarını önleyici ve hipolipidemik [8] etkilere sahip olduğunu göstermektedir (Şekil 1).

**Şekil 1.** *G. biloba*'nın farmakolojik etkileri.

*G. biloba*'nın sahip olduğu önemli farmakolojik etkilerin nedeni, yapısında var olan biyoaktif bileşenlerdir. Standardize *G. biloba* ekstraktı esas olarak flavonoidler (serbest flavonoidler ve flavonoid glikozitler), terpen laktonlar (bilobalide, Ginkgolide A, Ginkgolide B, Ginkgolide C, Ginkgolide J vb.) ve fenolik asitlerden oluşur. Bunlardan flavonoidler ve terpen laktonlar genellikle başlıca biyoaktif bileşenler olarak kabul edilir [9].

**Şekil 2.** *G. biloba* 'nın başlıca biyoaktif bileşenleri.

Tüm dünyada olduğu gibi ülkemizde de Sağlık Bakanlığı onaylı *G. biloba* ekstraktı içeren tablet, kapsül solüsyon vb. değişik formda farmasötik ürünlere rastlamak mümkün.

Bunun yanında *G. biloba* standardize ekstraktı dünyada en yaygın şekilde kullanılan bitkisel ürünlerden ve/veya besin takviyelerinden biridir [10-13].

Günümüzde insanlar, iş yoğunlukları ve hızlı hayat tempolarına yardımcı olmak üzere besin takviyelerini tercih edebilmektedirler. Bu ürünlerin tercih nedenleri arasında, doğal oldukları için zararsız olduklarının düşünülmesi, hekim tarafından reçete edilmeden farklı yollarla kolay ulaşılabılır olması gösterilmektedir [14].

Ayrıca *G. biloba* içerdiği yüksek flavonoid içeriği ile de tercih edilmektedir. Gerçekleştirilen çalışmalar, flavonoid alımının kardiyovasküler hastalıklar ve farklı kanser türleri üzerine olumlu etkilerinin olduğunu göstermektedir [15,16].

Ne yazık ki flavonoidler insan vücudunda biyolojik olarak sentezlenemezler bu nedenle dışarıdan alınmalıdır. Ancak kişi başına toplam flavonoid tüketimi yetersiz ve/veya dengesiz beslenme nedeniyle dünya genelinde önemli farklılıklar göstermektedir. Bu nedenle besin takviyelerinin kullanımı son yıllarda giderek artmaktadır [17]. Market, internet vs. gibi çok farklı kanallarla ulaşılır olan bu ürünlerin güvenliği, kalitesi ve etkinliği sağlık yetkilileri ve sağlık profesyonelleri için büyük endişe kaynağı haline gelmiştir. Çünkü bu ürünlerin toplam

fenol, flavonoid ve antioksidan kapasite değerlerine ulaşmak her zaman mümkün olmamaktadır.

Diyet takviyesi endüstrisinde doğal ürünlere olan talep, dünyanın çeşitli yerlerinde büyük ilgi uyandırmaya devam etmektedir Öyle ki bu amaç için dünyada da büyük ölçekli *G. biloba* ekimi yapılmaktadır. S. Gafner tarafından rapor edilen 2018 yılındaki çalışmaya göre [18], *G. biloba* yaprak ekstraktının, 2013'te 118 milyon ABD doları olan Pazar payı, 2016'da 162 milyon ABD dolarına yükselmiştir. Canadian Phytopharmaceutical Corp verilerine göre, 2015 yılında Çinli üreticiler, *G. biloba* ekstraktının maliyetinin kilogram başına 150 ABD Doları ile 240 ABD Doları arasında olduğunu bildirmişlerdir. Bu nedenle *G. biloba* ürünleri ile çalışırken flavonal glkozit içeriğini arttırmak için, düşük maliyetli başka kaynaklar ile tağşiş edilip edilmediğinin kontrolü son derece önemlidir. Kalite güvencesi ve kalite kontrol standartları gereği, bitmiş ürünün imalatında uygun bitki bölümlerinin ve doğru botanik taksonun kullanılması hem ürünü kullanan tüketiciler hem de üretimi endüstrisi için son derece önemlidir.

Standardize EGb 761 ekstraktı kullanan ürünlerin etiketlerinde söz konusu değerler belirtilmelidir. Ancak dünya pazarında *G. biloba* ekstraktı içeren ürünlere ilişkin gerçekleştirilen araştırmalarda büyük ölçüde değişen konsantrasyonlarda miktarlar tespit edildiği farklı çalışmalarda rapor edilmektedir [19-21]. Bu durum etken maddenin daha ucuz ve kolay bulunabilir daha ucuz botanik malzemelerle karıştırılabileceğini ortaya koymaktadır. Tüm farmasötik ürünlerde olduğu gibi, bitkisel kaynaklı besin takviyelerinin de kalite kontrolü kritik öneme sahiptir. Ne yazık ki ekonomik bazı kaygılar nedeniyle söz konusu ürünlere hala tağşişe rastlanılmaktadır. Bu durum ürün güvenilirliği için büyük tehlike kaynağıdır [22,23].

Bu bilgiler ışığında çalışmada *G. biloba* ekstraktının antioksidan aktivitesi DPPH ve CUPRAC yöntemleri kullanılarak belirlendi. Çalışmanın ilerleyen bölümlerinde *G. biloba* ekstraktı içeren besin takviyeleri de çalışmaya dahil edilerek daha fazla sayıda örneğin antioksidan kapasitesi ve kimyasal kompozisyonu belirlenecektir. Böylelikle *G. biloba* ekstraktı içeren besin takviyelerinde herhangi bir tağşiş olup olmadığı araştırılacaktır.

## **2. MATERYAL ve METOD**

### **2.1. Kullanılan Kimyasallar**

*G. biloba* ekstrakt standardı, troloks (6-Hydroxy-2,5,7,8-tetramethylchroman-2-carboxylic acid), butil hidroksi tolüen-BHT (2,6-Di-tert-butyl-4-methylphenol), neokuproin (2,9-dimetil

1,10-fenantrolin), DPPH (2,2-Difenil -1-pikrilhidrazil) ve etanol Sigma Aldrich firmasından temin edildi.

## **2.2. Kullanılan Antioksidan Tayin Yöntemleri**

### **2.2.1. CUPRAC Yöntemi**

*G. biloba* standartının antioksidan aktivitesini ölçmede kullanılan ilk yöntem Bakır (II) iyonu indirgeme esaslı antioksidan kapasite tayin yöntemi olan CUPRAC'dır [24]. Bunun için  $1.0 \times 10^{-2}$  M 1 mL bakır (II) klorür çözeltisi,  $7.5 \times 10^{-3}$  M neokuprin çözeltisi ve 1 M (pH=7) amonyum asetat tamponu sırasıyla test tüplerine eklendi. Tüplere etanol de hazırlanmış *G. biloba* standartı ve trolox eklenerek son hacim 4.1 mL olacak şekilde üzerleri su ile tamamlandı. Tüpler 30 dakika oda sıcaklığında karanlıkta bekletildi ve 450 nm'de absorbansları ölçüldü. Çalışma üç paralel olacak şekilde gerçekleştirildi. Pozitif standart olarak troloks kullanıldı ve sonuçlar troloks ekivalanı olarak (mg TE/g ekstraktı) ifade edildi.

### **2.2.2. DPPH• radikali giderim aktivitesi tayini**

*G. biloba* standartının antioksidan aktivitesini ölçmede kullanılan ikinci yöntem olarak DPPH kullanıldı. Bu amaçla *G. biloba* standartı etanolde çözülerek 1 mg/mL konsantrasyonlarda stok çözeltiler hazırlandı. Etanol de hazırlanan 100 µl 0.2 mM DPPH radikal çözeltisi üzerine farklı konsantrasyonlarda (0- 1000 µg/ml) hazırlanan her bir *G. biloba* standartından 100 µL eklendi. Örneklerin absorbansı, 517 nm'de ölçüldü [25]. Her bir örneğin radikal süpürme aktivite yüzdeleri aşağıdaki eşitlik kullanılarak hesaplandı.

$$\% \text{ DPPH radikal giderme aktivitesi} = \{(A_0 - A_1)/A_0\} \times 100$$

$A_0$ : kontrol absorbansı;  $A_1$ : örnek absorbansı

Bütün testler üç kez tekrarlandı ve ortalama değerler hesaplandı. Daha sonra konsantrasyona karşı yüzde inhibisyon grafiği çizilerek  $IC_{50}$  değeri hesaplandı. Pozitif kontrol olarak BHT kullanıldı.

## **3.BULGULAR**

### **3.1. CUPRAC Yöntemi ile Elde Edilen Sonuçlar**

Antioksidan aktivite tayininde kullandığımız ilk yöntem, Apak ve arkadaşlarının geliştirdikleri CUPRAC yöntemi olup temel prensip antioksidanlar varlığında Cu (II) 'nin Cu (I)'e indirgemesidir. *G. biloba* standartının CUPRAC ile antioksidan aktivite tayin sonucu  $0.53 \text{ mmol} \pm 0.02$  Trolox/g örnek olarak belirlendi. Elde edilen bu değer *G. biloba* standartının standart olarak kullanılan antioksidanlar kadar etkili olduğu sonucunu gösterdi.

### 3.2. DPPH• Yöntemi ile Elde Edilen Sonuçlar

DPPH• radikali giderim aktivitesi tayininde temel prensip, DPPH• radikalinin, antioksidanların varlığında redoks tepkimesine göre süpürülmesidir. DPPH• radikal çözeltisine özgül olan koyu menekşe rengi antioksidanların varlığında zamanla açılır. Absorbans şiddetindeki azalma ise spektrofotometrik olarak ölçülür. *G. biloba* standartının DPPH• radikali süpürme aktivitesi incelediğinde, *G. biloba* standartının %92.4 gibi yüksek bir % inhibisyon değerine sahip olduğu belirlendi. Farklı konsantrasyonlarda bulunan % inhibisyon grafiği Şekil 3’de verildiği gibidir.

Şekil 3. % İnhibisyon grafiği

Serbest radikalleri %50 oranında gidermek için gerekli olan örnek konsantrasyonunu ifade eden IC<sub>50</sub> değeri hesaplanırken, örnek konsantrasyonuna karşılık gelen % inhibisyon grafiğinden elde edilen denklem kullanıldı. Elde edilen sonuçlar, *G. biloba* standartının IC<sub>50</sub> değerinin 0.33 ± 0.03 µg/mL olduğunu gösterdi. IC<sub>50</sub> değeri ne kadar düşükse o bileşiğin DPPH• radikalini giderme aktiviteside o kadar yüksektir. Bu nedenle *G. biloba* standartının yüksek antioksidan aktiviteye sahip olduğu görülmektedir.

### 4. SONUÇ ve DEĞERLENDİRME

*G. biloba* standardının antioksidan aktivitesi, CUPRAC ve DPPH yöntemleriyle belirlenmiş olup, sonuçlar Trolox ve BHT standart antioksidan maddelerle karşılaştırılarak değerlendirildi. Yapılan antioksidan testleri sonucunda DPPH için IC<sub>50</sub> 0,33 µg/mL, CUPRAC için ise 0,53 mmol Trolox/g ekstarkt olarak belirlendi. Elde edilen bu değerler *G. biloba* standardının yüksek antioksidan özellikte olduğunu kanıtladı. Elde edilen bu bulgular, planlanan çalışmanın öncü

verileri olup, çalışmanın detaylandırılması planlanmaktadır. Bu amaç için içeriğinde *G. biloba* ekstraktı olduğu belirtilen özellikle aktar ve web siteleri aracılığı ile temin edilen çok sayıda besin takviyeleri de çalışmaya dahil edilecektir. Söz konusu bu ürünlerin farklı ekstraksiyon yöntemleri ile elde edilen ekstraktlarının antioksidan kapasiteleri, toplam fenolik ve flavonoid içeriği tespit edilecektir. Bunun yanında kimyasal kompozisyonları farklı kromatografik yöntemlerle belirlenecektir. Böylelikle içeriğinde *G. biloba* ekstraktı olan besin takviyelerinin içeriği karşılaştırılacaktır.

**ÖZET**

Denge ve yürüyüş problemlerinin değerlendirilmesi, özellikle düşme riskinin belirlenmesi ve rehabilitasyon programının planlanması açısından gereklidir. Nörolojik ve ortopedik hastalıklarda, yaşlı bireylerde mobilite ve dengenin değerlendirilmesinde kullanılan birçok fonksiyonel test bulunmaktadır. Bilimsel araştırmalarda ve klinik uygulamalarda sıklıkla kullanılan bu testler genellikle öne yürüme, dönme ve adımlama gibi fonksiyonları değerlendirmektedir. Günlük hayatta kapı açmak, ani engellerden kaçınmak gibi durumlarda gerekli olan geri yürüme fonksiyonu öne yürümeden daha zordur. Görsel bilgi olmaksızın, alışılmış yürüme paterninden farklı bir fonksiyon gerektirdiğinden daha fazla kognitif yüklenme ve nöromuskuler kontrol gerektirmektedir. 3 metre geri yürüme testi nöromuskuler kontrol, propriosepsiyon, düşme riski ve dengeyi değerlendirmek için geliştirilmiş bir testtir. Fonksiyonel testlerin klinik uygulamada ve bilimsel araştırmalarda kullanılabilmesi için psikometrik özelliklerinin uygun olması gerekir. Bu derlemenin amacı farklı yetişkin populasyonlarda 3 metre geri yürüme testinin psikometrik özelliklerinin incelenmesidir. Literatür araştırmasında 3 metre geri yürüme testinin geçerlik ve güvenilirliğini araştıran çalışmalar incelendi. Genel tarama modeline göre ve ilgili literatürün sistematik derlenmesi ile gerçekleştirilen çalışma bulguları, “3 meter backward walk test” anahtar kelimeleri ile MEDLINE ve Google Scholar veri tabanlarında Ekim 2022 tarihine kadar yayınlanmış eserlerin taratılması ile ortaya konmuştur. Kriterlere uygun 7 çalışma değerlendirmeye alınmıştır. Bu çalışmalarda 3 metre geri yürüme testinin inme geçirmiş bireyler, yaşlı yetişkinler, demanslı bireyler, multiple sklerozlu bireylerde geçerlik ve güvenilirliği araştırılmıştır. Eş zamanlı geçerlik beş çalışmada incelenmiş, orta- yüksek korelasyon değerleri bulunmuştur. Test-tekrar test tutarlılığı yedi çalışmada incelenmiş ve yüksek olarak bulunmuştur (Sınıf içi korelasyon katsayısı=0,85-0,99). Değerlendiriciler arası tutarlılığı ise dört çalışmada incelenmiş ve yüksek bulunmuştur (ICC=0,83-0,99). 3 metre geri yürüme testinin multiple skleroz, inme, demans gibi nörolojik hastalıklarda ve yaşlı bireylerde geri yürüme hızını, mobilite ve denge performansını değerlendirmede kullanılabilecek geçerli ve güvenilir bir test olduğu belirlenmiştir.

**Anahtar Kelimeler:** Geri Yürüme, Geçerlilik, Güvenilirlik

**PSYCHOMETRIC PROPERTIES OF THE 3-METER BACKWARD WALK TEST IN  
DIFFERENT ADULT POPULATIONS: REVIEW****ABSTRACT**

Evaluation of balance and gait problems is necessary especially in terms of determining the risk of falling and planning the rehabilitation program. There are many functional tests used in the evaluation of mobility and balance in elderly individuals in neurological and orthopedic diseases. These tests, which are frequently used in scientific research and clinical applications, generally evaluate functions such as walking forward, turning and stepping. The backward walking function, which is required in situations such as opening a door and avoiding sudden obstacles in daily life, is more difficult than walking forward. Without visual information, it requires more cognitive load and neuromuscular control as it requires a different function from the usual walking pattern. The 3 meter backward walk test is a test developed to assess neuromuscular control, proprioception, fall risk and balance. In order to functional tests to be used in clinical practice and scientific research, their psychometric properties must be appropriate. The purpose of this review is to examine the psychometric properties of the 3 meter backward walk test in different adult populations. In the literature review, studies investigating the validity and reliability of the 3 meter backward walk test were examined. The study findings, which were carried out according to the general scanning model and by systematically compiling the relevant literature, were revealed by scanning the works published until October 2022 in MEDLINE and Google Scholar databases with the keywords "3 meter backward walk test". 7 studies that met the criteria were evaluated. In these studies, the validity and reliability of the 3 meter backward walk test were investigated in individuals with stroke, older adults, individuals with dementia, and individuals with multiple sclerosis. Concurrent validity was examined in five studies, and moderate-high correlation values were found. Test-retest consistency was examined in seven studies and found to be high.(Intraclass correlation coefficient=0.85-0.99) Inter-rater consistency was examined in four studies and found to be high (ICC=0.83-0.99). It has been determined that the 3 meter backward walk test is a valid and reliable test that can be used in neurological diseases such as multiple sclerosis, stroke, dementia, and in evaluating backward walking speed, mobility and balance performance in elderly individuals.

**Keywords:** Backward Walk, Validity, Reliability

## **GİRİŞ**

Denge; doğru postürü sağlama, bu postürün vücudun statik ve dinamik değişikliklerine uyum sağlayabilme ve planlı bir şekilde hareketi devam ettirebilme yeteneğidir. Denge statik ve dinamik olmak üzere ikiye ayrılır. Yürüyüş günlük yaşamda en fazla yaptığımız aktivitelerdendir ve dinamik dengenin kontrollü bir şekilde devamlılığını gerektirir. Fizyoterapide birçok hastada denge problemleri görülür ve bu problemler yürüyüşü de etkilemektedir. Literatüre bakıldığında ise birçok hastalıkta denge ve yürüyüş beraber değerlendirilmiştir (1, 2). Denge ve yürüyüş problemlerinin değerlendirilmesi, özellikle düşme riskinin belirlenmesi ve rehabilitasyon programının planlanması açısından gereklidir. Nörolojik ve ortopedik hastalıklarda, yaşlı bireylerde mobilite ve dengenin değerlendirilmesinde kullanılan birçok fonksiyonel test bulunmaktadır (3). Bilimsel araştırmalarda ve klinik uygulamalarda sıklıkla kullanılan bu testler genellikle öne yürüme, dönme ve adımlama gibi fonksiyonları değerlendirmektedir.

Günlük hayatta kapı açmak, ani engellerden kaçınmak gibi durumlarda gerekli olan geri yürüme fonksiyonu öne yürümeden daha zordur. Görsel bilgi olmaksızın, alışılmış yürüme paterninden farklı bir fonksiyon gerektirdiğinden daha fazla kognitif yüklenme ve nöromuskuler kontrol gerektirmektedir. Yapılan bir araştırma gösteriyor ki inme sonrası yürüyüşü ve dengeyi iyileştirmek için yararlı bir yöntem olarak bulunmuş, geleneksel tedaviye de uygulanabilen erişilebilir ve etkili bir rehabilitasyon eğitimi yöntemi olduğu belirtilmiştir (4). Geri yürümenin denge üzerine etkisinin araştırıldığı bir makalede geri yürüme eğitiminin, düşme riski yüksek olanlar arasında denge performansını artırmak için potansiyel yararlı bir araç olarak hizmet edebileceği gösterilmiştir (5).

3 Metre Geri Yürüme Testi (3MGYT) nöromuskuler kontrol, propriosepsiyon, düşme riski ve dengeyi değerlendirmek için geliştirilmiş bir testtir. İlk olarak Carter ve arkadaşları tarafından 2019 yılında geliştirilmiş, düşme riskini belirlemede kullanılacak tanısal doğruluğu yüksek bir test olduğu belirtilmiştir (6). Bu testte 3 metrelik işaretlenmiş düz bir zeminde katılımcıların arkasına bakmadan mesafeyi yürümeleri istenir. Test katılımcıya iyice anlatılır ve anladığından emin olunur. Katılımcıdan 3 metrelik mesafeyi geriye doğru en hızlı şekilde yürütmesi ve mesafe bitince durması istenir. Bu mesafeyi kaç saniyede yürüdüğü kronometre ile ölçülerek kaydedilir. Test üç kez tekrarlanır ve üç denemenin ortalaması alınarak kayıt edilir (6).

Fonksiyonel testlerin klinik uygulamada ve bilimsel araştırmalarda kullanılabilmesi için psikometrik özelliklerinin uygun olması gerekir. Farklı popülasyonlarda uygulanabilirliğinin

belirlenebilmesi için geçerliliği ve güvenilirliğinin yapılması gerekmektedir. 3MGYT'nin inme, multiple skleroz gibi çeşitli hastalıklarda geçerliliği ve güvenilirliği araştırılmıştır (7, 8). Ancak, 3MGYT'yi kullanmak isteyen klinisyenlere genel bir bakış sağlamak için yapılmış daha önce yapılmış bir derleme çalışmasına rastlanmamıştır. Bu derlemenin amacı 3MGYT'nin psikometrik özelliklerinin kanıtlandığı farklı yetişkin grupları tespit etmek, geçerlik ve güvenilirlikle ilgili sonuçları derlemektir.

## **METOD**

3 Metre Geri Yürüme Testinin yetişkin popülasyonunda geçerliliği ve güvenilirliği ile ilgili literatür taraması gerçekleştirildi. Genel tarama modeline göre ve ilgili literatürün sistematik derlenmesi ile gerçekleştirilen çalışma bulguları, “3 meter backward walk test” anahtar kelimeleri ile MEDLINE ve Google Scholar veri tabanlarında Ekim 2022 tarihine kadar yayınlanmış eserlerin taratılması ile ortaya koyuldu. Elde edilen çalışmalardan araştırma konusu ve amacına uygun olmayanlar ve tam metnine ulaşılamayan çalışmalar elendi. İki veri tabanındaki ortak makaleler belirlendi. Kriterlere uygun 7 çalışma değerlendirmeye alınmıştır.

### **Dahil Etme Kriterleri**

- Araştırma amacına ve konusuna uygun olması,
- Araştırmanın yetişkin popülasyonda yapılmış olması,
- 3 MGYT'nin geçerliliği ve güvenilirliğini araştırmış olması derlemeye dahil edilme kriterleridir.

### **Dışlanma Kriterleri:**

- Araştırmanın 18 yaş altı bireylerde gerçekleştirilmiş olması,
- Çalışmanın tam metnine ulaşılamaması,
- 3 MGYT'nin sonuç ölçümü olarak kullanılması ancak psikometrik özelliklerinin analiz edilmemesi dışlanma kriterleridir.

Çalışmaların istatistiksel sonuçlarını yorumlamak için tanınmış kılavuz puanlar kullanıldı. Pearson korelasyon katsayıları (r) için 0,1 ila 0,3 arasındaki puanlar zayıf, 0,4 ila 0,6 orta ve 0,7 ila 0,9 güçlü olarak kabul edildi (9). Sınıf İçi Korelasyon Katsayıları (ICC'ler) için 0,4'ten düşük puanlar zayıf, 0,4 ila 0,59 orta, 0,6 ila 0,74 iyi ve 0,75 ila 1,00 mükemmel olarak kabul edildi (10).

## **SONUÇLAR VE BULGULAR**

### **3 METRE GERİ YÜRÜME TESTİNİN (3MGYT) GEÇERLİLİĞİ**

#### **Eşzamanlı Geçerlilik**

İncelenen 7 çalışmanın hepsinde eşzamanlı geçerliliğe bakılmıştır.

İnmeli hastalarda yapılan araştırmada 3MGYT ile Berg Denge Ölçeği ( $r=-0,691$ ,  $p=0,001$ ) ve Zamanlı Kalk ve Yürü Testi ( $r=0,849$ ,  $p=0,001$ ) arasında güçlü bir korelasyon saptanmıştır (7). Hafif etkilenimli multiple skleroz hastalarında yapılan çalışmada 3MGYT ile Zamanlı Kalk ve Yürü Testi ( $r=0,968$ ,  $p=0,001$ ), Fonksiyonel Uzanma Testi ( $r=0,931$ ,  $p=0,001$ ), Zamanlı 25 Adım Yürüme Testi ( $r=0,879$ ,  $p=0,001$ ), Dinamik Yürüme İndeksi ( $r=-0,871$ ,  $p=0,001$ ), düşme hikayesi ( $r=0,932$ ,  $p=0,001$ ) arasında güçlü ilişki bulunmuştur (11). Multiple sklerozlu hastalarda yapılan başka bir çalışmada 3MGYT ve Zamanlı Kalk ve Yürü Testi ( $r = 0,374$ ,  $p=0,018$ ), 2 Dakika Yürüme Testi ( $r=0,319$ ,  $p=0,045$ ), 12 Madde Multiple Skleroz Yürüme Skalası ( $r=0,423$ ,  $p=0,007$ ) arasında anlamlı ilişki bulunmuştur (12). Yine Multiple sklerozlu ayaktan başvuran hastalarda yapılan başka çalışmada 3MGYT ile Zamanlı Kalk ve Yürü Testi ( $r = 0,814$ ;  $p<0,001$ ), Berg Denge ölçeği ( $r=-0,732$ ,  $p<0,001$ ), Dört Kare Adım Testi ( $r=0,644$ ,  $p<0,001$ ), Uluslararası Düşme Etkinlik Ölçeği ( $r=0,692$ ,  $p<0,001$ ), EDSS (Expanded Disability Status Scale) ( $r=0,692$ ,  $p<0,001$ ) arasında güçlü ilişki bulunmuştur (8). Toplumda yaşayan yaşlı yetişkinlerde yapılan çalışmada 3MGYT ile Zamanlı Kalk ve Yürü Testi ( $r= 0,649$ ,  $p<0,001$ ) arasında anlamlı ilişki olduğu belirtilmiştir (13). Demanslı yaşlı bireylerde yapılan çalışmada 3MGYT ile Zamanlı Kalk ve Yürü Testi ( $r= -0,82$ ,  $p<0,001$ ), 10 Metre Yürüme Testi ( $r=0,84$ ,  $p<0,001$ ), Berg Denge Ölçeği ( $r=0,60$ ,  $p<0,001$ ) arasında anlamlı ilişki bulunmuştur (14). Subakut ve kronik inmeli bireylerde 3MGYT ile GAITRite® yürüyüş analizi sistemi ile yapılan test arasında subakut inmeli bireylerde ( $ICC=0,96$ ) ve kronik inmeli bireylerde ( $ICC=0,97$ ) arasında anlamlı ilişki bulunmuştur (15).

Bu sonuçlar inmeli, multiple sklerozlu, hafif etkilenimli multiple sklerozlu, ayaktan multiple sklerozlu, demanslı bireylerde ve toplumda yaşayan yaşlı yetişkinlerde 3MGYT'nin eşzamanlı geçerliğinin yüksek olduğunu göstermektedir.

### **3 METRE GERİ YÜRÜME TESTİNİN (3MGYT) GÜVENİRLİĞİ**

#### **Değerlendiriciler Arası Güvenirlilik**

4 çalışma İnter-rater (değerlendiriciler arası) güvenilirliği ölçmüştür. Multiple sklerozlu hastalarda ICC değeri 0,932-0,935 arasında bulundu (12). Demanslı hastalarda  $ICC=0,97$

olarak bulunmuştur (14). Subakut inmeli bireylerde ICC=0,99 olarak, kronik inmeli bireylerde 0,99 olarak bulunmuştur (15). Ayaktan inmeli hastalarda ICC değeri 0,987 ve 0,989 olarak bulunmuştur (8).

#### **Test- Tekrar Test Güvenirlik**

7 çalışmada güvenilirliği değerlendirilmiştir. Test tekrar test değerlendirmesi için 3 gün, 7-10 gün aralıklar kullanılmıştır (8, 11). İnmeli hastalarda ICC=0,985 bulunmuştur (7). Hafif etkilenimli multiple sklerozlu hastalarda ICC=0,998 olarak bulunmuştur (11). Multiple sklerozlu hastalarda ICC değeri 0,944-0,945 arası bulunmuştur (12). Demanslı hastalarda ICC=0,96 olarak bulunmuştur (14). Toplumda yaşayan yaşlı bireylerde ICC=0,94 olarak bulunmuştur (13). Subakut inmeli bireylerde ICC=0,96 olarak, kronik inmeli bireylerde 0,94 olarak bulunmuştur (15). Ayaktan inmeli hastalarda ICC değeri 0,854 ve 0,889 olarak bulunmuştur (8).

#### **İç Tutarlılık**

Yalnızca iki çalışmada Cronbach's Alfa değeri incelenmiştir. İnmeli hastalarda Cronbach's alfa katsayısı 0,974 bulunmuştur (7). Hafif etkilenimli multiple sklerozlu hastalarda Cronbach's alfa katsayısı 0,998 olarak bulunmuştur (11).

#### **Standart Ölçüm Hatası**

Çalışmada standart ölçüm hatası (Standart Error of Measurement, SEM) analiz edilmiştir. İnmeli bireylerde 1,11 sn olarak bulunmuştur (7). Hafif etkilenimli multiple skleroz hastalarında 0,18 sn olarak bulunmuştur (11). Multiple sklerozlu bireylerde 0,4-0,476 sn arasında bulunmuştur (12). Demanslı yaşlı bireylerde 0,04 sn olarak bulunmuştur (14). Toplum içinde yaşayan yaşlı bireylerde 0,55 sn olarak bulunmuştur (13). Subakut inmeli bireylerde 0,025 m/sn olarak, kronik inmeli bireylerde 0,039 m/sn olarak bulunmuştur (15).

#### **Minimal Belirlenebilir Değişiklik**

Çalışmada minimal belirlenebilir değişiklik (Minimal detectable Change, MDC) analiz edilmiştir. İnmeli bireylerde 1,57 sn olarak bulunmuştur (7). Hafif etkilenimli multiple skleroz hastalarında 0,5 sn olarak bulunmuştur (11). Multiple sklerozlu bireylerde 1,1-1,3 sn arasında bulunmuştur (12). Demanslı yaşlı bireylerde 0,1 sn olarak bulunmuştur (14). Toplum içinde yaşayan yaşlı bireylerde 1,52 sn olarak bulunmuştur (13). Subakut inmeli bireylerde 0,07 m/sn olarak, kronik inmeli bireylerde 0,11 m/sn olarak bulunmuştur (15). Ayaktan başvuran inmeli hastalarda 1,69 sn olarak tespit edilmiştir (8).

## **TARTIŞMA**

Sonuçlar 3 Metre Geri Yürüme Testinin farklı yetişkin popülasyonlarda güçlü bir eşzamanlı geçerliğe sahip olduğunu göstermektedir. Güvenirlikle ilgili sonuçlar incelendiğinde ise iç tutarlılığının, test-tekrar test güvenilirliğinin, değerlendiriciler arası güvenilirliğinin yüksek olduğunu göstermektedir. Araştırmalardaki popülasyonlarda sonuçlar geçerlik ve güvenilirliği destekleyici nitelikte değerlere sahiptir. Test nispeten ucuz, uygulaması hızlı ve kolaydır.

2019 yılından beri 3MGYT'nin psikometrik özelliklerinin incelendiği popülasyonların genellikle düşme riski yüksek olan nörolojik hastalığa sahip veya geriatric bireyler olduğu görülmektedir. Psikometrik özelliklerinin geçerli ve güvenilir olduğunu göstermesi zamanla bu popülasyonlarda klinikte kullanımının artacağını da düşündürmektedir. Düşme riskini belirlemede klinikte sıklıkla kullanılan dinamik denge değerlendirme testlerine göre daha üstün çıkması da özellikle düşme riski bulunan grupta kullanılması gereken bir test olduğunu göstermektedir (16).

Eşzamanlı geçerlik inceleyen çalışmalar incelendiğinde en çok Zamanlı Kalk ve Yürü testinin kullanıldığı görülmüştür (7, 8, 11-14). Zamanlı kalk ve yürü testi klinikte çok tercih edilen bir test olsa da düşme riskini belirleme konusunda kısıtlılıkları vardır (17). Son zamanlarda yapılan çalışmalarda düşme riskinin belirlenmesinde sadece tek bir test değil, farklı parametreleri değerlendiren birden fazla test kullanılması gerektiğini belirtilmektedir (18). Düşmeler farklı yönlerde doğru hareketler esnasında görülebileceği için geri yürüme performansının değerlendirilmesi gerektiğinden 3MGYT bu konuda kullanışlı bir testtir.

Bu derlemede 3MGYT'nin psikometrik özelliklerinin en sık multiple skleroz hastalarında incelendiği dikkat çekmektedir (8, 11, 12). Dahil edilen çalışmalardan iki tanesi inmeli bireylerde gerçekleştirilmiştir (7, 15). Bir çalışmada demanslı bireylerde (14), bir çalışmada toplum içinde yaşayan yaşlı bireylerde (13) geçerlik ve güvenilirlik incelenmiştir. Bu çalışmalar özellikle denge problemi yaşayan, düşme riski bulunan bireylere yönelik gerçekleştirilecek müdahale çalışmalarında sonuç ölçümü olarak kullanılabilirliğini göstermektedir.

Sonuçlar 3MGYT'nin farklı popülasyonda geçerli ve güvenilirliği olduğunu göstermektedir. Bu sonuçlar sınırlı sayıda hastalığın değerlendirilmesi sonucu elde edilmiştir. Bu çalışmalar elde edilen sonuçlar diğer hastalıklarda da yapılmasının iyi sonuçlar çıkarabileceğini göstermektedir. Bu nedenle farklı hastalık gruplarında araştırılması literatür açısından da faydalı bilgiler sağlayacaktır.

**BAZI JEL DOZİMETRELERİN RADYOLOJİK ÖZELLİKLERİNİN İNCELENMESİ**

**Dr. Öğr. Üyesi Turan ŞAHMARAN (Orcid ID: 0000-0003-3708-6162)**

Kırıkhan Meslek Yüksekokulu, Tıbbi Hizmetler ve Teknikler Bölümü, Optisyenlik Programı,  
Hatay

**ÖZET**

Radyoterapide dozimetri, tedavinin etkinliğini ve verilen hasta dozunun güvenilirliğini garanti etmek için son derece önemlidir. Uluslararası protokoller tarafından önerilen ana dozimetre malzemesi olarak su belirlenmiştir. Ancak son yıllarda katı su fantomu ile birlikte jel dozimetrelerde dozimetri aracı olarak kullanılmaktadır. Bu çalışmanın amacı, yüksek enerjilerde bazı jel dozimetrelerin radyolojik özelliklerinin direkt metod, XCOM, Auto  $Z_{eff}$  PhyX-PSD, ve XMuDAt programlarıyla belirleyip su ile elde edilen sonuçlarla karşılaştırmaktır. Jel dozimetre malzemesi olarak kullanılan FAX, MAGAT, PAGAT kütle azalım katsayısı bulunarak elde edilen sonuçlar yardımıyla etkin atom numarası ve etkin elektron yoğunlukları hesaplanmıştır. FAX için 6/18 MV foton enerjisinde denklem 4, XCOM, XMuDAt ve PhyX-PSD ile elde edilen kütle azalım katsayıları sırasıyla 0.0276/0.0184  $cm^2/g$ , 0.0276/0.0185  $cm^2/g$ , 0.0275/0.0184  $cm^2/g$ , 0.0260/0.0220  $cm^2/g$ ; MAGAT için 6/18 MV foton enerjisinde denklem 4, XCOM, XMuDAt ve PhyX-PSD ile elde edilen kütle azalım katsayıları sırasıyla 0.0265/0.0185  $cm^2/g$ , 0.0267/0.0180  $cm^2/g$ , 0.0266/0.0180  $cm^2/g$ , 0.0250/0.0210  $cm^2/g$ ; PAGAT için 6/18 MV foton enerjisinde denklem 4, XCOM, XMuDAt ve PhyX-PSD ile elde edilen kütle azalım katsayıları sırasıyla 0.0273/0.0184  $cm^2/g$ , 0.0275/0.0184  $cm^2/g$ , 0.0275/0.0185  $cm^2/g$ , 0.0250/0.0210  $cm^2/g$ ; su için 6/18 MV foton enerjisinde denklem 4, XCOM, XMuDAt ve PhyX-PSD ile elde edilen kütle azalım katsayıları sırasıyla 0.0276/0.0185  $cm^2/g$ , 0.0277/0.0185  $cm^2/g$ , 0.0275/0.0184  $cm^2/g$ , 0.0280/0.0188  $cm^2/g$  olarak bulunmuştur. Elde edilen kütle azalım katsayıları kullanılarak her bir hesaplama yönteminde etkin atom numarası ve etkin elektron yoğunluğu hesaplanmıştır. Yapılan çalışma sonucunda jel dozimetreler ile su sonuçları arasında iyi bir uyum olduğu, 6 MV ve 18 MV foton enerjilerinde kütle azalım katsayısı sonuçları arasındaki farkın %3'ü geçmediği görülmüştür. Bu sonuçlar kullanılan jel dozimetrelerinin suya alternatif olacağı konusunda bilgi vermektedir.

**Anahtar kelimeler:** Jel dozimetre, etkin atom numarası, kütle azalım katsayısı

**INVESTIGATION OF THE RADIOLOGICAL PROPERTIES OF SOME GEL DOSIMETERS****ABSTRACT**

Dosimetry in radiotherapy is extremely important to ensure the efficacy of the treatment and the safety of the dose given to the patient. Water was determined as the main dosimeter material recommended by international protocols. However, in recent years, it has been used as a dosimetry tool in gel dosimeters together with the solid water phantom. The aim of this study is to determine the radiological properties of some gel dosimeters at high energies with the direct method, XCOM, Auto  $Z_{\text{eff}}$ , PhyX-PSD, and XMuDat programs and compare them with the results obtained with water. The effective atomic number and effective electron densities were calculated with the help of the results obtained by finding the mass reduction coefficients of FAX, MAGAT, PAGAT, which were used as gel dosimeter materials. For FAX, the mass attenuation coefficients obtained by the eq. 4, XCOM, XMuDat and PhyX-PSD at 6/18 MV photon energy were 0.0276/0.0184 cm<sup>2</sup>/g, 0.0276/0.0185 cm<sup>2</sup>/g, 0.0275/0.0184 cm<sup>2</sup>/g, 0.0260/0.0220 cm<sup>2</sup>/g; For MAGAT, the mass attenuation coefficients obtained by the eq. 4, XCOM, XMuDat and PhyX-PSD at 6/18 MV photon energy were 0.0265/0.0185 cm<sup>2</sup>/g, 0.0267/0.0180 cm<sup>2</sup>/g, 0.0266/0.0180 cm<sup>2</sup>/g, 0.0250/0.0210 cm<sup>2</sup>/g; For PAGAT, the mass attenuation coefficients obtained by the eq. 4, XCOM, XMuDat and PhyX-PSD at 6/18 MV photon energy were 0.0273/0.0184 cm<sup>2</sup>/g, 0.0275/0.0184 cm<sup>2</sup>/g, 0.0275/0.0185 cm<sup>2</sup>/g, 0.0250/0.0210 cm<sup>2</sup>/g; For Water, the mass attenuation coefficients obtained by the eq. 4, XCOM, XMuDat and PhyX-PSD at 6/18 MV photon energy were 0.0276/0.0185 cm<sup>2</sup>/g, 0.0277/0.0185 cm<sup>2</sup>/g, 0.0275/0.0184 cm<sup>2</sup>/g, 0.0280/0.0188 cm<sup>2</sup>/g, respectively. Effective atomic number and effective electron density were calculated in each calculation method using the obtained mass attenuation coefficients. As a result of the study, it was seen that there was a good agreement between the gel dosimeters and the water results, and the difference between the mass attenuation coefficient results at 6 MV and 18 MV photon energies did not exceed 3%. These results give information that the gel dosimeters used will be an alternative to water.

**Keywords:** Gel dosimeter, effective atomic number, mass attenuation coefficients

## 1. GİRİŞ

Radyoterapide fantomlar kullanılarak yapılan dozimetrik ölçümler kalite kontrol işlemlerinde ve hasta güvenliğinde çok önemlidir. ICRU 44 raporunda, fantomların soğurulan dozun hesaplanmasındaki belirsizliği %1'in altındaysa bu fantomları su eşdeğeri olarak tanımlamaktadır (ICRU, 1989). Radyoterapide yüksek enerjili ışınlar kullanılarak bir materyalin su eşdeğerliliğinin değerlendirilmesi, etkileşim tesir kesiti, enerji ve atomik bileşiminin birbirleriyle bağımlılığının dikkate alınmasını gerektirir (Gargetta ve ark., 2020). İdeal bir katı su fantomu suya eşdeğer radyolojik özellikler (etkin atom numarası, elektron yoğunluğu, kütle sönüm veya lineer azalım katsayısı) sergilemeli ve su ile benzer etkin atom numarasına ( $Z_{eff}$ ), elektron yoğunluğuna ( $n_{eff}$ ) ve kütle yoğunluğuna sahip olmalıdır (Baldock ve ark., 2010). Radyoterapide dozimetri, tedavinin etkinliğini ve verilen hasta dozunun güvenilirliğini garanti etmek için son derece önemlidir. Uluslararası protokoller tarafından önerilen ana dozimetre malzemesi olarak su belirlenmiştir. Ancak son yıllarda katı su fantomu ile birlikte jel dozimetrelerde dozimetri aracı olarak kullanılmaktadır. Absorbe edilen doz ölçümlerinde, kalite güvencesi/kontrolü son derece önemlidir. Hedef hacimde ve komşu dokularda doz dağılımları dikkatle değerlendirilmelidir (Garibaldi ve ark., 2017; Yonai ve ark., 2010). Jel dozimetri, sulu jellerin kimyasal türlerde radyasyonun neden olduğu değişiklikleri uzamsal olarak depoladığı bir kimyasal dozimetri sınıfıdır. Doza bağlı değişiklikler daha sonra çeşitli tekniklerle üç boyutta incelenebilir (Schreiner ve ark., 2010).

Megavoltaj ve kilovoltaj fotonları, megavoltaj elektronları, nötronlar ve protonlar gibi farklı tedavi modaliteleri ve radyasyon nitelikleri dahil olmak üzere çok çeşitli uygulamalar için birkaç jel dozimetri formülasyonu literatürde verilmiştir (Gorjiara ve ark., 2011). Jel dozimetreler, görüntüleme prosedürlerinde, konformal/IMRT terapilerde ve diğer karmaşık uygulamalarda doğrudan doz ölçümlerinde, wedgeli ve wedgesiz profil sonuçlarını elde etmede ve radyasyon dozunu değerlendirmede kullanılmıştır (Cosgrove ve ark., 2000; Baldock ve ark., 2010; Ibbott, 2006).

Bu çalışmanın amacı, yüksek enerjilerde bazı jel dozimetrelerin radyolojik özelliklerinin direkt metod, XCOM, PhyX-PSD, Auto  $Z_{eff}$  ve XMuDat programlarıyla belirleyip su ile elde edilen sonuçlarla karşılaştırmaktır. Jel dozimetre malzemesi olarak kullanılan FAX, MAGAT, PAGAT kütle azalım katsayısı bulunarak elde edilen sonuçlar yardımıyla etkin atom numarası ve etkin elektron yoğunlukları hesaplanmıştır.

## 2. MATERYAL VE YÖNTEM

Bu çalışmada jel dozimetri olarak kullanılan FAX, MAGAT, PAGAT malzemelerinin 6 MV ve 18 MV foton enerjisindeki radyolojik özellikleri incelenmiştir. Malzemelerin yoğunlukları ve elementel ağırlıkları tablo 1’de verilmiştir.

**Tablo 1.** Malzemelerin yoğunlukları ve elementel ağırlıkları

Cl		0.0482	0.000023	
$\rho$ (g/cm <sup>3</sup> )	1	1.019	1.038	0.9896

### 2.1 Kütle azalım katsayısı

Lineer zayıflatma katsayısı,  $\mu$  ile ifade edilir ve soğurucu ortamda birim uzunluk başına etkileşim olasılığıdır (Hubbell, 1982).

$$I=I_0 e^{-\mu x} \quad (1)$$

Burada  $I_0$  başlangıçtaki radyasyon şiddeti,  $I$  malzemeyi geçtikten sonraki radyasyon şiddeti,  $\mu$  (cm<sup>-1</sup>) toplam sönüm katsayısı,  $x$  (cm) ise malzeme kalınlığıdır. Burada toplam sönüm katsayısı ( $\mu$ ), fotoelektrik ( $\tau$ ), Compton ( $\sigma$ ) ve çift oluşum ( $\kappa$ ) katsayılarının toplamıdır. Kütle sönüm katsayısı ( $\mu_m$ ), lineer sönüm katsayısının ( $\mu$ ) malzemenin yoğunluğuna ( $\rho$ ) oranı ile bulunur ve birimi cm<sup>2</sup> g<sup>-1</sup>’dir.

$$\mu_m = \mu / \rho \quad (2)$$

Farklı elementlerin oluşturmuş olduğu malzeme için toplam sönüm katsayısı, malzemeyi oluşturan elementlerin sönüm katsayılarının toplamıdır.

$$\mu / \rho = \sum_i w_i (\mu / \rho)_i \quad (3)$$

Burada,  $w_i$  i. elementin karışım içindeki ağırlıksal yüzdesi,  $\mu_i$  i. elementin lineer zayıflatma katsayısı,  $\rho_i$  ise i. elementin yoğunluğudur.  $Z_{eff}$  için hesaplama yöntemleri aşağıda açıklanmıştır.

## 2.2 Direkt Yöntem

Malzemelerin toplam foton etkileşimleri için  $Z_{\text{eff}}$  hesaplamalarında kullanılan pratik bir metoddur. Direkt yöntem olarak isimlendirilen bu yöntemde, herhangi ek bir interpolasyona ihtiyaç duyulmadan hesaplama yapılabilmektedir. Denklem 4, hem bileşiklerin hem de karışımların  $Z_{\text{eff}}$ 'lerini hesaplamak için kullanılabilir (Manohara ve ark., 2008).

$$Z_{\text{eff}} = \frac{\sum_i f_i A_i (\mu/\rho)_i}{\sum_j f_j A_j (\mu/\rho)_j} \quad (4)$$

Burada  $f_i$  molar fraksiyon,  $A_i$  atom ağırlığı (15),  $Z_j$  atom numarası,  $(\mu/\rho)_i$  kütle zayıflama katsayısıdır. Direkt yöntem kullanılarak yapılan hesaplamalarda malzemeyi oluşturan elementlerin toplam kütle zayıflama katsayıları WinXCom bilgisayar programından elde edilmiştir.

## 2.3 XMuDat

XMuDat bilgisayar programı bileşikler için tek değerli  $Z_{\text{eff}}$  değeri üretebilmektedir.

$$Z_{\text{eff}} = (\alpha_i Z_i^{m-1})^{1/(m-1)} \quad (5)$$

where  $\alpha_i$  is the fractional number of the electrons of the  $i$ th element, and  $m$  is a constant between 3 and 5. It is preferred that  $m$  is set to 3.6 for material with  $Z_{\text{eff}} < 6$  and 4.1 for material with  $Z_{\text{eff}} > 6$ .

## 2.4 Phy-X/PSD

Enerji bölgesi 1 keV – 20 MeV arasındaki fotonlar için  $Z_{\text{eff}}$ 'i (hem foton etkileşimi hem de foton enerji soğurması için) hesaplamak üzere kullanıcı dostu bir GUI arayüzü ile geliştirilmiştir (Şakar ve ark., 2020). Ayrıca 1 MeV -1 GeV enerji aralığında elektronlar, protonlar, alfa parçacıkları ve C iyonları içinde  $Z_{\text{eff}}$  hesaplanabilmektedir.

## 2.5 XCOM

XCOM ve WinXCom gibi programların veri tabanlarında elementlerin foton etkileşim tesir kesitleri ve  $\mu/\rho$  verilmektedir. Ayrıca 1 keV'den 100 GeV'ye kadar mono enerjik foton enerjilerinde kullanıcılar bileşikler ve karışımlar için tesir kesitleri ve  $\mu/\rho$  tanımlayabilmektedir.  $Z_{\text{eff}}$  ile  $n_{\text{eff}}$  birbiri ile yakından bağlantılıdır.  $n_{\text{eff}}$  değerleri,  $Z_{\text{eff}}$  değerleri kullanılarak farklı yöntemler aracılığıyla hesaplanabilmektedir. Malzemelerin  $n_{\text{eff}}$  değerleri denklem 7 kullanılarak hesaplanmıştır.

$$n_{\text{eff}} = N_A \frac{n Z_{\text{eff}}}{\sum_i n_i A_i} = N_A \frac{Z_{\text{eff}}}{\langle A \rangle} \quad (7)$$

burada  $\langle A \rangle$  malzemenin ortalama atomik kütesidir.  $n$  bileşiği oluşturan toplam atomların sayısı,  $N_A$  Avogadro sayısıdır.

### 2.6 Auto\_ $Z_{eff}$

Auto- $Z_{eff}$ , Microsoft Visual Basic .NET programlama dili kullanılarak yazılmıştır. Auto- $Z_{eff}$  programı, enerjiye bağlı etkin atom numarasının, ortalama atom sayılarının ve spektral ağırlıklı ortalama atom sayılarının hızlı hesaplanması için kullanılır. Bu bilgisayar programında, 10 keV–10 GeV enerji aralığı ve  $Z=1$  ile  $Z=100$  arasında değişen elementler için foton etkileşim kesit matrisleri oluşturulmuştur. Malzemeler için katsayıların hesaplanması, kesirli bileşenlerin doğrusal toplanabilirliğine dayalıdır ve tek enerjilerde önceden hesaplanmış matrisle karşılaştırılır. Bu nedenle, etkin atom numaraları, bitişik kesit verilerinin enterpolasyonu yoluyla elde edilir. (Taylor ve diğerleri, 2012).

## 3. BULGULAR VE TARTIŞMA

Tablo 2’de malzemelerin kütle azalım katsayıları farklı yöntemler ile hesaplanarak gösterilmiştir. Tablo 3 ve 4’de çeşitli hesaplama yöntemleri kullanılarak 6 MV ve 18 MV için etkin atom numaraları ve etkin elektron yoğunlukları gösterilmiştir.

**Tablo 2.** 6 MV ve 18 MV foton enerjisi için farklı yöntemlerle elde edilen kütle zayıflama katsayılarının karşılaştırılması ( $\text{cm}^2 \text{g}^{-1}$ )

FAX	3.53	3.51	3.55	4.08	3.92	3.94	7.50

**Tablo 4.** 6 MV ve 18 MV foton enerjisi için farklı yöntemlerle elde edilen etkin elektron yoğunlukları

Malzemeler	6 MV $n_{eff}$ ( $\times 10^{23}$ e/g)			18 MV $n_{eff}$ ( $\times 10^{23}$ e/g)			XMuDat
	Direkt	Auto_Zeff	Phy-X/PSD	Direkt	Auto_Zeff	Phy-X/PSD	
Su	1.48	1.48	1.47	1.71	1.68	1.71	3.34
MAGAT	1.67	1.66	1.66	1.75	1.74	1.70	3.22
PAGAT	1.53	1.52	1.55	1.73	1.69	1.69	3.32
FAX	1.47	1.45	1.46	1.69	1.67	1.68	3.34

Tablo 2’de kütle azalım katsayıları karşılaştırıldığında, 6 MV ve 18 MV foton enerjisi için su ve jel dozimetreler arasındaki farkın %3’ün altında olduğu görülmektedir. Tablo 3’de direkt metod yöntemi ile elde edilen  $Z_{eff}$  değerlerinin Auto\_Zeff ve Phy-X/PSD programında elde edilen değerler ile uyum içerisinde olduğu görülmüştür. XMuDat programı gibi enerjiden bağımsız olarak elde edilen  $Z_{eff}$  değerleri, enerjiye bağlı olan diğer yöntemlerle karşılaştırıldığında değerler arasında farklılıklar olduğu görülmektedir. 6/18 MV foton enerjilerinde kısmen Compton saçılması ve çift oluşum olayı baskın olduğundan dolayı farklılığın bundan kaynaklandığı düşünülebilir. Tablo 4’de elde edilen  $Z_{eff}$  değerleri kullanılarak  $n_{eff}$  değerleri hesaplanmıştır. Asady ve ark. (2022) yapmış olduğu çalışmada MAGAT polimer jel dozimetre formülasyonlarının radyolojik özelliklerini (lineer ve kütle azalım katsayısı, CT değerleri) Amerisyum gama kaynak kullanarak belirlemiştir. Ayrıca elde edilen sonuçları su ve yumuşak doku ile karşılaştırılmış ve uyum içerisinde olduğunu bulmuştur. Bizim çalışmamızda da 6 MV ve 18 MV foton enerjisinde su ve MAGAT için farklı yöntemlerle elde edilen kütle azalım katsayısı ve etkin atom numaraları arasında uyum olduğu gözlenmiştir. Mariotti ve ark. (2022) yapmış olduğu çalışmada, BANG, Fricke, ITABIS, MAGIC, NBT-Pluronic, NIPAM, PAGAT ve PRESAGE gibi jel dozimetrelerin doz dağılımlarına bakmış ve sonuçları su ile karşılaştırmıştır. Bu çalışmaya göre jel dozimetrelerden elde edilen sonuçlar su ile uyumlu çıkmış ve ortalama uyarılma enerjileri ve kütle yoğunlukları arasındaki belirsizlik  $\pm\%10$  olarak bulunmuştur. Bizim çalışmamızda da  $Z_{eff}$  ve  $n_{eff}$  değerleri su ile karşılaştırıldığında elde edilen sonuçlar arasındaki farkın %3’ü geçmediği görülmüştür.

#### **4. SONUÇ**

Bu çalışmada farklı jel dozimetre malzemelerinin suya göre radyolojik özellikleri farklı metodlar kullanılarak karşılaştırılmıştır. Bu malzemelerin kütle azalım katsayıları,  $Z_{eff}$  ve  $n_{eff}$  değerleri su ile elde edilen sonuçlarla uyum içerisinde olduğu bulunmuştur. Elde edilen sonuçlar su ile kıyaslandığında aralarındaki farkın %3'ün altında olduğu görülmüştür. Bundan dolayı bu malzemelerin günlük veya haftalık dozimetrik ölçümlerde kullanılmasında bir sakınca olmadığı düşünülmektedir.

### ÖZET

Dünya Sağlık Örgütü'ne göre; madde kötüye kullanımı, sigara, alkol ve yasa dışı uyuşturucular da dâhil olmak üzere psikoaktif maddelerin zararlı veya tehlikeli kullanımınıdır. Birleşmiş Milletler Uyuşturucu ve Suç Ofisi (UNODC) tarafından yayınlanan 2021 Dünya Uyuşturucu Raporuna göre, 2020 yılında dünya genelinde yaklaşık 275 milyon kişi uyuşturucu kullanıyordu ve 36 milyondan fazla kişi madde kullanım bozukluğundan muzdaripti. Emniyet Genel Müdürlüğü'nün (EGM), 2021 yılını baz alarak, 2022 yılında 27.779 kişi ile yaptığı çalışmanın raporuna göre; hayatında en az bir kez herhangi bir uyuşturucu madde kullanan bireylerin %26,6 sının lise ve üzeri öğrenime sahip olduğu, ve eğitim düzeyinin düşük olmasının uyuşturucu kullanımında etkili olduğu belirtilmiştir. Madde kullanımı ve bağımlılığı sorunu tüm dünyada olduğu gibi ülkemizde de hızla artmaya devam eden çok önemli bir toplumsal sorun haline gelmiştir, bireyin tüm yaşamını, ailesini, sosyal çevresini ve toplumu etkileyen önemli bir sorundur. Bağımlılıklar; sağlık, eğitim, iş, sosyal, kültürel alan gibi birçok alanı etkilemekte, çeşitli kayıplara neden olmakta ve şiddet, suç eylemleri, sağlık bakım ihtiyaçları, rehabilitasyon hizmetleri, işgücü verimliliğinin azalması ve yargı şeklinde insani, sosyal, sağlık ve ekonomik maliyetleri artırmaktadır. Dolayısıyla bağımlı kişiyi etkileyen bu sorunlar, bağımlı kişinin yaşam hakkı, sağlık hakkı, eğitim hakkı, çalışma hakkı gibi haklarının da ihlaline neden olmaktadır. Bu nedenle madde bağımlılığına yönelik politikalar ve koruyucu önlemler önemli bir yere sahiptir. Buna göre bu yazıda madde bağımlılığının toplumsal bir sorun olduğu, birey ve toplum üzerindeki etkileri, madde bağımlılığına yönelik politikalar, önlemler ve hemşirelik müdahalelerinden bahsedilecektir

**Anahtar Sözcükler:** Madde bağımlılığı, toplumsal sorunlar, önlem, politika.

## **SUBSTANCE ADDICTION AS A SOCIAL PROBLEM**

### **ABSTRACT**

According to the World Health Organization; Substance abuse is the harmful or dangerous use of psychoactive substances, including cigaret, alcohol and illegal drugs. According to the 2021 World Drug Report published by the United Nations Office on Drugs and Crime (UNODC), approximately 275 million people worldwide were using drugs in 2020, and more than 36 million people suffered from substance use disorders. According to the report of the General Directorate of Security (EGM), based on the year 2021, with 27,779 people in 2022; It has been stated that 26.6% of individuals who use any drug at least once in their life have a high school or higher education, and the low level of education is effective in drug use. The problem of substance use and addiction has become a very important social problem that continues to increase rapidly in our country as well as all over the world. It is an important problem that affects the whole life of the individual, his family, social environment and society. Addictions; It affects many areas such as health, education, business, social, cultural area, causes various losses and increases human, social, health and economic costs in the form of violence, criminal acts, health care needs, rehabilitation services, decreased labor productivity and justice. Therefore, these problems affecting the addicted person also cause the violation of the rights of the addicted person, such as the right to life, the right to health, the right to education, and the right to work. For this reason, policies and protective measures for substance abuse have an important place. Accordingly, in this article, it will be mentioned that substance addiction is a social problem, its effects on the individual and society, policies, precautions and nursing interventions for substance addiction.

**Keywords:** Substance abuse, social problems, prevention, policy.

## 1. GİRİŞ

Bağımlılık, geniş anlamı bir kavram olup, bir kişiye, nesneye veya varlığa karşı engel olunamayan bir istek duyma halidir. Bireyin ruhsal, bedensel ve sosyal yaşamına zarar verse de birey takıntılı şekilde durumunu sürdürmektedir. Aynı zamanda yasadışı uyuşturucu kullanımının toplum üzerinde de önemli etkileri bulunmaktadır. Toplum ve birey üzerindeki etkileri, ailelerin ve toplumun yaşadıkları olumsuz sağlık sonuçları ve ağır bir mali yüküdür (Bayram, 2013). Avrupa'da 80 milyon kadar kişinin hayatlarının bir döneminde herhangi bir uyuşturucu madde kullandığı belirtilmektedir. Ülkemizde ise bu durumun 1/10 oranında olduğu düşünülmektedir. Bu yüzden, madde kullanımı ve yaygınlığının gençlerde yüksek düzeyde seyretmesi uluslar için ciddi ve ehemmiyet verilmesi gereken bir sorun aynı zamanda bir endişe kaynağıdır. Madde bağımlılığından korunmaya yönelik çalışmalarda, madde kullanımının engellenmesi işyerleri, okul, emniyet, toplum sağlığı merkezleri gibi kurumlarda çalışan bireylerin rol ve sorumlulukları bulunmaktadır. Özellikle okul sağlığı alanında ve sağlık merkezlerinde yer alan hemşirelerin ise hedefi öncelikli olarak rol ve sorumluluklarını yerine getirmek olmalıdır. Bu kurumlarda çalışan hemşireler, her bir bireyi ailesi ile beraber değerlendirmeli, madde kullanımı açısından riskli kişileri belirlemeli ve danışmanlık hizmetlerinin sunulması için psikiyatri hemşireleri ve psikiyatrist gibi sağlık çalışanlarına yönlendirmelidir (Soy ve Zorlu, 2020).

## 2. BAĞIMLILIK VE MADDE BAĞIMLILIĞI

Bağımlılık, vücudun fonksiyonlarına zarar veren bir maddenin bırakma isteğine rağmen engel olunamayan bir arzu ile kullanım durumunun devam etmesi, maddenin bireyi kontrol etmesi ve sonucunda birçok yoksunluk belirtisi ve sorun yaşamasına rağmen maddeyi bırakamama halidir (Özkan, 2022). Madde bağımlılığı, tütün, alkol ve yasadışı uyuşturucuları (opioidler, kanabinoidler, kokain vb.) ve psikoaktif maddelerin zararlı kullanımını ifade etmektedir (Khatib ve ark., 2018). Dünya Sağlık Örgütü madde bağımlılığını, alkol ve yasadışı uyuşturucular da dâhil psikotrop maddelerin tehlikeli ve zararlı kullanımı olarak, ifade etmiştir (WHO, 2022). Madde bağımlılığı yerine uyuşturucu bağımlılığı terimi günlük hayatta sıklıkla kullanılmaktadır. Ancak Dünya Sağlık Örgütü (WHO) madde bağımlılığı yerine madde bağımlılığı terimini kullanmayı tercih etmektedir. Çünkü esrar, eroin, afyon gibi bilinen narkotik maddelerin yanı sıra sentetik olarak üretilmiş birçok uyuşturucu, uyarıcı vb. maddeler, uçucu maddeler veya halüsinojenler gibi diğer ana işlevleri olan maddelerin kötüye

kullanılması da söz konusu olabilir. Bu nedenle uyuşturucu, uçucu maddeler, alkol, sigara, sentetik narkotik-uyarıcı maddeler gibi tüm maddelere tekabül eden bağımlılığı madde bağımlılığı olarak ifade etmek mümkündür (Bayram, 2013).

### **Toplumsal Sorun Olarak Madde Bağımlılığı**

Madde bağımlılığı problemi, tüm uluslarda olduğu gibi ülkemizde de çok hızlı bir şekilde artmış ve bir toplumsal sorun olma özelliği kazanmış (Bayram, 2013) olup, bireyin ailesini, sosyal çevresini, tüm yaşamını ve dolayısıyla da tüm toplumu etkileyen önemli bir sorundur. Madde bağımlılığı; sağlık, eğitim, çalışma, sosyal, kültürel gibi birçok alanı etkilemekte, çeşitli kayıplara yol açmakta (Karadağ, 2021; WHO, 2022) ve şiddet, suç eylemleri, sağlık hizmetleri ihtiyaçları, rehabilitasyon hizmetleri, azalan işgücü verimliliği ve yargı harcamaları şeklinde insani, sosyal, sağlık ve ekonomik maliyetlerde artışa neden olmaktadır (Lo ve ark., 2020). Bunun dışında suça yatkınlık, trafik kazaları, özkıyım, iş hayatının aksamaması, aile parçalanması ve ekonomik sorunlar gibi bireye ve topluma birçok zararı olan çok boyutlu biyopsikososyal bir sorun olarak da nitelendirilmektedir (Yıldırım ve ark., 2011). Bunun dışında, özellikle gençler üzerinde ciddi etkilerine bağlı olarak suça yönelim çok fazla görülmektedir. Madde kullanımına çok küçük yaşlarda ya da ileri yaşlarda başlanabilmesine karşın son zamanlarda genellikle adölesan döneminde başlanmaktadır. Gençlerin madde kullanımına yönelmesinin nedenleri arasında gençlerin sosyal ve duygusal ihtiyaçlarını karşılamak, daha çok eğlenmek, yaşadığı problemlerden kaçmak ve heyecan yaşamak gibi nedenlerdir (Altundağ, 2020).

Madde bağımlılığı, Psikolojik (Psişik) Bağımlılık ve Fizyolojik (Fiziksel) Bağımlılık şeklinde sınıflandırılmaktadır (Altundağ, 2020; Karadağ, 2021).

**-Psikolojik (Psişik) Bağımlılık:** Bireyin kullandığı maddeye alışması, arzu etmesi ya da ihtiyaçlarını gidermek amacıyla maddeye düşkünlüktür. Bireyde bağımlılığın oluşması kullanılan madde türüne, madde kullanım süresine ve kişilik özelliklerine göre değişebilmektedir. Maddenin, yalnızca psikolojik bağımlılık geliştirmesi, fiziksel bağımlılık yaratmaması, maddenin çekilmesi durumunda yoksunluk sendromuna yol açmamaktadır.

**-Fizyolojik (Fiziksel) Bağımlılık:** Tolerans veya yoksunluk belirtilerinden en az birinin veya her ikisinin bulunması fizyolojik bağımlılığı tanımlamaktadır. Maddenin kesilmesi veya azalması, sinirlilik, uykusuzluk, baş ağrısı, kasılmalar, ishal, iştahsızlık, terleme, kusma, mide bulantısı, epilepsi ve diğer yoksunluk belirtilerine yol açıyorsa buna fizyolojik bağımlılık denir. Yoksunluk belirtilerinin şiddeti, fiziksel bağımlılığın yoğunluğu ile doğru orantılıdır. Fizyolojik bağımlılık ve psikolojik bağımlılık, kişide birlikte görülebilmekle birlikte, fizyolojik bağımlılığın

tedavisi kolay olup, psikolojik bağımlılıktan kurtulmak için bireyin istekli olması gerekmektedir (Altundağ, 2020).

### **MADDE BAĞIMLILIĞINDA DSM-V'E GÖRE TANI KRİTERLERİ**

DSM V'e göre, madde bağımlılığı ruhsal bir hastalıktır fakat madde kullanımı ruhsal bir hastalık değildir. Bağımlı olarak teşhis edilebilmesi için, son bir yıl içinde klinik olarak belirgin bir sıkıntıya ve işlevsellikte azalmaya neden olan aşağıdaki belirtilerden en az ikisinin ortaya çıkması gerekir:

1. Maddeyi bırakma ya da kontrol etme isteği ya da başarısız çabaları,
2. İstenilenden fazla veya uzun süreli kullanım,
3. Maddeyi bulmak, kullanmak veya zararlı etkilerinden kurtulmak için gerekli faaliyetlere çok fazla vakit harcamak
4. Maddeyi kullanmak için güçlü bir istek ya da duyguya sahip olmak,
5. Tekrarlı kullanım (işte, okulda, evde) sonucu sorumluluklarını yerine getirememe
6. Kullanım (iş, boş zaman vb.) nedeniyle günlük aktivitelerin kesilmesi veya azaltılması
7. Olumsuz etkilere (sosyal ve kişilerarası sorunlar) rağmen kullanmaya devam etmek,
8. Tehlikeli olması muhtemel hallerde bile kullanmaya devam etmek,
9. Olumsuz fiziksel ya da ruhsal etkilerine rağmen kullanmaya devam etmek,
10. Maddeye karşı tolerans gelişmiş,
11. İstenilen etkiyi yaratmak için maddeye olan ihtiyacın arttırılması,
12. Aynı nicelikte olan maddenin sürekli kullanımı sonucu etkinin azalması,
13. Mide bulantısı, kusma, uykusuzluk, sinirlilik, kaygı, saldırganlık, huzursuzluk, ishal, titreme, terleme, kas ağrıları, ateş vb. yoksunluk belirtilerinin gelişmesi

Yukarıdaki semptomlardan özellikle yoksunluk krizi, tolerans gelişimi ve bağımlılık yapan madde aldıktan sonra krizin ortadan kalkması bağımlılık tanısını belirlemede en etkili ve yeterli semptomlardır. Her madde yoksunluk belirtileri göstermeyebilir. 1 yıl içinde belirtilerden 2 veya 3'ü varsa hafif, 4 veya 5 varsa orta, 6 veya daha fazla varsa şiddetli olarak kabul edilir. Birçok madde bağımlısında, ajitasyon, titreme, kas krampları ve nöbetler gibi yoksunluk krizi semptomlarının bazılarının diğer hastalıkların semptomlarıyla karıştırılabileceğine yönelik dikkat edilmelidir. Madde ile ilgili krizler ancak ilgili maddeleri alarak tamamen ortadan kaldırılabilir (Karadağ, 2021).

### MADDE BAĞIMLILIĞININ PREVELANSI

Birleşmiş Milletler Uyuşturucu ve Suç Ofisi (UNODC) tarafından yayınlanan 2021 Dünya Uyuşturucu Raporu'na göre, 2020 yılında dünya çapında yaklaşık 275 milyon kişi uyuşturucu kullanırken, 36 milyondan fazla insan madde kullanım bozukluklarından muzdarip olduğunu belirtmiştir. Aynı rapora göre; 2010-2019 yılları arasında, kısmen küresel nüfus artışına bağlı olarak, uyuşturucu kullanan insan sayısı yüzde 22 artmıştır. Sadece demografik değişikliklere dayanarak, mevcut bulgular, 2030 yılına kadar küresel olarak uyuşturucu kullanan insan sayısında yüzde 11'lik ve hızla büyüyen aynı zamanda genç nüfusu nedeniyle Afrika'da yüzde 40'luk belirgin bir artış olacağını düşündürmektedir. En son küresel tahminlere göre, 15 ila 64 yaş arasındaki nüfusun yaklaşık yüzde 5,5'i geçen yıl en az bir kez uyuşturucu kullanırken, 36,3 milyon kişi veya uyuşturucu kullanan toplam kişi sayısının yüzde 13'ü madde kullanım bozukluklarından muzdariptir. Ayrıca, veriler göstermektedir ki 1995-2019 yılları arasında, esrarı zararlı olarak algılayan ergenlerin yüzdesi Amerika Birleşik Devletleri'nde yüzde 40 ve Avrupa'da yüzde 25 oranında azalmıştır (UNODC, 2021).

Emniyet Genel Müdürlüğü'nün (EGM), 2022 yılında yayınladığı, 2021 yılının baz alınarak "Hayatında herhangi bir maddeyi en az bir kez kullandığımı beyan etme" ile ilgili olarak 27.779 kişi ile yaptığı çalışmanın raporuna göre; %26,6 sının lise ve üzeri öğrenime sahip olduğu belirtilmiştir. Düşük eğitim ya da eğitimsizliğin uyuşturucu kullanımında etkili olduğu söylenebilirse de maddeye bağlı eğitimi tamamlamanın göz ardı edilmemesi ve üzerinde çalışmalar yapılması gerekmektedir. Yine aynı rapora göre madde kullanımına başlama yaşının 21,22 olduğu, 15-24 yaş arası gençlerin risk grubunda olduğu belirtilmiştir. Uyuşturucu madde kullanımı öncesi tütün kullananların oranının %82,4 olduğu, başlama yaş ortalamasının 16,72; benzer şekilde alkol kullanımının %37,9 ve alkol kullanmaya başlama yaş ortalamasının 18,04 olduğu belirlenmiştir. Her iki raporda da kadınlarda madde kullanım oranı, erkeklere göre daha düşüktür.

Tablo 1'e göre; kamu harcamaları 2020 yılında 2019 yılına göre yaklaşık %28,2 artarak 1 milyar 840 milyon 513 bin TL olarak gerçekleşmiştir (Türkiye Uyuşturucu Raporu, 2021).

## **BAĞIMLILIK YAPICI MADDELER**

Uyuşturucu maddeler, tıp literatüründe psikoaktif madde olarak isimlendirilmektedir ve alındıklarında ruhsal, bedensel, davranışsal etkilere yol açan ve bağımlılık yapabilen kimyasallardır. Önceleri yabancı verilerde ilaç anlamına gelen “drug” adı verilmiştir. Ancak bu kullanımın yanlış olduğu anlaşılmış ve “substance” olarak isimlendirilmişlerdir.

Bağımlılık yapıcı maddelerin sınıflandırılması şu şekildedir:

- Tütün
- Alkol
- Uyarıcılar: Kokain, Amfetamin, Ecstasy, Kafein
- Opiyatlar: Eroin, Esrar, Morfin, Kodein ve benzerleri
- Merkezi Sinir Sistemini etkileyenler: Amfetamin, Benzodiazepinler, Barbitüratlar
- Uçucu maddeler: Tiner, Gazolin, Glue (Bali), Benzen,
- Halüsinojenler: LSD (LiserjikAsidDietilamid), Psilocybin, Meskalin, DMT(dimetiltriptamin), DET (dietiltriptamin), MDA (metilendioksi amfetamin) DOM (dimetoksimetil amfetamin),
- Fensiklidin (PCP).

Birçok madde uyuşturucu niteliğindedir. Alkol ve sigara, halk dilinde kullanılan uyuşturucu ifadesi içinde geçmez fakat alkol ve sigaranın birer şiddetli bağımlılık yapıcı madde olma özelliği değerlendirilmiş ve dünya çapında uyuşturucu maddeler içinde yer almasına karar verilmiştir (Karadağ, 2021). Tütün ve alkol, farklı toplumlarda ve kültürlerde farklı sosyal gruplar tarafından sık olarak kullanılan ve yasal olarak kullanılması onaylanmış iki madde çeşidi (Lo ve ark., 2020) olarak karşımıza çıkarken, en çok kullanılan madde ise esrardır (Nawi ve ark., 2021; Karakaş ve Söğütçü, 2016).

## **MADDE BAĞIMLILIĞINDA RİSK FAKTÖRLERİ**

Madde kullanım bozukluğu konusunda risk faktörleri bireysel, ailevi riskler ve çevresel riskler olarak 4 gruba ayrılmaktadır (Altundaş, 2020; Yeişlay, 2022; Islam ve ark., 2022; Gökler ve Koçak, 2008; Nawi ve ark., 2021; Brumback ve ark., 2021). Bu risk faktörlerin içinde, özellikle bireysel risk faktörleri madde bağımlılığının gelişiminde önemlidir (Nawi ve ark., 2021).

**-Bireysel Faktörler:** Agresif, benlik saygıları düşük, sorunları ile baş edemeyen, hayır deme becerisi olmayan, okul başarısında düşüş, mesleki olarak başarısız olan bireyler ile depresyon, stres gelişimi, meraklı bir kişiliğe sahip olmak, cinsiyet, duygu düzenleme bozukluğunun olması ve çocuk esirgeme kurumlarında kalmış olmak madde kullanım bozukluğunda bireysel

faktörler olarak sıralanmaktadır. Opioid kötüye kullanımı için detoksifikasyon tedavisi gören 112 genci içeren bir çalışmada, etkilenen katılımcıların çoğunluğunun duygularını düzenlemekte zorlandığı saptanmıştır (Wilson ve ark., 2017). Boylamsal yapılan bir çalışmada, Çocuk esirgeme kurumlarında kalanlarda esrar kullanım oranlarının 36 ay sonra % 9'dan % 18'e yükseldiği gözlenmiştir (Schleimer ve ark., 2019). Bunlarla birlikte, ergenlerin rutin ağrı tedavisine ihtiyaç duyduğu bir hastalığının olması (genellikle opioid kullanımı) ve ilacı zararsız olarak algılama da bireysel risk faktörlerindedir. Odak grup tartışmasında gençler kullanım esnasında motivasyonlarının arttığını ifade etmişlerdir (Nawi ve ark., 2021). Önceden başka bir madde kullanım varlığı; e-sigara içen kişilerde özellikle de esrar, alkol ve yaygın olarak reçete edilen ilaç kullanımının olduğu saptanmıştır. Araştırmacılar, e-sigara kullanımının, muhtemelen davranışın normalleştirilmesi yoluyla daha ciddi madde bağımlılığına yol açabileceğini ifade etmektedirler.

**-Ailevi Riskler:** Ebeveynlerde madde kullanımı varlığı, ebeveynlerden birinin yokluğu ya da parçalanmış aileler, ebeveyn ve aile arasındaki iletişim sorunları, ebeveynin düşük eğitime sahip olması, ailenin denetiminin zayıf olması, fiziksel şiddet başta olmak üzere aile içi şiddete maruz kalmak.

**-Akran Grupları:** Akran gruplarına dâhil olma isteği, akranların baskısı ve madde kullanımı.

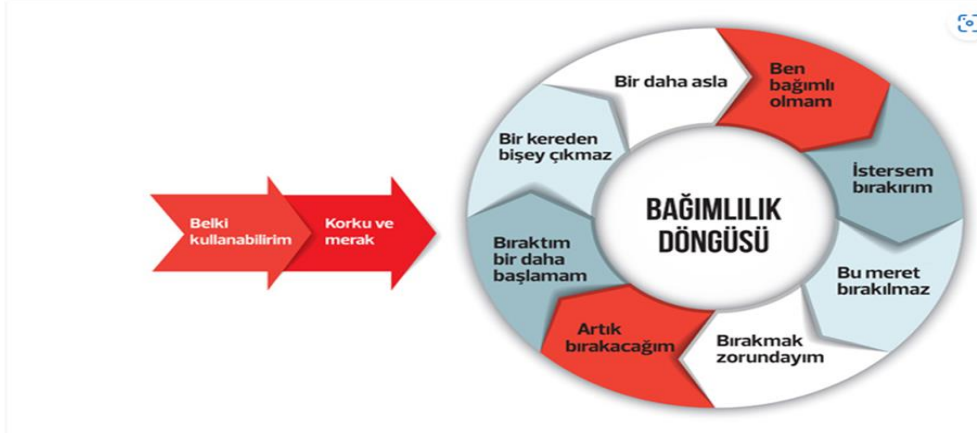

**-Çevresel Faktörler:** Düşük sosyoekonomik bir çevreye bağlı olma ve buna bağlı olarak maddeye kolay ulaşım.

### **MADDE BAĞIMLILIĞINDA KORUYUCU FAKTÖRLER**

Bireylerde, yüksek benlik saygısı, dindarlık, cesaret, akran faktörleri, öz kontrol, ebeveynin kontrolü , akademik yeterlilik ve güçlü mahalle bağlılığı belli başlı koruyucu faktörlerindedir (Nawi ve ark., 2021). İyimser bir kişiliğe sahip olan kişilerin, madde kullanımına karşı güçlü bir inancı olan ve sağlıklarını korumak için güçlü bir arzusu olan bireylerin uyuşturucu bağımlılığına karışmaktan korunma olasılıkları daha yüksektir (Nawi ve ark., 2021; Marin ve ark., 2019). Özellikle baba figürü kendisini yeterli bilgi ile donattığında koruyucu etkisinin olduğu belirlenmiştir (Nawi ve ark., 2021). Bireyin güçlü dini inançlara sahip olması, ergenlerin uyuşturucu bağımlılığına karışmasını önleyebilecek çok önemli bir koruyucu faktör olarak hizmet etmektedir. Buna ek olarak, okul bağlılığı ve yetişkin desteği de madde bağımlılığında koruyucu faktör olarak rol oynamaktadır (Nawi ve ark., 2021). Ayrıca, 1104 öğrenci ile yapılan

bir araştırmada iyimser bir özelliğe sahip gençlerin uyuşturucu bağımlısı olma ihtimalinin daha düşük olduğu şeklindedir (Marin ve ark., 2019).

## MADDE KULLANIMI DÖNGÜSÜ

**Tablo 2.** Madde Kullanım Döngüsü

Bağımlılık Döngüsü aşırı merak ve madde kullanma isteğiyle başlar, sanki bir anda hiçbir şey olmuyormuş gibi kişinin yavaş bir şekilde kontrolünü kaybettiği düşünceleriyle ilerleyen bir sonu olmayan döngüdür. Bu döngünün ileri aşamalarında birey maddeyi kullanmaya devam eder, istediği anda bırakabileceğini düşünür ancak zaman geçtikçe bırakmakta zorlanacağını anlar. Bu kısır döngü böyle devam ediyor

## MADDE BAĞIMLILIĞININ SONUÇLARI

Çağımızın en önemli sorunlarından biri olan madde bağımlılığının sonuçları da önem kazanmaktadır. Bireyi ve çevresini dolayısıyla tüm toplumu etkileyen madde bağımlılığına tek bir perspektiften bakmak doğru değildir. Bağımlılık teşhisi konan bir birey; genetik arka planı, bireysel yapısı ve çevresi bir bütün olarak düşünülmelidir. Sebepleri çok boyutlu olmakla birlikte, bu sorunun sonuçları da birçok farklı alanı etkilemektedir (Yılmaz, 2019). Madde bağımlılığının sonuçları bireysel, çevresel ve toplumsal sonuçlar olarak ele alınmıştır.

**-Bireysel Sonuçlar:** Madde kullanımı, bireyde psikolojik, fizyolojik ve zihinsel işlevlerde kayıp ve zararlara yol açmaktadır. Maddeler, türlerine göre birçok zararlı etki yaratırlar. Gözler, solunum sistemleri, sindirim, karaciğer, iç organlar ve böbrekler gibi birçok organ üzerinde olumsuz etkileri vardır. Merkezi sinir sistemine verdiği zarar nedeniyle bunama, halüsinasyonlar ve hafıza kaybı gibi zihinsel işlevlerde de olumsuz sonuçlara neden olur.

Bireyin işini ve okulunu kaybetmesi, toplumun bakış açısına bağlı olarak kişide gelişen sorunlar, fizyolojik etkiler ve zihinsel işlevlerdeki değişiklikler de bireyde değersizlik, saldırganlık ve yalnızlık gibi olumsuz sonuçlara neden olmaktadır (Yılmaz, 2019).

**-Çevresel Sonuçlar:** Birey, madde bağımlılığı tanısı aldıktan sonra çevresindekilerle iletişimde büyük değişiklikler yaşamaktadır. Özellikle toplumumuzda sosyal olarak yakın bağların varlığı, bağımlı bireyin çevresi tarafından kısa sürede fark edilmesine ve toplumdan dışlanmasına neden olabilmektedir. Bu durum bireyi olumsuz yönde etkileyerek okuldan, akrabalarından, işten ve çevresinden uzaklaşmasına ve maddeye daha fazla bağımlı hale gelmesine neden olur (Yılmaz, 2019).

**- Toplumsal Sonuçlar:** Toplumumuzda ve birçok toplumda madde kullanımı ve satışı suç olarak kabul edilmektedir. Bu durum madde kullanıcılarının suçlu olarak görülmesine ve toplumdan dışlanmasına neden olmaktadır. Madde bağımlısı okul çağındaysa, rollerini yerine getirmediği için sosyal sorunlar yaşamaya başlar. Bunun sonucunda kişide oluşturduğu etkiler, kişiyi yine toplumsal olarak kabul görmeyen davranışlara itecektir. Böylece toplumun bireyi dışlaması sonucunda, dışlanan birey kendisini maddeye iten ortama daha fazla sığınacak ve böylece bağımlılığı daha da artacaktır (Yılmaz, 2019).

## **MADDE BAĞIMLILIĞINA YÖNELİK POLİTİKALAR, ÖNLEMLER VE HEMŞİRELİK GİRİŞİMLERİ**

Madde bağımlıları bağımlılıktan pek çok zarar görmekte ve kullanılan maddenin yol açtığı sağlık sorunları, işlerinden ayrılma, eğitimlerini tamamlayamama, sosyal izolasyon, aile hayatının parçalanması, suç işleme gibi sonuçlarla karşılaşmaktadırlar. Dolayısıyla bağımlı kişinin bu sorunları yaşamamasına neden olanlar, bağımlı kişinin yaşam hakkı, eğitim hakkı, sağlık hakkı, çalışma hakkı gibi haklarının da ihlaline neden olmaktadır (Bayram, 2013). Bu nedenle madde bağımlılığında yapılacak politikalar ve koruyucu önlemler önemli bir yere sahiptir. Madde bağımlılığına yönelik politikalar ve önleme programları, bağımlılık sürecini belirleyen ve önleme çalışmaları için girişimlerin yapılacağı etki alanlarını içermektedir. Bu etki alanları birey aile, okul, akran grupları ve çevresel faktörlerden oluşmaktadır (Altundağ, 2020).

Bağımlılık dünyada olduğu gibi ülkemizde de bireyi ve toplumu olumsuz etkileyen önemli bir sağlık sorunudur. Bu sorunun tedavisi oldukça uzun bir süreçtir ve kişiden kişiye değişir. Bu sürecin uzunluğu, olumsuz fiziksel ve duygusal durum, kişinin değişime ve motivasyona hazır olma duygusunu azaltan ve maddeye yeniden başlama riskini artıran dürtü ve istekler gibi

faktörlere veya kişilerarası çatışmalar ve sosyal baskılar gibi faktörlere bağlı olarak değişmektedir. Bununla birlikte, bağımlığın önlenmesinde ve tedavi sürecinde ekip çalışmasının önemli bir konumunun olduğu belirtilmektedir (Evli ve Albayrak, 2020). Bağımlılık, ailevi, duygusal, kişilerarası ve çevresel sorunlarla birlikte bütüncül bir kavram olarak düşünülmelidir. Hemşirelerin madde bağımlılığında korunma ve rehabilitasyon sürecinde multidisipliner bir ekiple birlikte çalışması gerekmektedir. Madde kötüye kullanımı veya madde bağımlılığı sorunu olan bireylerin bakımının nihai amacı, bireylerin madde kullanımından uzak durmalarını sağlamaktır. Bireylerin maddeden uzak durmaları ancak iyi çalışma düzeni, sağlığının iyi olması, olumlu kişilerarası ilişkiler ve genel sosyal uyum ile sağlanabilir (Karakaş ve Ersöğütçü, 2016).

Hemşirenin rollerine bakıldığında ise birincisi önleme, bir kişinin hiç bağımlılık yapıcı maddeye başlamaması; ikinci olarak madde kullanan bireyin bağımlılıktan kurtulmasını sağlayacak tedavi programlarının oluşturulması ve bunlara katılım sağlanması; üçüncüsü, bireye ve madde bağımlılığından kurtulamayan diğer kişilere zarar verme riskini azaltmayı amaçlamaktadır (Evli ve Albayrak, 2020).

1. Madde bağımlılığına yönelik hemşirelik bakımında ilk aşamada, bireyin kendisini değerlendirilmelidir. Hemşire, bireyi değerlendirirken, öncelikle ne tür bir madde kullandığını, maddeyi hangi yolla ve ne kadar aldığını, ne kadar süredir kullandığını ve en son kullanım zamanını, madde kullanım miktarını ve sıklığını değerlendirir. Bununla birlikte, madde kullanımını bırakmayı düşünüp düşünmediği ve kullanım sonunda ne olduğu gibi doğrudan maddeye yönelik bilgileri edinmelidir.

2. Madde kullanımında önleme çalışmaları önemli bir yer tutmakta olup, ebeveynlerin çocukları ile etkili iletişim kurması sağlanmalı ve arkadaş çevresi konusunda sınırlamalara özen göstermeleri sağlanmalıdır.

3. Bireylere ve ailelere destek vermek. Gittikçe artan madde kullanımı ve kullanma yaşının düşmesiyle birlikte konu hakkında aileler bilinçlendirilmelidir.

4. Bireylere ve gençlere yönelik hayır diyebilme, problem çözme, iletişim teknikleri, öfke kontrolü, stresle baş edebilme becerilerine yönelik eğitimler verilmelidir.

5. Okul ortamları çocuklara göre düzenlenmeli ve okul dışında, çeşitli sosyal, kültürel ve bilimsel etkinlikler düzenlenmeli.

6. Madde kullanımına yönelik özellikle devlet tarafından yasal düzenlemeler yapılmalıdır.

7. Yapılan bu uygulamaların madde bağımlılığından kurtulmaya yardım ettiği, ruhsal durum ve yaşam kalitesine olumlu etkisinin olduğu da hatırlatılmalıdır (Altundağ, 2020; Evli ve Albayrak, 2020; Karakaş ve Ersöğütçü, 2016).

#### **-Madde Bağımlılığına Yönelik Politikalar**

Madde bağımlılığını önleme faaliyetleri bir bütün olarak ele alınması gereken bir sorundur ve bu sorunla mücadelede birçok aktörün yer alması gerekmektedir. Devlet tarafından madde kullanımını önlemek için bazı yasal düzenlemeler yapılmış, talebin azaltılmasına yönelik plan ve politikalar oluşturulmuş, birçok devlet kurumuna görev ve sorumluluklar verilmiştir. Bu kapsamda Türkiye'de önleme faaliyetleri çeşitli sivil toplum kuruluşları ve TUBİM ile birlikte Milli Eğitim Bakanlığı, Adalet Bakanlığı, Sağlık Bakanlığı, Aile ve Sosyal Politikalar Bakanlığı, üniversiteler, Radyo ve Televizyon Üst Kurulu (RTÜK), Diyanet İşleri Başkanlığı ve Belediyeler gibi birçok kurum tarafından sürdürülmektedir. (Albayrak ve Balcı, 2014).

Ülkemizde uyuşturucuyla mücadelenin temelini olan belge 2018-2023 Uyuşturucuyla Mücadele Strateji Belgesi ve Eylem Planıdır. 2018-2023 Uyuşturucuyla Mücadele Strateji Belgesi ve Eylem Planı'nın temel amacı, tüm toplumu her türlü maddeden uzak tutmaktır. Önleme çalışmaları, maddeye olan talebin engellenmesi odaklı yürütülmektedir. Bu boyutta başta gençler olmak üzere tüm toplumu uyuşturucuya karşı korumak, maddeyi bir veya daha fazla kez denemiş ancak henüz bağımlılık geliştirmemiş kişilere danışmanlık ve tedavi hizmeti vermek, uyuşturucu bağımlılarının tedavisi ve tedavi gören bağımlıların sosyal entegrasyonunun desteklenmesi amacıyla çeşitli çalışmalar yapılmaktadır. İnsanların uyuşturucu kullanma eğilimlerini birçok sosyal ve kültürel faktörün etkilediği ve çocuk ve gençlerin uyuşturucunun olumsuz etkilerini anlaması durumunda kullanım oranlarının düştüğü belirtilmektedir. Bu anlayış doğrultusunda, gençleri madde kullanımından uzak tutmak için önleyici faaliyetler uygulanmaktadır. ALO 191 Uyuşturucuyla Mücadele Danışma ve Destek Hattı, okul bazlı önleme çalışmalarının yanı sıra, uyuşturucu kullanımını önlemek ve insanları tedaviye yönlendirmek için 7 gün 24 saat hizmet vermektedir. Alkol ve Madde Bağımlılığı Tedavi Merkezleri (AMATEM) tedavi hizmetlerinin verilmesinden sorumlu kurumlar arasındadır. Madde bağımlılığı tedavisi tamamen ücretsizdir ve sağlık sigortası olmayan kişilerin tedavisi ücretsiz olarak uygulanmaktadır. Sağlık Bakanlığı'na bağlı ve ülke genelinde hizmet veren AMATEM sayısı 33 olup, AMATEM'lerin toplam yatak kapasitesi 704 kişidir. Ergen ve çocukların tedavisinden sorumlu tedavi merkezleri olan Çocuk ve Ergen Alkol Madde Bağımlılığı Tedavi Merkezlerinin (ÇEMATEM) sayısı ise 6'dır. Ülkemizde bağımlılıkla

mücadelenin her kademesinde kurumlar arası işbirliğine öncelik verildiği, önleme, tedavi ve rehabilitasyonu içerir ve bu doğrultuda faaliyetler yürütülür. Aslında bağımlılık sorununu tek bir kurumun sorumluluğuna bırakılmadan topyekûn bir mücadele ile çözmeye çalışmak, sorunla etkili bir şekilde mücadele etmek açısından önemlidir (Dönmez ve Aydoğdu, 2020).

#### **-Madde Bağımlılığına Yönelik Önlemler**

Önleme çalışmaları, maddeye talebin engellenmesi odaklı gerçekleşmektedir. Bu kapsamda başta gençler olmak üzere tüm toplumu madde kullanımına karşı korumak, bir veya daha fazla kez madde kullanmış fakat hala bağımlılık geliştirmemiş kişilere danışmanlık ve tedavi hizmeti vermek, madde bağımlılığı tanısını almış kişilerin tedavisi ve tedavi gören bağımlı olanların sosyal entegrasyonunun desteklenmesi amacıyla türlü programlar uygulanmaktadır (Johnston ve ark., 2014) ve madde kullanımının önlenmesine yönelik çalışmalar genellikle risk grubuna odaklanmaktadır. (Albayrak ve Balcı, 2014).

#### **-Çevresel Önleme**

Çevresel önleme politikaları, insanların madde kullanımına ilişkin seçimler yaptığı sosyal, kültürel, ekonomik ve fiziksel ortamları değiştirmeyi amaçlamıştır. Kurumların bu alanda uygulayacakları politikalar kendi inisiyatiflerine bırakılmak yerine kanunlarla güvence altına alınmıştır. Örneğin, alkol ve tütün gibi maddelerin kullanımının yaygın olduğu umumi dinlenme ve eğlence mekanlarının açılmasını ve işletilmesini düzenleyen 25902 sayılı İşyeri ve Çalışma Ruhsatları Hakkında Yönetmelik'in 30. maddesinde “Kamu ve özel okul binaları, ilkokul ve ortaokul öğrencilerinin barınmaları yurt ve anaokullarına 100 metre mesafede tespit edilemez”; 32. maddede “Meyhane, kahvehane, kıraathane, bar, elektronik oyun merkezi gibi halka açık yerler ve açık alkollü içki satışı yapılan yerler, resmi ve özel okul binaları ve ilkokul ve ortaokul öğrencilerinin barındığı yurtlar ve anaokullarından kapıdan kapıya en az 100 m uzaklıkta olması zorunludur” ve 36. Maddede “Yasal istisna olmaksızın; 18 yaşından küçük çocuklar eğlence, oyun, içki ve benzeri amaçlarla umuma açık yerlerde çalıştırılmaz. Bu kural ve uygulamalar; alkol ve tütün bağımlılığı riski altındaki öğrencilerin ve çocukların korunması açısından devletin “çevresel önleme”ye verdiği önemin açık bir kanıtıdır (Albayrak ve Balcı, 2014).

#### **-Okul Odaklı Önleme**

Çocukların ve gençlerin en önemli risk grupları olduğu ve zamanlarının çoğunda eğitim kurumlarında oldukları düşünüldüğünde, okul merkezli talep azaltma çalışmaları ehemmiyet kazanmaktadır. Toplumun farkındalığını artırmayı ve bireysel, ailesel ve toplumsal tüm

düzeylede sorumluluk geliřtirmeyi amalayan okul odaklı önleme alıřmalarında Milli Eđitim Bakanlıđı tarafından yürütölen alıřmalar ön plandadır. Milli Eđitim Bakanlıđı, ocukları ve gençleri olası risklerden (madde kötüye kullanımı, řiddet, cinsel istismar vb.) korumak amacıyla *Eđitim Ortamlarında řiddetin Önlenmesi ve Azaltılması Stratejisi ve Eylem Planı*’nı (2006-2011) hazırlamıřtır. Bu Eylem Planı’nda ve madde bađımlılıđının gençler arasında giderek yaygınlařtıđından bahsedilmektedir. Bu soruna özüm olarak öđrencilerde řiddet davranıřlarını önlemeye ve azaltmaya yönelik eylem biçimleri belirlenerek uygulamaya konulmuřtur. Bu dođrultuda tüm öđrencilere temel önleme, koruma ve müdahale hizmetlerinin sunulması, risk altındaki tüm ocukların belirlenmesi ve sunulacak hizmetlerde bütüncöl bir yaklařımın izlenmesi stratejik hedefler olarak belirlenmiřtir. Okullarda tüm öđrencilere verilen uyuruřturucu ve madde kullanımını önleme eđitimi, okullarda TUBİM İl İrtibat Görevlileri (İLTEM), psikolojik danıřmanlar ve rehber öđretmenler tarafından yürütölmektedir (Albayrak ve Balcı, 2014).

#### ***-Aile Odaklı Önleme***

Genlerin madde kullanımını önlemek amacıyla öncelikle aile ortamında erken ocukluk döneminden bařlayarak ocuđun ruhsal geliřimi güçlendirilmeli, ocuđun madde kullanımına karřı direncini artırmak ve sosyal yeteneklerini geliřtirmek için aileler desteklenmelidir (Albayrak ve Balcı, 2014).

#### ***-Toplum Odaklı Önleme***

Aile ve okul merkezli önleme faaliyetlerine göre toplum odaklı önleme faaliyetleri yürüten kurum sayısı daha fazladır. Kamuya bađlı kurum ve kuruluşlar, faaliyet alanlarına uygun olarak hazırladıkları program ve projeler sayesinde madde bađımlılıđı ile mücadele ve bađımlılıđın önlenmesi konusunda toplumu bilinlendirmek için alıřmaktadır. MEB, TUBİM, Sađlık Bakanlıđı, Aile ve Sosyal Politikalar Bakanlıđı, Diyanet İřleri Başkanlıđı ve eřitli sivil toplum kuruluşları toplum merkezli önleme faaliyetlerinde önde gelen aktörlerdir. Toplum odaklı önleme faaliyetleri yürüten bir diđer birim olan İl Halk Sađlıđı Müdürlükleri, madde kullanımını önlemeye yönelik projeler yürütmüř ve bu projeler kapsamında birçok madde bađımlılıđı tanısını almıř bireyleri tedaviye yönlendirmiř, bu konuda bilgilendirme ve bilinlendirme eđitimi de vermiřtir (Albayrak ve Balcı, 2014).

#### ***-Ulusal ve Yerel Medya Kampanyaları***

Görsel ve iřitsel medya, toplumun bütün kesimleri için insan hayatını řekillendiren önemli unsurlardır. Medyanın gücünden yararlanmak, madde kullanımıyla mücadelede en etkili

yöntemlerden biridir. Madde kullanımına karşı medyada kültür ve normların yaygınlaştırılması, bu konuyla ilgili yayınların kontrol edilmesi ve sorumsuz, teşvik edici ve caydırıcı yayınlara yaptırım uygulanması, alkol ve sigara reklamlarının yasaklanması, medyada aktif olan bireylerin olumlu tutumları ve mesajları madde bağımlılığı alanında birincil korumada önemli bir role sahiptir (Albayrak ve Balcı, 2014).

## **SONUÇ**

Madde bağımlılığı önemli bir toplumsal sorun olmakla birlikte, önleme ve koruma çalışmalarında birçok kurum, kuruluş ve medyanın etkisi olduğu gibi psikiyatri hemşirelerinin de önemli yetki ve etkileri vardır. Psikiyatri hemşireleri özellikle toplumsal sorunlar, madde kullanım oranları, özellikle çocuk ve gençlerin madde kullanımının önlenmesi konusunda farkındalık yaratacak eğitimler vermeli ve danışmanlıklar sürdürmelidir. Disiplinler arasında yer almalı ve sahada farkındalık çalışmalarına yön vermelidir.

### **ÖZET**

Toplumsal sorunlar, toplumsal yaşamın başlangıcından beri süregelen olgulardır. Günümüz dünyasında kamuoyunda belli başlı toplumsal sorunlara işsizlik, her türlü bağımlılık, zorunlu göç, şiddet, cinsiyet eşitsizliği, eğitim eşitsizliği, terör, intiharlar, aşırı nüfus artışı ve insan hakları ihlalleri, eğitim, sağlık ve aile kurumlarına ilişkin sorunlar örnek olarak verilebilir. Ruh sağlığı, sağlık ve esenliğin ayrılmaz bir parçasıdır ve bir dizi biyolojik, sosyal, ekonomik ve çevresel faktör tarafından belirlenir. Dünya çapında, zihinsel bozukluklar en yaygın ancak kronik ve engelleyici sağlık koşulları arasındadır. Ruhsal bozuklukların biyolojik veya kalıtsal nedenleri olsa da sosyal, ekonomik ve çevresel faktörlerden de etkilenirler. Bu nedenle ruhsal bozukluklar birçok ülkede önemli ekonomik ve sosyal yük haline dönüşmekte ve düşük gelirli insanlar, işsizler, evsizler, düşük eğitimliler, göçmenler, şiddet mağdurları, mülteciler, istismara uğramış kadınlar ve ihmal edilen yaşlılar arasında ruhsal bozukluk riski artmaktadır. Toplumsal sorunların ruhsal bozukluklara yol açmasını önlemek için; öncelikle sağlık politikalarında işsiz ve yoksul bireylerin sağlığının korunması koruyucu sağlık hizmetlerine ağırlık verilmesi ve uluslararası işbirliğinin artırılması gerekmektedir. Kadınların ve yaşlıların ekonomik alanda güçlendirilmesi ve sosyal destek programlarının oluşturulması son derece önemlidir. Sosyal sorunların neden olduğu ruhsal bozuklukların önlenmesi için multidisipliner bir ekip içerisinde yer alan psikiyatri hemşirelerine de önemli görevler düşmektedir. Buna göre bu çalışmada sosyal sorunlar ile ruhsal bozukluklar arasındaki ilişki ve bu duruma yönelik önerilerde bulunulacaktır.

**Anahtar Sözcük:** ruhsal bozukluk, toplumsal sorunlar, psikiyatri hemşireliği

## **SOCIAL PROBLEMS THAT THREAT MENTAL HEALTH**

### **ABSTRACT**

Social problems are phenomena that have been going on since the beginning of social life. In today's world, unemployment, all kinds of addiction, forced migration, violence, gender inequality, education inequality, terrorism, suicides, overpopulation and human rights violations, problems related to education, health and family institutions can be given as examples. Mental health is an integral part of health and well-being and is determined by a range of biological, social, economic and environmental factors. Worldwide, mental disorders are among the most common yet chronic and disabling health conditions. Although mental disorders have biological or hereditary causes, they are also affected by social, economic and environmental factors. Therefore, mental disorders are turning into a significant economic and social burden in many countries, the risk of mental disorders is increasing among low-income people, the unemployed, the homeless, the low-educated, immigrants, victims of violence, refugees, abused women and the neglected elderly. To prevent social problems from causing mental disorders; first of all, it is necessary to protect the health of unemployed and poor individuals in health policies, to focus on preventive health services and to increase international cooperation. It is extremely important to empower women and the elderly in the economic field and to establish social support programs. Psychiatric nurses, who work in a multidisciplinary team, have important duties to prevent mental disorders caused by social problems. Accordingly, in this paper, the relationship between social problems and mental disorders and suggestions for this situation will be made.

**Keywords:** mental disorder, social problems, psychiatric nursing

## GİRİŞ

İnsan; biyolojik, sosyal, kültürel ve ruhsal yönlerinin hem kendi içinde hem de çevreyle sürekli bir etkileşim içinde olan, bu yönlerin bütününden oluşan bir varlıktır. Bir bütün içinde iyi ve sağlıklı olabilmesi, insanın, tüm bu yönlerinin en uygun düzeyde işlev gösterebilmesi ile mümkündür (Kaya ve Hiçdurmaz, 2018). Bununla birlikte, içinde yaşadığımız çağda özgürleşen bireyler, özgürlüğün karşılığı olarak, daha çok belirsizlik ve riskle karşı karşıya kalmak zorunda kalmış olup, gittikçe gelişen ve değişen dünyada bulunan toplulukların yaşamlarındaki problemler farklılaşmakta ancak hiçbir zaman tamamıyla çözülememektedir (Yılmaz ve ark., 2017; Bozkurt, 2000). Toplumların yaşadığı bu sorunlar toplumun içindeki birçok insan tarafından değerlerine uymadığına ve düzeltilmesi için harekete geçilmesi gerektiğine inanılan bir durum olup, alanların birisinde oluşan bir problem diğer alanları da etkileyerek bireyin iyilik halinin ve sağlık durumunun bozulmasına yol açabilmektedir (Kaya ve Hiçdurmaz, 2018; Çoban, 2021).

Toplumsal sorunlar; toplumsal çevrenin koşullarında ortaya çıkan, toplumun büyük bir bölümünü sarsan, topluma ait bazı değerlerle bağdaşmayan ve bu nedenle çekinilen ve düzelebilmesi için de topluma ait güç ile araçların kullanılması gereken durumlardır. Günümüz şartlarında yoğun olarak gözlenen bu toplumsal sorunlara; yoksul olmak, işsiz olmak, çocuk istismarı, suç ve şiddet problemleri, engelli olma problemleri, madde bağımlılığı başta olmak üzere her türlü bağımlılık, yanlış/çarpık kentleşme, göçler, terörle ilgili problemler, nüfus yoğunluğu, açlıkla ilgili problemler, çevresel sorunlar, eğitim, sağlık, aile gibi kurumlara ilişkin sorunlar (Yılmaz ve ark., 2017) örnek olarak verilebilir.

Toplumsal sorunlara konu oluşturan bu durumlar yaşamın başlangıcından beri var olan olgular olup, toplumdan topluma ve zamandan zamana değişiklik göstermekte ve insanlığın tamamı için büyük riskli durumlara neden olmaktadır. Bu sorunların çözümü ise ulusal ve uluslararası alanda ciddi çabalar gerektirmektedir çünkü toplumsal problemler genellikle tüm dünyayı ilgilendiren problemlerdir (Çoban, 2021; Aydemir, 2020). Ruh sağlığı ise sağlık ve esenliğin ayrılmaz bir parçası olup, bir dizi biyolojik, sosyal, ekonomik ve çevresel faktörlerden etkilenmekte, buna bağlı olarak toplumda gelir ve istihdamda azalmaya neden olmakta ve bu durum yaşam boyu devam edebilmektedir (Akkaş&Emsen, 2022). Toplumsal sorunların ve bu toplumsal sorunlara bağlı olarak ortaya çıkan ruhsal hastalıkların gelişiminin önlenmesinde bireyler başta olmak üzere multidissipliner ekip içerisinde yer alan psikiyatri hemşirelerine de

önemli görevler düşmektedir. Aşağıda günümüzde sıkça karşılaştığımız bazı toplumsal sorunlar ve ruhsal bozukluklar ile ilişkisi ele alınmış olup, önlenmesine yönelik önerilere yer verilmiştir.

### **İŞSİZLİK/YOKSULLUK**

Yoksulluk, toplumun en düşük yaşam ölçütünün beklentilerini yansıtan, insanlık başlangıcından beri bulunan ve endüstriyel devrimle daha belirgin sınırlara ulaşan toplumsal bir sorun olup, bireylerin yalnızca gelir, tüketim gibi ekonomik olanaklardan yoksunluk durumlarını değil, paralel olarak sağlık, ulaştırma, eğitim, sosyal güvence ile toplum ile ilgili hizmetlerden de yoksun kalmalarını ifade etmektedir (Karadağ&Mermer, 2020). Gelişmiş ve gelişmekte olan toplumlarda yoksulluk probleminden özellikle yaşlı bireyler, engelli bireyler, kadın ve çocuklar daha fazla etkilendiği söylenebilir. Maddi durumu yetersiz olan yoksul ailelere bakıldığında en çok sıkıntıyı çocuklar yaşamakta (Karadağ&Mermer, 2020) olup, bu durum, özellikle çocuk yoksulluğunu gündeme getirmektedir. Çocuk yoksulluğu, çocukların gelişimi ve refahı üzerinde kalıcı etkileri olan dünya genelinde bir toplumsal sorundur. Birleşmiş Milletler Uluslararası Çocuklara Acil Yardım Fonu (UNICEF) (2016) tarafından yayınlanan bir rapora göre, dünya çapında yaklaşık 900 milyon insan, günde 1,9 dolardan az harcama yapan yeni bir yoksulluk standardı altında yaşamakta ve çocuklar bu nüfusun neredeyse yarısını oluşturmaktadır. Dünya Bankası Grubu ve UNICEF (2016), dünya çapında 89 ülke arasında yapılan bir anket sonuçlarına göre, aşırı yoksulluk içindeki çocuk sayısının 385 milyona ulaştığı belirtilmiştir. Çin'de çocuk sayısı yoksulluk oranı %2'ye ulaşmış ve aşırı yoksul çocukların oranı %1,8 olmuştur. Bu durum, Çin'de çok sayıda çocuğun yoksulluk yaşadığını göstermektedir (Li ve ark., 2019).

Yoksul bireyler eğitim olanaklarından daha çok mahrum olduğundan dolayı, yoksulların iş ve meslek edinme şansını azaltmasına ve vasıfsız ve güvencesiz işlerde çalışmasına daha az para kazanmasına, işsiz kalmasına neden olmaktadır. İşsizliğin artmasıyla yoksullukta artmakta ve bu süreç kısır döngü biçiminde devam etmektedir, kendilerinin ve sorumlu oldukları aile üyelerinin yaşamlarını idame ettirme çabaları yoksul bireylerin ruh sağlığına zarar vermekte, stres, anksiyete ve depresyon gibi rahatsızlıklar sıklıkla görülmektedir. Yoksul aile çocukları, ailelerinde ihmale ve istismara, şiddet ve sömürüye toplumun diğer kesimlerine göre daha yüksek oranda kalmaktadır. Ek olarak diğer sosyo-ekonomik seviyelerde olan akranlarına imrenerek suça işleme yatkınlıkları artmaktadır, öz güvenleri ve benlik saygıları sağlıklı olarak gelişmemekte mutsuzluk, anksiyete ve bağımlılık riskleri artmaktadır (Karadağ&Mermer, 2020). İş faktörü, yoksulluk ve ruh sağlığı arasında önemli bir ilişki söz konusudur. Bir işe sahip

olma durumu; yetişkin bireyde, sağlıklı bir benlik için gerekli olan, öz yeterliliği, öz saygıyı ve kendini gerçekleştirme destekler, bu yetilerin sağlıklı gelişimi de toplumsal yapı ile önemli bir köprü oluşturur, bu sebeple işe sahip olma önemli belirleyicilerdendir (Kaya, 2007). İşsizlik ise bireyin hem sosyal hem de ekonomik yönden etkileyerek fiziksel ve psikolojik açıdan yıpranmasına, yaşam standardının düşmesine, uzun vadede yoksulluk çekmesine neden olur (Batic-Mujanovic ve ark., 2017). Kolombiya’da 13.201 hanede 44.988 kişiyi kapsayan çalışmada, 2-17 yaşları arasındaki toplam 1754 ergen yapılan görüşmelerde yoksul hanede yaşayan ergenlerin, yoksul olmayan hanelerdeki ergenlere göre ruh sağlığı sorunlarına sahip olma riskinin% 50 daha yüksek olduğu tespit edilmiştir (Díaz ve ark., 2022). Çanakkale’de 315 üniversite mezunu işsiz genç ile yapılan çalışmada, işsiz üniversite mezunlarının yarısından fazlasında yüksek depresyon riski belirlenmiş olup, işsizlik süresiyle depresyon riski arasında anlamlı bir ilişkinin olduğu saptanmıştır (Polat ve Bacak, 2018). Bu çalışmalara dayanarak, ruh sağlığının ülkelerin sosyoekonomik gelişimini engelleyebileceği için sadece bireysel bir sorun olmadığını, bir ülkenin geniş kalkınma planını hazırlarken sürdürülebilir kalkınma için potansiyel bir tehdit olarak görülmesi gerektiğini (Cénat ve ark., 2022) söyleyebiliriz.

Multidisipliner bir ekip içerisinde, ruh sağlığı ve sosyal alanda önemli bir yeri olan psikiyatri hemşirelerinin yoksulluğun ekonomik, politik, sosyal etkilerini azaltan programlar, proje ve yapısal yeniliklerin desteklenmesinde, yoksul bireylerin toplumsal hayatın içerisine katılımının sağlanmasında ve yaşam kalitelerinin artırılmasında mesleki rollerini kullanmaları önemlidir. Aynı zamanda işsiz/yoksul kişi ve onun ailesi, ruhsal açıdan sağlıklarının etkilenmemesi ve bozulmamasına dikkat edilmeli, sağlıkta sosyal ölçütlere dikkat çekilmeli, sağlığı geliştirmede etkin yaklaşımlar geliştirmede liderlik rolü üstlenilmeli, toplumda işsiz ve yoksulların savunucusu olunmalı, işsiz ve yoksul ailelerin başa çıkma etme becerileri geliştirilmeli, hayatlarını devam ettirme çabaları ile kaynakları desteklemelidir, uygun olan toplumsal kaynakları kullanmalarında aileye rehberlik edilmelidir (Karadağ&Mermer, 2020).

### **ZORUNLU GÖÇ**

Göç; toplumsal, siyasi ya da ekonomik olan nedenlerle kişinin ya da topluluğun yaşadığı ülkeden farklı bir ülkeye, herhangi bir yerleşim yerinden farklı bir yerleşim yerine gitmesi, bölgesel olarak mekân değiştirme durumunu kapsayan sosyal olan değişim durumudur. Türkiye’de 1950’li yıllardan beri iç göç, 1980’li yıllardan sonra terör olaylarında kaynaklı batıya göç hızlanmıştır. Bununla birlikte, 2011 yılından itibaren Ortadoğu’dan Türkiye’ye göç sürekli göç almaktadır (Solgun ve Durat, 2017). Savaş, etnik veya dinsel özellikli

anlaşmazlıklar, siyasi/politik baskılar, ağır yoksulluk, işsizlik, kariyerde yükselme, istendik olan iş imkânları, eş ve ailesel sebepler, sağlık imkânlarına yakın olma isteği, iklimsel nedenler, doğal afetler, evlilik gibi sebepler göç nedenleridir. Toplum sisteminde mekân olarak eşitsizlik veya dengesizlik durumları da göç yaşanmasına sebep olabilmektedir (Solgun ve Durat, 2017; Topçu ve Başer, 2006).

Göçmenlerin, kamp ortamlarında zorlu yaşam şartlarında yaşaması, güvensizliği deneyimleten yaşantılara maruz kalmaları, uyum göstermeye zorunlu hissetme, sosyal ve kültürel açıdan yalnız hissetme, toplumsal desteğin yetersizliği, sosyal yönden pasiflik durumu ve suçlu hissetme duyguları onların ruhsal olarak yıpranmasına ve ruh sağlıklarının bozulmasına neden olmaktadır. Göçmenlerde toplumun diğer kesimlerine göre; depresyon, anksiyete, intihar, dikkat eksikliği, bunaltı, agorofobi, psikosomatik belirtiler, uyku bozuklukları ve travma sonrası stres bozukluğu gibi psikiyatrik bozukluklar fazla görülmektedir (Aktaş ve ark., 2017). Solgun ve Durat (2017)'ın Veiling ve ark. (2008)'dan aktardığına göre; Hollanda'daki göçmen bireylerle yaptıkları çalışmada, göçmen bireylerin yoğun yaşadığı yerleşim yerlerindeki göçmenlerde şizofreni riskinin daha az olduğu saptanmıştır. Bu çalışmaya göre kendi kültürel ortamında yaşıyor olmanın kişilerarası ilişkileri arttırarak kendini yabancı ve kimsesiz olma hissini duygusunu azalttığı için koruyucu olduğu söylenebilir. Hollanda'da 648 Türk, 102 Fas ve 311 Surinamlı ile yapılan çalışmada şizofreninin haricinde, madde kullanımı sorunları ile duygu durum bozuklukları göçmen gruplarda yüksek olarak tespit edilmiştir. Hollanda'da yapılmış olan araştırmalarda, depresif bozuklukların en fazla Türk olan göçmen gruplarda olduğu saptanmıştır (Kamperman ve ark. 2007).

Tüm bu sonuçlara dayanarak, klinisyenlerin ve hizmet sağlayıcıların mültecilerin ruhsal sorunlarının ve ihtiyaçlarının ve sosyal zorluklarının farkında olmaları gerektiğini, mülteci çocuklara etkili ruh sağlığı hizmetleri sunmak için, hizmetlere erişimi kolaylaştıran ve tedaviye uyumu artıran politikaların geliştirilmesi gerektiğini söyleyebiliriz. Bu bağlamda ruh sağlığı ve psikiyatri hemşiresinin, diğer sağlık disiplinleri ile birlikte, göçmen bireylerin problemlerini ve ihtiyaçlarını saptaması, göçmen bireylere yönelik koruyucu müdahaleleri yapması gerekmektedir. Hemşireler, göçmenlere depresyon ve psikososyal sorunları ile ilgili farkındalıklarını artırma ve uygun baş etme becerilerini geliştirmeye yönelik danışmanlık hizmeti vermelidir. Ayrıca, göçmenlerin çevredeki kişilerle iletişim kurmaları için ortam oluşturulmalı ve önyargılarının en aza indirilmesi hedeflenmelidir. Hemşireler başta sağlık hakkı olmak üzere göçmenlerin sosyal haklarının da savunuculuğunu yapmalı, göçten etkilenen

aile ve çocuklara yönelik psikososyal destek sağlamalıdır, özellikle bu gruplara öncelik verilmeli, özel grup olarak kabul edilmeli, mevcut sağlık durumlarının devam ettirilmesi ve daha iyi duruma getirilmesi için destek olunmalıdır (Gümüş ve Bilgili, 2015; Kaya ve Hiçdurmaz, 2018).

## **TERÖR**

Terör olgusu, günümüzün en çok tartışılan kavramlarından biridir. Köken olarak Latince “terrere” kelimesinden gelen terör, “korktuğu için sarsıntı yaşama”, “korktuğu için titreme, titremeye sebep olma”, “korktuğu için dehşet yaşama” gibi anlamlara gelir. Terör, kişilerde yılgınlık yaratan, büyük çaplı korku veren bir eylem olarak tanımlanmaktadır (Şen, 2015). Terör olayları yoğun travmaya neden olan olgular olup, travma etkisi yaratan durumun peşinden bu duruma maruz kalan bireylerin yanında; aile, yakınlar, yardıma çalışan bireyler, gönüllü olanlar, olayı basından izleyen kişiler de bu travmatik olaya dolaylı biçimde maruz kalmaktadır (Aktaş ve ark., 2017). Yapılan araştırmalara bakıldığında; terör saldırılarının ardından saldırıya görerek işiterek tanık olan bireylerde diğer dönemlerde TSSB ortaya çıktığı belirlenmiştir (Mazurkiewicz ve ark., 2022; Gabriel ve ark., 2007; Aktaş ve ark., 2017). Terör olayını yaşamış kişilerde sonrasında şok yaşama, korkma, öfkelenme, suçlu hissetme, kaygılı olma, çaresiz ve umutsuz hissetme, yorgun ve gergin olma, uyku problemleri, yeme bozukluğu, kalp ritim bozuklukları, ani irkilme, huzursuz ve güvensiz olma, reddedilmiş hissetme, her şeyi kontrol etme isteği, aşırı yargılayıcı, suçlayıcı olma, çevresine ve olaylara yönelik ilgi azalması görülmüştür (Aktaş ve ark., 2017). Zeytinoglu-Saydam ve arkadaşlarının (2020) Türkiye’de 282 kişi ile yaptığı çalışmanın sonuçları dikkate alındığında, katılımcıların terör olaylarından çok fazla etkilendiği, kendini güvende hissetme durumlarının orta seviyede olduğu, TSSB tanısını almış olanların da oranının %9,2 olduğu saptanmıştır. Bu sonuç, terörle ilgili olumsuz durumları ve travmaları yaşayan farklı ülkelere göre düşüktür, terörle ilgili olayları devamlı olarak yaşayan ülkelerdeki (ör: İsrail) oranlara (%9,4) benzerdir (Bleich ve ark., 2003).

Teröre maruz kalan, travma yaşayan kişiler; yüksek oranda iç ya da dış uyaranlara maruziyet yaşamakta, etkili olmayan başa çıkma mekanizmaları sonunda ruhsal problemler ile fiziksel problemleri yaşayabilmektedir. Bu bağlamda psikiyatri hemşireleri; kişinin yaşam olaylarını anlamlandırma, hissettiği duygusal baskı ve problemlerle başa çıkma ve pozitif ilişkiler geliştirebilmede desteklemeli; Travmaya maruz kalanlara yönelik olarak güvenli bir çevre oluşturmalı; bakımlarını sağlarken, kişilerin ve toplulukların kültürel değer ve inançlarına dikkat edilmeli; travma etkisi yaratan durum esnasında bireyin yaşadığı duygularla tepkilerine

dikkat edilmeli ve bireyin yaşadığı duyguyu tanımlayabilmesine yardım edilmeli; hastayla güvene dayalı bir ilişki kuralı, duygu ve düşüncelerini ifade edebilmesi konusunda cesaretlendirmelidir. Ayrıca psikiyatri hemşireleri tecrübeleriyle bireylere yönelik psikolojik destek aşamasında öncelikle ele alınması gereken grupları tespit ederek, sonrasındaki süreçlerde mağdur olanlarla onların yakını olanlara psikoöğitimler yapabilirler (Aktaş ve ark., 2017; Büyükbayram ve ark., 2016).

### **MADDE BAĞIMLILIĞI**

Bağımlılık, bir nesneye, kişiye veya varlığa karşı önüne geçilemeyen bir istek duyma, bireyin ruhsal, bedensel ve sosyal yaşamına zarar verse de devamlı şekilde engellenemeyen istek duyarak kişinin bu durumu sürdürmesi halidir (Bayram, 2013). Madde bağımlılığı, tütün, alkol ve yasadışı uyuşturucuları (kokain, kanabinoidler ve opioidler) ve ayrıca psikoaktif ilaç ilaçlarını da içine alan psikoaktif maddelerin zararlı kullanımını ifade etmektedir (Khatib ve ark., 2018). Dünya Sağlık Örgütü madde bağımlılığını; alkol ile yasadışı olan uyuşturucu maddeleri de içeren psikoaktif maddelerin zararlı ya da tehlikeli kullanımını biçiminde tanımlamıştır (WHO, 2022). Dünya Sağlık Örgütü 2014 yılı istatistiklerinde sigara içiminin dünyada bir senede hemen hemen 6 milyon kişinin ölümüne neden olduğu, tütün ve türevlerinin 2030'a kadar yıllık 8 milyonun üzerinde kişinin hayatını kaybetmesine sebep olacağına dikkat çekmektedir. Yine bu raporda değişik ülkelerde, 13-15 yaş arası gençlerin sigara kullanımlarına bakıldığında erkeklerin %8-34 arasında, kızlarda ise %4-30 oranında olduğu görülmektedir (Mete ve ark., 2020).

Madde kullanımıyla birlikte bağımlılık problemi dünya genelinde ki gibi ülkemizin de giderek artan, sağlık, eğitim, çalışma, sosyal, kültürel gibi birçok alan başta olmak üzere bireyin tüm yaşamını, ailesini, sosyal çevresini ve toplumu etkileyen çok önemli bir toplumsal sorun olma niteliği kazanmıştır (Bayram, 2013; Karadağ, 2021; WHO, 2022). Buna bağlı olarak şiddet, suç eylemleri, sağlık hizmetleri ihtiyaçları, rehabilitasyon hizmetleri, azalan işgücü verimliliği ve yargı harcamaları şeklinde insani, sosyal, sağlık ve ekonomik maliyetlerde artış olmaktadır (Lo ve ark., 2020). Madde bağımlılığının, aynı zamanda trafik kazası, özkıyım, suça yönelim, ailelerde parçalanma, iş yaşamında bozulma, mesleki kayıp ile parasal sorunlar biçiminde, kişiye ve topluma pek çok zararı olup, özellikle gençler üzerinde ciddi etkilere yol açmaktadır. Madde kullanımına genellikle adölesan döneminde başlanmaktadır. Bireylerde suça yönelim çok fazla görülmektedir. Gençler daha çok eğlenebilmek, sosyal ve duygusal ihtiyaçlarını karşılamak, problemlerinden uzaklaşmak, heyecanlanmak şeklinde farklı nedenlerden dolayı

maddeyi kullanmaya yönelmektedir (Altundağ, 2020; Yıldırım ve ark., 2011). Altıntaş ve arkadaşlarının (2007) ifade ettiğine göre; psikoaktif maddenin kötüye kullanım durumu ya da bağımlılık durumu olan bireylerde psikiyatrik hastalıkların görülme oranı 2,7 kat fazla olup, psikiyatrik hastalıkların bir tanesinin eşlik etme oranının ise %70-75 arasında değiştiği vurgulanmıştır. Madde bağımlılığı olan bireylerde psikoz görülme durumu toplumun diğer kesimlerine göre daha yüksektir.

Tüm bilgiler ışığında, psikiyatri hemşireleri, bağımlı hastaların baş etme davranışları ile ilgili ilgili veriler toplayıp, olası hemşirelik tanılarını koyarak bakım sürecini yönetebilirler, uygun etkin baş etme stratejilerini geliştirip, sosyal destek sistemlerini harekete geçirip, duygularının ifade etmeleri sağlanarak, problem çözme becerilerini artırılabilir. Bununla birlikte bir psikiyatri hemşiresinin nihai hedefi, bağımlı bireyin olumsuz duygularını tamamen ortadan kaldırmaktan da öte, olumsuz duygular üzerinde kontrol sağlayabilme, motivasyonunu sürdürebilme, istenilen başarıyı elde etmek amacıyla duyguları düzenlemeye destekleyerek bireyin güçlenmesini sağlamak olmalıdır (Arabacı ve ark., 2018).

## **ŞİDDET**

Türk Dil Kurumu (TDK); şiddeti, *karşıt görüşte olanlara kaba kuvvet kullanma* olarak tanımlamaktadır (TDK, 2022). Şiddet, kişinin kendine ya da bir başkasına zarar verme kastıyla güç kullanma durumunu da kapsayan, ekonomik, biyolojik, kültürel, sosyal, politik ve psikolojik nedenleri olan, kişinin düşünce ve davranışlarıyla ilişkili olan çok boyutlu bir olgudur (Yorulmaz ve Karadeniz, 2021). Ana özellikleri ne olursa olsun, zamana ve topluma göre değişen şiddet olgusu, birçok toplumsal sorunun da kaynağını oluşturmakta, bireylere fiziksel ve ruhsal olarak zarar vermekle kalmayıp, sosyal olarak da olumsuz etkilemektedir. Ayrıca, günümüz toplumunda en önemli sorunlarından birisi olup, sağlıklı toplumların oluşmasında önemli bir engeldir (Özerkmen ve Gölbaşı, 2010). Özellikle kadına yönelik şiddet, kalkınma hedeflerine ulaşmada ilerleme kaydedilmesinin önündeki en büyük engeldir ki bunu ele almayan hiçbir devletin binyıl kalkınma hedeflerine ulaşma şansı çok azdır. Bu rağmen, aile içi şiddet konusu, uluslararası kalkınma gündeminde, planlamada, programlamada ve bütçe lemede düşük bir önceliğe sahip olmaya devam etmektedir (Semahegn ve Mengistie, 2015). Dünyada hiçbir ülke kadınları şiddete karşı güvende değildir. Dünya çapında, kadınların %40-70'i yakın partnerleri tarafından öldürülüyor. DSÖ'nün çok ülkeli çalışmasına göre, aile içi şiddet Japonya'da %15'ten Etiyopya'da %71'e kadar değişmiştir (Semahegn ve Mengistie, 2015).

Şiddete maruz kalan çocuklarda özgüven eksikliği, korkular taşıma, iletişim sorunları yaşama, öğrenme gücü, okul başarısında düşüklük, korku, sinirlilik, duygu ve davranış bozuklukları, anksiyete, depresyon görülebilmekte, bununla birlikte çocuklar madde kullanımı, intihar , sonraki yaşamlarında daha fazla şiddete maruz kalma ve kendilerinin de şiddet uygulaması açısından da risk altında olmaktadır (Lök ve ark., 2016). Çocuklar kadar kadınlara yönelik şiddet de aile şiddet kapsamına giren, insan hakları ihlalleri ve kadınları fiziksel, ruhsal, zihinsel ve üreme sağlığını olumsuz etkileyen toplumsal bir sorundur (Semahegn ve Mengistie, 2015). Psikiyatri hemşirelerinin de içinde bulunduğu, çok sektörlü bir yaklaşımla birlikte, şiddetin önlenmesi ve bunlara yanıt verilmesi için; şiddete maruz kalan kadın ve çocuklar erken teşhis edilmeli ve uygun yönlendirme ve desteğin sağlanması yoluyla şiddetin tekrarlanmasını önlenmeli; yaşam becerilerinin ve gençlere öğretilen kapsamlı cinsellik eğitimi müfredatının bir parçası olarak eşitlikçi cinsiyet normları teşvik edilmeli; ergenlerin, oluşturulacak şiddet önleme programlarına katılması sağlanarak, şiddet ve şiddet nedenlerine ilişkin görüşlerinden yararlanmaları sağlanmalı; gençlere şiddet karşısında “hayır” diyebilecekleri ortamlar oluşturmaları sağlanmalı ve okullarda öğrencilere şiddetin fiziksel boyutu kadar, duygusal, cinsel ve ekonomik boyutu konusunda da farkındalık kazandırılmalı; okullarda, gerçekleşebilecek olası şiddet olaylarının önlenmesinde görev alabilecek okul sağlığı hemşirelerinin istihdam edilmesi ve bu hemşirelerin,

- Ergenlerde ailesel risk faktörlerinin belirlenmesinde,
- Şiddet uygulayan veya şiddete uğrayan çocuklara gerekli yardımın sağlanmasında,
- Ergenlerde düzenli ruh sağlığı taramalarının yapılmasında aktif olarak rol almaları sağlanmalıdır (WHO, 2021; Özgür ve ark., 2011).

### **SUÇ İŞLEMENE YATKINLIK**

Suç, nicelik ve nitelik olarak çok yönlü bir kavram olmakla birlikte, Türk Ceza hukukunda *yasanın cezalandırdığı hareket* olarak tanımlanmış ve toplumsal yapı gibi birçok değişkene bağlı olarak değişen sosyal bir olgudur (Çopur ve ark., 2015). Giddens’e göre suç kavramı, geleneksel kural ve değerlere denk olmayan davranışlarda bulunma ve bu uygun olmayan davranışların yıkıcı özellik taşıması nedeniyle toplumsal yapıya yönelen bir tehdittir (Karakartal, 2020). Bu tanıma göre suç kavramı toplumsal bir sorun olmakla birlikte, diğer toplumsal sorunlar ile rölatif bir ilişki içerisinde olmakta, göç, madde bağımlılığı ve şiddet gibi olgularla ilişkili olduğu bilinmektedir.

Madde bağımlılığı, bireyi suç işlemeye yönelten nedenler arasında olup, uyuşturucu; kişilerin durum ve davranışlarında değişime yol açarak bireyin suç mağduru olmasına ve şiddet, saldırganlık ve hırsızlık suç türlerinin dışında trafik kazaları, medde kuryeliği ve cinsel saldırı gibi suçları işlemesine yol açmaktadır (Boles ve Miotto, 2003; Karakartal, 2020). Toplumu tehdit eden işsizlik sorunu ise bireylerin yaşam standardını düşürmekte, yoksullaşmasına ve toplumdaki izole olmalarına yol açarak, türlü sosyal ve psikolojik sonuçların ortaya çıkmasına neden olmaktadır. Bu gençler, işsizliğin getirdiği sorunlara karşılık olarak intihara yönelmekte, evliliklerini ertelemekte, boşanmalarla birlikte aile kurumuna yönelmiş tehditler artmakta ve tüm bu durumlara bağlı olarak suça yönelmektedir (Özer ve Topal, 2017). Yoksulluk, işsizlik ve eşitsizliğin ötesinde cinayet gibi şiddet içeren suçlarla ilgili ve yaygın olarak inanılan önemli bir faktör de göç olup, 2017'de Çin'de tahmini 287 milyon kırsal göçmen işçinin olduğu, bir popüler medya analizi sonuçlarına göre göçmenler toplam şiddet içeren suçların %80'inden fazlasını oluşturduğu saptanmıştır (Dong ve ark., 2020).

Toplumsal sorunların sonuçları ile ortaya çıkan suç gibi sorunları önlemenin en önemli yolu, toplumun yapısını, temel ihtiyaçlarını ve önceliklerini tanımak, en kısa sürede ve istenen düzeyde bunlara cevap vermek olup, bu durum etkin yönetimin bir gereği olmaktadır. Şiddete ya da cinsel istismara maruz kalmış, aile içinde suç işlemiş bireyler bulunan ve göç etmiş düşük gelirli ailelerin çocuklarının suça yönelmesi ihtimali yüksek olduğundan, böyle çocuklar tespit edilip gerekli psikolojik desteğin sağlanmalı ve düzenli ziyaretler yapılmalıdır (Çopur ve ark., 2015).

## **SONUÇ**

Toplumsal sorunlar insanlık tarihiyle var olan olgular olup, birbirini etkilemekte ve desteklemektedir. Bu sorunlar, bireylerde istihdam ve gelir kaybına yol açmakta ve toplumsal dışlanmaya kadar sonuçlara yol açmaktadır. Ruh sağlığı ise esenliğin önemli bir parçası olup, ruh sağlığının korunması amacıyla psikiyatri hemşireleri başta olmak üzere tüm ruh sağlığı profesyonellerine ve elbette devlet kurumlarına da önemli görevler düşmektedir.

**ÖZET**

Bu araştırmanın amacı sporcuların ahlaktan uzaklaşma düzeylerini bazı demografik bilgilere göre incelemektir. Çalışmada, betimsel nitelik taşıyan tarama modeli kullanılmıştır. Araştırmanın evreni, spor yükseköğretim kurumlarındaki sporculardan, örneklem grubu ise, Ordu Üniversitesi Spor Bilimleri Fakültesi sporcuları arasından tesadüfi örneklem yöntemi ile seçilmiş 159 katılımcı oluşturmaktadır. Araştırmada veri toplama aracı olarak, araştırmacılar tarafından geliştirilen “Kişisel Bilgi Formu” ile Boardley ve Kavussanu (2008) tarafından geliştirilen Gürpınar (2015) tarafından Türkçeye uyarlanan “Sporda Ahlakdan Uzaklaşma Ölçeği” kullanılmıştır. Araştırmada ölçek maddelerinin iç tutarlılığını belirlemek için güvenirlik katsayısı (cronbach alfa katsayısı) hesaplanmıştır. Ölçeğin güvenirlik katsayısı (cronbach alfa katsayısı) 0,733 olarak tespit edilmiştir. Çalışmada elde edilen verilerin değerlendirilmesinde, normallik varsayım analizine göre; ikili kıyaslamalarda Student t-testi, üç ve daha fazla grup karşılaştırmalarında ise tek yönlü varyans analizi ve Tukey çoklu karşılaştırma testleri kullanılmıştır. Sporcuların Yaş, spor yaşı, anne eğitim durumu ve baba eğitim durumu değişkenlerine göre sporda ahlaktan uzaklaşma ölçeği toplam puanları arasında anlamlı bir farklılık tespit edilmemiştir. Cinsiyet ve spor türüne göre toplam puanlar da ise anlamlı farklılık belirlenmiştir. Yapılan analiz sonucu, erkek sporcuların kadın sporculara göre toplam puan ortalamalarının daha yüksek olduğu saptanmıştır. Bir diğer bulgu da ise takım sporcularının bireysel sporculara göre ahlaktan uzaklaşma puanlarının daha yüksek olduğu görülmüştür. Bu anlamda erkek sporcuların kadın sporculara göre spor ahlakından daha uzak olduğu yorumu yapılabilir. Aynı şekilde takım sporu yapan sporcuların bireysel spor yapan sporculara göre spor ahlakından daha uzak olduğu söylenebilir. Bu anlamda erkek sporcular ve takım sporu yapan sporcular için sporun etik ve norm değerlerini vurgulayacak, fair-play kavramını açıklayacak etkinlikler ve seminerler yapılması tavsiye edilmektedir.

**Anahtar kelimeler:** Ahlak, ahlaktan uzaklaşma, spor

## **EXAMINATION OF ATHLETES' LEVELS OF MORAL DISENGAGEMENT**

### **ABSTRACT**

The aim of this research is to examine the level of athletes' demoralization according to some demographic information. In the study, descriptive screening model was used. The universe of the study consists of 159 participants selected by random sampling method from among the athletes of Ordu University Faculty of Sports Sciences and the sample group consists of athletes from sports higher education institutions. In the study, the "Personal Information Form" developed by the researchers and the "Moral Disengagement Scale in Sports" developed by Boardley and Kavussanu (2008) and adapted to Turkish by Gürpınar (2015) were used as data collection tools. The reliability coefficient (cronbach alpha coefficient) of the scale was determined as 0,733. In the evaluation of the data obtained in the study, according to the normality assumption analysis; Student's t-test was used for binary comparisons, one-way analysis of variance and Tukey multiple comparison tests were used for three or more group comparisons. According to the variables of age, sports age, maternal education status and father education status of the athletes, no significant difference was found between the total scores of the scale of demoralization in sports. Total scores according to gender and type of sport were also significantly differentiated. As a result of the analysis, it was determined that the total average score of male athletes was higher than female athletes. Another finding was that team athletes had higher scores of demoralization than individual athletes. In this sense, it can be interpreted that male athletes are more distant from sports ethics than female athletes. In the same way, it can be said that athletes who do team sports are more distant from sports ethics than athletes who do individual sports. In this sense, it is recommended to organize events and seminars for male athletes and team sports that will emphasize the ethical and normative values of sports and explain the concept of fair play.

**Keywords:** Morality, moral disengagement, sport

## **GİRİŞ**

Son yıllarda alan yazın incelendiğinde, fair play ve sportmenlik ile ilgili birçok çalışmanın olduğu bilinmektedir (Akpınar ve Küçükkatçeken 2019; Başaran ve ark. 2017). Yapılan çalışmalar, spor içerisindeki düzen ve sistem yönünden önemi tartışılmaz bir durumdur. Spor içerisinde ahlaki normlara göre hareket etmenin yanında ahlaktan uzaklaşabilecek davranışların da olduğu söylenebilir. Bu noktada sporcu ve antrenörlerin ahlaki kurallara uygun olmayan davranışları sergilerken, yeri geldiği zaman bu davranışları uygularken haklı olduklarını ifade edebilmektedirler.

Spor içerisindeki işleyişin düzeni ve sisteminin bozulmaması açısından, sporcuların ahlaktan uzaklaşabilecek davranışlardan sakınmaları önemlidir. Ahlaktan uzaklaşma mekanizmaları, sergilenen davranışlar yönünden rehberlik ettiği ifade edilebilir. Bu mekanizmalar; ahlaksızlığı meşrulaştırma, örtmeceli sınıflandırma, avantajlı karşılaştırma, sorumluluğun yer değiştirmesi, sorumluluğun dağılmaması, sonuçların saptırılması, insani özelliklerden uzaklaşma ve suça dayanak oluşturma olarak sınıflandırılmaktadır. Açıklanan mekanizmaların daha detaylı incelenmesi önemli olacaktır. Genel olarak sporcuların galibiyet için uygulamış oldukları davranışlar hatalı olsa bile, övgüye değer olarak nitelendirilmektedir. Bu olay ahlaksızlığı meşrulaştırmaktadır. Örtmece kelime anlamı bir takım kaba ve çirkin kavramları değiştirerek daha uygun hale getirme durumu olarak tanımlanabilir. Bu durum sporda örtmece yaparak, ahlaki kurallara uygun olmayan kavramları esneterek ifade edebilmektedir. Bunların yanında sporcular bazı kötü davranışları daha çirkin davranışlarla karşılaştırarak, masum göstermekte ve bazı kötü davranışları ise toplumun ve üstlerinin sorumlu olduğunu aktarmaktadır. Sorumluluğun dağılması mekanizması incelenecek olunursa, takım olarak şiddet içeren davranışlar sergilenmesi sonucunda, sorumluluğun bireyler tarafından kabul edilmeme durumu olarak açıklanabilir. Sporcuların şiddet içeren davranışları ve çirkin söylemlerinin daha sonra önemsiz olduğunu düşünmektedirler. Yani sonuçları saptırmaktadırlar. Son olarak sporcular, rakiplerini insani özelliklerden yoksun olduklarını ve yapılan şiddet içerikli davranışlarının, tahrik sonucunda gerçekleştirdiklerini ifade etmektedirler. Bunlar ise, insani özelliklerden uzaklaşma ve suça dayanak oluşturma mekanizmalarını nitelemektedir (Gürpınar 2015). Bu tanımlamalar neticesinde; sporda ahlaktan uzaklaşma durumu, sporun içerisinde kural, ilke ve etik prensiplere uygun olmayan davranışlar bütünü olarak açıklanabilir. Böylece bu çalışmanın amacı, sporcuların ahlaktan uzaklaşma düzeylerinin incelenmesidir.

## **ARAŞTIRMA VE BULGULAR**

Araştırmada, mevcut durumu tespit etmeyi amaçladığı için betimsel nitelik taşıyan tarama modeli kullanılmıştır. Tarama modelleri, geçmişte ya da halen var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımlarıdır (Karasar, 2015).

### **Evren ve Örneklem**

Araştırmanın evreni, spor yükseköğretim kurumlarındaki öğrencilerden, örneklem grubu ise, Ordu Üniversitesi Spor Bilimleri Fakültesi öğrencileri arasından tesadüfi örneklem yöntemi ile seçilmiş 159 katılımcıdan oluşmaktadır.

### **Veri Toplama Araçları**

Araştırmada veri toplama aracı olarak, araştırmacılar tarafından geliştirilen “Kişisel Bilgi Formu” ile Boardley ve Kavussanu (2008) tarafından geliştirilen, Gürpınar (2015) tarafından uyarlanan “Sporda Ahlaktan Uzaklaşma Ölçeği” kullanılmıştır. Kişisel bilgi formunda; cinsiyet, yaş, spor yaşı, spor türü, anne ve baba eğitim durumu değişkenleri yer almaktadır. Sporda Ahlaktan Uzaklaşma Ölçeği 7’li likert tipi olup, tek faktörlü yapı olarak 8 maddeden oluşmaktadır. Sporda Ahlaktan Uzaklaşma Ölçeği Cronbach’s Alpha ( $\alpha$ ) değeri 0,78 olarak hesaplanmıştır.

### **İstatistiksel Analiz**

Verilerin istatistiksel analizinde öncelikli olarak normallik varsayımı KolmogorovSmirnov ve Shapiro-Wilk testi ile incelenmiştir. Normal dağılım gösteren ölçeğin, elde edilen verilerin değerlendirilmesinde ikili gruplar (spor türü, cinsiyet, yaş) için Student t-testi, ikiden fazla gruplar (anne ve baba eğitim durumu ve spor yaşı) için Tek Yönlü Varyans Analizi ve Tukey çoklu karşılaştırma testi uygulanmıştır. Araştırmada elde edilen verilerin analizinde SPSS 22.0 V. istatistik paket programı kullanılmıştır. Araştırma bulguları, n (%), ortalama, standart sapma değerleri olarak verilmiş olup, bulgular  $p < 0,05$  düzeyinde anlamlı kabul edilmiştir.

**Tablo 1.** Araştırmaya Katılan Sporcuların Demografik Özelliklerine Göre Dağılımı

		n	%
Cinsiyet	Erkek	84	52,8
	Kadın	75	47,2
Yaş	18-21	91	57,2
	21 yaş ve üzeri	68	42,8
Anne Eğitim Durumu	İlköğretim	113	71,1
	Lise	34	21,4
	Üniversite	12	7,5
Baba Eğitim Durumu	İlköğretim	95	59,7
	Lise	48	30,2
	Üniversite	16	10,1
Spor Türü	Bireysel	75	47,2
	Takım	84	52,8
Spor Yaşı	0-2	14	8,8
	3-4	28	17,6
	5 yıl ve üzeri	117	73,6

**Tablo 2.** Cinsiyet Değişkenine Göre Sporcuların Ahlaktan Uzaklaşma Düzeyleri

Cinsiyet	n	Ort.	Ss.	P
Erkek	84	27,69	7,25	<0,001
Kadın	75	22,60	7,66	

Araştırmada, sporcuların cinsiyet açısından ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olduğu tespit edilmiştir.

**Tablo 3.** Yaş Değişkenine Göre Sporcuların Ahlaktan Uzaklaşma Düzeyleri

Yaş	n	Ort.	Ss.	P
18-21	91	25,42	7,14	0,797
21 yaş ve üzeri	68	25,10	8,76	

Çalışmada, sporcuların yaş değişkeni açısından ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olmadığı tespit edilmiştir.

**Tablo 4.** Anne Eğitim Durumu Değişkenine Göre Sporcuların Ahlaktan Uzaklaşma Düzeyleri

Anne Eğitim Durumu	n	Ort.	Ss.	P
İlköğretim	113	25,47	7,88	0,895
Lise	34	24,82	8,12	
Üniversite	12	24,83	7,25	

Araştırmada, sporcuların anne eğitim durumu değişkeni açısından ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olmadığı tespit edilmiştir.

**Tablo 5.** Baba Eğitim Durumu Değişkenine Göre Sporcuların Ahlaktan Uzaklaşma Düzeyleri

Baba Eğitim Durumu	n	Ort.	Ss.	P
İlköğretim	95	24,47	7,62	0,270
Lise	48	26,66	7,82	
Üniversite	16	26,00	8,83	

Çalışmada, sporcuların baba eğitim durumu değişkeni açısından ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olmadığı tespit edilmiştir.

**Tablo 6.** Spor Türü Değişkenine Göre Sporcuların Ahlaktan Uzaklaşma Düzeyleri

Spor Türü	n	Ort.	Ss.	P
Bireysel	75	23,73	6,74	0,016
Takım	84	26,67	8,52	

Araştırmada, sporcuların spor türü değişkeni açısından ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olduğu tespit edilmiştir.

**Tablo 7.** Spor Yaşı Değişkenine Göre Sporcuların Ahlaktan Uzaklaşma Düzeyleri

Spor Yaşı	n	Ort.	Ss.	P
0-2	14	24,07	5,23	0,816
3-4	28	25,67	8,82	
5 yıl ve üzeri	117	25,34	7,91	

Çalışmada, sporcuların spor yaşı değişkeni açısından ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olmadığı tespit edilmiştir.

## SONUÇ

Çalışmada, sporcuların yaş, anne eğitim durumu, baba eğitim durumu ve spor yaşı değişkenlerine göre ahlaktan uzaklaşma düzeylerinde anlamlı bir farklılık tespit edilmemiştir. Cinsiyet ve spor türü değişkenlerinde ise ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olduğu tespit edilmiştir.

Cinsiyet değişkenine göre incelendiğinde, sporcuların ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olduğu saptanmıştır. Yapılan analize göre, erkeklerin kadınlara göre puan ortalamalarının yüksek olduğu belirlenmiştir. Bu durum erkeklerin kadınlara göre daha hırslı olmalarına bağlanabilir. Alan yazın incelendiğinde Sarıkol (2021), Eroğlu ve ark. (2020), Turan (2020), Akoğlu ve ark. (2019), Yıldız (2019)'ın çalışma sonucu ile mevcut araştırma sonucu benzerlik gösterirken, Eriş (2020)'in çalışma sonucu ise örtüşmemektedir. Yaş değişkenine

göre incelendiğinde, sporcuların ahlaktan uzaklaşma düzeylerinde herhangi bir anlamlı farklılık olmadığı tespit edilmiştir. Yaşın ahlaktan uzaklaşma düzeyine bir etkisi olmadığı görülmektedir. Literatür incelendiğinde, Çavdar (2019)'ın çalışma sonucu ile araştırma sonucu benzerlik göstermektedir. Anne ve baba eğitim durumu değişkenine göre, sporcuların ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olmadığı bulunmuştur. Alan yazın incelendiğinde, Çavdar (2019)'ın çalışma sonucu ile mevcut araştırma sonucu benzerlik gösterirken, Eroğlu ve ark. (2020)'nin araştırma sonucuyla ise uyuşmamaktadır. Spor türü değişkenine bakıldığında, sporcuların ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olduğu tespit edilmiştir. Yapılan analizde, takım sporcularının bireysel sporculara göre puan ortalamalarının yüksek olduğu belirlenmiştir. Bu durum, takım sporcularının diğer takım arkadaşlarının baskısından kaynaklı olabileceği söylenebilir. Literatür incelendiğinde, Eriş (2020)'in çalışma sonucu ile araştırma sonucu benzerlik göstermektedir. Spor yaşı değişkenine göre incelendiğinde, sporcuların ahlaktan uzaklaşma düzeylerinde anlamlı farklılık olmadığı tespit edilmiştir. Alan yazın incelendiğinde, Çavdar (2019)'ın çalışma sonucu ile mevcut araştırma sonucu benzerlik gösterirken, Eroğlu ve ark. (2020)'nin araştırma sonucuyla ise örtüşmemektedir. Araştırma sonuçlarına göre, takım sporcuları ile erkek sporcuların ahlaktan uzaklaşma düzeylerinin yüksek olduğu tespit edilmiştir. Erkek sporcuların hırs ve azimlerini olumsuz şekilde göstermemeleri açısından antrenörlerin disiplinli davranmaları ve kurallara göre hareket edilmesi noktasında uyarılarda bulunması önerilebilir. Bunun yanında takım sporcularının daha adil ve sportmence davranmaları yönünde birbirlerini tetiklemeleri gerekmektedir. Sonuç olarak, sporculara fair-play kavramını açıklayacak etkinlikler ve seminerler yapılması tavsiye edilmektedir.

**ÖZET**

Bu araştırmanın amacı sporcularda başarı amacı düzeylerini bazı demografik bilgilere göre incelemektir. Çalışmada, betimsel nitelik taşıyan tarama modeli kullanılmıştır. Araştırmanın evreni, spor yükseköğretim kurumlarındaki sporculardan, örneklem grubu ise, Ordu Üniversitesi Spor Bilimleri Fakültesi sporcuları arasından tesadüfi örneklem yöntemi ile seçilmiş 111 katılımcı oluşturmaktadır. Araştırmada veri toplama aracı olarak, araştırmacılar tarafından geliştirilen “Kişisel Bilgi Formu” ile Karanfil ve ark. (2021) tarafından geliştirilen “Sporda Başarı Amacı Ölçeği” kullanılmıştır. Araştırmada ölçek maddelerinin iç tutarlılığını belirlemek için güvenirlik katsayısı (cronbach alfa katsayısı) hesaplanmıştır. Ölçeğin güvenirlik katsayısı (cronbach alfa katsayısı) 0,851 olarak tespit edilmiştir. Çalışmada elde edilen verilerin değerlendirilmesinde, normallik varsayım analizine göre; ikili kıyaslamalarda Student t-testi, üç ve daha fazla grup karşılaştırmalarında ise tek yönlü varyans analizi ve Tukey çoklu karşılaştırma testleri kullanılmıştır. Sporcuların cinsiyet, anne eğitim durumu, baba eğitim durumu ve spor türü değişkenlerine göre sporda başarı amacı ölçeği toplam puanları arasında anlamlı bir farklılık tespit edilmemiştir. Ancak, yaş değişkenine göre toplam puan ve ego alt boyut puanları açısından anlamlı farklılık olduğu tespit edilmiştir. Spor yaşında ise ustalık alt boyut puanları arasında anlamlı farklılık belirlenmiştir. Yapılan analiz sonucu, yaşı 21 ve üzeri olan sporcuların toplam puan ortalamalarının daha yüksek olduğu saptanmıştır. Böylece sporcuların yaşı arttıkça sporda başarı amaçlarının da artacağı düşünülmektedir. Sporun içerisinde bulunan rekabet, hedefe ulaşma, hırs ve azim gibi özellikler sporcular için önemli yer edinmektedir. Bu özelliklerin tümüne sahip olan sporcuların spordaki başarı amaçlarını da etkilediği düşünülmektedir. Sonuç olarak, yaşı küçük olan ve tecrübe sahibi olmayan sporculara tecrübeli ve başarılı sporcular dahilinde eğitim ve öğretim verilmesi tavsiye edilmektedir.

**Anahtar kelimeler:** Amaç, Başarı, Spor

**EXAMINATION OF THE LEVEL OF ACHIEVEMENT PURPOSE IN ATHLETES****ABSTRACT**

The aim of this research is to examine the success goal levels in athletes according to some demographic information. In the study, descriptive screening model was used. The universe of the study consists of 111 participants selected by random sampling method from among the athletes of Ordu University Faculty of Sports Sciences and the sample group consists of athletes from sports higher education institutions. As a data collection tool in the study, the "Personal Information Form" developed by the researchers and the "Achievement Goal Scale In Sports" developed by Karanfil et al. (2021) were used. In the study, reliability coefficient (cronbach alpha coefficient) was calculated to determine the internal consistency of the scale items. The reliability coefficient (cronbach alpha coefficient) of the scale was determined as 0.851. In the evaluation of the data obtained in the study, according to the normality assumption analysis; Student's t-test was used for binary comparisons, one-way analysis of variance and Tukey multiple comparison tests were used for three or more group comparisons. According to the variables of gender, maternal education status, father education status and sports type of athletes, no significant difference was found between the total scores of the achievement purpose in sports scale. However, according to the age variable, it was found that there was a significant difference in terms of total score and ego sub-dimension scores. In sports age, a significant difference was determined between the mastery sub-dimension scores. As a result of the analysis, it was found that the total score averages of the athletes aged 21 and over were higher. Thus, it is thought that as the age of athletes increases, their success goals in sports will also increase. Features such as competition, goal reaching, ambition and perseverance in sports have an important place for athletes. It is thought that athletes who have all of these characteristics also affect their success goals in sports. As a result, it is recommended that young athletes who are young and do not have experience be given education and training within experienced and successful athletes.

**Keywords:** Goal, Achievement, Sports

## 1. GİRİŞ

Başarı amacı teorisi, bireyin hedeflediği amaca yönelik duygu, düşünce, motivasyon ve azim gibi isteklerini açıklamaktadır. Bireyin hedeflerine yaklaşım şekillerini, performansını ve potansiyelini ortaya koymaktadır (Bodmann, Hulleman ve Harackiewicz, 2011). Tanımlardan da yola çıkarak bir kişinin amacına ulaşmasında “neden başarmalıyım?” sorusuna cevap aramaktadır. Bu anlamda başarı amacı teorisinin iki farklı yönelim durumu ortaya çıkmaktadır. Bunlar; ego ve görev yönelimidir. Ego yönelimi; bireyin dışarıya karşı üstünlük sağlamak ve yeteneklerini kanıtlamak için gösterdiği performanstır. Görev yönelimi ise; bireyin başarıya ulaşmakta gösterdiği performansın yeterliliğidir (Nicholls, 1989; Fry ve Newton, 2003). Başarı amacı teorisi eğitim alanı ile yakından ilgilidir. Özellikle öğrenci ve öğretmenlerin hedefe ulaşmak için girdiği yönelimi açıklamada birçok kez çalışma konusu olmuştur (Wolters, 2004; Anderman ve Patrick, 2012)

Başarı amacı teorisinin bir diğer çalışma alanı ise içerdiği bolca rekabet, mücadele ve yarışmanın olduğu spor alanıdır. Bir sporcu, antrenör ya da spor kurumunun hedefine “neden?” ulaşmak istemesi bu teori ile yakından ilgilidir. Spor alanında yapılan çalışmalar bireyin hedefine yönelimini farklı şekillerde ortaya koymuştur. Bir sporcunun diğer sporculara yeteneğini kanıtlama çabasına girmesi ve hedefine bu şekilde ulaşmak istemesi ego yönelimi ile ilgilidir. Sporcunun hedefine ulaşması için kendini geliştirmesi ve azim göstermesi ise ustalık yönelimi ile ilgilidir. Görev yönelimi, sporcunun başarı elde etmesi için azim, istek, çaba ve güç göstermesi olarak tanımlanırken ego yönelimi sporcunun hedefe ulaşmaya yönelik karakteristik inançlarını ortaya koymaktadır (Duda, 1993; Kristiansen, Halvari ve Roberts, 2012).

Tanımlardan da anlaşıldığı gibi bir sporcunun hedefine ulaşması iki farklı yönelimle gerçekleşmektedir. Ego yönelimi bireyin karakteristik özellikleri, yetenek gösterme çabaları, motivasyonu ve inançları ile ilgiliyken görev yönelimi doğrudan hedefe ulaşmak istemesi ve görevi başarıyla tamamlaması ile açıklanmaktadır. Sporun temasında güç ve rekabet vardır. Rekabetin artması ise doğrudan çekişmeli mücadelelere zemin hazırlamaktadır. Sporcular bu zeminde kazanmak ve rakiplerine üstünlük sağlamak istemektedir. Bu üstünlüğün sağlanması ise şüphesiz çalışmak ve inanmak ile ilgilidir. Bir diğer unsur ise sporcunun amacına ulaşmak istemesinin nedeni ile ilgilidir. Bu anlamda çalışmanın amacını sporcularda başarı amacı düzeyinin incelenmesi oluşturmaktadır. Çalışmadan elde edilecek bulgular ile literatürdeki bahsi geçen soruların cevaplanacağı düşünülmektedir.

## 2. YÖNTEM

Araştırmada, mevcut durumu tespit etmeyi amaçladığı için betimsel nitelik taşıyan tarama modeli kullanılmıştır. Tarama modelleri, geçmişte ya da halen var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımlarıdır (Büyüköztürk, 2010; Karasar, 2015).

### **Evren ve Örneklem**

Araştırmanın evreni, spor yükseköğretim kurumlarındaki öğrencilerden, örneklem grubu ise, Ordu Üniversitesi Spor Bilimleri Fakültesi öğrencileri arasından tesadüfi örneklem yöntemi ile seçilmiş 105 katılımcıdan oluşmaktadır. Örneklem grubu belirlemede Tavşancıl (2002)'in "örneklem grubu ölçek madde sayısının 5 katı kadar olmalıdır" önerisi ile belirlenmiştir.

### **Veri Toplama Araçları**

Araştırmada veri toplama aracı olarak, araştırmacılar tarafından geliştirilen "Kişisel Bilgi Formu" ile Karanfil ve ark. (2021) tarafından geliştirilen "Sporda Başarı Amacı Ölçeği" kullanılmıştır. Kişisel bilgi formunda; cinsiyet, yaş, anne ve baba eğitim durumu, spor türü ve spor yaşı değişkenleri yer almaktadır. Sporda Başarı Amacı Ölçeği 5'li likert tipinde olup, 2 faktörlü (ego ve ustalık) yapı olarak 11 maddeden oluşmaktadır. Ölçeğin Cronbach's Alpha ( $\alpha$ ) değerleri incelendiğinde, ego alt boyutu için 0,88, ustalık 0,91 ve Sporda Başarı Amacı Ölçeği toplam Cronbach's Alpha ( $\alpha$ ) değeri için 0,87 olarak hesaplanmıştır.

### **İstatiksel Analiz**

Verilerin istatistiksel analizinde öncelikli olarak normallik varsayımı KolmogorovSmirnov ve Shapiro-Wilk testi ile incelenmiştir. Normal dağılım gösteren Sporda Başarı Amacı Ölçeği'nden elde edilen verilerin değerlendirilmesinde ikili gruplar (cinsiyet, yaş, spor türü) için Student t-testi, ikiden fazla gruplar (anne ve baba eğitim durumu ve spor yaşı) için Tek Yönlü Varyans Analizi ve Tukey çoklu karşılaştırma testi uygulanmıştır. Araştırmada elde edilen verilerin analizinde SPSS 22.0 V. istatistik paket programı kullanılmıştır. Araştırma bulguları, n (%), ortalama, standart sapma değerleri olarak verilmiş olup, bulgular  $p<0,05$  düzeyinde anlamlı kabul edilmiştir.

### 3. BULGULAR

**Tablo 1.** Araştırmaya Katılan Sporcuların Demografik Özelliklerine Göre Dağılımı

Değişken	Kategori	n	%
Cinsiyet	Kadın	49	46,7
	Erkek	56	53,3
Yaş	18-20	86	81,9
	21 ve üzeri yaş	19	18,1
Anne Eğitim Durumu	İlköğretim	74	70,5
	Lise	23	21,9
	Üniversite	8	7,6
Baba Eğitim Durumu	İlköğretim	60	57,1
	Lise	31	29,5
	Üniversite	14	13,3
Spor Türü	Bireysel	53	50,5
	Takım	52	49,5
Spor Yaşı	0-2	11	10,5
	3-4	13	12,4
	5 ve üzeri yıl	81	77,1

**Tablo 2.** Cinsiyet Değişkenine Göre Sporcuların Sporda Başarı Amacı Durumları

Ölçek ve Alt Boyutlar	Cinsiyet	n	Ort.	S.s.	t	p
Ego	Erkek	49	22,59	3,054	,244	,696
	Kadın	56	22,37	2,625		
Uсталık	Erkek	49	28,79	2,700	-,018	,986
	Kadın	56	28,80	1,633		
Toplam Puan	Erkek	49	51,38	5,183	,391	,808
	Kadın	56	51,17	3,547		

Tablo 2.'de sporcuların cinsiyetine göre sporda başarı amacı puanları arasında anlamlı bir farklılık tespit edilmemiştir.

**Tablo 3.** Yaş Değişkenine Göre Sporcuların Sporda Başarı Amacı Durumları

Ölçek ve Alt Boyutlar	Yaş	n	Ort.	S.s.	t	p
Ego	18-20	86	22,29	3,032	-2,337	<b>,003*</b>
	21 ve üzeri	19	23,31	1,293		
Uсталık	18-20	86	28,72	2,364	-,787	,134
	21 ve üzeri	19	29,15	1,014		
Toplam Puan	18-20	86	51,01	4,734	-2,322	<b>,006*</b>
	21 ve üzeri	19	52,47	1,576		

Tablo 3.'te sporcuların yaşlarına göre sporda başarı amacı puanları arasında ego alt boyutu ile toplam puanlarında istatistiksel olarak anlamlı farklılık tespit edilmiştir.

**Tablo 4.** Anne Eğitim Durumu Değişkenine Göre Sporcuların Sporda Başarı Amacı Durumları

Ölçek ve Alt Boyutlar	Anne Eğitim Durumu	n	Ort.	Ss.	f	p
Ego	İlköğretim	74	22,20	2,960	1,181	,311
	Lise	23	23,13	2,473		
	Üniversite	8	23,12	2,232		
Uсталık	İlköğretim	74	28,71	2,361	,251	,778
	Lise	23	29,08	1,729		
	Üniversite	8	28,75	1,752		
Toplam Puan	İlköğretim	74	50,91	4,666	,855	,855
	Lise	23	52,21	3,502		
	Üniversite	8	51,87	3,603		

Tablo 4.'te sporcuların anne eğitim durumuna göre sporda başarı amacı puanları arasında anlamlı bir farklılık tespit edilmemiştir.

**Tablo 5.** Baba Eğitim Durumu Değişkenine Göre Sporcuların Sporda Başarı Amacı Durumları

Ölçek ve Alt Boyutlar	Baba Eğitim Durumu	n	Ort.	Ss.	f	p
Ego	İlköğretim	60	22,45	3,010	,510	,602
	Ortaöğretim	31	22,22	2,871		
	Önlisans ve üzeri	14	23,14	1,703		
Uсталık	İlköğretim	60	28,56	2,540	1,611	,205
	Ortaöğretim	31	29,38	1,453		
	Önlisans ve üzeri	14	28,50	1,698		
Toplam Puan	İlköğretim	60	51,01	4,897	,244	,784
	Ortaöğretim	31	51,61	3,800		
	Önlisans ve üzeri	14	51,64	3,103		

Tablo 5.'te sporcuların baba eğitim durumuna göre sporda başarı amacı puanları arasında anlamlı bir farklılık tespit edilmemiştir.

**Tablo 6.** Spor Türü Değişkenine Göre Sporcuların Sporda Başarı Amacı Durumları

Ölçek ve Alt Boyutlar	Spor Türü	n	Ort.	Ss.	t	p
Ego	Bireysel	53	22,16	2,998	-1,057	,215
	Takım	52	22,78	2,622		
Uсталık	Bireysel	53	28,66	2,766	-,663	<b>,048*</b>
	Takım	52	28,94	1,377		
Toplam Puan	Bireysel	53	50,83	5,063	-1,125	,083
	Takım	52	51,73	3,509		

Tablo 6.'da sporcuların spor türü değişkenine göre sporda başarı amacı puanları arasında ustalık alt boyutu puanlarında anlamlı farklılık olduğu tespit edilmiştir.

**Tablo 7.** Spor Yaşı Değişkenine Göre Sporcuların Sporda Başarı Amacı Durumları

Ölçek ve Alt Boyutlar	Spor Yaşı	n	Ort.	S.s.	t	p
Ego	0-2	11	21,454	3,615	1,346	,265
	3-4	13	21,846	3,387		
	5 ve üzeri yıl	81	22,716	2,594		
Ustalık	0-2	11	27,181	4,976	4,029	<b>,021*</b>
	3-4	13	28,461	1,761		
	5 ve üzeri yıl	81	29,074	1,481		
Toplam Puan	0-2	11	48,636	8,333	1,346	,265
	3-4	13	50,307	4,210		
	5 ve üzeri yıl	81	51,790	3,473		

Tablo 7.'de sporcuların spor yaşı değişkenine göre sporda başarı amacı puanları arasında ustalık alt boyutu puanlarında anlamlı farklılık olduğu tespit edilmiştir.

#### 4. SONUÇ VE DEĞERLENDİRME

Bu çalışmanın amacı sporcularda başarı amacı düzeyinin bazı değişkenlere göre belirlenmesidir.

Çalışma sonuçlarına göre sporcuların cinsiyet, anne eğitim durumu, baba eğitim durumu ve spor türü değişkenlerine göre sporda başarı amacı ölçeği toplam puanları arasında anlamlı bir farklılık tespit edilmemiştir. Ancak yaş, spor türü ve spor yaşı değişkenlerine göre puanlar arasında anlamlı farklılık olduğu tespit edilmiştir. Yapılan analiz sonucunda yaşı 21 ve üzeri olan sporcuların toplam puan ve ego puanlarının 18-20 yaş kategorisine göre daha yüksek olduğu saptanmıştır. Spor türüne göre ustalık alt boyut puanlarında takım sporcuları lehine anlamlı farklılık belirlenmiştir. Spor yaşında ise ustalık alt boyut puanları arasında spor yaşı 5 yıl ve üzeri olan sporcular lehine anlamlı farklılık görülmektedir.

Bu sonuçlara göre sporcuların cinsiyet, anne eğitim durumu ve baba eğitim durumlarının başarı amaçlarını etkilemediği sonucuna ulaşılabilir. Yaşları 21 ve üzeri olan sporcuların 18-20 yaş kategorisindeki sporculara göre başarıya ulaşma çabalarının daha yüksek olduğu söylenebilir. Sporcular deneyim ve tecrübe kazandıkça mücadele ve azimlerinin de artacağı düşünülmektedir. Bunun sonucu olarak başarıya ulaşma çabalarında da artış olacağı öngörülmektedir. Ayrıca 21 ve üzeri yaş kategorisindeki sporcuların 18-20 yaş kategorisindeki sporculara göre ego puanlarının daha yüksek olduğu görülmektedir. Ortaya çıkan bu sonucun sporcuların yaşlarının artmasıyla başarı amaçlarının ego ile ilişkili olduğu yorumu yapılabilir. Sporcuların spor türlerinde takım sporcularının bireysel sporculara göre ustalık puanlarının

daha yüksek olduğu tespit edilmiştir. Bu bulgu; takım uyumu, takım içerisindeki aile ortamı ve birden fazla sporcu ile mücadele ile açıklanabilir. Aynı sayıdaki müsabakaya çıkan bir takım sporcusu ile bireysel sporcunun karşılaşacağı rakip sayısı daha fazla olacaktır. Bu nedenle takım sporcuları bireysel sporculara göre daha fazla rakiple mücadele edecektir. Bunun sonucunda ise daha fazla tecrübe ve deneyim kazanacağı düşünülmektedir. Bir diğer bulguda ise spor yaşı 5 yıl ve üzeri olan sporcuların diğer spor yaşı kategorisindeki sporculara göre ustalık puanlarının daha yüksek olduğu belirlenmiştir. Bu bulguya göre tecrübeli ve deneyimli sporcuların daha tecrübesiz sporculara göre başarı amaçlarının daha yüksek olduğu öngörülmektedir.

## **ÖZET**

Bu çalışma, temaslı ve temassız olarak ön çapraz bağ (ÖÇB) sakatlığı yaşamış olan profesyonel erkek futbolcuların, COL3A1 (rs1800255) gen polimorfizmlerinin genotip ve alel dağılımlarını incelemek amacıyla yapılmıştır. Çalışmaya en az 2 kez ön çapraz bağ ameliyatı geçirmiş 40 profesyonel erkek futbolcu (Temaslı: 14, Temassız: 26) gönüllülük esası ile katılmıştır. Sporculardan elde edilen kan örneklerine DNA izolasyon kitleri kullanılarak DNA izolasyonu yapılmıştır. Temaslı ve temassız ÖÇB sakatlığı yaşayan futbolcuların genotip ve alel dağılımları Ki-kare testi veya Fischer's exact testi ile karşılaştırılmıştır. Elde edilen bulgular, temaslı ya da temassız ÖÇB sakatlığı yaşayan futbolcuların genotip (AA-AG-GG) dağılımları bakımından istatistiksel olarak farklılaşmadıklarını göstermektedir ( $p>0.05$ ). Alel dağılımları (A-G) incelendiğinde de yine istatistiksel olarak bir farklılığa rastlanmadığı tespit edilmiştir ( $p>0.05$ ). Sonuç olarak, profesyonel erkek futbolcuların ön çapraz bağ sakatlığı yaşama biçimleri (temaslı-temassız) ile COL3A1 rs1800255 polimorfizmi arasında bir ilişkinin olmadığı düşünülmektedir.

**Anahtar kelimeler:** Ön çapraz bağ, COL3A1, polimorfizm, genotip, alel, futbol

**INVESTIGATION OF COL3A1- rs1800255 GENE VARIANT DISTRIBUTION IN PROFESSIONAL MALE FOOTBALL PLAYERS WITH CONTACT AND NON-CONTACT ANTERIOR CRUCIATE LIGAMENT INJURIES****ABSTRACT**

This study was conducted to examine the genotype and allele distributions of COL3A1 (rs1800255) gene polymorphisms in professional male football players who had contact and non-contact anterior cruciate ligament (ACL) injuries. 40 professional male football players (Contact: 14, Non-Contact: 26) who had undergone anterior cruciate ligament surgery at least 2 times participated in the study on a voluntary basis. DNA isolation was performed on blood samples obtained from athletes using DNA isolation kits. Genotype and allele distributions of football players with contact and non-contact ACL injuries were compared with Chi-square test or Fischer's exact test. The findings show that football players with contact or non-contact ACL injuries do not differ statistically in terms of genotype (AA-AG-GG) distributions ( $p>0.05$ ). When the allele distributions (A-G) were examined, it was determined that there was no statistical difference ( $p>0.05$ ). As a result, it is thought that there is no relationship between the way (contact-non-contact) professional male football players experience anterior cruciate ligament injury and the COL3A1 rs1800255 polymorphism.

**Keywords:** Anterior Cruciate Ligament, COL3A1, polimorphism, genotype, allele, football

## 1. GİRİŞ

Futbol, fizyolojik talepleri yüksek olan ve yüklenme-dinlenme döngüsünü içeren aralıklı bir takım sporudur. Profesyonel futbolcuların bir maç boyunca yaklaşık olarak 8000-12.000m mesafe kat ettikleri bilinmektedir ve bu mesafenin yaklaşık %20'si maksimal ya da maksimale yakın koşu hızlarında olmaktadır (Bishop ve ark., 2011; Stolen ve ark., 2005). Sıçrama ve müdahale gibi anlık hareketler de bir maç sırasında futbolcular tarafından sıklıkla gerçekleştirilir (Bangsbo, 1994; Zois ve ark., 2011). Futbolun yüksek fizyolojik talepleri göz önüne alındığında, futbolcuların çok sayıda sakatlıklarla karşılaşması da beklenen bir sonuç olarak kabul edilmektedir (Agel ve ark., 2007; Dvorak ve ark., 2000). Bu sakatlıklardan biri olan ön çapraz bağ (ÖÇB) yaralanmaları, spor popülasyonundaki en ağır yaralanmalardan biri olarak kabul edilmektedir (Brooks ve ark., 2005). Futbolcular, özellikle ani yavaşlama ve yön değişikliği içeren aksiyonlarda risk altındadır. ÖÇB yaralanmalarının görülme sıklığı sedanter bireylerde (toplumda) düşük olmasına rağmen (10.000'de 1) (Marshall ve ark., 2007), düzenli olarak spor yapan bireylerde 10 kat artabilmektedir (Parkkari ve ark., 2008).

ÖÇB, diz eklemine bulunan dört ana ligamentten biridir. Ligamentler, bir eklemi çevreleyen ve iki ucundaki kemiğin birbirine bağlantısını sağlayan yoğun kolajenöz doku bantları olarak tanımlanmaktadır (Frank, 2004). Kolajen, ligamentlerin ana bileşenidir. Tip I kolajen, kolajenlerin %85'ini oluşturmaktadır. Geri kalanı ise Tip III, VI, V, XI ve XIV türlerinden oluşmaktadır (Szumilo, 2014). Tip III kolajen, Tip III kolajen pro- $\alpha$ 1 zincirlerini üreten COL3A1 geninin bir ürünüdür (O'Connel ve ark., 2013). COL3A1 geni, kromozom 2q31 üzerinde bulunmaktadır (Fujiwara ve ark., 2010). Tip III kolajen, tendonlar için önemli bir fibriller kolajendir. İyileşme sürecinde ve fibrilogenez sırasında önemli olduğu düşünülmektedir (Banos ve ark., 2005; Liu ve ark., 1995). Tendon gelişimi sırasında tip I kolajen ile birlikte lokalize olur ve bazı durumlarda heterotipik fibriller oluşturabilir (Banos ve ark., 2005). Kolajen tip III, ifade edildiği dokuların gücünü ve esnekliğini ayarlama da önemli bir role sahiptir. Stepien-Slodkowska ve arkadaşları (2015), kayakçılar ile yapılan bir çalışmada, AA genotipine sahip olanların AG+GG genotipine sahip olanlardan yaklaşık 5 kat daha yüksek ÖÇB yaralanma riskine sahip olduğunu tespit edilmiştir. O'Connel ve arkadaşları (2013) ise aşıl tendinopatisi yaşayan ve yaşamayan insanlarda COL3A1 genini incelediği çalışmada, polimorfizmler ve aşıl tendinopatisi arasında herhangi bir ilişki olmadığını belirtmiştir.

Futbol gibi çok sayıda aksiyonun anlık olarak gerçekleştiği bir branşta sporcuların sakatlık ile karşılaşmaları da kaçınılmazdır. Özellikle diz, ayak bileği ve kalça eklemine oluşturan yapılardaki (kemik, kas, tendon, ligament gibi) sakatlıklar çok sık yaşanmaktadır. Bu sakatlıkların en çok karşılaşılanlarından biri de ÖÇB sakatlıklarıdır. Temaslı veya temassız olarak ön çapraz bağ sakatlığı yaşayan profesyonel erkek futbol oyuncularının COL3A1 rs1800255 polimorfizmlerinin genotip ve alel dağılımları bakımından incelenmesi bu çalışmanın amacını oluşturmaktadır.

## **2. ARAŞTIRMA VE BULGULAR**

### **2.1. Araştırma Grubu**

Çalışmaya dahil edilen araştırma grubu, en az 10 yıl futbol geçmişine sahip 40 profesyonel erkek futbol oyuncusundan (Temaslı=14, Temassız=26) oluşmaktadır. Tüm örneklem grubu Türkiye profesyonel futbol liglerinde (Süper Lig, 1.Lig, 2.Lig, 3.Lig) mücadele eden, 18 yaşından büyük profesyonel futbolculardan oluşmaktadır. Sporcuların sakatlıkları MR görüntülemeleri ile tespit edilmiştir. Özel ve genel sağlık durumundan ötürü kan vermesi sakıncalı olan, sağlık açısından risk taşıyan, araştırmanın denek ve kontrol gruplarına uygun nitelik taşımayan futbolcular araştırmaya dahil edilmemiştir. Çalışmaya katılacak olan tüm sporculara araştırma hakkında detaylı bilgilendirme yapılmış ve gönüllü olarak katıldıklarına dair formlar doldurtulmuştur. Araştırma süreci, Helsinki Deklarasyonu ilkelerine uygun olarak yürütüldü. Araştırmanın etik olarak uygunluğu, Tokat Gaziosmanpaşa Üniversitesi Klinik Araştırmalar Etik Kurulu'nun 28/01/2021 tarih ve 21-KAEK-028 sayılı kararı ile onaylandı.

### **2.2. Genetik Analiz**

Genomik DNA (gDNA), bir DNA izolasyon kiti (GeneAll) kullanılarak periferik kandan izole edildi. COL3A1 rs1800255 (Ala531Thr) gen polimorfizmi, polimeraz zincir reaksiyonu (PCR) tabanlı restriksiyon fragmanı uzunluk polimorfizmi (RFLP) yöntemi kullanılarak analiz edildi. COL3A1 polimorfizmi için kullanılan primerler F: 5' AAG TATACA AAT TTC TAG ATT G 3', R: 5' ATA AAT GAT CAG AAG GAA ATC A 3' idi. PCR, 2 µl gDNA, her primerden 0.8 nmol/µL, 1.5 µL MgCl<sub>2</sub> (25mM), 2.5 µL 10× PCR tamponu, 0.3 µL dNTP (25mM) ve 1 Unite Taq polimeraz (Thermo) içeren toplam 25 µL hacimde gerçekleştirildi.

İlgilenilen bölgeyi büyötmek için aşağıdaki koşullar kullanılmıştır: 3 dakika boyunca 94 °C, ardından 30 saniye boyunca 94 °C'de 30 döngü denatürasyon, 30 saniye boyunca 50 °C'de tavlama, 60 saniye boyunca 72 °C'de uzatma ve 10 dakika boyunca 72 °C'de son bir uzatma

adımı. Restriksiyon endonükleazı, COL3A1 rs12722 polimorfizmini ayırt etmek için Alu I kullanıldı.

### 2.3. İstatistiksel Analiz

Elde edilen verilerin istatistiksel analizleri Open Epi Info Software Version 3.2.2 (CDC, Atlanta GA, ABD) kullanılarak gerçekleştirilmiştir. Temaslı ve temassız ÖÇB sakatlığı yaşayan futbolculardan oluşan gruplara ait sonuçlar Ki-kare veya Fischer's exact test ile karşılaştırılmıştır. Tüm analizlerde anlamlılık değeri  $p < 0.05$  olarak kabul edilmiştir.

**Tablo 1.** Temaslı veya temassız olarak ön çapraz bağ sakatlığı yaşayan profesyonel futbolcuların COL3A1 (rs1800255) polimorfizminin genotip ve minör alel frekans dağılımları.

		Temaslı	Temassız	p	OR (95%CI)
COL3A1	n	14	26	,807	-
	AA	28,6 (4)	38,5 (10)		
	AG	28,6 (4)	26,9 (7)		
	GG	42,9 (6)	34,6 (9)		
	G	53,6 (15)	50,0 (26)	,817	-

\* $p < 0,05$ , OR: Olasılık Oranı

COL3A1 (rs1800255) polimorfizminin genotip ve minör alel frekans dağılımları Tablo 1'de gösterilmiştir. Analiz sonuçları incelendiğinde, temaslı veya temassız olarak ÖÇB sakatlığı yaşayan profesyonel erkek futbol oyuncularının genotip ve alel dağılımları bakımından farklılaşmadıkları görülmektedir ( $p > 0.05$ ).

### 3. SONUÇ

Bu çalışma temaslı veya temassız olarak ÖÇB sakatlığı yaşayıp ameliyat geçmişine sahip olan profesyonel erkek futbol oyuncularının sakatlığa maruz kalma biçimlerinin COL3A1 (rs1800255) polimorfizmi ile açıklanıp açıklanamayacağını incelemek üzere gerçekleştirilmiştir. Çalışmada elde edilen ana bulgular, temaslı ya da temassız ÖÇB sakatlığı yaşayan futbolcuların genotip (AA-AG-GG) ve alel (A-G) dağılımları bakımından istatistiksel olarak farklılaşmadıklarını göstermektedir.

ÖÇB kopukları, tüm branşlardaki sporcular için korkulan ve yaygın olarak karşılaşılan sakatlıklardır. ÖÇB kopmaları hem yarışmacı hem de rekreasyonel spor aktiviteleri anında sıklıkla yaşanabilmektedir (Tifford ve Jackson, 2001). Stepien-Slodkowska ve arkadaşları (2015) yaptıkları çalışmada, ACL kopuğu geçmişine sahip Polonyalı erkek kayakçılar ile sağlıklı rekreasyonel kayakçıların COL3A1 rs1800255 gen polimorfizminin incelendiği bir çalışmada, AA genotipine sahip kayakçıların, AG+GG genotipine sahip kayakçılardan neredeyse 5 kat daha yüksek sakatlık riskine sahip oldukları tespit edilmiştir. Bu çalışmadaki

profesyonel erkek futbolcularda ise anlamlı bir farklılığın olmadığı belirlenmiştir. O'Connell ve arkadaşları (2015), Güney Afrika ve Polonya'lı katılımcılardan oluşan örneklem grubu ile gerçekleştirilen araştırmada, Güney Afrika kohortunda COL3A1 rs1800255 gen polimorfizmi ve ACL yırtığı arasında anlamlı bir ilişkiye rastlanmadığını belirtmişlerdir. Aynı çalışmada Polonya kohortunda COL3A1 rs1800255 AA genotip görülme sıklığı ACL grubunda kontrol grubuna kıyasla daha yüksek bulunmuştur. Sivertsen ve arkadaşlarının (2019), Norveç ve Finlandiya'da takım sporlarında mücadele eden elit kadın sporcular ile yaptıkları araştırmada, belirlenen 6 kolajen gen polimorfizminin (COL1A1 rs1800012-rs1107946, COL3A1 rs1800255, COL5A1 rs12722-rs13946, COL12A1 rs970547) ACL sakatlık riskini açıklamadığı tespit edilmiştir.

Sonuç olarak, temaslı ya da temassız şekilde ön çapraz bağ sakatlığı yaşayan profesyonel erkek futbol oyuncularının, sakatlığa maruz kalma biçimlerinin COL3A1 (rs1800255) polimorfizmi ile açıklanamayacağı düşünülmektedir. Futbol gibi çok çeşitli aksiyonu içeren ve sakatlık riski yüksek olan bir branşta, sporcuların ÖÇB yaralanma potansiyelleri hakkında fikir sahibi olabilmek için bu sonuçların önemli olduğu söylenebilir.

**ABSTRACT**

**Background and purpose:** Energy is one of the main components of sustainable development strategy in every country. In every society, from traditional to industrial, lack of access to energy costs create a crisis, and energy management is the only and closest way to exploit more fuels. And energy resources , and very country must determine the solution to the energy crisis within the framework of its economic development strategy. The increase in energy consumption , in addition to the increase in cost , undoubtedly increases the emission of greenhouse gases and other environmental pollutants, pollutants that have a direct negative impact on the public health of communities and the ecosystem, and impose a very high social cost on society.

**Result:** Today , due to energy limitations , manufacturers and large industries are looking for ways to reduce and optimize energy in order to have the ability to remain competitive in the market in addition to meeting the needs in this field. As one of the important energy consumers, the food industry needs to manage its resource consumption.

**Conclusion:** Therefore, in this research, we review the studies conducted in the field of energy consumption optimization for the production of various foods.

**Key words:** Energy management, food industry, reducing environmental pollution

## **INTRODUCTION**

The increasing population of the world , especially developing countries on the one hand and the need to provide food for this population on the other hand , has not resulted in the indiscriminate harvesting of resources , and in pursuit of setting the goals of the third millennium of the United Nations . Researchers have presented various interdisciplinary approaches to achieve a kind of dynamic balance in the production and consumption of resources , one of the most important of which is the approach of combining energy and food. Due to the limitations of available resources , which are increasing day by day .This approach increases productivity by using the integration of energy and food cycles. The increase in population , excessive use of available resources , significant growth of industrial production and less attention to the issue of pollution and waste caused industrial and household waste to be produced at a faster rate than the earth can absorb it . Energy resources are consumed at a faster rate than they are stored . However , in order to achieve the goals of sustainable development , it is necessary to search for the production process of goods and services and the optimal use of energy resources and to prevent possible risks to the environment . Energy is one of the main components of sustainable development strategy in any country . In every society , from traditional to industrial , the lack of access to energy and high energy costs create a crisis , and energy management is the only and closest way to exploit more of the available fuels and energy sources , and every country must find a solution to the energy crisis. Determine in the framework of its economic strategy. The increase in energy consumption , in addition to increasing the cost , undoubtedly increases the emission of greenhouse gases and other environmental pollutants. Pollutants that have a direct negative impact on the impose very high social cost on society. Hydroponics and greenhouse production are ways to obtain profitable products. A sustainable crop production system requires maintaining high harvest quality while keeping energy and raw material consumption low. Today , due to the limitation of energy resources , manufactures and large industries are looking for ways to reduce and optimize energy consumption so that in addition to meeting the needs in this field , they have the ability to remain competitive in the market. The evolution of environmental protection strategies indicates the evolution of environmental approaches that are related to the expansion of the concept of sustainable development. Energy saving is one of the most important problems in all industrialized countries. Therefore , in this research , we focus on the researches carried out to optimize and reduce energy in the food industry.

## **SOLAR ENERGY**

It is the most unique source of renewable energy in the world and is the energies on earth .The sun is a huge and infinite source of energy on which the life of the earth depends. Although the use of solar energy is still not developed as much as it should be , but the energy needed by about 160 thousand villages in the world is based on solar energy. The use of solar energy is one of the best ways to produce energy compared to other energy transfer models , which can be used in the food industry to dry food , which is one of the most important unit operations in food processing , because the most important step in the process after from the harvest of agricultural products , it is the drying process. Drying is a complex process that consumes a lot of energy. Choosing the right drying method can preserve the color and appearance of the product in addition to economic savings. Currently , two traditional and industrial methods are used to dry agricultural products. If the product is dried in the traditional way(spreading out in the sun), the time required for drying is long , on the other hand , the attack of insects and birds, such as dust and rain in this method are factors that reduce the quality of the dried product. They turn industrial dryers are also not cost- effective due to high initial cost and high energy consumption and have not attracted the attention of farmers , so using a solar dryer was cost – effective .As one of the important consumers of energy , the food industry needs to manage its resource consumption. Steam supply systems , compressors and pumps are among the most important energy-consuming sectors in the food industry , and new solutions are always introduced to optimize consumption in these sectors. In addition to the industry , the role of planning and monitoring system and industrial equipment suppliers in reaching energy management goals is significant. Sweet bread production industry also requires the use of advanced equipment related to energy consumption, which is obtained from diesel fuel , natural gas and electricity. Regarding the evaluation of energy flow and the environmental effects caused by energy consumption in the production of various foods , including industrial breads and similar foods , various researches have been done. For example in a research on the production of industrial bulky bread whose energy sources was natural gas and electricity , it was said that 22 and 14 Megajoules of energy were used to produce one kilograms of bulky bread , respectively. In the field of energy consumption in the production of bulky breads , the result of Barakat et al.s study show that 4 Megajoules of energy were used to produce each kilograms of industrial bulky bread. The result of the research on the evaluation of environmental pollutants in the production of bulk bread with a life cycle approach in Belgium

have shown that the removal of coal and the use of other energy carriers in recent years lead to a decrease in global warming potential indicators and photochemical oxidation.

### **CONCLUSION**

Therefore , you should try to be able to use the least amount of energy as possible in setting up food industry factories , and also use new ways of working to minimize their energy consumption for the use of devices.

**OSMANLI DİYARBEKİRİ'NDE MÜSLÜMAN VE GAYRİMÜSLİMLERİN  
İKTİSADİ İLİŞKİLERİNE GENEL BİR BAKIŞ (1800-1853)**

**Doç. Dr. Ümit GÜLER (Orcid ID: 0000-0002-0828-4197)**

Batman Üni. İslami İlimler Fakültesi, İslam Tarihi ve Sanatları Bölümü, İslam Tarihi ABD

**ÖZET**

Döneme ait şer'iyeye sicilleri Osmanlı Diyarbekiri'ndeki Müslüman ve gayrimüslimlerin iktisadi ilişkilerinin oldukça sıkı ve kapsamlı olduğunu ortaya koymuştur. Bunun yanı sıra iktisadi ilişkiler çerçevesindeki bilimum tüm belgeler, münferit vakalar müstesna Müslim veya gayrimüslimler açısından herhangi bir umumi mağduriyet durumunun söz konusu olmadığını da göstermiştir. Toplumlar arası iktisadi ilişkilere dair belge sayıları kimi başlıklarda sınırlı bir sayıda ortaya çıkmışsa da bu durum, ilişkilerin sınırlı bir çerçevede olduğu anlamına gelmemektedir. Zira belgelere doğrudan yansıyanların haricinde muhtelif belgeler içerisinde dolaylı olarak yer alan ilişkiler de mevcuttur. Bilhassa tereke kayıtlarında zikredilen alacaklı veya verecekli Müslüman ve gayrimüslimlerin isimleri söz konusu ilişkilerin belgelere doğrudan yansıyan ilişkilerden çok daha geniş ölçüde olduğuna işaret etmiştir.

**AN OVERVIEW OF THE ECONOMIC RELATIONS BETWEEN MUSLIMS AND  
NON-MUSLIMS IN OTTOMAN DIYARBEKIR (1800-1853)****ABSTRACT**

The shar'iyye registers of the period reveal that the economic relations between Muslims and non-Muslims in Ottoman Diyarbekir were quite close and extensive. In addition, all documents in the framework of economic relations show that there was no general victimization of Muslims or non-Muslims, except in isolated cases. Although the number of documents on inter-communal economic relations is limited in some chapters, this does not mean that these relations were limited in scope. For, in addition to those directly reflected in the documents, there are also relations that are indirectly mentioned in various documents. In particular, the names of Muslim and non-Muslim creditors and debtors mentioned in the probate records indicate that these relations were much broader than those directly reflected in the documents.

## GİRİŞ

Osmanlı Devleti tebaasını dinî olarak Müslim ve gayrimüslim (zimmî) olmak üzere esasen iki kategoriye ayırmıştır.<sup>25</sup> Hâkimiyeti altındaki gayrimüslimlerle zimmet anlaşmaları yaparak onlarla olan hukuki ilişkilerini belirli bir çerçevede yürüten Osmanlı,<sup>26</sup> Tanzimat öncesi ve sonrası olmak üzere temelde iki farklı hukuki yaklaşım üzerinde hareket etmiş; zaman içerisinde gayrimüslimlerin hukuki statülerinde birtakım değişim ve dönüşümler meydana getirmiştir.<sup>27</sup>

Tanzimat öncesi dönem itibarıyla toplum içerisinde meydana gelen hukuki ihtilaflarda esas müracaat mercii şer‘î mahkemeler olmuştur.<sup>28</sup> Binaenaleyh Osmanlı coğrafyasında bilumum tüm toplumun hususen de yüzyıllarca birlikte yaşayan Müslüman ve gayrimüslimlerin karşılıklı olarak kurmuş oldukları ilişkilerin en açık, güvenilir ve zengin biçimde gözlenebileceği kaynaklar şer‘î mahkemelerce tutulan *şer‘iyye sicilleri*dir.<sup>29</sup> Bu hususiyetinden mütevellit şer‘iyye sicilleri, Osmanlı sosyal tarihi araştırmalarının temel kaynağı mesabesindeir.<sup>30</sup>

İslam coğrafyasının yüzyıllar boyu iç içe yaşamış birçok etnik ve dinî grubunun adeta bir buluşma noktası olan<sup>31</sup> ve bu niteliği sebebiyle Osmanlı’nın küçük bir nüvesi olarak adlandırılan Diyarbakır,<sup>32</sup> öncesinde olduğu gibi Osmanlı döneminde de kozmopolit bir sosyal dokuya sahiptir.<sup>33</sup> Bunun yanı sıra gayrimüslimler, 1895 yılı itibarıyla Diyarbakır kazasının %33.7 gibi dikkate değer bir nüfus oranını teşkil etmekteydiler.<sup>34</sup> Diyarbakır’ın, mezkûr

<sup>34</sup> 1895 yılı itibarıyla Diyarbakır şehrindeki gayrimüslim dinî gruplar ve nüfus oranları şöyledir: Gregoryen Ermeniler (%57.3), Süryani kadim kilise mensupları (%19), Katolikler (%5.2), Protestan Ermeniler (%5.1), Keldaniler (%4.4),

kozmpolit yapısıyla devletin merkezi bölgelerinden ve devlet otoritesinin daha güçlü olduğu İstanbul'dan uzakta bulunmasının, oradaki toplumsal ilişkileri daha hassas ve önemli kılması da önem arz eden bir diğer husustur.<sup>35</sup>

### **1. Alacak Verecek Meseleleri**

Döneme ait şer'iyeye sicilleri Osmanlı Diyarbakiri'nde Müslüman ve gayrimüslimlerin şer'i mahkemeye yansıyan iktisadi ilişkilerinin en büyük kısmının alacak verecek meselelerine dair olduğunu göstermektedir. Bu kapsamda 41 vaka tespit edilmiş olup bunların 25'inde (%60.97) davacılar Müslümanken, 16'sında (%39.02) gayrimüslimdir. Dolayısıyla davalılar da aynı doğrultuda 25 vakada (%60.97) gayrimüslimlerden, 16 vakada (%39.02) Müslümanlardan müteşekkildir. Ortaya çıkan bu netice gayrimüslimlerin iktisadi hayat içerisinde aktif ve etkili olduklarına dair dikkate değer bir görünümdür. Söz konusu davaların tamamına yakınında davacılar bizzat mahkemeye müracaat etmekle birlikte vekil kullandıkları da olmuştur.<sup>36</sup> Söz konusu vakaların tamamına yakınında erkekler tarafları oluşturmuştur. Nitekim sadece bir vakada davacı, iki vakada da davalı olarak Müslüman kadınlar yer almıştır. Gayrimüslim herhangi bir kadının alış veriş meselelerinde Müslümanlar karşısında taraf olmaması dikkat çekici bir bulgudur. Bu da gayrimüslim kadınların ticari hayat içerisinde pek fazla etkinlik göstermediklerine işaret etmektedir.

Taraflar arasında söz konusu olan alacak verecek meseleleri daha çok ticari alış verişlerden kaynaklanmış; mal satımı sonrası ödemenin yapılmaması veya ödemeye dair diğer ihtilaflar mahkemeye yansımıştır. Kimi vakaların karz, yani borç para verme sebebiyle oluştuğu da gözlenmektedir. Bu da Müslüman ve gayrimüslimlerin gündelik hayat içerisinde birbirlerine borç alıp verdiklerine işaret etmektedir. Taraflar arasındaki kimi ihtilafların terekeler üzerindeki alacak iddialarıyla ortaya çıktığı da olmuştur.<sup>37</sup>

İlgili dönemde birçok gayrimüslimin davasını Müslüman tanıkların şahitlikleriyle ispatlanmış olması dikkat çekicidir. Bu durum Müslüman ve gayrimüslimlerin toplumsal ilişkilerine dair müspet bir görünüm olmakla birlikte Müslüman ahalinin adaletin tecelli etmesi için gerekli hallerde kendi dindaşlarının aleyhine de olsa mahkeme huzuruna çıkıp gayrimüslimleri

---

Yezidiler (%3.8), Yahudiler (%1.5), Katolik Süryaniler (%1.8), Katolik Rumlar (%0.3), Kıbtiler (%0.04). bk. Bülent Çukurova & Bülent Erantepli, "XIX. Yüzyılda Diyarbakır'ın Sosyal ve İdari Yapısı", *Osmanlı'dan Cumhuriyet'e Diyarbakır*, ed. Bahaeddin Yediyıldız & Kerstin Tomenendal (Ankara: Diyarbakır Valiliği, 2010), II/359-360.

<sup>35</sup> Aydın – Verhei, "Diyarbakır Vilâyetinde Etnik-Dini Gruplar", 15-16.

<sup>36</sup> DŞS, 3745, 22a-2.

<sup>37</sup> DŞS, 3803, 28b-1; DŞS, 3803, 27b-1.

desteklediklerini göstermektedir.<sup>38</sup> Herhangi bir ayırım yapılmaksızın mahkemede deliller doğrultusunda hüküm verildiği gözlenmiş; bunun yanı sıra alacak verecek davalarında Müslim veya gayrimüslimler açısından herhangi bir umumi mağduriyet durumuna rastlanmamıştır.

## **2. Alım Satım İlişkileri**

Müslüman ve gayrimüslimlerin iktisadi ilişkilerine dair döneme ait belgeler, alacak verecek davalarından sonra en yoğun ilişkinin alım satım kayıtları olduğunu göstermektedir. Bu kapsamda 23 belge tespit edilmiştir. Tarafları itibariyle 23 kaydın 13'ünde (%56.52) Müslümanlar, 10'unda da gayrimüslimler satıcı konumundadır. Dolayısıyla alıcıların da 10'u (%43.47) Müslüman olup 13'ü (%56.52) gayrimüslimdir. Ortaya çıkan bu durum dikkate değerdir. Zira ilgili belgeler alım satım işlemlerinde gayrimüslimlerin Müslümanlara nazaran daha fazla alıcı konumda olduklarını ortaya koymaktadır. Bu da toplumlar arasındaki gayrimenkul mal hareketinin daha çok gayrimüslimler lehine geliştiğine işaret etmektedir. Bu da gayrimüslimlerin iktisadi düzeylerine ve toplumlar arası ilişkilere ışık tutan önemli bir görünümdür.

Alım satım işlemlerinde bulunan taraflara cinsiyetleri açısından bakıldığında satıcıların 6'sının (%26), alıcıların da 2'sinin (%8) kadın olduğu görülür. Dolayısıyla alım satım işlemlerinde kadınların daha çok satıcı, nadiren de alıcı olarak yer aldıkları anlaşılmaktadır. Bu da cinsiyetler açısından gayrimenkul mal hareketinin daha çok erkekler lehine geliştiğine işaret etmektedir. Mezkûr satış işlemlerinde bulunan kadınların 4'ü Müslüman olup ikisi gayrimüslimdir. Alış işleminde bulunan her iki kadının da Müslüman olduğu anlaşılmaktadır. Dolayısıyla kadınların taraf olduğu sekiz alım satım işlemi bağlamında Müslüman kadınların %75 oranında gayrimüslim kadınlardan daha aktif oldukları anlaşılmaktadır.

## **3. Mülkiyet Davaları**

Osmanlı Diyarbekiri'nde müslim-gayrimüslim iktisadi ilişkilerine dair belgelere yansıyan bir diğer önemli görünüm de mülkiyet davalarına dairdir. Tarafların birbirlerine yönelik herhangi bir suç iddiası olmamakla birlikte zaman zaman bazı menkul - gayrimenkul mallar üzerinde mülkiyet ihtilafı yaşadıkları olmuştur. Bu kapsamda 14 vaka tespit edilmiştir. Bu vakaların 10'unda (%71.42) Müslümanlar, dördünde de (%28.57) gayrimüslimler davacı konumdadır. Bu doğrultuda davalıların da %71.42'sini gayrimüslimlerin, %28.57'sini Müslümanların oluşturduğu söylenebilir. Tarafların tamamı erkeklerden müteşekkildir. Görüldüğü üzere mülkiyet davalarında gayrimüslimler büyük oranda davalı konumdadırlar. Gayrimüslimlerin

<sup>38</sup> DŞS, 3746, 55a-2; DŞS, 3745, 23a-1; DŞS, 3702, 7b-4.

neden bu denli yüksek bir oranda davalı konumda bulduklarına yönelik net bir cevap verebilmek mümkün olmamakla birlikte muhtemelen bunun temel sebebi çalıntı veya kayıp malların daha çok gayrimüslimlere satılmış olmasıdır. Şöyle ki, söz konusu vakalarda mülkiyet davasına konu olan malların niteliğine bakıldığında bunların biri hariç<sup>39</sup> tamamının menkul mallardan oluştuğu görülür. Bu menkullerin tamamına yakını da merkep, eşek, beygir, öküz ve inek gibi büyük baş hayvanlardan oluşur. Bunların dışında menkul olarak sadece bir vakada çalıntı iddia edilen bir fistan dava konusu edilmiştir.<sup>40</sup> Davacılar mezkûr malları talep ederken davacı oldukları şahısları hırsızlık veya gasp gibi herhangi bir suçla itham etmeksizin o kişilerin ellerinde bulunan söz konusu malların daha önce çalıntı olduğunu veya kaybolduğunu iddia ederek kendilerine iade edilmesini talep etmişlerdir. Davalıların da tamamına yakını iddiaya konu olan malları başkalarından satın aldıklarını, dolayısıyla kendi mülkleri olduğunu iddia etmişlerdir. Davacıların şahitler vasıtasıyla dokuz vakada (%69.23) söz konusu malların kendilerine ait olduklarını ispatlayabildikleri gözlenmiştir. Dört vakada da (%30.76) davalar delil yetersizliğinden ötürü sonuçlandırılmamıştır. İddiaya konu olan malların dokuz vakada kaybolduğu, dört vakada da çalıntı ifade edilmiştir. Dolayısıyla söz konusu kayıp hayvanları bulan veya bunları çalan bazı kişilerin bu malları bir başkasına sattıkları kuvvetle muhtemeldir. Esas mal sahibi olan kişiler de hayvanlarını tespit ettiklerinde mahkemeye müracaat ederek bunları talep etmişler ve genellikle de iddialarını tanıklar vasıtasıyla ispatlayarak mallarına kavuşmuşlardır.

#### **4. Ticari Hayatta Yaşanan İhtilaflar**

Osmanlı Diyarbakiri'nde Müslüman ve gayrimüslim reayaya müntesip kişilerin hayatın olağan akışı içerisinde birbirleriyle geniş ölçüde ve rahat biçimde ticari ilişki içerisinde oldukları gözlenmiştir. Elbette ticaretin olduğu yerde taraflar arasında zaman zaman birtakım ihtilafların çıkması kaçınılmazdır. Bu bağlamda Diyarbakir'de de Müslüman ve gayrimüslimler arasında birtakım anlaşmazlıklar çıkmıştır. Bunlardan biri de şüfa hakkıdır. Şüfa, ön alım hakkı anlamına gelmektedir.<sup>41</sup> Bu dönemde Müslüman ve gayrimüslimler arasında vaki olan iki şüfa davası sicillere yansımıştır. Her ikisinde de davacılar gayrimüslim olup davalılar Müslümandır. Bunların birinde davalı, davacının şüfa hakkının olduğunu ikrar ederek iddiayı kabul etmiş ve

<sup>39</sup> Penbeciler çarşısında yer alan bir dükkânın mülkiyeti hususunda bir ihtilaf yaşanmış olup taraflar sulh anlaşmasıyla meseleyi çözüme kavuşturmuşlardır. bk. DŞS, 3731, 30a-1.

<sup>40</sup> DŞS, 3791, 8a-2.

<sup>41</sup> Şüfa, satılan veya bedel şartı ile hibe edilen bir gayrimenkulü veya o hükümde olan bir malı alıcıya veya kendisine hibe edilen şahsa her kaç mal olmuş ise o miktar ile alıcıdan veya satıcıdan ya da hibe edilenden cebren alıp temellük etmek anlamına gelir. bk. Mehmet Erdoğan, *Fıkıh ve Hukuk Terimleri Sözlüğü*, (İstanbul: Ensar Neşriyat, 2015), 529. Geniş bilgi için bk. İbrahim Kâfi Dönmez, "Şüfa", *DİA*, 39/248-252.

hâkim de satışı iptal ederek şüfa hakkı gereği satışın davacı şahsa yapılmasına hükmetmiş ve işlem kayıt altına alınmıştır.<sup>42</sup> Bir diğer şüfa davasında da Eto v. Haçador adlı zimmi, satın aldığı evdeki şüfa hakkı iddiasıyla Seyyid Ahmed b. Mustafa'dan davacı olmuştur. Davalı şahıs, alım işlemi öncesinde şüfa hakkı gereği davacıyı bilgilendirdiğini, ancak onun şüfa hakkından vaz geçtiğini savunarak iddiayı reddetmiştir. Mahkeme, davalının bu iddiasını ispatlaması için kendisine süre tanımış ancak kendisi bunu gerçekleştirememiştir. Buna binaen davacı haklı görülmüş ve satışın iptal edilerek evin kendisine satılmasına hükümlenmiştir.<sup>43</sup>

### **5. Bazı İktisadi ve Hukuki Uygulamalar**

Döneme ait belgeler, Osmanlı Diyarbekiri'nde Müslümanlar ve gayrimüslimler arasında günlük ticari hayat içerisinde cari olan bazı iktisadi ve hukuki uygulamalara da ışık tutmaktadır. Bunların başında rehin uygulaması gelmektedir. Bu kapsamda olduğu tespit edilen dört belgede Müslümanlar ve gayrimüslimler arasında alış veriştiren veya karzdan kaynaklı bazı borçlara mukabil rehin verildiğini göstermektedir. Söz konusu uygulamalarda rehin bırakanların tamamının zimmilerden, rehin alanların da Müslümanlardan olduğu gözlenmiştir ve tarafların tamamı erkeklerden müteşekkildir. Büyük çaplı borçlara mukabil rehin bırakılan mallar arasında ev gibi kıymetli gayrimenkuller bulunurken, karz edilen bazı küçük çaplı meblağlara karşılık olarak bir vaka da bir çift sim kemer; bir başka vakada da sim kemer, sini, testi ve kürk gibi eşyalar verilmiştir. Alacaklı kişiler borçların ödenmemesine istinaden mahkemeye müracaat ederek rehnedilen evin satışını müzayede usulüyle gerçekleştirebilmişlerdir. Bazen de rehnedilen evin boşaltılarak alacaklıya teslimi istenmiş ve mahkeme bu talebi haklı bulmuştur. Karz mukabili verilen rehinler de alacaklının elindeyken kaybolabilmiş ve bu durum borçlunun borcunu ödemesiyle ortaya çıkınca süreç mahkemeye taşınabilmiştir. Bu durumda mahkeme kaybolan rehin eşyasının bedelinin, rehin veren kişiye ödenmesine hükmetmiştir.

Döneme ait belgeler Müslüman ve gayrimüslimlerin zaman zaman birbirlerine bazı eşyalarını emanet bırakabildiklerini ve kiraladıklarını da göstermektedir.

<sup>42</sup> DŞS, 3774, 5b-3.

<sup>43</sup> DŞS, 3775, 3a-3.

## SONUÇ

Döneme ait şer‘iyye sicilleri Osmanlı Diyarbekiri’ndeki Müslüman ve gayrimüslimlerin iktisadi ilişkilerinin oldukça sıkı ve kapsamlı olduğunu ortaya koymuştur. Bunun yanı sıra iktisadi ilişkiler çerçevesindeki bilumum tüm belgeler, münferit vakalar müstesna Müslim veya gayrimüslimler açısından herhangi bir umumi mağduriyet durumunun söz konusu olmadığını da göstermiştir. Toplumlar arası iktisadi ilişkilere dair belge sayıları kimi başlıklarda sınırlı bir sayıda ortaya çıkmışsa da bu durum, ilişkilerin sınırlı bir çerçevede olduğu anlamına gelmemektedir. Zira belgelere doğrudan yansıyanların haricinde muhtelif belgeler içerisinde dolaylı olarak yer alan ilişkiler de mevcuttur. Bilhassa tereke kayıtlarında zikredilen alacaklı veya verecekli Müslüman ve gayrimüslimlerin isimleri söz konusu ilişkilerin belgelere doğrudan yansıyan ilişkilere çok daha geniş ölçüde olduğuna işaret etmektedir.

**OSMANLI DİYARBEKİRİ'NDE MÜSLÜMAN VE GAYRİMÜSLİM  
TOPLUMLARIN SUÇ İLİŞKİLERİ  
(1800-1853)**

**Doç. Dr. Ümit GÜLER (Orcid ID: 0000-0002-0828-4197)**

Batman Üni. İslami İlimler Fakültesi, İslam Tarihi ve Sanatları Bölümü, İslam Tarihi ABD

**ÖZET**

Bu araştırmada ortaya çıkan netice, bir İslam devleti olan Osmanlı'nın hâkimiyeti altında yaşayan Diyarbekir gayrimüslimlerinin umumi bir mağduriyet ve hukuksuzluğa maruz kalmadıkları yönündedir. Bunun da ötesinde Müslüman ve gayrimüslimlerin toplumsal ilişkilerinin genel itibarıyla olumlu bir nitelik arz ettiği, toplumsal entegrasyon düzeylerinin yüksek olduğu gözlenmiştir. Bilhassa dinî hak ve hürriyetler açısından toplumlar arası ilişki oldukça müspet bir görünüm arz etmiştir. Müslüman toplumun gayrimüslimlere yönelik umumi bir baskı ve hukuksuzluğa başvurmamaları ve toplumlar arası ilişkinin müspet bir görünüm arz etmesi bilhassa ilgili dönem konjonktürü açısından son derece kıymetli bir neticedir. Birçok belgeden de gözlendiği üzere gayrimüslimler, bir Müslüman tarafından hukuksuzluğa maruz kaldıklarını düşündüklerinde doğrudan şer'î mahkemeye ve patrikleri veya temsilcileri vasıtasıyla Dîvân-ı Hümâyun'a ulaşabilmişlerdir. Bu merciler de Müslümanların karşısında gayrimüslimlerin hukukunu korumaya ve adaleti tesis etmeye gayret etmişlerdir. Netice itibarıyla Osmanlı Diyarbekiri'ndeki Müslüman ve gayrimüslim toplumlar arasında vaki olan suç hadiselerinin son derece az sayıda ve genel itibarıyla gündelik hayatta karşılaşılabilecek basit nitelikte olduğu söylenebilir.

**CRIMINAL RELATIONS BETWEEN MUSLIM AND NON-MUSLIM  
COMMUNITIES IN OTTOMAN DIYARBEKIR (1800-1853)****ABSTRACT**

The conclusion of this study is that the non-Muslims of Diyarbekir living under the rule of the Ottoman Empire, an Islamic state, were not subjected to any general victimization and lawlessness. Moreover, it was observed that the social relations between Muslims and non-Muslims were generally positive and that their level of social integration was high. Especially in terms of religious rights and freedoms, the relationship between the communities was quite positive. The fact that the Muslim society did not resort to general oppression and lawlessness against non-Muslims and that the relationship between the communities was positive is an extremely valuable result, especially in terms of the conjuncture of the relevant period. As observed in many documents, when non-Muslims felt that they had been subjected to unlawful treatment by a Muslim, they could reach the Sharia court directly and through their patriarchs or representatives to the Dîvân-ı Hümâyûn. These authorities endeavored to protect the law of non-Muslims against Muslims and to establish justice. In conclusion, it can be said that the incidents of crime between Muslim and non-Muslim communities in Ottoman Diyarbekir were extremely few and generally of a simple nature that could be encountered in daily life.

**Keywords:** Ottoman Diyarbekir, Muslim-Muslim Relations, Crime, Social History.

## GİRİŞ

Osmanlı Devleti esas itibarıyla İslam hukukunun üstünlüğü ilkesini takip etmiş<sup>44</sup> ve toplumu oluşturan bireyleri, etnik kökenlerini dikkate almayarak dinî açıdan gruplandırmıştır.<sup>45</sup> Dinî aidiyetleri temelinde müslim ve gayrimüslim (zimmi) olmak üzere iki kategoriye ayrılan Osmanlı vatandaşları içerisinde Müslümanlar, hukukî olarak tek bir yapı arz ederken gayrimüslimlerin belirgin biçimde dinî ve mezhepsel farklılıkları vardı.<sup>46</sup> Tanzimat öncesi dönemde Müslüman toplumu içerisinde meydana gelen hukuki meselelerde yegâne müracaat mercii şer‘î mahkemeler iken gayrimüslim toplum içerisinde meydana gelen ihtilaflarda her iki tarafın da rızası olduğu takdirde ruhani reislerinin sınırlı bazı alanlarda hukuki yetkileri bulunmaktaydı.<sup>47</sup> Ancak taraflardan birinin Müslümanlardan diğerinin gayrimüslimlerden olduğu durumlarda yegâne müracaat mercii şer‘î mahkemelerdi.<sup>48</sup> Dolayısıyla Osmanlı Devleti hâkimiyetindeki coğrafyada bilumum tüm toplumun hususen de yüzyıllarca birlikte yaşayan Müslüman ve gayrimüslimlerin karşılıklı olarak kurmuş oldukları ilişkilerin en açık, güvenilir ve zengin biçimde gözlenebileceği kaynaklar şer‘î mahkemelerce tutulan *şer‘iyye sicilleri*dir. Bu niteliği sebebiyle şer‘iyye sicilleri Osmanlı sosyal tarihi araştırmalarında temel kaynak konumundadır.<sup>49</sup>

Döneme ait müslim-gayrimüslim suç ilişkilerini yansıtmaları bakımından şer‘iyye sicillerinin yanı sıra ahkâm defterleri de son derece önemlidir. Dîvân-ı Hümâyün’dan sadır olan hüküm, kanunname ve nizam mahiyetindeki kararların kaydedildiği defterlere *ahkâm defterleri* denilir.<sup>50</sup> Bu tür kayıtların mahfuz olduğu defterler, esas itibarıyla Müslüman ve gayrimüslim tebaanın şikâyet ve problemlerini çözüme kavuşturmak ve adaleti tesis etmek amacıyla Dîvân-ı Hümâyün tarafından düzenlenmişlerdir.<sup>51</sup>

Tarihsel olarak çok kültürlü ve renkli bir sosyal yapıya sahip olan Diyarbakır, Osmanlı döneminde de İslam coğrafyasının yüzyıllar boyu iç içe yaşamış birçok etnik ve dinî grubunun adeta bir buluşma noktasıydı <sup>52</sup>ve bilhassa dinî açıdan Anadolu'nun diğer şehirlerine nazaran çok daha fazla çeşitlilik ihtiva etmekteydi.<sup>53</sup> Nitekim 1895'te Diyarbakır kazasının %33.7'sini gayrimüslimler oluşturmaktaydı.<sup>54</sup> Bu kozmopolit yapısının yanı sıra Diyarbakır'ın, Osmanlı İmparatorluğu'nun Rumeli ve Batı Anadolu gibi merkezi bölgelerinden ve devlet otoritesinin daha muhkem olduğu İstanbul'dan uzakta bulunması oradaki toplumsal ilişkileri daha hassas ve önemli kılmaktadır.<sup>55</sup>

### **I. Cinayet**

19. yüzyıl Osmanlı Diyarbakır'ına ait kadı sicilleri ve ahkâm defterleri üzerine yapmış olduğumuz incelemede, Müslüman ve gayrimüslimler arasında meydana gelen altı cinayet hadisesi tespit edilmiştir. Bu altı vakanın tamamında katiller değil, katil zanlıları söz konusudur. Zira bunların hiçbirinde cinayet iddiası hukuken ispatlı değildir. Katil zanlılarının müntesibi oldukları toplumlara bakıldığında biri hariç tamamının Müslümanlardan olduğu gözlenmiştir. Bu da gerçekleşen cinayet hadiselerinde Müslümanların gayrimüslimlere nazaran daha fazla cinayet suçuna karıştıklarına işaret etmektedir. Ancak bu noktada dikkatlerden kaçırılmaması gereken husus, incelenen dönemin genişliğine ve belgelerin zenginliğine mukabil vaka sayısının son derece az olmasıdır. Dolayısıyla gayrimüslimler açısından umumi bir mağduriyet durumunun ortaya çıkmadığı, hatta toplumlar arası cinayet hadiselerinin son derece düşük olduğu ifade edilebilir. Cinsiyetleri açısından katil zanlılarına bakıldığında bunların tamamının erkeklerden müteşekkil olduğu görülür. Bir başka ifadeyle bu dönemde toplumlar arası suç ilişkilerinde hiçbir kadının cinayet suçuyla itham edilmediği ortaya çıkmaktadır.

Sözü edilen altı vakada yedi maktul yer almaktadır. Zira bu vakaların birinde iki maktul söz konusudur. Maktullerin müntesibi oldukları topluma bakıldığında altısının gayrimüslim, birinin Müslüman olduğu görülür. Bu vakaların birinde katil zanlısı gayrimüslim, maktul ise

<sup>52</sup> İbrahim Özcoşar, "Bir İslam ve Osmanlı Şehri Olarak Diyarbakır/Amid", Osmanlı'dan Günümüze Diyarbakır, ed. İbrahim Özcoşar v.dğr. (İstanbul: Ensar Yay., 2018), 20; İlhan Kaya, "Azınlıklar, Çok Kültürlülük ve Diyarbakır", *Nebiler, Sahabiler, Azizler ve Krallar Kenti Diyarbakır 2* (Diyarbakır: Diyarbakır Valiliği Kültür ve Sanat Yayınları, 2011), 216 vd.; Suavi Aydın – Jelle Verhei, "Diyarbakır Vilâyetinde Etnik-Dinî Gruplar, Yerel Güçler ve Osmanlı Devleti Üzerine Birkaç Not (1800-1870)", *Osmanlı Döneminde Diyarbakır'da Toplumsal İlişkiler (1870-1915)*, der. Joost Jongerden – Jelle Verhei (İstanbul: İstanbul Bilgi Üniversitesi Yayınları, 2015), 15-16.

<sup>53</sup> Kenan Ziya Taş, *Tarih Işığında Güneydoğu ve Diyarbakır* (Ankara: Berikan Yayınevi, 2012), 21.

<sup>54</sup> Şehirdeki gayrimüslim dinî gruplar ve nüfus oranları (1895 yılı itibarıyla) şöyledir: Gregoryen Ermeniler (%57.3), Süryani kadim kilise mensupları (%19), Katolikler (%5.2), Protestan Ermeniler (%5.1), Keldaniler (%4.4), Yezidiler (%3.8), Yahudiler (%1.5), Katolik Süryaniler (%1.8), Katolik Rumlar (%0.3), Kıbtiler (%0.04). bk. Bülent Çukurova & Bülent Erantepli, "XIX. Yüzyılda Diyarbakır'ın Sosyal ve İdari Yapısı", *Osmanlı'dan Cumhuriyet'e Diyarbakır*, ed. Bahaeddin Yediylidiz & Kerstin Tomenendal (Ankara: Diyarbakır Valiliği, 2010), II/359-360.

<sup>55</sup> Aydın – Verhei, "Diyarbakır Vilâyetinde Etnik-Dinî Gruplar", 15-16.

Müslümandır. Diğer vakalarda katil zanlılarını Müslümanlar, maktulleri gayrimüslimler oluşturmuştur. Ancak yukarıda da ifade edildiği gibi vaka sayısı son derece az olduğu için umumi bir mağduriyet durumundan bahsedilmesi mümkün değildir. Buna karşın Müslümanların cinayet bağlamındaki suç hadiselerine daha fazla karıştıkları açıktır. Cinsiyet açısından maktullerin büyük çoğunluğunu erkekler oluşturmuş, sadece bir vakada Ketrine bnt. Bolos adlı gayrimüslim bir kadının bilinmeyen bir sebeple azatlı köle Şakir b. Abdullah tarafından katledildiği anlaşılmaktadır.<sup>56</sup>

Bu dönemde toplumlar arası cinayetlerin hangi şekil ve yöntemlerle işlendiğine dair bazı bilgi ve bulgulardan da bahsedilebilir. Nitekim mezkûr cinayet vakalarının ikisi boğma suretiyle gerçekleşmiştir. Bunun dışında birer vakanın da sopa ile darp, hançerleme ve kaza kurşunuyla vuku bulduğu anlaşılmaktadır. Toplumlar arasında meydana gelen mezkûr cinayetlerin hangi sebeplerle işlendiği sorusu önemlidir. Acaba vuku bulan eylemler, toplumsal grup ayrışmasıyla meydana gelen cinayetler mi yoksa hayatın tabii seyri içerisinde meydana gelen olaylar mıdır? Maalesef şer‘iyye sicilleri ve ahkâm defterleri formatları gereği bu hususlara dair pek fazla bilgi sunmamaktadır. Ancak olaylar üzerine yapılan incelemede cinayetlere sebebiyet verecek bir toplumsal grup ayrışmasına veya toplumsal grup asabiyetiyle işlenen herhangi bir cinayete rastlanmamıştır. Zira vaki olan cinayetlerin benzerleri, hayatın normal akışı içerisinde Müslümanlar arasında da meydana gelebilmiştir.<sup>57</sup>

Toplumlar arası cinayet suçlarında dikkati celbeden bir diğer husus, cinayet vakalarının hiçbirinin ispatlanamamış olmasıdır. Ancak dikkat edilmesi gerekir ki cinayet vakalarının ispatında yaşanan güçlük sadece toplumlar arası ilişkilerde değil, döneme ait genel bir sorundur.<sup>58</sup> Dolayısıyla bunun Müslim-gayrimüslim suç ilişkileri yönü itibarıyla özel bir durum olduğu söylenemez. Yine dönemdeki genel temayüle uygun olarak<sup>59</sup> taraflarını Müslüman ve gayrimüslimlerin teşkil ettiği iki cinayet davasının sulh ile sonuçlandığı da olmuştur. Bu da toplumlar arası cinayet hadiselerinde zaman zaman tarafların sulh uygulaması ile uzlaşmaya gittiklerini göstermektedir. Bunun yanı sıra bir gayrimüslim tarafından Dîvân-ı Hümâyün’a cinayet de ihtiva eden kimi suçların ulaştırılmasıyla Dîvân’ın zimmi reayanın hak ve hukukunun korunması yönünde birçok ferman sadır ederek cinayet hadiselerinin sonuçsuz kalmaması ve reayanın hukukunun korunması hususunda gayret ettiğini göstermektedir.

<sup>56</sup> DŞS, 3803, 13a-3.

<sup>57</sup> Ümit Güler, *Osmanlı Toplumunda Cinayet* (Ankara: İlahiyât Yayınları, 2020), 37.

<sup>58</sup> Güler, *Osmanlı Toplumunda Cinayet*, 54.

<sup>59</sup> Güler, *Osmanlı Toplumunda Cinayet*, 55-56.

Cinayet hususunu bitirmeden önce son olarak ilgili fermanlarda yer alan, konuya dair şu pasajlara yer verilebilir:

“...imdi sen ki buldukları kazânın nâib-i mûmâileyhisin, ma‘rifetinle eşkıyâ-yı merkûmları buldurup huzûr-ı şer‘e ihzâr ve terâfu‘-ı şer‘-i şerîf ederek husûs-ı mezbûr inhâ olduğu üzere olduğu hâlde emlâk ü eşyâ-yı mağsûbe ba‘de’s-sübût alıverilip ve mâdde-i katl dahi kimin üzerine şer‘an sâbit olur ise ber-muktezâ-yı şer‘-i enver edâ-yı şer‘-i şerîf ve ihkâk-ı hakka dikkat ve kazıyyede alâkası olmayan bî-cürm kesâna azv û töhmet ve isnâd-ı kabâhat ile bî-vech ta‘addî etdirilmemesi husûsuna mübâderet olunmak bâbında...”<sup>60</sup>; “...mâdde-i katl kimin üzerine şer‘an sâbit olur ise ba‘dehû icâbı icrâ olunmak üzere sûret-i hâli bâ-i‘lâm ve tahrîrât Dersaadet‘ime inhâya mübâderet ve kazıyyede alâka vü medhali olmayan bî-cürm kesâna azv [ü] töhmet ü kabâhat ile bî-vech ta‘addî olunmaması husûsuna dikkat...”<sup>61</sup>

## **II. Gasp**

Döneme ait belgelerde Müslüman ve gayrimüslimler arasında gerçekleşen dört gasp vakası tespit edilmiştir. Bu vakaların tamamında suç isnadının ispatlı olmadığı, dolayısıyla davalıların zanlı statüsünde buldukları gözlenmiştir. Dört vakanın ikisinde Müslümanlar, diğer ikisinde gayrimüslimler zanlıdır. Bu vakaların ikisinde gasp eyleminin eşkıya çetesi tarafından gerçekleştirildiği anlaşılmaktadır. Dolayısıyla tespit edilen gasp eylemlerinde eşkıyalık faaliyetlerinin önemli bir yerinin olduğu söylenebilir. Ayrıca gerek Müslümanlar gerekse gayrimüslimler arasından da eşkıyalık faaliyetinde bulunanlar çıkabilmiştir. Kimi Müslüman ve gayrimüslimlerin eşkıyalık faaliyetlerinde işbirliği yaptığı da anlaşılmaktadır.<sup>62</sup>

## **III. Zabt**

Döneme ait belgeler içerisinde taraflarını Müslümanların ve gayrimüslimlerin oluşturduğu dört zabt vakası tespit edilmiştir. Bu vakaların üçünde davacı şahıslar gayrimüslim olup birinde Müslümandır. Davalılar da üç vakada Müslüman, bir vakada gayrimüslimdir. Bir vaka hariç tarafların tamamı erkeklerden müteşekkildir.

## **IV. Hırsızlık**

Döneme ait belgeler içerisinde hırsızlığa dair altı vaka tespit edilmiştir. Bu vakaların beşinde davalılar Müslüman iken birinde gayrimüslimdir. Üç vakada suç ispatlı iken diğer vakalarda

<sup>60</sup> DAD, 7, 147-1.

<sup>61</sup> DAD, 8, 14-1; Ayrıca bk. DAD, 8, 42-3; DAD, 8, 60-3; DAD, 8, 81-2.

<sup>62</sup> DŞS, 3746, 4b-2.

ispatlı değildir. Mağdurlar cenahında ise beş vakada gayrimüslimler, bir vakada ise Müslüman bir şahıs yer almıştır. Söz konusu olaylarda tüm tarafların erkeklerden müteşekkil olduğu gözlenmiştir. İlgili vakalara toplumlar arası suç ilişkisi açısından bakıldığında bu vakaların dördünde davalının Müslüman, davacının gayrimüslim; birinde davalının gayrimüslim, davacının Müslüman olduğu görülür. Hırsızlığa konu olan mallar da genellikle para, altın, direk, merkep veya katırdır.

#### **V. Mala Zarar Verme**

Döneme ait belgeler, taraflarını Müslümanların ve gayrimüslimlerin oluşturduğu üç mala zarar verme vakasının meydana geldiğini göstermektedir. Bu vakalarda davalıların ikisi gayrimüslimken biri Müslümandır. Vakaların ikisinde davalılar zanlı konumundayken gayrimüslimin davalı olduğu vakada suç ispatlıdır. Davacı cenahında da iki Müslüman, bir zimmi yer almaktadır ve tarafların tamamı erkeklerden müteşekkildir. Zararın söz konusu olduğu mallar, iki vakada beygir, bir vakada da katırdır. Davacılar, bir vakada beygirin ölümüne, bir vakada beygirin sakatlanmasına, bir başka vakada da katırın elden çıkmasına sebebiyet verilmesinden dolayı dava açmışlardır. Mezkûr davaların biri fetvaya havale edilmiş,<sup>63</sup> biri ispatlanmış,<sup>64</sup> bir diğeri de delil yetersizliği sebebiyle düşmüştür.<sup>65</sup>

#### **VI. Dinî Hak ve Hürriyetlere Yönelik Suçlar**

Osmanlı Diyarbakiri'nde sosyal hayatta iç içe ve temas halinde yaşayan Müslüman ve gayrimüslim ahalinin birbirlerinin dinî hak ve hürriyetlerine yönelik nasıl bir tutum takındıkları hususu son derece önemlidir. Zira bir İslam devleti olan Osmanlı'nın tebaası konumunda olan gayrimüslimler, acaba bu konuda Müslüman ahali tarafından taciz ve baskılara maruz kalmışlar mıdır? Böylesi olaylar olmuşsa devletin tutumu ne yönde olmuştur? Bu gibi sorular çerçevesinde yapmış olduğumuz inceleme, ilgili dönemde her iki ahali arasında<sup>66</sup> meydana gelen iki vakayı ortaya koymuştur. Bu vakaların her ikisinde müştekilerin Ermeni reayadan, zanlıların da Müslümanlardan oldukları anlaşılmıştır. Bunların birinde Ermenilerin kendi cemaatlerini kiliseye davet için tahta çaldıklarını ancak bazı Müslümanların buna engel olduğunu; bir diğer vakada da Ermenilerce *zangoç* adı verilen kilise görevlilerinin kendilerinin

<sup>63</sup> DŞS, 3767, 5a-3.

<sup>64</sup> DŞS, 3702, 5b-3.

<sup>65</sup> DŞS, 3774, 16b-1.

<sup>66</sup> (Devlet görevlileri ile gayrimüslim reaya arasında meydana gelen sorunlar bu çalışmanın kapsamına girmemektedir.)

sakini oldukları mahallede kimi Müslümanlar tarafından saldırıya uğrayıp darp edildiklerini ifade etmişlerdir.

İlgili belgeler, Osmanlı Diyarbekiri'nde Müslüman ve gayrimüslim toplumlar arasında dinî hak ve hürriyetlere yönelik tacizlerin son derece az gerçekleşen suçlardan olduğunu göstermiştir. Ortaya çıkan bu durum, toplumların birbirlerinin kutsallarına, dinî hak ve hukuklarına genel itibarıyla saygı ve hoşgörülle yaklaştıklarını ortaya koymaktadır. Zira şayet bu hususta bilhassa gayrimüslimlerin umumi bir mağduriyet durumları söz konusu olsaydı bu çerçevede patrikleri vasıtasıyla durumun padişaha iletilmesi ve buna binaen mağduriyetin giderilmesi babında birçok yazışmanın yapılması beklenirdi. Nitekim padişaha gönderilen arzuhâllerin dikkate alınarak sözü edilen olumsuzlukların menî sadedinde çok ciddi talimatların yerel mahkemeye gönderildiği belgelerden açık biçimde gözlenebilmektedir. Ortaya çıkan bu durum, Osmanlı devlet yönetiminin ve Müslüman toplumun gayrimüslimlerin hak ve hürriyetlerine gösterdikleri müspet tutumu ve farklı dinlere mensup toplulukların barış içerisinde yüzyıllarca birlikte yaşama tecrübelerini yansıtmaları bakımından son derece kıymetlidir.

## **VI. SONUÇ**

Döneme ait Diyarbekir şer'iyeye sicilleri ve ahkâm defterlerine dayalı olarak ortaya çıkan bu çalışma, Osmanlı'nın Müslüman ve gayrimüslim tebaasının toplumsal ilişkilerine dair dikkate değer görünümeler ortaya koymuştur. Bunların ilki her iki toplum arasında vaki olan suç hadiselerinin son derece sınırlı olmasıdır. Buradan hareketle ilgili dönemde toplumlar arasındaki ilişkinin genel itibarıyla olumlu bir niteliğe sahip olduğu söylenebilir. Nitekim vaki olan suç hadiseleri genel olarak basit nitelikli suçlardır. Örneğin ilgili dönemde toplumlar arasında herhangi bir tecavüz, taciz veya iffet davası söz konusu olmamıştır. Bu gibi hadiseler vaki olmuşsa dahi döneme ait mahkeme sicillerine ve ahkâm defterlerine yansıtılacak düzey ve ciddiyette olmadığı açıktır. Ciddi nitelikli suçların da son derece az sayıda olduğu ortaya çıkmıştır. Örneğin dinî hak ve hürriyetlere yönelik suçların sadece iki; cinayet hadiselerinin de altı vakayla sınırlı olması bu yönde dikkate değer bir bulgudur. Şüphesiz insanın olduğu yerde münferit de olsa birtakım suç hadiselerinin olması kaçınılmazdır. Bu durum tüm toplumlarda böyledir ve insan doğasının bir gereğidir. Burada esas önem arz eden, umumi bir mağduriyetin ve hukuksuzluğun olup olmadığıdır. Bu araştırmada ortaya çıkan netice, bir İslam devleti olan Osmanlı'nın hâkimiyeti altında yaşayan Diyarbekir gayrimüslimlerinin umumi bir mağduriyet ve hukuksuzluğa maruz kalmadıkları yönündedir.

### **ÖZET**

Geçmişten günümüze toplumun en temel yapı taşı aile olarak kabul edilmektedir. Aile, çocuğun ilk eğitim aldığı yer olması açısından aileye farklı sorumluluk ve görevler yüklenmektedir. Çünkü aile, gerek çocuğun bakımı ve güvenliği gerekse sosyalizasyonu açısından büyük önem arz etmektedir. Bu görev ve sorumlulukları yerine getiren aileler sağlıklı aileler olarak kabul edilebilir. Bunun dışında, işlevlerinde aksamaların gerçekleştiği aileler ise sağlıksız aileler olarak tanımlanmaktadır. Sağlıksız ailelerde çocuğa yönelik ihmal istismar gibi çocuğun fiziksel ve ruhsal bütünlüğünü bozacak durumlar gerçekleşebilir. Bu durumlar şiddet, cinsel içerikli davranışlar ya da çocuğun onur ve haysiyetini zedeleyici söylemler olarak karşımıza çıkabilmektedir. Sosyal hizmet mesleği çeşitli dezavantajlı gruplarla çalışsa da bunlardan en önemli olanlardan birisi çocuklar olarak kabul edilmektedir. Çünkü toplumun temel yapı taşı aile, ailenin temel yapı taşı da çocuk oluşturmaktadır. Multidisipliner bir çalışma alanı olan sağlıkta da çocuğa yönelik tıbbi, psikolojik ve sosyal olarak müdahale alanları bulunmaktadır. Bu çalışmada çocuk ihmal ve istismarına yönelik müdahaleler konusu üzerinde durulmuştur. İhmal ve istismar kavramları ile ilgili tanımlar yapılmış, çocuk ihmal ve istismarına yönelik müdahalelerde kuramların rolüne yer verilmiştir. Buna bağlı olarak çocuk ihmal ve istismarına yönelik müdahale basamakları incelenmiştir.

**Anahtar kelimeler:** İhmal, istismar, çocuk, sosyal hizmet.

**AN EVALUATION ON INTERVENTIONS TO CHILD NEGLECT AND ABUSE****ABSTRACT**

From past to present, the most basic building block of society is accepted as family. Since the family is the first place where the child receives education, different responsibilities and duties are assigned to the family. Because the family is of great importance in terms of both the care and safety of the child and its socialization. Families thatful fill these duties and responsibilities can be considered healthy families. Apart from this, families in which dys functions ocur are defined as unhealthy families. In unhealthy families, situations such as neglect of the child and abuse may ocur that will disrupt the physical and mental integrity of the child. These situations may appear as violence, sexually explicit behaviors or statements that harm the honor and dignity of the child. Although the social work profession works with various disadvantaged groups, one of the most important ones is considered to be children. Because the basic building block of the society is the family, and the basic building block of the family is the child. Health, which is a multidisciplinary field of study, also has medical, psychological and social intervention areas for the child. This study focuses on interventions for child neglect and abuse. Definitions have been made about the concepts of neglect and abuse, and the role of theories in interventions for child neglect and abuse has been given. Accordingly, the steps of intervention for child neglect and abuse were examined.

**Key Words:** Neglect, abuse, child, social work.

## **1. GİRİŞ: ÇOCUK İHMAL VE İSTİSMARI**

Amerikan Psikoloji Birliği'nin (2002) yaptığı tanıma göre çocuğa yönelik kötü muamele, *"Etkileri, yoğunluğu ve içeriği sebebiyle çocuğun ruhsal ve sosyal sağlığını etkileyen önemli bir toplumsal bir sorundur"* biçiminde tanımlanmıştır (Sürsavur ve Demirel, 2018: 64). Çocuk istismarı, ebeveyn ya da bakımını üstlenen yetişkin bir birey tarafından çocuklara uygulanan, ahlaki değerler ve alanında uzman olanlar tarafından uygun olmayan ya da zarar verebilecek şekilde tanımlanan, çocukların gelişim sürecini güçleştiren ya da sınırlandıran davranışların bütünü olarak ifade edilmektedir (Yaşar, 2016: 1). Kısaca, çocuklarda ciddi fiziksel veya psikolojik yıkımlara ve çocuk ölümlerine neden olan sosyal ve tıbbi bir problem olarak tarif edilebilir.

Çocuklara yönelik gerçekleşen ihmal ve istismar olayları kültürel yapıdan, coğrafi yapıdan, sosyal ve ekonomik gelişmişlikten ayrı olarak uzun yıllardır hayatımızda var olan bir gerçekliktir (Vizard, 1991 aktaran Uğurlu ve Gülşen, 2014: 9). Çocuklara yönelik ihmal ve uygulanan istismar olayı oldukça eski bir geçmişe dayandığı söylenebilir. Eski bir geçmişi olsa da, bu konunun toplum gündeminde yerini alması oldukça yakın zamanda gerçekleşmiş bir durum olarak ifade edilebilir (Taş, 2017: 1). Çocuğun bedensel sağlığı, ruhsal ve sosyal gelişimi üzerinde olumsuz etkileri olan çocuk istismarı konusunun sosyal bir sorun haline gelecek şekilde Türkiye'de gündeme taşınması 2000'li yılların başından itibaren gerçekleşmiştir (Güner vd., 2010: 109; Küçük, 2016: 262 aktaran Kaya Kılıç ve Tekin, 2019: 845). Ancak hâlâ bu konu üzerinde gerçekleştirilen çalışmalar sadece çocukla ilgili kurum ve kuruluşlara yöneliktir (Dallar Bilge vd., 2013: 33).

Aile, toplumun temel yapı taşıdır ve her toplumda aile kurumundan söz edilebilir. Aile kurumu, toplumdaki topluma ve zamandan zamana değişen, farklılık gösteren bir yapıya sahiptir (Dikici, 2020: 58). Fakat her aile, farklı sosyo-kültürel özellikler bağlamında çocuk yetiştirme konusunda da farklılıklar göstermektedir. Her toplum, çocuk yetiştirme konusunda birbirinden farklı yöntemler kullansa da, zaman içerisinde çocukların fiziksel olarak cezalandırıldıkları, beraberinde psikolojik parçalanmaların meydana geldiği ve hatta cinsel olarak yıpratıldıkları bilinmektedir (Bilir vd., 1991: 58). Çocuğun ilk sosyal çevresi, ailesidir. Çünkü aile kurumunun önemli fonksiyonlarından birisi, çocukların ihtiyaçlarının karşılanması ve geleceğe yönelik atacağı adımlarda yardımcı olmaktır. Ailenin bu fonksiyonlarına rağmen, çocuk istismarı vakalarının aile ortamında gerçekleştiği görülmektedir (Özyürek vd., 2018: 437). İstismarcı ebeveyn tüm etnik, coğrafi, dini, eğitimsel, mesleki ve sosyo-ekonomik düzeylerde yer alan

kişilerden olabilsede, sosyo-ekonomik açıdan dezavantajlı olarak ifade edilen kesimden olma ihtimali daha yüksektir (Kara vd., 2004: 141).

## **2. ÇOCUK İHMAL VE İSTİSMARININ ÇOCUK ÜZERİNDEKİ ETKİLERİ**

Çocuk istismarı oldukça önemli bir sosyal sorundur. Uzun vadede olumsuz etkileri gözlemlenmektedir (Taner ve Gökler, 2004: 84). Anne-babalar, bakımını üstlenen kişiler bilerek veya bilmeyerek dogmatik olarak var olan tavır ve davranışlarla çocuklara ihmal ve istismarda bulunabilmektedirler. Bu davranışlar çocukların gelişimini engellemektedir (Taş, 2017: 2). Yetişkinlik çağına kadar etkisi devam eden, asosyal davranışlar sergileme, ikili ilişkiler kurmada güçlük çekme, toplumun ahlaki değerleriyle ters düşen hareketlerde bulunma, madde bağımlılığı ve suça yönelme gibi davranışlar sergileyebilmektedirler (Finkelhor 1994 aktaran Ak, 2015: 26). Yapılan çalışmalar, erken çocukluk döneminde istismara maruz kalmanın, uzun vadede genç suçluluğu, yetişkin suçluluğu ve şiddet suçları ile sonuçlandığını ortaya çıkarmaktadır (Topçu, 2009: 13).

Çocukluk dönemindeki olumsuz deneyimler ile yetişkinlik döneminde meydana gelen ruhsal sorunların ilişkisine değinen birçok araştırmanın bulunduğu bilinmektedir (Yiğit ve Erden, 2015: 48). Garrison (1987), Hort ve Brassord (1987) gerçekleştirdikleri literatür araştırması sonucunda, doğrudan doğruya ve şiddetli bir duygusal istismar olayı, birçok davranış bozukluklarının çocuklarda görülmesine neden olduğunu ve buna bağlı olarak öğrenme güçlükleriyle ilişkili olduğunu ortaya koymuşlardır (Kozcu, 1991: 383). Duygusal olarak ihmal ve istismara maruz kalan çocuklar üzerinde gerçekleştirilen on sekiz çalışmanın değerlendirilmesi sonucunda, duygusal olarak kötü muameleye maruz kalan çocukların duygularını ifade etme ve duyguların farkındalığında: duygusal olarak kötü muameleye uğramamış çocuklarla karşılaştırıldığında önemli ölçüde daha yetersiz oldukları gözlemlenmiştir (Luke ve Banerjee, 2013 aktaran Üstündağ, 2020: 137). Mullen vd. (1996) intihara başvurma girişimlerinin fiziksel açıdan istismar olaylarında beş kat artarken, duygusal içerikli istismarda bu oranın 12 kata kadar yükseldiğini ifade etmiştir (Dinleyici ve Şahin Dağlı, 2016: 6).

Fiziksel istismara maruz kalmış çocukların on iki yıl takip edildiği bir araştırmada, istismara uğramış çocukların, istismar deneyimlememiş olan çocuklara göre okul devamsızlığı oranlarının, depresyon, kaygı bozukluğu, travma sonrası stres bozukluğu ve pasif agresif

davranış düzeylerinin daha yüksek olduğu ve daha fazla sosyal sorunlar yaşadığı görülmüştür (Lansford, 2002 aktaran Sofuoğlu ve Cankardaş Nalbantçılar, 2018: 6).

Cinsel istismara uğramış çocuklarda da anksiyete meydana gelebilmektedir. Bununla birlikte uyku yönünden birtakım sıkıntılar, kâbus görmeler, yeni fobiler, fizyolojik şikâyetler ve korkuya yönelik refleksler gözlenmektedir (Tıraşçı ve Gören, 2007: 72).

İstismara uğrayan çocuklarla detaylı bir görüşme gerçekleşmeden ve fiziki muayene yapılmadan gönderildiklerinde, bu çocukların sonraki zamanlarda yaklaşık olarak %5-10'unun cinayete kurban gittiği, %35-50'sinin ise ağır derecede yaralandığı gözlenmiştir (Kara vd., 2004: 149).

Çocuk istismarı konusu çocukların üzerinde bırakmış oldukları etkiler bağlamdan son derece önemli bir konudur. İstismara uğrayan çocuklarda fizyolojik etkilerine ek olarak istismar mağduru çocuğun, güven duygusu sarsılır ve sevgisizliği öğrenir. Bu nedenle anne-babaları ya da çocuklara bakan kişilerce gerçekleştirilen istismar olayları ve ihmal durumları sadece aileleri değil, toplumu da ilgilendirmektedir. Bu nedenle önemli bir sosyal sorun olarak kabul edilmektedir (Altıparmak vd., 2013: 355).

### **3. ÇOCUK İHMAL VE İSTİSMARINDA ROL OYNAYAN ETMENLER**

İstismar ve ihmalin gerek ruhsal ve sosyal gerekse biyolojik incelemelere göre çeşitli nedenleri bulunmaktadır (Polat Külcü ve Karataş, 2016: 49). Barınma sorunları, işsizlik sorunu, madde ve alkol bağımlılığı, aile içi şiddet ve ailede bulunan ruhsal hastalıklar çocuk istismarına yol açabilecek risk etmenlerinin başında gelmektedirler (Ayvaz ve Aksoy, 2004: 27). Bu etmenler 3 başlık altında incelenecek olursa:

#### **3.1. Aileden Kaynaklı**

Ebeveynlerin çocuklarına ihmal ve istismar uygulamasının nedeni, onların çocuklarına değer vermemeleri ya da onları umursamamaları değil, ebeveynlik becerilerinin yeteri kadar olmamasıdır (Yaşar, 2016: 4). Gerçekleştirilen çalışmalarda çocuk sayısının fazla olması, işsizlik, anne-babadan birinin üvey olması ya da tek ebeveynlik, ailenin izole bir yaşam tarzı içerisinde olması, ailenin güçlü yönlerinin yetersiz olması fiziksel şiddete neden olan risk faktörleri olarak görülmektedir (Cowen, 1999 aktaran Güler vd., 2002: 129). Fiziksel olarak gerçekleşen istismar ve ihmal olayları için, ebeveyne ilişkin risk etkenlerine ek olarak: ağır psikolojik rahatsızlıklar, madde bağımlılığı, sosyal destek yokluğu, çocuklukta istismara maruz kalması gibi etkenler etkili olabilmektedir (Power, 1990 aktaran Taner ve Gökler, 2004: 82).

Ayrıca çocuk annelerin çocukları daha sağlıksızdır. Kötü muameleye maruz kalma olasılıkları daha fazladır. Beslenme sorunu ve yasadışı davranışlarla birlikte, maddi ve manevi açıdan daha düşük bir düzeyde yaşarlar (Turan ve Dokgöz, 2007: 138).

Çocukların davranışları üzerinde ebeveynlerin rolü oldukça fazladır. Çünkü çocuklar gözlemedikleri anne-babalarını rol model olarak alırlar. Onları tekrarlama yoluyla öğrenirler ve onları bu şekilde taklit ederler. Çocukların, ebeveynlerince kötü muameleye maruz kalması, ebeveynleri arasındaki şiddete şahit olması yaşam tarzlarını, aralarındaki bağı etkiler ve kendi çocuklarına kötü muamelede bulunmasına neden olur (Kutlu, 2007 aktaran Dallar Bilge vd., 2013: 28).

İstismar uygulayan ebeveynler çoğunlukla şahsi çıkarlarını çocuklarından üstün görmektedir. Onlara göre çocuklar, birer cinsel obje ve araçtır. Çocuk hakkında çok fazla gerçekçi beklenti içerisine girmezler. Ayrıca sosyal ilişkileri de oldukça zayıf kişiler olarak tanımlanmaktadır (Berkowitz, 2004 aktaran Yıldız vd., 2017: 306). Cinsel içerikli istismarlar aile içerisinde çok fazla görülmektedir. Bu aileler, işlevselliği bozuk aileler olarak da ifade edilmektedir. Bu tarz ailelerde ihmal ve istismara neden olduğu varsayılan çeşitli patolojiler bulunmaktadır (Turan ve Traş, 2016: 44). Gerçekleştirilen çalışmalar sonucu çocuğu kötü muameleye maruz kalmış anneler, diğer annelere göre daha az sorun çözme yeteneğine sahiptir ve sorunların üstesinde gelme yetenekleri düşüktür. Babaların durumuna bakıldığında ise, iletişim becerilerinin yetersiz olduğu görülmüştür (Paradise vd., 1994 aktaran Ünal, 2017: 23).

### **3.2. Çocuktan Kaynaklı**

Çocuğun yaşı, cinsiyeti, doğum ağırlığı, doğum sırası, fiziksel engelinin varlığı gibi etkenler çocuğun kötü muameleye maruz kalma riskini artırmaktadır (Ünal, 2008: 15). Planlanmayan veya istenmeyen gebelik ya da evlilik dışı dünyaya gelen çocuk olması gibi durumlarda da ebeveyni ya da bakım veren kişinin çocuğa kötü muamelede bulunduğu görülmektedir (Aral, 1991 aktaran Acehan, 2013: 605). Çocuğun zor karakteristik özellikleri sahip olması ve çocukta bulunan ruhsal hastalıklar bu riski artırabilmektedir (Dinleyici ve Şahin Dağlı, 2016: 5). Ayrıca huysuzluk yaşayan, devamlı ağlama halinde olan, yemek ve uyku konusunda sorunlu ve ebeveynleri ile ikili ilişkilerde yetersiz olan çocukların ihmal ve istismar edildiği belirtilmektedir (Cüceloğlu, 1998: 379).

Yapılan bir araştırmada: engelli çocukların diğer çocuklara göre daha çok kötü muameleye maruz kaldığı, engel sahibi olan çocuklar içinden ise mental rahatsızlığı bulunan çocukların, diğer engelli olan çocuklardan daha çok duygusal, fiziksel ve cinsel istismara maruz kaldığı

tespit edilmiştir (Bilge ve Baykal, 2010). Fiziksel istismara maruz kalması sebebiyle sosyal hizmet kuruluşlarınca bakım tedbir kararı uygulanan çocukların %9,3'ünde mental, %4,2'sinde ise bedensel engel olduğu verisine ulaşılmıştır (Kutsal, 2004 aktaran Paslı, 2017: 104). Minnesota'da sosyal hizmetler ve eğitim idaresi veri tabanları taranarak gerçekleştirilen bir araştırmada istismar öyküsü olan 10.394 çocuğun % 32'sinin özel eğitim ve rehabilitasyon aldığı, bu çocukların da %73'ünün hafif düzeyde mental retardasyonu olan çocuklar olduğu sonucuna ulaşılmıştır (Haigh, 2013 aktaran Yıldırım Sarı vd., 2016: 502).

İstismarcı kişiler ile gerçekleştirilen görüşmeler sonucu, istismarda bulunacakları çocuğun suskun ve içe kapanık kişilik özelliklerine sahip olmasının ve çocuğun ebeveyninin ya da bakım verenin kendisini tanıması ve güven duymasının istismarı kolaylaştırdığı sonucuna ulaşılmıştır (Elliot, 1995 aktaran Kaytez vd., 2018: 19).

### **3.3. Çevresel ve Toplumsal Etmenler**

Ebeveynlerin sınırlı bir sosyal çevre içerisinde yer alması, arkadaşlarının ve sosyal destek sistemlerinin olmaması ya da çevrelerindeki bireylerle anlaşmazlık yaşamaları birtakım sorunları ortaya çıkarmıştır. Bununla birlikte aile etrafında ortaya çıkan hastalıkların ve yaşanan kazaların, ailede yer alan sistem ve alt sistemler arasındaki uyumsuzluğu etkilediği çocuk ihmal ve istismarına neden olduğu düşünülmektedir (Bilir vd., 1991: 59).

Konu ile ilgili gerçekleştirilen bir çalışmada, özellikle gelişmişlik düzeyi yüksek toplumlarda istismar ve ihmale yol açan etmenler arasında ailenin toplumdan tecriti, düzenli bir ekonomik gelire sahip olmama ve sabit bir adreste ikamet edememe gibi faktörler de gösterilmiştir (Bahçecik ve Kavaklı, 1993:13). Sosyal destekten yoksun olmak ya da bir dereceye kadar sosyal izolasyon içerisinde yaşamak olarak açıklanabilir (Bee ve Boyd, 2009: 245).

## **4. ÇOCUK İHMAL VE İSTİSMARINA YÖNELİK MÜDAHALELER**

### **4.1 Çocuk İhmal ve İstismarına Yönelik Müdahalelerde Kuramların Rolü**

#### **4.1.1. Sosyal Öğrenme**

Bireyin cinsel ve psişik kimliği doğuştan değil hayatı süresince etkileşim içerisinde olduğu etmenler tarafından meydana gelmektedir (Kurtay ve Kurtay, 2020;203). Bu etmenlerden en önemlisi aile içi iletişim ve aile içi dinamiklerdir. Anne-babalar küçükler için rol model olarak sosyalizasyonunu sağlar. Anne-baba rol model olarak çocuğun davranışlarını sosyalleşmesine olanak sağlarken, çocuklar da anne-babaların eylemlerini etkilemektedir. Öyle ki anne-babasının saldırganca hareketleri çocuk için saldırganlık modeli oluşturur (Aydın, 1997; 89-

90). Şiddet eğilimli annelerle gerçekleştirilen bilimsel araştırmalara göstermektedir ki, annelerin çocuklarına karşı ihmal ve istismar davranışlarında bulunmalarının temel nedeni küçüklüklerinde kötü muameleye maruz kalmaları ve bundan kaynaklı olarak kendi annelerini içselleştirmeleridir (deMause, 2020; 219)

#### **4.1.2. Ekolojik Model**

Sorunlar, birey ile çevre arasında ortaya çıkan uyumsuzluklar sosyal sorunların ortaya çıkmasına neden olmaktadır (Turan, 2012; 319). Bu sebeple ekolojik yaklaşımda kişi ve/veya kişiler dâhil oldukları çevre ile kurdukları etkileşimleri sonucu ayak uyduran ve gelişim gösteren canlılar olarak değerlendirilir. Çevresi içerisinde birey ekolüyle ilerlemesi sebebiyle ekolojik model hem içsel hem de dışsal faktörleri inceler (Duyan vd., 2008; 52).

Çocuklar fiziksel, biyolojik ve sosyal çevreden en çok etkilenen önemli bir çalışma grubudur (Güler ve Çobanoğlu, 1994; 11). Günümüzde mutlu ve üretken bir hayat süren çoğu birey yorucu ve meşakkatli koşullarda yetişmektedir. Bu bireyler suç oranı yüksek sorunlu bir fiziksel ve sosyal ortamda büyütülmüş, ebeveyni ya da bir akrabası ya da bir başkası tarafından istismar ve ihmal edilmiş; devlete bağlı kurum ya da kuruluşlarda kalmış olabilir (Zastrow, 2010;13). Aynı zamanda çocuğun kişisel gereksinimleri mikro düzeyde incelenmeden yalnızca aileyle birlikte çalışmak, senelerce ihmal ve/veya istismara maruz kalan kişilerde meydana gelen bağlanma sorunlarını çözemez (BoydWebb, 2011; 298). Bu nedenle sosyal ve siyasi akımlar, sağlık hizmetlerinin sadece hasta bireylere değil, tüm topluma eşit olarak ulaştırılması ve bireyin çevresi ile birlikte ele alınması fikrini savunmaktadır (Afşar Çelik, 2005; 5).

#### **4.1.3. Psikolojik Model**

Yaşadığımız günün her anı, görünüşte unutulmuş bir geçmişin gölgesi altında kalır (Öneş, 1972; 55). Geçmişte meydana gelen sorunlar, kişinin günümüzde yaşamını olumsuz yönde etkilediği zaman önem kazanırlar ve araştırılırlar. Ancak geçmişte olup bitenlere müdahale etme gibi bir imkân bulunmamaktadır. Ama onların tesir ettiği duygu, düşünce ve davranışlar yatıştırılabilir ve tedavi edilebilir (Turan, 2012; 255).

Bu konuda gerçekleştirilen araştırmalarda çocuklarını istismar eden ebeveynlerin onlara karşı realist olmayan beklentilerde buldukları, yerine getirilmemiş bağımlılık gereksinimlerinin olduğu ve kendilerinin de çocukluk zamanlarında ihmal ve istismara maruz kaldıkları düşünülmektedir (Polat, 2001; 33). Çocukken cinsel, fiziksel, duygusal olarak istismara uğrayan ve ihmal edilen bir ebeveyn, kendi çocuğuna şefkat ve merhamet göstermesini beklemek zordur. Ebeveynler de insandır ve tarihte çoğu birey küçükken bağlanma sorunu

yaşadıkları, özel bölgelerine yönelik kötü davranışlarda bulunuldukları, şiddete maruz kaldıkları, cinsel olarak sömürüldükleri ve duygusal olarak istismara maruz kaldığı için ebeveyn olarak çocuklarının sevgi dolu bakım verenleri olmamaları pek şaşırtıcı değildir (deMause, 2020; 59)

#### **4.1.4. Psikiyatrik Model**

Psikiyatrik sosyal hizmet; zihinsel ve psikolojik sorunları sebebiyle psikiyatrik müdahale çerçevesinde değerlendirilmesi gereken birey ya da bireylerin; sosyal uyumsuzlukları ve gereksinimleri üzerine odaklanan bir işlev bir görevdir (French, 1948 aktaran Özdemir, 2019; 60)

Çocukluklarında istismara uğrayan bireyler maruz kaldıkları cinsel istismarın meydana getirdiği psikolojik nevrozları bastırırlar. Ama bu kişiler hayatları boyunca diğer bireylerle etkileşim içinde olmakta ve ikili ilişkiler kurmakta zorlanırlar çünkü cinsel istismara maruz kalan çocuklar yetişkin bir birey olduklarında güven sorunu yaşamaktadırlar (Zastrow, 2010; 295)

Harvard Akıl Sağlığı Yazısına göre (Çocuk İstismarı, 1993), cinsel veya fiziksel istismar mağduru çocuklar ve yetişkinlere nasıl davranılacağına yönelik kabul görmüş bir davranış kalıbı bulunmamaktadır. Semptomların, değişkenlik göstermesinden kaynaklı olarak çeşitli psikoterapi ve ilaç tedavisi gerekebilmektedir. (BoydWebb, 2011; 425)

#### **4.1.5. Sosyolojik Model**

Sosyolojik modelde ise psikiyatrik modelin tersine toplumsal değerler, toplumsal kurumlar, kültürel yapı, aile yapısı ve sosyoekonomik durum istismarın ortaya çıkmasında etkili olan nedenler olarak kabul edilmektedir (Kurtay ve Kurtay, 2020; 178).

Psikopatolojinin aileden çocuğa aktarılışında hem çevre hem de kalıtsal etmenler tesir etmektedir. Parçalanmış aile olmak, aile içi iletişim bozuklukları, aile içi dinamiklerde bozulmalar, ailede psikolojik sorunlar gibi çevresel etkiler ile çocuklukta psikolojik rahatsızlıkların varlığı arasında bir bağlantı olduğu ileri sürülmektedir (Yöntem Fidan, 2011; 2). Bu açıdan çocuğun korunması, desteklenmesi ve üstün yararının sağlanmasına yönelik farkındalıklar direkt sosyoekonomik sınıf ve aileyle ilgili olduğu öne sürülmektedir (Zastrow, 2010;687)

Aile içi sorunlar yaşayan, aile sistemi tam olarak oturmamış ailelerde büyüyenlere ne olmaktadır? Herkes bu tür ailelerde dünyaya gelen ve büyüyen çocukların aileden ayrılma sürecinde daha istekli ve gayretli olacağını düşünmektedir. Ancak aksi gerçekleşmektedir. Aile

sistemi ne kadar düzensiz ve alt sistemler ve üst sistemler arasındaki çatışma ne kadar büyükse, aile içi roller ne kadar karmaşıkça bireylerin aileden ayrılma ihmali o kadar düşüktür. Çünkü ayrılmak için kişi o bilgi ve beceriye sahip değildir. Dışlanma korkusuyla ailelerine daha da bağımlı hale gelirler (Yalom, 1980; 619).

#### 4.2. Çocuk İhmal ve İstismarını Önlemeye Yönelik Müdahale Basamakları

Çocuk ihmal istismarında önleme iki sebeple önem arz etmektedir. Birincisi, çocuk ihmal ve istismarı meselesine insancıl yaklaşım bunu gerektirir. İkincisi ise, yerinde ve zamanında müdahale ile çocukların evden kaçmalarının, okulda problemler yaşamalarının, suça sürüklenmelerinin ve madde bağımlısı olmalarının, önemli ölçüde psikolojik ve gelişimsel bozukluklardan zarar görmelerinin önüne geçmiş olunur (Şirin, 2007; 93).

15. yy İtalya’da ebeveyn ensesti ve anne-babaların erkek çocuklarını cinsel ilişki için para karşılığında pazarlamasından 1900’lü yıllarda İngiltere’de bulaşıcı hastalıklarının iyileşmelerinin tek çözümünün çocuklarla cinsel birliktelik yaşaması gerektiğini savunan pedofililere kadar, çocuklara yönelik kötü muameleye çok az müdahale edilmiş ve bu suçlar nadiren cezalandırılmıştır (deMause, 2020; 307). Çocuğa yönelik kötü muamelenin önlenmesinde en etkili yöntemler Türk Ceza Hukukunda yer almaktadır (Akkaş, 2021;91). 1989 yılında Birleşmiş Milletler Genel Kurulu tarafından kabul edilen ve 27 Ocak 1995 yılında Türkiye’de yürürlüğe giren BM Çocuk Haklarına Dair Sözleşme, günümüzde çocukların ihmal ve istismardan korunmasında önemli bir yere sahiptir (Derin ve Öztürk, 21; 50). İhmal ve istismara uğrama riski bulunan ya da kötü muamele görmüş çocuklara yönelik koruyucu ve destekleyici tedbirler de Çocuk Koruma Kanunu ile yasalaştırılmıştır (Özdemir ve Asil, 2021: 3).

Çocuğa yönelik kötü muameleyle mücadelede önleme çalışmaları üç aşamalı olarak gerçekleştirilmektedir.

##### 4.2.1. Birincil Koruma

Bir ülkenin yaşam kalitesi, o ülkede yaşayan çocukların refah seviyeleri ile paralellik göstermektedir (Polat, 1999;32). Refah seviyesini belirleyen en önemli etmen de çocukların fiziksel ve ruhsal olarak tam iyilik halinde olmalarıdır. Günümüzde sağlık sisteminde çocukların fiziksel ve ruhsal sağlığını koruma ve geliştirme uygulamalarının yer alması çocuk sağlığı açısından önem arz etmektedir. Bunun temel nedeni bireyin uygulanacak tıbbi müdahale yönelik bilgi sahibi olma, tedavi sürecine etkin olarak katılabilme ve kendi geleceğini tayin edebilme hakkına sahip olmasıdır (Çınar vd., 2018; 27)

Toplum, sorumluluğunun farkında olarak problemleri çözmek için bir şeyler yapmak, olaylara ve toplumsal sorunlara müdahale edilmesi gerektiğini düşünmek ve harekete geçmek zorundadır. Yalnızca o zaman güvenilir ve sorumluluğunun farkında bir toplum olma özelliği kazanılabilir

1960'lı yıllar öncesinde kısmen ailenin gizli bir kurum ve özel bir alan olarak görülmesi nedeniyle aile içi şiddet, ihmal ve istismar dikkat çekmemekteydi. Aile sisteminde var olan bu sorunlar yalnızca ailede yer alan bireyleri ilgilendiren bir durum olarak görülürdü. Ama son 40 yılda bu durum değişti ve toplumsal sorunlara yönelik farkındalıklar gelişti (Zastrow, 2010;270)

Çocuklara yönelik kötü muameleyi, ebeveynlerin çocukların poposuna şamar atmasını dahi onaylamayan cezaları yürürlüğe sokan- Amerika da dahil Avrupa, Afrika ve Asya'daki- 36 ülkede gelişen çocuk yetiştirme uygulamalarının olumlu sonuçları alenen görülmektedir. Bu uygulamalara göre anne-babalar, çocuklarına şiddet uyguladıkları için ağır cezalarla cezalandırılmamakta, aksine terapötik görüşme gerçekleştirmek ve ebeveynin çocuk yetiştirme konusundaki becerilerini artırmak amacıyla hane ziyaretleri gerçekleştirilmektedir (deMause, 2020; 365-366).

Sağlık çalışanları tarafından da gerçekleştirilen hane ziyaretleri esnasında ailenin ihtiyaçlarını belirlemek, anne-babaya ve çocuğa yönelik risklerin tespiti ve var olan risklere yönelik psiko-sosyal ve sosyoekonomik müdahalelerin gerçekleştirilmesi konusunda aileye destek olmak da birincil koruma kapsamındadır (Turhan vd., 2006;156).

#### **4.2.2. İkincil Koruma**

Çocuklara yönelik kötü muamelenin gerçek boyutları tam olarak tespit edilememektedir. Kesin sonuçların elde edilmesi iki nedenle gerçekleştirilememektedir: toplumun ve toplumsal sorunların çözümünde yer alan profesyonellerin riskli durumların üzerine gitmemesi ve ihmal ve istismara maruz kalan çocukların uğradıkları kötü muameleyi konuşmamalarıdır (Zastrow, 2010; 277)

Çocuklara yönelik kötü muamele suçunun çeşitli sebeplerden kaynaklı olarak çoğu zaman gizli kaldığı ve bu nedenle istismarcının hak ettiği cezayı almadığı gerçeği göz önüne alındığında, çocuklara yönelik ihmal ve istismar suçuyla mücadelede en temel husus bu suçla ilgili en ufak şüphe, delil ya da itiraf gibi çeşitli bilgilere sahip olan ya da ulaşan profesyonellerin bu durumu yetkili mercilere bildirmesidir (İltaş ve Işık-Yılmaz, 2021; 107).

Bildirim sonrasında adli sürecin en kısa sürede başlatılması hem ihmal ve istismara maruz kalan çocukların hak ve adalet duygularının gelişmesi hem de başka çocukların olası istismarlardan korunması açısından önemlidir (Kurtay ve Kurtay, 2020; 221). Çünkü yargı bir sosyal denetim aracıdır (Duyan vd., 2008;188)

#### **4.2.3. Üçüncül Koruma**

Tüm dünya da insanların nevrozları, psikolojik sorunları ve ruhsal bunalımlarından kaynaklı şiddetli duygularını değiştirmek, şüphesiz zor ve uzun yıllar alabilecek bir süreçtir. Lakin tarihin tekrarlanmasına gerek yoktur. Sadece erken travmalar tekerrür talep eder (deMause, 2020; 377). Bu amaçla sosyal hizmet uzmanları ve profesyoneller çocuğa yönelik kötü muamele şüphesinin ardından çocuğun hem bedensel hem de psikolojik olarak iyilik halinin sağlanması ve toplumsal entegrasyonu için terapötik çalışmalar gerçekleştirirler. Bu çalışmalar sorunun varlığı ve boyutuna göre mikro, mezzo ve makro düzeylerde olabilir (Shuder, 2004; 75). Hangi düzeyde olursa olsun tüm bu çalışmalar üçüncül koruma kapsamında değerlendirilmektedir.

#### **4.3. Çocuk İhmal ve İstismarına Yönelik Bireysel ve Kurumsal Yükümlülükler**

Tomanbay (1999)'a göre çocuğa kötü davranma, çocukla farkına varmadan ya da bilerek, onun bedensel, ruhsal, sosyal yapısında zararlara ve bozulmalara yol açacak biçimde iletişim kurmak ve sürdürmektir (Tomanbay, 1998). Çoğu zaman bugün sorun olan vakalar, son çöküntüden yıllar önce belirti vermiş, hatta fark edilmişlerdir. O zaman durumu gören ya da hissedenden birçok kişi veya kurum yetkili mercilerden haberdar olmamış, müdahale için gerekli girişimlerde bulunmamış veya bulunamamıştır. Hoş olmayan her şeyin üzerinden bakışlarımızı çabucak çeviriniz, her zaman hiçbir şey görmüyormuş gibi yapınız: 19. yy ahlak yasası kısaca budur (Öneş, 1972; 13).

Anayasanın 5,17 ve 56. Maddelerinde yer alan kuralların dayandığı temel ilke, kişilerin devletçe her türlü zarardan korunmaları gerekliliğidir (Duyan vd., 2008; 10). Bu amaçla kötü muamele mağduru çocukla derinlemesine görüşmeler ve ailesi hakkında sosyal incelemeler gerçekleştirmek ve bu doğrultuda müdahaleler gerçekleştirmek gerekir. Ancak çocuk ihmal ve istismarında çocuklarla bireysel görüşmeler çoğunlukla çocuk tarafından herhangi bir eylemle başlamaz. Farklı kaynaklardan yararlanır. Bu kaynaklar çeşitli meslek grupları ya da profesyoneller olabilir. Doktorlar, öğretmenler ve diş hekimleri de dâhil olmak üzere profesyoneller, yasa gereği herhangi bir çocuğa yönelik kötü muameleyi yetkili mercilere bildirmek ve bunu raporlaştırmak zorundadır (Kadushın ve Kadushın, 2013; 298).

Çocuk Koruma Kanununun 6. Maddesinin 1. Fıkrasına göre; adli ve idari merciler, kolluk görevlileri, sağlık ve eğitim kurumları, sivil toplum kuruluşları korunmaya ihtiyacı olan çocuğu aile ve sosyal hizmetler bakanlığına bağlı kurum/kuruluşlara bildirmekle yükümlüdür (Gürel,2020;26). Ancak göstermektedir ki çocuk ile ilgili çalışan sivil toplum kuruluşlarının çevre ve kadın sorunları ile ilgili çalışan kuruluşlara göre yeterince organize olamadıkları dikkat çekmektedir (Polat, 1999;35)

Kamu çalışanları arasında çocuğa yönelik kötü muameleyi bildirenlerin başında rehber öğretmenler gelmekte, sağlık ve sosyal hizmet çalışanları ise ender olarak yetkili makamlara bildirimde bulunmaktadır (Keser, 2021;97)

Sağlık profesyonelleri tarafından şüpheli ihmal ve istismar vakalarının bildirimi çeşitli ülkelerde yasal olarak zorunludur (Pash, 2017; 94). Ülkemizde de çocuk ihmal ve istismar konularında etkili bir şekilde etkin mücadele verebilmek adına için ihtiyaç duyulan yasal düzenlemeler yapılmış, çocuğa yönelik fiziksel ve cinsel şiddet içerikli istismar eylemlerine ek olarak ihmal de Türk Ceza Kanunu'nda suç olarak nitelendirilmiş, çeşitli hukuki düzenlemeler şeklinde sağlık alanında çalışanlara, kamu kurum ve kuruluşlarında görevli olanlara ve bütün insanlara bildirim zorunluluğu getirilmiştir (Özdemir ve Asil, 2021; 3).

Bir suçu işleyen veya bu suça yardım ve yataklık eden kişi/kişilerin gerçekleştirmiş oldukları suçu bildirmesi faillerden beklenen bir hareket değildir. Bu sebeple bu kişilerin gerçekleştirdikleri ve faili oldukları bir suçu yetkili mercilere bildirmemesi hukuki olarak cezalandırılması gereken bir davranış olarak görülmemektedir (Akkaş, 2021; 102). Buna ek olarak gerçekleştirilmekte olan ya da gerçekleştirilmesine yardım edilmiş bir suçu yetkili mercilere bildirmeyen herkes suçun fail olabilir (Ünver, 2012; 278)

Ceza bir toplumda bozulmuş bir dengeyi ve sükûneti tekrar sağlamayı hedefler (Picca,1992; 45). TCK ya göre hukuki yaptırımlar sadece çocuğa yönelik kötü muameleyi gerçekleştiren istismarcılara uygulanmaz. Yasaya göre aynı zamanda çocuğa yönelik ihmal ve istismardan haberdar olan ya da bireylerin de sorumlulukları ve yükümlülükleri vardır (Derin ve Öztürk, 2021; 51). Sorumluluğun birçok tanımı mevcuttur. Güvenilir, emniyet edilir kişiler sorumluluk sahibi olarak adlandırılır. Sorumluluk aynı zamanda kanuni, ekonomik veya ahlaki sorumluluğu da ifade etmektedir (Yalom, 1980; 341). Çocuklarla çalışma gerçekleştiren ya da iş yükümlülüğü gereği birebir iletişimde bulunan sağlık personellerinin görev ve sorumlulukları büyüktür. Olağan durumlar dışında gerçekleşen vakalarda var olan tıp ve sağlık bilgisine ek

olarak yapılması gereken iş ve işlemler ya da sorumluluk çerçevesi hakkında bilgi sahibi olmak çok önemlidir (Gözübüyük vd., 2015; 324).

Sağlık mesleği mensuplarının bir suçun işlendiğini öğrenmesi durumunda nasıl hareket etmesi gerektiği TCK m.280 de ayrı bir suç türü olarak düzenlenmiştir. Buna göre;

*(1) Görevini yaptığı sırada bir suçun işlendiği yönünde bir belirti ile karşılaşmasına rağmen durumu yetkili makamlara bildirmeyen veya bu hususta gecikme gösteren sağlık mesleği mensubu bir yıla kadar hapis cezası ile cezalandırılır (Akkaş, 2021;108).*

Kanun metninde adı geçen sağlık hizmeti veren kişiler ise; doktorlar, hemşireler, ebeler, sağlık memurları ve hasta bakıcılarıdır (Aydın, 2014;43).

Hekimin çocuğa yönelik ihmal ve istismarı içeren fiziki belirtilerle karşılaşması ve bu belirtilerden şüphelenmesi durumunda ilk olarak bildirim yükümlülüğünü gerçekleştirilmesi beklenmeyip öncelikle tıbbi müdahalede bulunması ve müdahale sonrasında vakit kaybetmeksizin bildirimini gerçekleştirilmesi gerekmektedir (Kocasakal, 2017; 203).

Yapılan bir çalışmada sağlık çalışanlarının ve çocukla çalışan uzman personelin istismar, ihmal ve aile içi şiddet vakaları ile oldukça sık karşılaştıkları ve bu olayların yönetimi açısından daha çok bilgiye ve beceriye ihtiyacı oldukları ifade edilmiştir. (Kurt ve Gün, 2017; 66).

## **SONUÇ YERİNE**

Çocuğun yaşamış olduğu istismar olayından kurtarılması ve istismar vakalarının önlenmesinde hekimlerin de önemli görev ve sorumlulukları bulunmaktadır. Ancak yaşanan istismar olayları neticesinde suçun ispatlanmasında yasal olarak hekimlerin herhangi bir sorumluluğu bulunmamaktadır. Hekimlere düşen en önemli sorumluluk, istismara uğramış çocukları tespit etmek ve bu çocukların yaşadıkları durumu ihbar ederek adli ve hukuki makamları bilgi sahibi etmektir. Yaşanan olayın ardından gerçekleşen ihbarın ardından bu sürecin yönetimi, adli ve hukuki makamlardır. Günümüzde çocuklara yönelik gerçekleşen istismar ve ihmal vakalarının önlenmesi hususunda hekimlere önemli görevler düşmektedir (Tınmaz Pehlivan, 2016; 72).

**ÖZET**

İşletmelerin sundukları bilgiler bilgi kullanıcılarının alacakları kararları etkilediğinden, bu bilgilerin güvenilirliğine ilişkin güvence ihtiyacı ortaya çıkmaktadır. Bağımsız denetim ve sınırlı denetim dışındaki denetimi ifade eden güvence denetimi, sürdürülebilirlik raporları gibi finansal olmayan bilgilere güvence sağlamaktadır. Bu çalışmanın amacı, BIST Sürdürülebilirlik Endeksindeki işletmelerin yayınladıkları sürdürülebilirlik raporlarına bağımsız dış güvence denetimi yaptırıp yaptırmadıklarını tespit etmektir. Yapılan araştırma sonucunda, araştırma kapsamındaki 51 işletmenin %31'i (16 işletme) bağımsız dış güvence denetimi yaptırdığı, bu işletmelerin 8'i üretim, 7'si mali sektörde, 1 işletmenin de ticaret sektöründe faaliyet gösterdiği tespit edilmiştir. Bağımsız dış güvence raporlarının tamamına yakınının dört büyük denetim firmasından alındığı görülmüştür.

**Anahtar Kelimeler:** Sürdürülebilirlik Raporları, Güvence Denetimi, Denetim

**ASSURANCE AUDIT IN SUSTAINABILITY REPORTS: A RESEARCH ON  
BUSINESSES IN BIST SUSTAINABILITY INDEX****ABSTRACT**

As the information provided by the enterprises affects the decisions of the information users, the need for assurance regarding the reliability of this information is also increasing. Assurance, which refers to audit other than independent audit and review, provides assurance to non-financial information such as sustainability reports. The purpose of this study is to determine whether businesses in the BIST Sustainability Index have independent external assurance performed on the sustainability reports they publish. As a result of the research, it was determined that 31% (16 enterprises) of the 51 enterprises within the scope of the research had independent external assurance audits, 8 of these enterprises were operating in the production sector, 7 in the financial sector and 1 enterprise in the trade sector. It has been observed that almost all of the independent external assurance reports were obtained from the four big audit firms.

**Key Words:** Sustainability Reports, Assurance, Audit

## **1. GİRİŞ**

İşletmelerin varlıklarını sürdürebilmeleri için finansal yapısının güçlü olmasının yanında toplumsal sorumluluğa da sahip olması gerektiği son yıllarda daha fazla ön plana çıkmaktadır. Ancak finansal raporlar işletmenin finansal durumu, finansal performansı ve nakit akışları hakkında paydaşlara karar almalarında faydalı bilgiler sunarken; işletmenin çevre, malzeme temini ve tüketimi, atık yönetimi, enerji tüketimi ve verimliliği, sera gazı emisyonları gibi toplumsal sorumlulukla ilgili faaliyetleri hakkında gerekli bilgileri sunamamaktadır. Günümüzde işletmelerin bir yandan toplum karşısındaki gücü artarken, bir yandan da paydaşlarından bağımsız bir yapıya sahip olmadıkları ve paydaş beklentilerini görmezden gelerek varlık gösterilemeyeceği gerçeği kabul edilmeye başlanmıştır. Bilgiye ulaşmanın çok kolay olduğu günümüz koşullarında, işletmelerin kurumsal kimlik ve itibar kazanabilmeleri için hesap verebilirliği yüksek, şeffaf, çevreye ve toplumsal ihtiyaçlara duyarlı bir yapıya sahip olmaları gerekmektedir. Bunun yolu ise paydaşlarla doğru iletişimden geçmektedir (Özbay, 2019:446). Finansal olmayan bu bilgilerin sunulmasında günümüzde kullanılan en etkili yöntemlerden birisi de sürdürülebilirlik raporlarıdır.

Sürdürülebilirlik raporu, sürdürülebilir kalkınmayı temel alan ve bir işletmenin sosyal, çevresel ve ekonomik faaliyetleri üzerinde ortaya çıkan etkinin raporlamasında kullanılan kurumsal raporlama aracıdır (Yüksel, Kayalı ve Kayalı, 2018: 112). Sürdürülebilirlik raporlaması finansal ve finansal olmayan bilgilerin hissedarlardan daha geniş bir alanı kapsayan paydaş grubuna raporlanmasını içeren bir alandır. Raporlar, raporlama yapan kurumun, paydaşları ilgilendiren faaliyetleriyle ilgili temel konuları yönetme yeteneği konusunda bilgi sağlamaktadır. Bu bilgiler ekonomik, operasyonel, sosyal, hayırseverlik ve çevresel hedefler konularını kapsamaktadır (Ballou, Heitger & Landes, 2006: 3). Sürdürülebilirlik odaklı bir şirket, farklı paydaşlara karşı sorumluluklarının tamamen farkındadır. Bu şirketler sosyal ve ekolojik performansının iyileştirmesine fırsat veren yöntem ve araçları benimsemektedirler. Bu nedenle yeni muhasebe sistemlerine ihtiyaç duymaktadırlar (Perrini& Tencati, 2006: 297-298). Sürdürülebilirlik raporlaması, rekabet gücünü ve itibarı artıran, geleceğe yönelik kararlar aldırın, sürekli gelişmeyi ve öğrenmeyi sağlayan bir etkidir. Sürdürülebilirlik risklerin yönetilmesinin yanında sosyal ve çevresel konularla ilgili uygulamaların faaliyete geçmesine yardımcı olmaktadır (Şahin ve Çankaya, 2018: 863).

Sürdürülebilirlik raporlarında yer alan bilgiler paydaşlar tarafından alınacak kararlarda kullanılmaktadır. Bu nedenle söz konusu bilgilerin açıklığı, şeffaflığı ve doğruluğu bu

raporlardan yararlanacak olan paydaşlar açısından önem taşımaktadır (Manetti & Toccafondi, 2012). Sürdürülebilirlik raporlarındaki finansal olmayan bilgilerin güvenilir olup olmadığının tespit edilmesi için yapılan denetim faaliyetleri de güvence raporlamasını ortaya çıkarmıştır. Sürdürülebilirlik raporlarının standartlara uygun bir şekilde hazırlanması için güvence denetiminden geçmesi önemlidir (Mammatt, 2009:7). Bu bağlamda güvence; karar alıcılar açısından yararlanacakları herhangi bir bilginin kalitesini artırmak adına verilen ve bilginin kalitesini ve değerini yükselten bağımsız mesleki hizmetler olarak tanımlanmaktadır (Bozkurt, 2012). Güvence ve doğrulama ile ifade edilen; raporun güvenilirliğini, doğruluğunu ve ilgi düzeyini değerlendiren bir dış denetimdir. Böyle bir denetimin amacı, raporun güvenilirliğini ikna edici bir şekilde ortaya koymaktır (Celayır, 2020:28). Sürdürülebilirlik raporlaması için küresel raporlama standartlarının arkasındaki teşvik edici güç olan Global Reporting Initiative (GRI), raporlama sürecinin bir parçası olarak üçüncü taraf doğrulamasını tavsiye etmektedir (Willaert, 2016). İşletmelerin finansal tablolarının denetime tabi olması , denetlenmeyen finansal tablolara göre daha güvenilir ve yararlı bilginin sunulması anlamına gelmektedir. Ancak işletmelerin gönüllülük esaslı hazırladıkları sürdürülebilirlik raporları açısından bağımsız denetim olgusu , yani finansal olmayan bilginin bağımsız denetime tabi tutulması değil, dış güvence alınması daha uygun olmaktadır (Uçma ve Yazıcı, 2016).

Bu çalışmanın temel amacı, BIST Sürdürülebilirlik Endeksi kapsamındaki şirketlerin 2015-2020 yıllarına ait sürdürülebilirlik raporlarının bağımsız güvence denetiminden geçme düzeylerini belirlemektir.

## **2. SÜRDÜRÜLEBİLİRLİK RAPORLAMASI**

Sürdürülebilirlik raporlaması, kuruluşların ekonomik, çevresel, sosyal ve yönetim performanslarını ölçmelerine, anlamalarına ve aktarmalarına, hedef belirlemelerine ve değişimi daha etkin bir şekilde yönetmelerine yardımcı olmaktadır. Bu açıdan, sürdürülebilirlik raporu, sürdürülebilirlik performansını ve etkilerini (olumlu veya olumsuz) aktarmak için temel platformdur (GRI, 2020b). Sürdürülebilirlik raporlaması aynı zamanda, kuruluşların çok çeşitli sürdürülebilirlik konularının etkilerini göz önünde bulundurmalarını sağlayarak, karşılaştıkları riskler ve fırsatlar hakkında daha şeffaf olmalarını sağlamaktadır (GRI, 2020).

Sürdürülebilirlik raporlaması kuruluşun faaliyetlerini daha sürdürülebilir hale getirmek için hedef belirlemelerine, finansal olmayan performanslarını ölçmelerine ve değişimi yönetmelerine yardımcı olan bir raporlama türüdür. Sürdürülebilirlik raporlarının

hazırlanmasına rehberlik eden Küresel Raporlama Girişimi (Global Reporting Initiative: GRI) standardı etkili bir sürdürülebilirlik raporlaması için düzenli olarak gözden geçirilmektedir (Sultankhanova, 2019:25).

Sürdürülebilirlik raporları hazırlamalarının işletmeler için yararları aşağıdaki gibi sıralanabilir (Kolk, 2004: s.54):

- İşletmelerin hedeflerini gerçekleştirme kabiliyetlerini artırır,
- Çevresel stratejilerin uygulanmasını kolaylaştırır,
- İşletme içinde çevresel konularda bilinçlenmeyi sağlar,
- İşletme mesajının açık olarak ifade edilmesini sağlar,
- Şeffaflığı arttırdığı için kredibilitiyi de artırır,
- İşletme itibarını artırır,
- Maliyet tasarrufu sağlar,
- Verimlilik artışı sağlar,
- Çalışanları motive eder.

GRI G4 kapsamında sürdürülebilirlik raporunun kategorileri aşağıdaki tabloda özetlenmiştir.

**Tablo 1.** Sürdürülebilirlik Raporunun Kategorileri

<b>Ekonomik Kategori</b>	<b>Çevresel Kategori</b>	<b>Sosyal Kategori</b>
Sürdürülebilirliğin ekonomik boyutu kuruluşun paydaşlarının ekonomik durumları ve yerel, ulusal ve küresel seviyedeki ekonomik sistemler üzerindeki etkileriyle ilgilidir. Ekonomik kategori sermayenin farklı paydaşlar arasındaki akışını ve kuruluşun toplum genelindeki temel ekonomik etkilerini göstermektedir.	Sürdürülebilirliğin çevresel boyutu kuruluşun kara, hava, su ve ekosistemler de dâhil olmak üzere yaşayan ve yaşamayan doğal sistemler üzerindeki etkisiyle ilgilidir. Çevresel Kategori (enerji ve su gibi) girdilerle ve (emisyonlar, atık sular ve atıklar gibi) çıktılarla ilgili etkileri kapsamaktadır. Buna ek olarak biyolojik çeşitlilik, nakliye, ürün ve hizmetle ilgili etkilerle beraber çevresel uyum ve harcamaları kapsamaktadır.	Sürdürülebilirliğin sosyal boyutu, kuruluşun içinde faaliyet gösterdiği sosyal sistemler üzerindeki etkileriyle ilgilidir. Sosyal Kategori aşağıdaki alt kategorileri içermekte: <ul style="list-style-type: none"><li>• İşgücü Uygulamaları</li><li>• İnsana Yaraşır İş</li><li>• İnsan Hakları</li><li>• Toplum</li><li>• Ürün Sorumluluğu</li></ul>

### **3. SÜRDÜRÜLEBİLİRLİK RAPORLARINA İLİŞKİN GÜVENCE DENETİMİ**

Güvence denetimi, sorumlu taraf dışındaki hedef kullanıcıların, denetime konu bilgiye (diğer bir ifadeyle dayanak denetim konusunun kıstaslar uygulanmak suretiyle ölçümünün veya

değerlendirilmesinin bir çıktısına) ilişkin güven seviyesini artıracak şekilde tasarlanmış bir sonuç bildirmek üzere, denetçinin yeterli ve uygun kanıt elde etmeyi amaçladığı denetimdir (KGK, 2020).

Kuruluşlar tarafından yayınlanan sürdürülebilirlik raporlarındaki bilgilerin güvenilirliği konusunda çeşitli yollarla güvence sağlayıcıları tarafından güvence sağlanmaktadır. Güvence sağlayıcılar bağımsız denetim kuruluşları veya uzman kuruluşlardır. Bu şekilde raporlara, üçüncü taraflar tarafından doğrulanması esasıyla güvence sağlanmaya çalışılmaktadır. Güvence sağlayıcısı bağımsız denetim kuruluşlarının da kendi sürdürülebilirliklerine verdikleri önemi ve sürdürülebilirliği kurum kültürünün bir parçası olarak benimsediğini sürdürülebilirlik raporu yayınlarken ortaya koyması beklenmektedir. Bu raporlarla, denetim kuruluşları sürdürülebilirlik yaklaşımlarını ve uygulamalarını paydaşlarına iletmelidirler (Yeşilçelebi, 2020:234).

#### **4. ARAŞTIRMANIN AMACI ve KAPSAMI**

Bu çalışmanın temel amacı, BIST Sürdürülebilirlik Endeksi'nde yer alan işletmelerin 2015-2020 yıllarına ait sürdürülebilirlik raporlarında sunulan bilgilerin doğruluğuna ilişkin güvence denetiminden geçme düzeylerinin tespit edilmesidir. Gönüllülük esasına dayalı olarak hazırlanan sürdürülebilirlik raporlarının bağımsız dış güvence denetiminden geçmesi, işletmelerinin şeffaflık ve hesap verilebilirlik ilkelerine uyumu hakkında da fikir verecektir.

1 Aralık 2020 tarihinden itibaren BIST sürdürülebilirlik endeksinde 58 şirket yer almıştır. Ancak araştırmamız 2015-2020 yıllarını kapsadığından, bu döneme ilişkin raporlarına ulaşılan 51 şirketin sürdürülebilirlik raporları incelenmiş ve bu raporlarda sunulan bilgilere ilişkin bağımsız dış güvencenin alınıp alınmadığı araştırılmıştır.

#### **5. BULGULAR**

Çalışmada 2015-2020 dönemini kapsayan, bu döneme ilişkin 51 şirketin sürdürülebilirlik raporları incelenmiştir. Güvence raporlarını incelemek için BIST Sürdürülebilirlik Endeksinde yer alan işletmelerin web sayfalarında yayınladıkları sürdürülebilirlik raporları içerik analizine tabi tutulmuştur. Analiz sonucunda elde edilen bilgiler aşağıda Tablo 2.'de gösterilmiştir.

**Tablo 2.** BIST Sürdürülebilirlik Endeksindeki İşletmelerden 2015-2020 Yıllarına İlişkin Sürdürülebilirlik Raporlarına Güvence Beyanı Alan İşletmeler

Tablo 2 incelendiğinde BIST Sürdürülebilirlik Endeksinde yer alan işletmelerden 16'sı 2015-2020 dönemine ilişkin sürdürülebilirlik raporlarına bağımsız dış güvence raporu almışlardır. Bağımsız dış güvence raporu alan işletmelerin 8'i üretim, 7'si mali sektörde faaliyet göstermektedir.

Araştırma kapsamındaki işletmelerin %31'i bağımsız dış güvence beyanına sahip olduğu görülmüştür. Sürdürülebilirlik raporlarının gönüllülük esasına dayanması ve güvence raporunun zorunlu olmayıp sadece tavsiye edilmesi nedeniyle işletmelerin yaklaşık üçte biri oranında bağımsız dış güvence beyanına sahip olduğu söylenebilir. Güngör (2019) tarafından

yapılan arařtırmada benzer durumun yurtdıřındaki iřletmeler için de geçerli olduđu görölmektedir.

Arařtırmada, bağımsız dıř güvence raporlarının tamamına yakınının dört büyük denetim firmasından alındıđı görölmüřtür.

## **6. SONUÇ**

Bu çalıřmada, Türkiye’de BIST Sürdürülebilirlik Endeksinde yer alan iřletmelerin 2015-2020 yıllarına iliřkin yayınladıkları raporlarına ne ölçüde bağımsız dıř güvence raporu aldıkları arařtırılmıřtır. Arařtırma kapsamındaki iřletmelerin %31’i bağımsız dıř güvence beyanına sahip olduđu görölmüřtür. Sürdürülebilirlik raporlarının gönüllülük esasına dayanması ve güvence raporunun zorunlu olmayıp sadece tavsiye edilmesi nedeniyle iřletmelerin yaklaşık üçte biri oranında bağımsız dıř güvence beyanına sahip olduđu görölmektedir. Bağımsız dıř güvence raporlarının tamamına yakınının dört büyük denetim firmasından alındıđı tespit edilmiřtir.

İřletmelerin sundukları finansal ve finansal olmayan bilgiler, bilgi kullanıcılarının iřletme ile ilgili aldıkları kararları etkilemektedir. Finansal bilgiler için bağımsız dıř denetim zorunlu iken, finansal olmayan bilgiler için böyle bir zorunluluk bulunmamaktadır. Bu durum, iřletmelerin sundukları bilgilerin, bilgi kullanıcılarını yanıltması ihtimalini ortaya çıkarmaktadır. Sürdürülebilirlik raporları gibi finansal olmayan raporlara iliřkin bağımsız güvence raporlarının alınmasının zorunlu kılınması, bilgi kullanıcılarının daha sađlıklı karar almalarına yardımcı olacaktır.

**ABSTRACT**

Water is one of the essential elements of life and is vital for the survival of living things. Therefore, the quality of water is very important for human and environmental health. With rapid industrialization, developing technology and population growth, tons of wastewater is discharged to the environment every year and water resources are rapidly depleted. Paper production processes, which have an important place in industrial production, have become environmentally critical due to the high amount of water used and pollutants that are difficult to biologically remove. In this study, the treatment of waste water taken from the paper production factory in Mersin region by electrocoagulation method was investigated. Electrocoagulation experiments were carried out at room temperature using iron electrodes as anode and cathode at pH value of wastewater. In the study, in which the effect of the current density was investigated, the change in the removal rates of organic pollutants in the wastewater was investigated as a result of the experiments carried out at 4 different current values ranging from 50 mA to 300 mA. The amount of treatment performed during the electrocoagulation of the paper waste water was followed by the Total Organic Carbon (TOC) measurement. As a result of the experimental studies, a maximum TOC removal of 88.95% was obtained after 1 hour of treatment at 100 mA flow in paper industry wastewater, while the minimum TOC removal was determined as 35,88% at 300 mA flow. At the end of the electrocoagulation process, the amounts of  $Fe^{+2}$  and  $Fe^{+3}$  transferred from the electrodes to the waste water were determined spectrophotometrically with UV-vis. In experimental conditions where 88.95% of the maximum TOC removal was achieved,  $Fe^{+2}$  and  $Fe^{+3}$  concentrations were determined as 10.32 ppm and 0.72 ppm, respectively. In conditions where TOC removal was minimum (35.88%),  $Fe^{+2}$  and  $Fe^{+3}$  concentrations were found to be 507,91 ppm and 1.70 ppm, respectively.

## **INTRODUCTION**

Water is one of our most important natural resources, which is essential for the survival of living things. Population growth, developing technology and rapid industrialization bring along the problem of water pollution, which is increasingly difficult to overcome. Environmental pollution increases with the wastewater generated as a result of industrial applications, and the ecological balance is adversely affected. The most affected by this situation is the aquatic environment [1].

Paper, a product with a long history all over the world, and accordingly, the paper industry still constitutes one of the most important industrial branches for both developed and developing countries [2]. The Paper Industry is one of the processes with the strongest environmental impact with the excessive water consumption per unit product and the non-biodegradable chemicals in the wastewater it produces [3]. During the pulping of wood, which is the main raw material of the paper industry, lignin, carbohydrates and various types of decomposers pass into the wastewater through dewatering, screening and washing processes. In addition, it was determined that many toxic compounds such as resins, unsaturated fatty acids, inorganic chlorinated compounds, volatile organics, and sulfur are present in wastewater, depending on the process applied [4]. As a result, it is possible that the wastewater of the paper industry has significant harmful effects on the environment. It is essential that such wastewater is treated effectively and delivered to appropriate receiving environments [5]. With wastewater treatment, very valuable water resources can be regained and depending on their post-treatment properties, they can be used in-process, as well as used as irrigation and even drinking water.

Electrochemical treatment methods are increasingly used in wastewater treatment due to their features such as being easy to control, reducing pollution at the maximum level in a short time, being easy to operate, being made with simple and low-cost equipment, using limited chemicals, and forming less sludge [6]. The chemicals in the paper wastewater make the wastewater conductive and provide the appropriate condition for the electrochemical process [4]. Electrocoagulation is a treatment method in which more than one conventional treatment process is used together. In this sense, the process combines the functions and advantages of electrochemistry with coagulation, flotation, oxidation, adsorption, and precipitation processes in water and wastewater treatment [7]. Al and Fe electrodes are primarily preferred in electrocoagulation process [8-9]. The electrocoagulation cell basically consists of an anode, a cathode metal plate pair, a conductive solution, and a power source [10].

The principle of the electrocoagulation (EC) process in removing pollutants is the anodic dissolution and hydrolysis of metal anodes such as aluminum and iron and the formation of slightly soluble metal hydroxides such as  $\text{Al}(\text{OH})_3$ ,  $\text{Fe}(\text{OH})_2$  and  $\text{Fe}(\text{OH})_3$  and their adsorption capacity is very high. It is based on removing adsorbed various pollutants on metal hydroxides from water by precipitation [11].

In this method, metal ions at the anode pass into the solution (oxidation process) and the  $\text{H}_2\text{O}$  molecule at the cathode is reduced so that  $\text{OH}^-$  ions and  $\text{H}_2$  gas (reduction process) are released. As a result, the reaction between  $\text{Al}^{3+}$  or  $\text{Fe}^{2+}$  and  $\text{OH}^-$  ions forms coagulants ( $\text{Al}(\text{OH})_3$  or  $\text{Fe}(\text{OH})_2$ ). Coagulants adsorb pollutants and cause sludge formation, while  $\text{H}_2$  gas floats pollutants to the surface of the wastewater.

Due to the advantages of electrochemical treatment methods and depending on the suspended solids content of wastewater, the EC method has been used in treating paper industry wastewater in this study. While examining the effect of current in the electrocoagulation process, the concentrations of Fe ions remaining in the solution after the process was determined spectrophotometrically.

## **MATERIAL AND METHODS**

### **Electrocoagulation Process**

In electrocoagulation experiments, Fe/Fe plate (10 cm × 5 cm) electrode pairs were used as anode and cathode. Before using the electrodes, to clean and activate the surface, it was first soaked in 1 M HCl solution for 5 minutes, sanded, then washed and dried in an oven.

Electrocoagulation experiments were carried out in 300 mL wastewater, without pH adjustment, at the wastewater's pH (pH=6.50) value and at room temperature.

To examine the effect of current, electrocoagulation experiments were carried out at four different current values (50, 100, 200, and 300 mA), and the samples during 1 h were used in the analysis after centrifugation. The energy consumption due to the applied current was determined by Eq. 1.

$$\text{Energy Consumption (kWh/m}^3\text{)} = (\text{V} \times \text{I} \times \text{t}) / \text{V}_{\text{solution}}$$

(1)

### Analyzes

The mineralization efficiency during the electrocoagulation of the paper wastewater was followed by Total Organic Carbon (TOC) measurement at the beginning and at different times (5-60 min). The mineralization efficiency was determined using Eq. 2.

$$TOC \text{ Removal } \% = \left( \frac{TOC_0 - TOC_t}{TOC_0} \right) \times 100 \quad (2)$$

At the end of the electrocoagulation experiments, the amounts of  $Fe^{+2}$  and  $Fe^{+3}$  transferred from the anode electrode to the wastewater were determined spectrophotometrically with UV-vis (Shimadzu) spectrophotometer. For  $Fe^{2+}$  ion analysis, 2 mL of standard Fe(II) solution (or sample), 5 mL of acetic acid (1M), 2 mL of sodium fluoride (0.1 M), 2 mL of phenanthroline (1.5 g/L) solutions were added, respectively, and completed to 25 mL with ultra-pure water. It was held for 10 min, and the absorbance value was determined at 510 nm.

In the case of the determination of  $Fe^{3+}$  ions concentration, 5 mL of salicylic acid and 5 mL of standard Fe(III) solution or sample were added to a test tube. It was analyzed at 525 nm.

## RESULTS AND DISCUSSION

### Physicochemical Properties of Wastewater

The physicochemical properties of the water taken from the paper production factory in Mersin province are given in Table 1. Since the conductivity of the wastewater was sufficient, no supporting electrolyte was used in the EC process. TOC content was measured after the filtration process.

**Table 1.** physicochemical properties of paper wastewater

Properties	Value
pH	6.50
Conductivity	600 mS/cm
Suspended solids	0.84%
Ash	0.58%
Total Organic Carbon (soluble)	3300 mg/L

### Electrocoagulation of Wastewater

The treatment of paper industry wastewater was investigated using the electrocoagulation method, one of the electrochemical treatment methods. The electrocoagulation process was carried out without pH adjustment using Fe/Fe electrode pair, and the effect of applied current on mineralization efficiency was investigated. The amount of current applied is accepted as one

of the critical parameters affecting the treatment efficiency in all electrochemical processes and is considered in experimental studies [5].

The wastewater mineralization efficiencies obtained after the EC process applied at 4 different current values in the 50-300 mA current range are given in Figures 1a-d. In the electrocoagulation process at 50 mA constant current, 40.93% TOC removal was achieved in the first 30 min, while ~72% mineralization was achieved after 45 and 60 min (Fig. 1a). As a result of increasing the current to 100 mA, 70.68% TOC mineralization was reached after the first 5 min and 88.95% mineralization was reached after 60 min, increasing depending on time (Fig. 1b). However, because of increasing the current to 200 and 300 mA, a significant decrease in mineralization efficiency occurred. After 60 min of EC treatment at constant currents of 200 and 300 mA, 68.00% and 35.88% mineralization were achieved, respectively (Fig. 1c-d).

While 72.00% TOC removal is achieved in 1 h at 50 mA constant current, this value increases to 88.95% at 100 mA current under the same conditions because higher amounts of  $Fe^{n+}$  ions pass into the solution medium (Eq. (3)) and the amount of  $Fe(OH)_3$  and  $Fe(OH)_2$  metal hydroxide flocs increases in bulk solution (Eqs. (4-5)). Since the organic pollutants in the wastewater have a larger surface area to be adsorbed, a significant increase in TOC removal has been achieved. This situation can be explained by Faraday's 1st Law, which explains electrochemical processes and states that the amount of substance released from the electrodes and the amount of electricity passing through the solution change in direct proportion [5].

Anode:

In the solution (with dissolved oxygen):

**Figure. 1.** Removal efficiency at (a) 50 mA, (b) 100 mA, (c) 200 mA, and (d) 300 mA (pH=6.50 V=300 mL).

When Figures 1c and d are examined, the %TOC removal efficiencies decreased with the current increase. The increase of the current causes more Fe(II) and Fe(III) formation, and the solution pH value rises rapidly. Previous studies have shown that the highest organic pollutant removal occurs in the pH 6-7 range. A decrease in organic pollutant removal efficiency was observed depending on the increase in pH (Eq. (6)).

The high amount of current reduces the removal efficiency by the rapidly produced gas bubbles as well as the increase in the temperature of the system due to damaging/dispersing the formed flocs [5]. At the same time, the increase in current will increase the energy consumption, thus increasing the cost [12].

Cathode:

In Table 2, energy consumption values against TOC removals obtained in 1 h at different currents were given.

**Table 2.** Effect of current on TOC removal and energy consumption

Results	Current (mA)			
	50	100	200	300
TOC Removal (%) at 1 h	72.00	88.95	68.00	35.88
Energy Consumption (kWh/m <sup>3</sup> )	16	42	112	288

As a result of the 1 h electrocoagulation process, depending on the applied current, Total Organic Carbon removal TOC efficiencies of 72.00%, 88.95%, 68.00%, and 35.88% were obtained, respectively, at 50, 100, 200 and 300 mA currents. When the results were examined, it was determined that the best TOC removal (removal efficiency was determined) with 88.95% at 100 mA constant current. When the energy consumption values calculated at the same current values are examined, it is seen that while 42 kWh/m<sup>3</sup> is obtained at 100 mA, the energy consumption at 200 and 300 mA increases by 2 and 4 times, respectively.

Figure 2 shows the distribution of free Fe ions in the solution depending on the current. It is seen that while the iron ions that pass into the solution at 50 and 100 mA precipitate by forming flocs, low concentrations of free Fe ions are present in the bulk solution. However, at high currents, high concentrations of free Fe ions, which support the degradation of the flocks, are measured.

**Figure 2.** Effect of current on free (a) Fe(II) and (b) Fe(III) ions concentration in the solution (pH=6.50 V=300 mL).

## CONCLUSION

The importance of water for humanity and all living things is essential. For this reason, it is crucial to treat wastewater and make it reusable. Depending on the quality of the wastewater after treatment, irrigation and in-process use are possible.

In this study, the oxidation of paper wastewater was carried out by the electrocoagulation method, which is one of the electrochemical methods. With the EC method, 89% TOC removal was achieved by applying 100 mA current in as little as 1 h, without adding chemicals and without changing the pH value of the wastewater. The energy consumption in these conditions was determined as 42 kWh/m<sup>3</sup>.

## ACKNOWLEDGEMENT

This study was supported by Mersin University Scientific Research Projects Unit with the project code BAP-2022-1-TP2-4578.

**ÖZET**

Değerler toplumsal yapının oluşması, gelişmesi ve sürdürülmesinde oldukça önemlidir. Oluşturulan bu toplumsal yapının sağlıklı olması ve gelecek nesillere aktarılması ise değerler eğitimi yoluyla sağlanmaktadır. Günümüz dünyasında devletlerin en önemli kültürlenme aracı okullardır. Bu yönüyle okullar gelecek nesillere kültür aktarımını doğru şekilde sağlama görevini de üstlenmektedirler. Okullarda verilen sosyal bilgiler dersi ile öğrencilerin geçmiş ve gelecek ilişkisini sağlıklı bir şekilde kurması, kültürünü, tarihini, bulunduğu coğrafyanın özelliklerini, üyesi olduğu milletin değerlerini ve vatandaş olarak sorumluluklarını bilen bireylerin yetiştirilmesi hedeflenmektedir. Bu durum sosyal bilgiler dersini değerlerin aktarımı bakımından da önemli bir yere koymaktadır. Sosyal bilgiler dersi içeriği yönüyle toplumsal hayatı yansıtmaktadır. Sosyal Bilgiler Dersi Öğretim Programı incelendiğinde içeriğinde yer alan değerlerin Türk tarihinde yazılan yazılı eserler içerisinde ele alınan değerler ile benzerlik gösterdiği görülmektedir. Bu eserlerden biri ise Yunus Emre'nin Risaletü'n Nushiyye eseridir. Bu araştırmanın amacı 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan değerler ile Yunus Emre'nin Risaletü'n Nushiyye eserinde yer alan ortak değerleri belirlemektir.

**INCLUDED IN YUNUS EMRE'S RISALETU NÜSHIYYE VALUES INCLUDED IN THE SOCIAL STUDIES TEACHING PROGRAM COMPARISON WITH VALUES****ABSTRACT**

Values are very important in the formation, development and maintenance of the social structure. The health of this social structure and its transfer to future generations is ensured through values education. In today's world, schools are the most important acculturation tool of states. In this respect, schools also undertake the task of ensuring the transfer of culture to future generations. With the social studies course given in schools, it is aimed that students establish a healthy relationship between the past and the future, and raise individuals who know their culture, history, characteristics of the geography, the values of the nation they are members of, and their responsibilities as citizens. This situation puts the social studies course in an important place in terms of the transfer of values. Social studies course reflects social life in terms of its content. When the Social Studies Curriculum is examined, it is seen that the values in its content are similar to the values discussed in the written works written in Turkish history. One of these works is Yunus Emre's Risaletü'n Nushiyye. The aim of this research is to determine the values in the 2018 Social Studies Curriculum and the common values in Yunus Emre's Risaletü'n Nushiyye.

## **GİRİŞ**

Toplumsal yapının sağlıklı, düzenli ve faydalı bir şekilde meydana getirilmesi ve bu yapının devam ettirilmesinde değerler önem arz etmektedir. Oluşturulan sağlıklı ve düzenli bir toplumsal yapının sürdürülebilir olması toplumu oluşturan bireylerin ortak değerler etrafında bir araya gelmesi ile mümkün olmaktadır. Bu değerleri benimseyen toplumlar ortak değerler etrafında bir araya gelemeyen toplumlara kıyasla tarih sahnesinde kalıcı olmuşlardır (Kan, 2010, s. 138). Buradan hareketle bakıldığında değerler gerek içinde yaşanan topluma uyum sağlamada gerekse toplumsal devamlılığın sağlanmasında önemli bir denetim mekanizması rolü üstlenmektedirler (Göz, 2014). Öte yandan sahip olduğu değerleri içselleştiremeyen ve de gelecek nesillere aktaramayan toplumlarda gerek bireysel gerekse toplumsal çalkantılar yaşanacak ve toplumsal devamlılık sekteye uğrayacaktır (Hökelekli, 2010, s. 6-7). Değerlerin varlığını devam ettirmesi ve gelecek kuşaklara aktarılması ise şüphesiz etkili bir değerler eğitimi ile olacaktır.

Değerler eğitimi gelişmiş ve gelişmekte olan ülkelerin pek çoğunda hala tartışılmaktadır. Değerler eğitimi, idealist anlayışa göre öğrencinin değerli davranış ve insan modellerini örnek alması amacıyla eğitilmesini içermektedir (Yel & Aladağ, 2009, s. 120). Değerler eğitimi, bir toplum tarafından önemli görülen, geçmişten günümüze getirilen standartların gelecek nesillere aktarılmasıdır.

Toplumsal hayat içinde arzu edilen toplum yapısının inşa edilmesi için değerler ve bu bağlamda değerler eğitimi önem arz etmektedir. Nitekim değerler eğitimi sayesinde bireyler kendi ahlaki kodlarını geliştirirken; diğer insanların ahlaki kodları hakkında da bilgi sahibi olabilmektedirler. Değerler eğitimi bunun yanında bireylerin kendi deneyimleri üzerinde düşüncelerini ve bu deneyimleri anlamlandırmalarını sağlamaktadır. Öte yandan toplumsal hayata uyum sağlamak adına bireyler dürüstlük, doğruluk, adalet, saygı, sevgi gibi değerlere ihtiyaç duymaktadırlar. Bu değerlerin bireyler tarafından içselleştirilmesi de etkili bir değer eğitimi sayesinde oluşmaktadır (Çelikkaya & Filoğlu, 2014, s. 1542). Bireylerin değerlerle donanmaları ve bu bağlamda değer eğitimi ile tanışmaları ailede başlayan bir süreçtir. Ancak sitemli bir değer eğitimin verilmesinde eğitim-öğretim faaliyetlerinin etkisi yadsınamaz bir gerçektir. Çünkü değer eğitiminin planlı bir şekilde gerçekleştirilmesi gerekmektedir (Doğanay, 2009, s. 227). Özellikle günümüz dünyasında ailede informal şekilde verilmeye çalışılan değer eğitimi yetersiz kalmaktadır. Bu nedenle de değer eğitimine önem veren her ülkede değerler gerek örtük gerekse planlı öğretim uygulamalarıyla eğitim öğretim süreçlerine ve bu bağlamda

öğretim programlarına dâhil edilmektedir. Nitekim değerler milletleri bir arada tutmaları, toplumda beraberliği sağlamaları sebebiyle günümüzde eğitim programlarında önemli bir yere sahiptir. Bu noktada sosyal bilgiler dersi ise ayrı bir önem taşımaktadır. Buradan hareketle bakıldığında demokrasi bilincini aşılması, milli, ahlaki ve evrensel değerleri gelecek nesillere aktarması, düzenli, temiz bir toplum oluşturulması ve kültürel devamlılığın sağlanması gibi misyonlar üstlenmesi sosyal bilgiler dersinin değerler eğitimi noktasındaki önemini ortaya koymaktadır. Öte yandan sosyal bilgiler dersi ortaya çıktığı günden bu yana “iyi-etkin vatandaş” yetiştirme gayretinde olmuştur. Etkin vatandaş yetiştirmek içinse değerlere ihtiyaç duyulmaktadır. (Kalin, 2017, s. 30). Nitekim etkin bir vatandaşın sorumluluklarını bilen, toplumsal sorunlara karşı duyarlı, adaletten ayrılmayan, toplumsal hayattaki ilişkileri saygı ve sevgi çerçevesinde yürüten, evrensel barışı savunurken; bağımsızlığından ve vatanseverliğinden de ödün vermeyen bir yapıda olması gerekmektedir.

Türkiye’de sosyal bilgiler dersi bağlamında değerler eğitimi sosyal bilgiler dersinin okutulmaya başlandığı 1968 yılından itibaren örtük bir şekilde verilmeye başlanmıştır. Bu anlamda sosyal bilgiler dersi öğretim programları kapsamında da ilk kez 1968 İlkokul Sosyal Bilgiler Dersi Öğretim Programı’nda örtük bir şekilde değerler eğitimine yer verildiği görülmektedir. Ancak planlı ve sistemli bir şekilde değerler eğitimine ilk kez 2005 Sosyal Bilgiler Dersi Öğretim Programı’nda (SBDÖP) rastlanılmaktadır. Uzun yıllar uygulamada kalan bu öğretim programı 2017 yılında yenilenmiş ve 2018 yılında revize edilerek basılı hale getirilmiştir. Değerler eğitimi açısından 2005 ve 2018 Sosyal Bilgiler Dersi Öğretim Programları karşılaştırıldığında 2005 programında yer bulan değerlerin büyük bir kısmının 2018 programında da yerini koruduğu görülmektedir. Bununla birlikte 2005 SBDÖP’nda yer verilen misafirperverlik, hoşgörü, sağlıklı olmaya önem verme ve temizlik değerleri 2018 SBDÖP’nda yer bulmazken; 2018 programına ise iki yeni değer eklenmiştir. Bunlar; eşitlik ve tasarruf değerleridir. 2018 programında yer alan değerler aşağıdaki tabloda gösterilmiştir.

**Tablo 1.** 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda Yer Alan Değerler

Adalet	Estetik
Aile Birliğine Önem Verme	Eşitlik
Bağımsızlık	Özgürlük
Barış	Saygı
Bilimsellik	Sevgi
Çalışkanlık	Sorumluluk
Dayanışma	Tasarruf
Duyarlılık	Vatanseverlik
Dürüstlük	Yardımseverlik

(MEB, 2018, s. 9)

Değerler eğitimi açısından ele alındığında sosyal bilgiler dersi bağlamında kullanılabilecek unsurlardan birini de edebiyat ve bu bağlamda edebi eserler oluşturmaktadır. Nitekim sosyal bilgiler dersinde edebiyatın kullanılması eleştirel düşünen, inanç, değerleri inceleyip bunlarla ilgili olumlu tutumlar geliştirebilen ve oluşturduğu tutumları hayatında uygulayabilen etkin bireylerin yetişmesinde önem taşımaktadır (Tokcan, 2016). Unutulmamalıdır ki edebi eserler toplumların bilgi depolarıdır (Şanlı, 2011, s. 152). Yunus Emre'nin Risaletü'n Nushiyye eseri de Türk-İslam kültürü ve medeniyetinin bir yansımasıdır. Bu sebeple değerler eğitimi noktasında önemli bir yere sahiptir. Anadolu coğrafyasında Yunus Emre (1240-1320) tarafından kaleme alınan Risaletü'n Nushiyye isimli eser yaklaşık 600 beyitten oluşmaktadır (Demir, 2016, 2031). Bu araştırmada 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan değerler ile Yunus Emre'nin Risaletü'n Nushiyye eserinde yer alan ortak değerlerin tespit edilmesi amaçlanmıştır.

## YÖNTEM

### Araştırma Deseni

Bu araştırma nitel araştırma yöntemlerinden doküman inceleme tekniği ile desenlenmiştir. Nitel araştırmalarda araştırmacılar, bilgiyi doğrudan ana kaynaktan almakta ve çalışma ortamı, katılımcılar ve dokümanlarla ilişki içinde uzun zaman harcayarak çalışmalarını yürütmektedirler (Büyüköztürk ve vd. : 254). Doküman incelemesi ise bir belgenin sistematik şekilde derinlemesine ele alınmasıdır (Sönmez & Alacapınar,2017). Aynı zamanda araştırılmak istenen olgu ve olaylar ile ilgili yazılı belgelerin analizi doküman inceleme ile yapılmaktadır. Nitel araştırma yöntemlerinde doküman inceleme tek başına veri toplama tekniği olarak kullanılabileceği gibi diğer veri toplama teknikleriyle de birlikte kullanılabilir (Yıldırım ve Şimşek, 2018).

### **Veri toplama aracı ve Verilerin Analizi**

Araştırmada veriler Yunus Emre'nin Risaletü'n Nushiyye adlı eserinden elde edilmiştir. İlgili eser Ziya Avşar tarafından yayıma hazırlanan ve Eskişehir 2013 Türk Dünyası Kültür Başkenti Ajansı tarafından bastırılmıştır. Elde edilen veriler betimsel analiz yaklaşımı ile analiz edilmiştir. Betimsel analizde, elde edilen veriler daha önceden belirlenen temalara göre özetlenir ve yorumlanır (Yıldırım ve Şimşek, 2018). Öte yandan betimsel analizde araştırmaya konu olan veriden yapılan doğrudan alıntılara sıklıkla yer verilebilmektedir. Bu çalışmada da betimsel analiz sonucunda ulaşılan sonuçlar betimsel bir biçimde sunulmuş ve Yunus Emre'nin Risaletü'n Nushiyye eseri 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer verilen değerlerle ilişkili olduğu düşünülen kısımlardan doğrudan alıntılar yapılmıştır.

### **BULGULAR**

2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan on sekiz değer yedi tanesine Yunus Emre'nin Risaletü'n Nushiyye eserinde rastlanmıştır. Eser ile programda benzerlik gösteren değerler: adalet, dürüstlük, eşitlik, özgürlük, saygı, sevgi, sorumluluk değerleridir.

#### ***Adalet Değerinin Yunus Emre'nin Risaletü'n Nushiyye Eserindeki Yansıması***

Genel tanımıyla "hak ve hukuka uygunluk" (TDK, 2022) olarak tanımlayabileceğimiz adalet kavramı bir değer olarak birçok ülkede olduğu gibi Türkiye'de de öğretim programları bağlamında öğrencilere kazandırılmak istenen değerler arasında yer almaktadır. Bu bağlamda ilgili değer; 2005 Sosyal Bilgiler Dersi Öğretim Programı'nda "Adil Olma" şeklinde yer almakla birlikte 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda "Adalet" olarak verilmiştir. Öte yandan adalet değeri öğretim programları bağlamında kazandırılması hedeflenen değerler arasında öncelikli öneme sahip olan ve diğer disiplinlerle ortak olarak kazandırılması hedeflenen "kök değerler" arasında yer almaktadır. Yunus Emre'nin Risaletü'n Nushiyye isimli eseri incelendiğinde 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan adalet değerinin ilgili eserde iki kez yer aldığı görülmektedir. Aşağıda Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan adalet değeriyle ilgili örneklere yer verilmiştir;

- "Cennet, Padişah'ın kerem ışığından, cehennem de adalet ışığındandır." (Avşar, 2013, s. 25).
- "Akıl, adaletli aziz kişidir,  
Bunalana medet onun işidir." (Avşar, 2013, s. 53).

Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan adalet değeriyle ilgili örnekler incelendiğinde ilk örnekte padişahın adil olmasının, adaletli davranmasının önemi belirtilmiş olup ikinci alıntıda adaletin sıkıntı yaşayanların medet umduğu bir kurum olduğu belirtilmiştir.

### ***Dürüstlük Değerlerinin Yunus Emre'nin Risaletü'n Nushiyye Eserindeki Yansıması***

Doğruluk aslında temelde “doğru olma durumu” olarak ifade edilebilir. Dürüstlük insani erdemlerin başında gelen özelliklerden biri olmakla birlikte bireylerin edinmeleri gereken değerler arasında da yer almaktadır. Buradan hareketle bakıldığında dürüstlük değeri hem 2005 hem de 2018 Sosyal Bilgiler Dersi Öğretim Programlarında yer bulan değerler arasında yer almaktadır. Aynı zamanda “kök değer” olarak tanımlanan ve ilkokuldan ortaöğretime her ders disiplini bünyesinde kazandırılması amaçlanan değerler arasında yer almaktadır. Yunus Emre'nin Risaletü'n Nushiyye isimli eseri incelendiğinde 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan dürüstlük değerinin ilgili eserde doğrudan 4 beyitte yer bulduğu görülmektedir. Öte yandan dürüstlüğün eserin genelinde doğrulukla birlikte ele alındığı görülmektedir. Bu durum bir değer olarak dürüstlüğün doğrulukla birlikte sağlanacağı anlamını doğurmaktadır. Aşağıda Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan dürüstlük değeriyle ilgili örneklere yer verilmiştir;

- “Dürüstler cümleden derinde yüzer,  
Özü doğru olanlar Arş'ta gezer.” (Avşar, 2013, s, 136).
- “Öğüdü cümle doğruluktan alır,  
Dürüstlük dirliği ebedî kalır.” (Avşar, 2013, s, 137).
- “İki âlem bir oddur bir nazarda,  
Dürüste birdir bugün de yarın da.” (Avşar, 2013, s, 137).
- “Dürüstlük kaftanın o dem giyesin,  
Cümle ahaliye doğru diyesin.” (Avşar, 2013, s, 138).

Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan dürüstlük değeriyle ilgili örnekler incelendiğinde ilk örnekte aslı doğru olanların, dürüstlükten taviz vermeyenlerin diğer insanlardan farklı oldukları vurgulanmıştır. İkinci beyit incelendiğinde dürüstlüğün ebedi olarak kalıcılığına vurgu yapılırken; üçüncü beyitte dürüst olanın zamana göre etkilenmeyeceği dün neyse bugün de aynı olacağı vurgusu yapılmıştır. Eserde dürüstlük değeri üzerinde yoğun bir şekilde durulduğu görülmektedir. Evrensel bir değer olan dürüstlüğün önemi Yunus Emre'nin diğer eserlerinde olduğu gibi bu eserinde de önemli bir yere sahiptir.

### ***Eşitlik Değerinin Yunus Emre'nin Risaletü'n Nushiyye Eserindeki Yansıması***

Eşitlik evrensel değerler arasında yer almakla birlikte Türk kültürü açısından ele alındığında milli değerlerimizle de doğrudan örtüştüğü görülmektedir. Toplumsal uyum ve barışın tesisinde de etkisi yadsınamaz bir değer olarak bizi karşılamaktadır. Sosyal bilgiler dersi bağlamında ele alındığıdaysa gerek iyi gerekse etkin vatandaşlığın içselleştirilmesine katkı sunan değerler arasında yer almaktadır. Bu anlamda eşitlik değeri hem 2005 hem de 2018 Sosyal Bilgiler Dersi Öğretim Programlarında yer bulmuştur. Yunus Emre'nin Risaletü'n Nushiyye isimli eseri incelendiğinde 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan eşitlik değerinin ilgili eserde doğrudan aynı isim altında olmasa da anlamsal bakımdan birçok beyitte yer bulduğu görülmektedir. Aşağıda Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan eşitlik değeriyle ilgili örneklere yer verilmiştir;

- *“Kimse kınanamaz suçu yüzünden,  
Sorulmaz başkasının suçu senden.*
- *Benim suçum için sana günah yok,  
Senin suçun için bana günah yok.”* (Avşar, 2013, s. 132).
- *“Ne hâcettir sana elin haberi,  
Ki farzdır herkese kendi pazarı.”*
- *“Kimsenin suçu sana zerre ermez,  
Elin yediği sana lezzet vermez.”* (Avşar, 2013, s. 133)

Eserde eşitlik değeri ile üzerinde durulan bölümler yukarıda alıntılanmıştır. Kimsenin suçundan ötürü kınanamayacağı, bir başkasının işlediği bir suçu için bir başkasından hesap sorulamayacağı ve herkesin kendisinden sorumlu olduğu konuları üzerinde durulduğu görülmüştür. Öte yandan eserde kibir üzerine yazılmış birçok beyte rastlanılmaktadır. Kendini üstün görme anlamı açısından kibir, eşitlikle doğrudan ilişkilendirilebilecek bir kavramdır. Aşağıda eserde kibir ile ilgili ifadeler barındıran örneklere yer verilmiştir.

- *Ateşle geldi dört türlü felâket;  
Şehvet, kibir, açgözlülük ve haset.* (Avşar, 2013, s. 21)
- *Varsa kibir haberi, hangi yere,  
İşiten lanet okur o habere.*
- *Sakin olmayasın kibirle yoldaş,  
Kibri nerde görürsen orda savaş.*
- *Kibir ve arzu vefa kılmaz sana,  
Yazık toprağa düştüğün o güne.* (Avşar, 2013, s. 45)

- *Kibir sahibinin nazarı yoktur,  
Bu sebepten gönülde nuru yoktur. (Avşar, 2013, s. 46)*
- *Kibirli kişiler dosta eremez,  
Kibir kendine düşmandır göremez. (Avşar, 2013, s. 48)*
- *Yazık, kibir işini çok uzattın,  
Kendi kendini gönüllerden attın. (Avşar, 2013, s. 49)*
- *Kibir geldi, seni karartıp gitti,  
Ecel atı yörüktür, gelip tuttu. (Avşar, 2013, s. 50)*
- *Arzu ve kibir nice tutar seni?  
Ölüm evreni bir gün yutar seni!*
- *Bu vade ermeden gel bir gözün aç,  
Arzu ve kibir yolundan beri kaç. (Avşar, 2013, s. 51)*
- *Çok hızlı davran ki ütülmeysin,  
Kibir tuzağına tutulmayasın.*
- *Kibrin öğüdünü tutarsan eğer,  
Biçemezsin tevazuya bir değer.*
- *Kibirlinin yeri Siccîn içinde,  
O yüzden olmadı hiç din içinde.*
- *Din yolu tutanın Siccîn nesidir?  
Kin ve kibir ehlinin din nesidir?*
- *Bana inanmazsan hâlin göresin,  
Şu ömrü, kibirle yele veresin! (Avşar, 2013, s. 52)*
- *Sözü bitmeden tevazu göründü,  
Kibir onu görüp yüz geri döndü.*
- *Kılıç çekip gelir, yer alçağından,  
Kibir onu görüp kaçtı dağından.*
- *Dağı ovayı doldurdu bir feryat,  
Kimine Cennet kimine Arasat.*
- *Tevazu kibr'in üstüne at sürdü,  
Kibir baktı, bir eri bin er gördü.*
- *Âsî kibir, hiç bırakmadı işi,  
Dağ başını tutup geçirdi kışı. (Avşar, 2013, s. 54)*

- *Halk içinde yüzünü yere bırak,*

*Bu durum kibir ehline çok uzak. (Avşar, 2013, s. 59)*

Yukarıda verilen beyitler incelendiğinde Yunus Emre'nin kibir üzerine geniş yer verdiği görülmektedir. Nitekim Risaletü'n Nushiyye'de doğrudan "Kibir Destanı" adıyla bir bölüm yer almaktadır. Eşitlik değerini benimseyememiş veya farklı bir anlatımla eşit olmaya tahammülü olmayanların temel özellikleri arasında yer alan kibirlilik Yunus Emre tarafından tüm yönleriyle ilgili eserde işlenmiş; buradan hareketle de eşitliğe vurgu yapılmıştır.

#### ***Özgürlük Değerinin Yunus Emre'nin Risaletü'n Nushiyye Eserindeki Yansıması***

Özgürlük, genel anlamıyla herhangi bir kısıtlamaya, zorlamaya bağlı olmaksızın düşünme veya davranma (TDK, 2022) şeklinde tanımlanmaktadır. Bu yönüyle le alındığında hemen her bireyin fitratı özelliklerinde yer bulan bir kavramdır. Bir değer olarak düşünüldüğünde ise Türk milleti açısından ayrı bir anlam ifade etmektedir. Zira her bir Türk vatandaşı özgürlüğüne özünden bağlı olmuş; bunu tarihi geçmişinde de defaten göstermiştir. Ana gayelerinden biri "vatandaş" yetiştirme gayreti olan sosyal bilgiler dersi açısından da bir değer olarak özgürlük ayrı bir önem taşımaktadır. Nitekim bireyi devlete vatandaş kılma noktasında kazandırılması gereken değerlerden birini özgürlük oluşturmaktadır. Öğretim programları bağlamında bakıldığında bu değer ilk defa 2005 Sosyal Bilgiler Dersi Öğretim Programı'nda yer almış; 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda da yerini korumuştur. Yunus Emre'nin Risaletü'n Nushiyye isimli eseri incelendiğinde 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan özgürlük değerinin ilgili eserde doğrudan aynı isim altında olmasa da anlamsal bakımdan bir beyitte yer bulduğu görülmektedir. Aşağıda Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan özgürlük değeriyle ilgili örneğe yer verilmiştir;

- *"Sabrın her yerde iyiliktir işi,*

*Dayım azad eder yâd ve bilişi". (Avşar, 2013, s. 83)*

Eserde özgürlük değerine yukarıdaki beyitte rastlanmış olup bu beyitte ise sabredeninin sonunun özgürlük olduğu vurgulanmıştır.

#### ***Saygı Değerinin Yunus Emre'nin Risaletü'n Nushiyye Eserindeki Yansıması***

Bir arada yaşamın temel gerekliliklerinden biri olarak bizi karşılayan saygı, çatışmalardan uzak uyumlu bir hayat için de gerek arz etmektedir. Kök değerler arasında da yer bulan bu değer gerek 2005 gerekse 2018 Sosyal Bilgiler Dersi Öğretim Programlarında yer almıştır. Yunus Emre'nin Risaletü'n Nushiyye isimli eseri incelendiğinde 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan saygı değerinin ilgili eserde doğrudan aynı isim altında olmasa da

anlamsal bakımdan bir beyitte yer bulduğu görülmektedir. Aşağıda Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan saygı değeriyle ilgili örneğe yer verilmiştir;

- *“Benim gibi kişiye hürmet etmez,  
Cevap verir bana, öğüt işitmez.”* (Avşar, 2013)

Risaletü'n Nushiyye'de yer bulan yukarıdaki beyit incelendiğinde Yunus Emre'nin hürmet etmenin yani saygı göstermenin önemini vurguladığı görülmektedir.

### ***Sevgi Değerinin Yunus Emre'nin Risaletü'n Nushiyye Eserindeki Yansıması***

Sevgi, insani özelliklerin temel boyutlarından birini oluşturmaktadır. Bu anlamda gerek bireysel yaşamın gerekse toplumsal uyumun sağlanmasında n fazla ihtiyaç duyulan değerlerden birini sevgi oluşturmaktadır. Nitekim sevgi zaten sevilen şeye değer katmak; onu değerli kılmaktır. Bir değer olarak sevgi hem 2005 hem de 2018 Sosyal Bilgiler Dersi Öğretim Programlarında yerini almıştır. Öte yandan “kök değerlerden” birini yine sevgi oluşturmaktadır. Yunus Emre'nin Risaletü'n Nushiyye isimli eseri incelendiğinde 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan sevgi değerinin ilgili eserde birçok beyitte yer bulduğu görülmektedir. Nitekim Yunus Emre eserlerinde gerek tabii sevgiyi gerekse ilahi sevgiyi yoğun işlemiştir. Aşağıda Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan sevgi değeriyle ilgili örneklere yer verilmiştir;

- *Sever dünyayı dünyadır imanı,  
Susuzdur, kanmaz dünyayla canı.*
- *Her neyi seversen imanın odur,  
Nasıl sevmezsin ki sultanın odur.*
- *Bil ki aşkıdır seni senden alan,  
Neyi seversen o tarafa salan.*
- *Sevdiğinden öteye durağın yok,  
Asıl mânâ budur, boş lakırdı çok.*
- *Bu yolda zıtlaşma olmaz, mânâ var,  
Her neyi seversen, odur sana yâr. (Avşar, 2013, s. 32)*
- *Dünyayı sevme, arta kalır senden,  
Gelip sonunda düşman, alır senden. (Avşar, 2013, s. 93)*
- *Sevmez dünyayı er oğlu erler,  
Baki hayat neyse onu dilerler. (Avşar, 2013, s. 109)*

- *Şekeri sevme ki Mısır'da biter*  
*Kim neyi severse orda yeter*
- *Neyi seversen çok gözlersin onu*  
*Görünmedi sana şeker cihanı (Avşar, 2013, s. 124)*
- *“Gözü görmez kişi sevgiden uzak,*  
*Dost nerde sen nerde, aç gözünü bak!” (Avşar, 2013, s. 127)*
- *“Yârini görmezsen o sevgi değil,*  
*Kabul etmezse göz neylesin gönül.*
- *Her sevgi tadını önce göz alır,*  
*O yüzden hasreti gönülde kalır.*
- *Gözü görmez kişinin sevgisi yok,*  
*Şu gözlü kişilerse sevgiyle tok” (Avşar, 2013, s. 128)*
- *“Gözü yok kişinin sevmek nesidir*  
*Gönlü kul eyleyen göz fitnesidir.” (Avşar, 2013, s. 129)*
- *Âşıktır doğruluğa doğru canlar,*  
*Doğruluğu bulur dostu sevenler, (Avşar, 2013, s. 136)*

Sevmenin ve sevginin öneminden bahsedildiği bu beyitlerde bireyin sevgiye önem vermesi gerektiğinin ve bunu yaşamına yansıtmasının önemi vurgulanmaktadır. Öte yandan Yunus Emre maddi çoğu zaman maddi sevginin ötesinde manevi sevgiye vurgu yaparak ilahi aşkı dile getirmiştir.

#### ***Sorumluluk Değerinin Yunus Emre'nin Risaletü'n Nushiyye Eserindeki Yansıması***

Sorumluluk hem kişinin kendine karşı hem de toplumsal hayat içinde birlikte yaşam sürdüğü diğer bireylere karşı görevleri arasında yer almaktadır. Sosyal bilgiler dersi bağlamında ele alındığında ise gerek 2005 gerekse 2018 Sosyal Bilgiler Dersi Öğretim Programlarında yer bulan değerlerden biri olmuştur. Yunus Emre'nin Risaletü'n Nushiyye isimli eseri incelendiğinde 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer alan sorumluluk değerinin ilgili eserde doğrudan aynı isim altında olmasa da anlamsal bakımdan bir beyitte yer bulduğu görülmektedir. Aşağıda Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde yer bulan sorumluluk değeriyle ilgili örneğe yer verilmiştir;

- *“Yunus, cümle sözün sana vazife,*  
*İş sana düşer, kimse etmez ifa.” (Avşar, 2013, s. 40)*

Risaletü'n Nushiyye'de yer bulan yukarıdaki beyit incelendiğinde bir işi yapmak, o işi yerine getirmek için sorumluluk almanın önemin vurgulandığı görülmektedir.

## SONUÇ

Yunus Emre'nin kâmil insan olma yolunda nasihatlerini barındıran ve bu yönüyle bir nasihatname özelliği taşıyan Risaletü'n Nushiyye, evrensel değerlerin pek çoğunu içeriğinde barındıran Türk-İslam edebiyatının önemli eserlerindedir. Bu yönüyle 2018 Sosyal Bilgiler Dersi Öğretim Programı'nda yer bulan değerlerin birçoğuna eserde rastlanılmaktadır. Yunus Emre'nin Risaletü'n Nushiyye eseri ile 2018 Sosyal Bilgiler Dersi Öğretim Programında bulunan değerlerin karşılaştırıldığı bu araştırmada 2018 Sosyal Bilgiler Dersi Öğretim Programında yer alan 18 değerden adalet, dürüstlük, eşitlik, özgürlük, saygı, sevgi ve sorumluluk, değerlerinin ortak olduğu tespit edilmiştir. Asıl amacı vatandaş yetiştirmek olan Sosyal Bilgiler dersi içeriğinde Türk milletinin özünde bulunan değerlerin kendine yer bulduğu görülmektedir. Değerlerden uzaklaşılın günümüzde hem Sosyal Bilgiler dersinin değer aktarımında öneminin bir kere daha ortaya konması hem de Türk milletinin önemli mutasavvıflarından olan Yunus Emre'nin Risaletü'n Nushiyye adlı eserindeki adı geçen değerler ele alınmıştır.

Unutulmamalı ki milletleri millet yapan, ortak duygu, düşünce ve ülküler etrafında milleti bir araya getiren en önemli unsurlardan biri değerlerdir. Bu yönüyle ele alındığında Türk-İslam edebiyatında önemli yer edinen birçok eserde olduğu gibi Yunus Emre'nin eserinde de değerler yoğun bir şekilde işlenmiştir. Bu durum günümüz eğitim sistemi bünyesinde okullarda öğretim programları dâhilinde verilmeye çalışılan değerler eğitiminin aslında edebi yazınımızda yaygın bulunduğunu ortaya koymaktadır. Buradan hareketle eğitim-öğretim faaliyetleri kapsamında sözlü ve yazılı edebi ürünlere geniş yer verilen sosyal bilgiler dersi bağlamında Yunus Emre'nin Risaletü'n Nushiyye isimli eserinin değerler eğitimi anlamında kullanılabileceği görülmektedir. Yunus Emre'nin Risaletü'n Nushiyye isimli eserinde tespit edilen bu ortak değerlerin işlendiği kısımların ortaokul düzeyinde sadeleştirilerek günümüz Türkçesi ile ders kitaplarında yer verilmesi öğrencilerin tarihi köklerinde bu değerleri görerek içselleştirmelerine katkı sağlayacaktır.

## GELENEKLE “UYUMSUZLUK” GÖSTEREN BİR TİYATRO OYUNU DİKKAT KÖPEK VAR

**Doktora Öğrencisi Hüseyin ÖZ (Orcid ID: 0000-0002-6027-6485)**

Hacettepe Üniversitesi, Sosyal Bilimler Enstitüsü/ Edebiyat Fakültesi, Türk Dili ve Edebiyatı  
Anabilim Dalı, Yeni Türk Edebiyatı Programı

### ÖZET

XX. yüzyılın ikinci yarısında Avrupa’da ortaya çıkan Absürt tiyatro ile birlikte yüzyıllardır alışıla gelen tiyatro geleneğinde değişimler meydana gelir. I. ve II. Dünya Savaşları, siyasal ve toplumsal değişimlerle şekillenen yeni dünya düzeni, insanların olaylara bakış açısını, ahlaki ve etik değerlerini, estetik beğenilerini, sorunlarını dile getiriş biçimlerini farklılaştırır. Bu değişimler tiyatronun anlatım tarzına, kişilerin diyaloglarına, işlenen temalara, sahneleme tekniklerine kadar birçok alana sirayet eder. Dünyada meydana gelen bu değişimlere Türk tiyatrosu da sessiz kalmaz. 1960’lı yıllardan itibaren ‘Cumhuriyet Dönemi Türk Tiyatrosu’ büyük bir gelişim ve değişim gösterir. 70’li yıllara gelindiğinde ortaya çıkan darbeler, üniversitelerdeki karşıt görüşlü öğrenciler arasında yaşanan çatışmalar, işçi hareketleri, emperyalizm karşıtı gösteriler ülkede yeni bir dönemin başlayacağını ilk işaretleri olur. Üniversitelerden uzaklaştırılan öğretim görevlilerinin yarattığı boşluk; sanatçıların, aydınların susturulması neticesinde yaşanan beyin göçü ve ilticalar; sanat ve kültür yaşamını kuraklaştırır. Ülke içinde köyden kente göçün hızlanması, şehirlerde baş gösteren işsizlik, gecekondulaşma neticesindeki çarpık kentleşme, tarımsal üretimin zayıflaması gibi nedenler ülkedeki kaos ortamını körükler. Özellikle ‘12 Mart Romanları’na yansıyan sosyal, ekonomik, kültürel, siyasal olaylar tiyatrodaki da varlığını hissettirir. Tiyatro yazarlarının bir kısmı ülkede yaşanan sıkıntılı durumları komedi türü ile anlatmaya çalışırken bir kısmı da Absürt tiyatronun özelliklerinden yararlanır. Melih Cevdet Anday’ın “Dikkat Köpek Var” adlı oyunu yalnız, bunalım içinde, varoluş sancılı yaşayan, özgürlüğünü gün geçtikçe kaybeden, toplum ile ölüm arasında sıkışıp kalmış insana, saçmanın deliliğe yaklaştığı dünyada seyircinin/okuyucuyunun algılama gücünü zorlamasıyla farklı bir deneyim yaratır. Bu çalışmada oyunun Absürt tiyatroya özgü nitelikleri ve Türk tiyatrosundaki yeri ve önemi tespit edilir. Anday’ın şair kimliğinin gerisinde kalan tiyatro eserleri böylece araştırmacıların dikkatine sunulur. Çalışmadaki amaca yönelik olarak oyunun sahip olduğu nitelikler metin odaklı bir okumayla anlamlandırılmaya çalışılır. İlk olarak oyunun sahip olduğu dramaturjik felsefi temeller açıklanır ve açılır. Sonra “Dikkat Köpek Var” adlı eser anlamsal ve biçimsel olarak çözümlenir ve oyunun Absürt tiyatro ile olan benzerlikleri ve farklılıkları tespit edilir.

**Anahtar Kelimeler:** Absürt tiyatro, varoluşçuluk, Melih Cevdet Anday

## **A THEATER GAME THAT SHOWS “INCOMPATIBILITY” WITH TRADITION DİKKAT KÖPEK VAR**

### **ABSTRACT**

With the Absurd theater that emerged in Europe in the second half of the 20th century, changes occur in the theater tradition that has been used for centuries. The new world order, shaped with the 1st and 2nd World Wars, political and social changes, differentiates people's perspectives on events, their moral and ethical values, aesthetic tastes and the way they express their problems. These changes affect many areas such as the narrative style of the theater, the dialogues of people in the plays, the themes and staging techniques. Turkish theater does not remain silent to these changes taking place in the world. Since the 1960s, the “Turkish Theatre in Republican Period” has undergone a great development and change. The coups that broke out in the 70s, the conflicts between the students with opposite views at the universities, the workers movements, and the anti-imperialist demonstrations are the first signs of a new era in the country. The gap created by the lectures fired from universities, the brain drain and asylums caused by the silenced of artists and intellectuals impoverish art and cultural life. Reasons such as the acceleration of migration from village to city in the country, unemployment in cities, unplanned urbanization as a result of slums, and weakening of agricultural production trigger chaos in the country. Especially the social, economic, cultural and political events reflected in the “12 March Novels” make their presence felt in the theatre. While some of the playwrights try to explain the troubled situations in the country with comedy genre, some of them benefit from the characteristics of the Absurd theatre. Melih Cevdet Anday's play “Dikkat Köpek Var” creates a different experience for people who are lonely, depressed, experiencing existential pains, losing their freedom day by day, stuck between society and death, in a world where nonsense is approaching insanity, forcing the perception power of the audience/reader. In this study, it is tried to determine the incompatible characteristics of the play and its place and importance in Turkish theater. The theater works of Anday that lag behind in his poetic identity are thus presented to the attention of researchers. For the purpose of the study, the qualities of the game are tried to be interpreted with a text-oriented reading. First, the dramaturgical philosophical foundations of the play are explained in details. Then, the play titled of “Dikkat Köpek Var” is analyzed semantically and formally. Anday's play similarities and differences with the Absurd theater are determined.

**Key Words:** Absurd theater, existentialism, Melih Cevdet Anday

## 1. GİRİŞ

Absürt kelimesi saçma, zırva<sup>1</sup>, uyumsuz, aykırı gibi anlamlara gelir. Modern tiyatro için red cephesi, avangard tiyatro ve anti - oyun olarak da kullanılan bir terimdir. Absürt sözcüğü farklı kullanımlarla karşımıza çıkmakla beraber felsefe tarihi içinde XX. yüzyılda ortaya çıkan varoluşçuluk akımı ile adından söz ettirmeye ve özellikle tiyatro alanında kendini hissettirmeye başlar. İnsanın varoluşunu, yaşamın anlamsızlığını ve insanlar arasındaki iletişim sorunlarını ele alan, problemlere eleştiri getiren ve yaşama dair sorunlarla insanların yüzleşmesini sağlayan özelliği ile absürdizm kısa zamanda birçok düşünürün, sanatçının dikkatini çeker.

Absürdizm I. ve II. Dünya Savaşı sonrasında ortaya çıkan ruh halinin yansımasıdır. Batı dünyasının determinist mantığı ile çözüme kavuşturulamayan meselerler savaşlarla çözülmek istenir. Özellikle II. Dünya Savaşı'nın doğurduğu açıklık, yokluk, sefalet ve ümitsizlik absürdizmi doğurur. Temelinde varoluşçuluk, nihilizm ve Albert Camus'nun absürt felsefesi vardır. Aydınlanmanın getirdiği kuru akılı putlaştıran ve pozitivist felsefeye karşı çıkan bu görüşler sorunları tespit eder ancak sorunlara dair çözüm sunamaz.

Varoluşçuluğun temel özellikleri absürdizmin çözümlenmesinde ve anlaşılmasında yol göstericidir. Varoluşçuluk “Weil’e göre bunalım, Mounier’ye göre umutsuzluk, Hamelin’e göre bunaltı, Banfi’ye göre kötümserlik, Wahl’a göre başkaldırı, Marcel’a göre özgürlük, Lukacs’a göre idealizm, Benda’ya göre usdışıcılık, Foulquié’ye göre saçmalık felsefesidir” (Bezirci, 1980, s. 7). Varoluşçuluk terimi bütün bu tanımları belli belirsiz karşılamakla beraber “insanda varoluş özden önce gelir” ilkesine dayanır (Johnston, 2019, s. 210). İnsanın kendi özünü kendinin yarattığına inanılır. Dünyaya gelen insanın dünyada kendi doğumu gerçekleştirdiği taktirde varoluşunu gerçekleştirir. Varoluşçulukla ilgili bu tanımlamalar yapılmaya çalışılsa da varoluşçuluğun mantıksal bir yapıda olmaması ve yaşamla beraber kavranabilen bir özelliğe dayanmasından dolayı kesin bir tanımı yapılamaz. Ancak varoluşçuluğun sınırlarını çizen temel ilkeler sıralanabilir: Bireycidir; herhangi bir düşünce okuluna bağlı değildir; gelenekçi felsefeyi küçümser; insanın dünyaya fırlatılmış olduğuna inanılır; önemli olan öznel hakikatlerdir; evrenin özü saçmadır, anlamsızdır, rasyonel değildir; insan kendi yaşamına kendi karar vermelidir.

<sup>1</sup>

Türk Dil Kurumu Sözlüğü ( <https://sozluk.gov.tr/> )

Varoluş felsefesine göre insan köklerinden kopmuş, temelini yitirmiş, geçmişini ve tarihini kaybetmiş, topluma yabancılaşmış, huzursuz ve mutsuz bireydir. Modernizmle birlikte insanın

geçmişle olan bağlantısının zayıflaması ve insanın kendini manasız bir varlık olarak görmesiyle II. Dünya Savaşı sonrasında bir çıkış yolu aranır. Ancak bu dönemde aranan çıkış yolu makinenin egemenliğinin gölgesinde gerçekleşir. Endüstri devrimiyle beraber makinenin egemenliğine girmiş olan insan kendi özünü ve benliğini yitirir. Makinenin bir çarkı haline dönüşen insan kendine, ürettiği nesneye yabancılaşır, nesneye dönüşür. Diğer yandan Marksist düşüncede yabancılaşma, kapitalist sistemde makinenin getirdiği üretim düzeniyle toplum ve mülkiyet düzeni arasındakiler çelişkileri vurgular. İnsan yaşadığı çelişkiler neticesinde Marks'ın bahsettiği dört farklı yabancılaşma aşamasından geçer: “Kişinin kendi üretim faaliyetine yabancılaşması, kendi ürününe yabancılaşması, çalışma arkadaşlarına yabancılaşması, diğer türlere yabancılaşma” (Aydın, 2010, s. 17-32). İnsan üretim, tüketim ve mülkiyet düzeni arasında bir uygarlık kuramaması neticesinde kendini saçma, yabancı, anlamsız hisseder. Bu his durumu insanı yalnızlığa, bunalıma sürükler. Sartre'ın ifadesiyle insan nedensiz, zorunsuz, anlamsız bir varlık haline gelir.

Varoluş felsefenin özünde kişinin kendini tanıması, özünü yaratması, benliğini kazanması, baskıdan kurtulması, zorbalığa karşı başkaldırması vardır. Bireyin kendi kendine gerçekleştireceği bu eylemler neticesinde birey ana gerçeğe dönüşür, bireysellik öncelenir ve toplum hor görülür. Bu özellikleriyle varoluşçu felsefe <sup>2</sup>Absürt tiyatroyu etkiler. Sevdâ Şener'in ifadesiyle varoluşçu tiyatroyla aynı politik ve kültürel atmosferden neşvünema bulan Absürt tiyatro; tarihsel, kültürel, sosyal gerçeklere de odaklanarak kurgulanan tiyatro metinlerinde kendini göstermeye başlar. Bu bağlamda özellikle 1960'li yıllardan sonra Türk tiyatrosu özel tiyatroların da çabasıyla Eugène Ionesco, Edward Albee, Arthur Adamov, Samuel Beckett, John Osborne, Harold Pinter gibi dünya tiyatrosunun öncü yazarlarını Türk

<sup>2</sup> Türkçede “absürt” sözcüğü kelime anlamı ve terim anlam bakımından farklı sözcüklerle karşılanırsa da Absürt tiyatro yerine “Uyumsuz tiyatro” ifadesi de kullanılmaktadır. Çünkü uyumsuz sözcüğünün absürdizmin ifade ettiği geniş anlam alanını kapsadığına inanılır. Zehra İpşiroğlu bu konuda şu değerlendirmeleri yapar: “Batı’da ‘Absürt Tiyatro’ diye tanımlanan bu akımın tam Türkçesini bulmakta zorluk çektim. Sözlükte absürd sözcüğünün karşılığı widersinning, unsinning (usdışı, saçma), ungerimeit ya da dissonant (uyumsuz) olarak veriliyor. Usdışı sözcüğü bize sürrealizm’i (gerçek-üstüçülük) animsatiyor. Surrealizm denince, bilinçaltının uyurgezerlere özgü bir otomatizm içinde ortaya dökülmesi akla geliyor. Absürd tiyatrodaki böyle bir otomatizm söz konusu değil, burada tam tersine eleştiren, sorunları deşen, onların özüne giden, bilinçaltının derinliklerine indiği zaman da onu gün ışığına çıkarmaya çalışan bir akıcılıkla, bilinçli bir tutumla karşılaşıyoruz. Absürd tiyatro yazarları, surrealistler gibi aklın kavrayamadığı, erişemediği, inanılmaz yaşantılar üzerinde değil, günlük yaşam düzeyinde oluşan gerçekler üzerinde duruyorlar. Ayrıca bu yazarlar akla ters düşen, ya da ona aykırı olanları da uğraşmıyorlar, bu nedenle absürd tiyatrosunun anlamsız ya da saçma tiyatro diye tanımlanmasını da doğru bulmuyorum. Burada mantıksal bir çelişki değil, gerçekçilik düzeyinde alışkanlıkların, gelenek ve törelerin dondurduğu kalıplarla yaşam arasındaki tutarsızlık, uyumsuzluk söz konusudur. (İpşiroğlu, 1996, s. 10-11). Ancak biz çalışmamızda Batı terminolojisine bağlı kalarak absürt ifadesini kullanmayı tercih ettik.

seyircisiyle buluşturur. Ayrıca aynı yıllarda Türk toplumunun geçirdiği sosyal ve kültürel dönüşümler, ülke yönetimindeki siyasal krizler, darbeler, işçi ve öğrenci hareketleri, yoksulluk, göç gibi konular

farklı anlatım tarzları ile yerli oyunlarla sahnelenmeye başlanır. Böylece Türk seyircisi Absürt tiyatronun yerli ve yabancı örnekleri ile tanışır.

Melih Cevdet Anday tarafından kaleme alınan “Dikkat Köpek Var” (1972) adlı tiyatro oyunu dilin kullanılışı, oyun kişileri, işlenen temalar, zaman ve mekân bakımından Absürt tiyatronun kendine has özelliklerine göre kurgulanmış bir eserdir. Tek perde ve tek sahneden oluşan oyun törenselliğe, geleneklere karşı çıkan isimsiz bir delikanlının topluma yabancılaşmış diğer oyun kişileriyle mantık ve düzen çerçevesine uymayan duygularla seyirciyi/okuyucuyu sarsar. Oyun kişilerinin eylemsizlikleri, sızlanma ve memnuniyetsizlikleri, oyundaki siyasal ve sosyal göndermeler, çelişkili durumlar; sorgulamaları beraberinde getirirken yasağın çiğnenmesi ile oyun kişileri geçmişin tutsaklığından kurtularak bireysel özgürlüklerine kavuşur.

## **2.ABSÜRT TİYATRONUN FELSEFİ TEMELLERİ**

Kierkegaard tarafından ilk kez kullanılan varoluşçuluk kavramı XIX. yüzyılda Almanya’da Nietzsche, Scheler aracılığı ile filizlenmeye başlar. Fransız Bergson; Blondel ile Hegel’in usçu ve diyalektikçi felsefesine karşı varoluşçuluğu destekler. Sartre ile varoluşçuluk popüler hale gelir. Sartre “Varlık ve Hiçlik” adlı eserindeki çelişkiler nedeniyle eleştiri oklarını üzerine çeker. Varoluşçulukta tüm ayrılıkların bir arada olması, diyalektiği içine alması ve aynı zamanda ona karşı olması, Hegelci görüngübilimden yararlanması varoluşçuluğu bir sentez haline getirirken kendine has özellikleri olan bir felsefi akım olmaktan uzaklaştırır. Sartre’ın yakın arkadaşı Albert Camus varoluşçuluğun önemli isimlerinden bir başkasıdır. Onun başlıca kavramları uyumsuz, saçma ya da absürttür. Farkındalığı son derece yüksek olan insan dünyadaki arayışına cevap bulamadığını görmeye başlar başlamaz saçma kendiliğinden ortaya çıkar ve dünya ile insan arasındaki uyumsuzluk belirginleşir. Bu uyumsuzluk içinde insan kaderini sevmeli ve intihar fikrinden uzaklaşarak Nietzsche’nin üstün insan fikrine denk düşen başkaldıran insana evrilmelidir.

Heidegger kaygı, korku, kuşku üzerindeki düşünceleri Kierkegaard’ın düşünceleriyle benzerlik gösterir. “Varoluş terimini modern anlamda kullanan ilk filozof [olan] Kierkegaard” (Akarsu, 1980, s. 114) insanın yaşamında somut düşünceye yönelmesini ister. İnsanı somut

düşünceye yönlendiren iki aracın korku ve iç – daralması olduğuna inanır. İnsan yaşadığı korku ile varoluşunu gerçekleştirebilir. Tanrı tarafından unutulmuş olabileceğini düşünen insan yaşadığı korkunun yarattığı uyanıklık ile yaşamını sürdürür.

Kierkegaard için varoluş, insanın ve hayatın kendisidir. Varoluş, insanın uğruna yaşaması ve ölmesi gereken bir hakikat aracıdır. İnsanın kendini tanıması ve anlaması için yapması gerekenlere yönelmesidir. Bu yönelişle beraber insan varoluşundan yola çıkarak birey olabilir. Bireyselleşme yolunda insanın izini sürekli takip etmesi gereken üç önemli öge vardır: estetik, etik ve din. Kierkegaard insan varlığını yalnızca akıl ile belirleyen Hegel ve dolayısıyla Kant'a temelde de Descartes'a karşı bir duruş sergiler. Kısacası 'düşünüyorsam öyle ise varım' önermesini "Ben var olduğum (jag Er til) ve düşünen biri olduğum için düşünüyorum ve var oluyorum" önermesine dönüştürür (Cauly, 2006, s. 64). İnsan var olma iradesiyle diğer varlıklardan etik zafer olasılığı içinde var olma iradesiyle ayrılır.

"İnsan tindir. Ama tin nedir? Tin ben'dir. Ama ben nedir? Ben, kendine bağlı olan bir ilişkidir; daha doğrusu ben, ilişki içinde bu ilişkinin içsel yönelimidir; ben, ilişki olmayıp ilişkinin kendine dönüşüdür

İnsan sonsuzluk ile sonlunun, geçici ile kalıcının, özgürlük ile zorunluluğun bir sentezidir, kısacası bir sentezdir. Sentez iki terimin ilişkisidir. Bu görüş açısından ben, hâlâ varolmamıştır"(Kierkegaard, 2014, s. 21).

İnsan bir sentezdir önermesi insanın sadece bir töz olmadığını ve ilişki halinde olan bir varlık olduğunu ileri sürer. İnsan kendini oluşturan bu ilişki dışında bir hiç'e dönüşür. Birçok unsurun oluşturduğu varoluş sürekli olarak içinde bulunduğu ilişkiler bütününden fazlası olmak zorundadır. Çünkü ben, sonsuzun ve sonlunun bileşiminden oluşur.

"Sonluluk, sonsuzluğa sınırlar getirir; aynı şekilde olabilirin alanındaki zorunluluğun alıkoyma rolü vardır. Sonlunun ve sonsuzun sentezi olarak ben, öncelikle ortaya konmuş, var olmuştur; daha sonra gelişmek için imgelem perdesine kendini yansıtır ve ona da olabilirin sonsuzluğunu uyandıran şey budur. Ben, zorunluluk kadar olasılık taşır, çünkü pekâlâ kendisidir ama kendisi haline gelmek zorundadır. Ben, zorunluluktur, çünkü kendisidir ve olabilir, çünkü kendisi haline gelmek zorundadır" (Kierkegaard, 2014, s.45).

Kierkegaard insanı değerlendirirken onu başkalarına nasıl davrandığı üzerinden bir değerlendirmeye tabi tutmaz. Yani insanı ahlak, gelenek, örf gibi normlar üzerinden iyi ya da kötü olarak nitelendirmez. Kierkegaard insanı 'iyi' olarak değerlendirirken etik<sup>3</sup>

<sup>3</sup> Etik: Felsefenin değerle ilgili boyutunu oluşturan bir temel disiplin olarak, doğru ve yanlışın teorisi; olması gerekenle ilkeleri ele alıp tartışan felsefe disiplini. Doğru ve yanlış, iyi ve kötü, adalet benzeri kavramları ele alıp tartışan etik, üç bölümden meydana gelir. bunlardan birincisi ve en önemlisi normatif etikdir. Olması gerekeni ele alan normatif etik, ahlaki değer ve erdemleri tartışırken, iyi bir ahlaki hayatın neden meydana geldiği, ahlaki bir eylem tarzını belirlemenin pratik yollarının neler olduğu üzerinde durur. Etiğin kimi zamanlarda normatif etiğe teşkil edebilen ikinci türü, insanların hangi ahlaki değerlere bağlandıklarını araştıran betimleyici etikdir. Buna mukabil, etiğin daha ziyade 20. Yüzyılda geliştirilmiş olan üçüncü bölümü, ahlak yargılarının anlamı ve gönderimiyle etik önermelerin doğruluk değerinin nasıl belirleneceği üzerinde duran metaetikten meydana gelir. (Cevizci, 2012, s. 165-66).

kavramından yararlanır. Bu değerlendirmeleri yaparken Tevrat'tan aldığı dini hikâyelerden, İbrahim peygamberin kurban hadisesinden, felsefe tarihi içinde yer edinmiş önemli düşünürlerin etik, insan ve varoluş üzerindeki fikirlerinden yararlanır, karşılaştırmalar ve çelişkiler üzerinden düşüncelerini sıralar. Hegel felsefesinin ahlakın tümel özelliğini savunan görüşlerine karşı çıkan Kierkegaard, Nietzsche'nin kitlenin doğruluğu ve ahlakı ortadan kaldırdığı fikrinde birleşir. "Nietzsche gibi, bireyin kişiliğini kitle içinden ortadan kaldırmak isteyen demokrasiden de, sosyalizimden de nefret eder. Kitle bireylerden kuruludur, ama o kitleyi kuran bireyler o anda hiçbir şey değillerdir" (Akarsu, 1980, s. 118).

Kierkegaard, Hegel'in tümel ahlak anlayışına ve insanın ahlaken sorumlu olduğu toplum fikirlerine karşı imanı önceleyen düşüncelerini "Korku ve Titreme" kitabında yer alan İbrahim peygamber kıssası üzerinden somutlaştırır. Hegel'e göre "[d]ini koruyan temel faktör tümeldir ve genel geçer etiğin yayılmasına olanak tanır. Din bu etik sınırların içinde yatar ve öznel bir Tanrı fikrine yer vermez, zira dinsel aktarım gerektirir" (Kierkegaard, 2019, s. 15). Kierkegaard, Hegelci etiğe karşı imanı ortaya atar ve İbrahim'in oğlu İshak'ı<sup>4</sup> 'Tanrı'ya kurban etmeye götüren şey etik midir yoksa iman mıdır?' sorusuna cevap arar. İbrahim peygamberin oğluna çok geç yaşında kavuşmasına rağmen Allah'ın emri ile kurban edeceği Moriya Dağı'na götürmesi ve imanı açısından verdiği sınavdan başarıyla geçmesi Kierkegaard'a göre onu bir 'iman şövalyesi' yapar. "Diğer yandan Hegel, imandan bahsederken İbrahim'in cani sıfatıyla boşlanıp afroz edilmesi gerektiği yerde, imanın babası sıfatıyla şan ve şeref kazanmasına yüksek sesle ve açıkça karşı [çıkır]" (Kierkegaard, 2019, s. 78). Hegel bu görüşü ile İbrahim peygamberi bir caniyeye dönüştürür. Hegel'in İbrahim peygamberi değerlendirilmesinde arketipik dinsel bakış görülür. Özellikle

<sup>4</sup> İshak'ın çocukluğu ve gençliğiyle ilgili olarak Tevrat'ta sadece iki hadise yer alır. İlkine göre İshak sütten kesildikten sonra İbrahim'in verdiği ziyafet esnasında İsmâil kardeşi İshak'a güldüğü için Sâre onun evden uzaklaştırılmasını ister. Tanrı ona, "Sâre'nin sana söylediği her şeyde onun sözünü dinle; çünkü senin zürriyetin İshak'ta çağrılacaktır" dediği için Hz. İbrâhim, İsmâil ile annesi Hâcer'i oradan uzaklaştırır (Tekvîn, 21/8-14; 25/9-11). Tevrat'a göre İsmâil ile İshak tekrar babalarının cenazesinde bir araya gelirler (Tekvîn, 25/9-10). İkinci olay da onun kurban edilmek istenmesiyle ilgilidir. Tevrat'a göre kurban edilmek istenen İshak'tır. Onun bu esnada kaç yaşında olduğu belli değilse de kurban taktimesinde nelerin gerekli olduğunu bildiğine ve yakılan kurban taktimesi için odun taşıyabildiğine göre (Tekvîn, 22/6) delikanlılık çağında bulunmalıdır. Yahudi tarihçi Josephus'un dediğine göre İshak yirmi beş, rabbilerin hesabına göre de otuz yedi yaşına geldiğinde (EJd., II, 482) Allah, İbrâhim'i denemek için sevdiği biricik oğlu İshak'ı Moriya diyarına götürüp bir dağ üzerinde yakılan kurban olarak takdim etmesini emreder (Tekvîn, 22/1-2). İbrâhim bu emir üzerine İshak'la beraber iki uşağını da yanına alarak Moriya diyarına gider. Yolda İshak babasına kurban edilecek kuzuyu sorar. Babası kuzuyu Allah'ın tedarik edeceğini söyler. Belirtilen yere vardıklarında ve İbrâhim İshak'ı kesmeye teşebbüs ettiğinde Rabb'in meleği müdahale eder, imtihanı başardığını bildirerek İshak'ın yerine kurban edilmek üzere bir koç verir. İbrâhim bu imtihanında başarılı olduğu için mübarek kılınır, zürriyetinin çoğaltılacağı müjdelendir (Tekvîn, 22/1-19).

İshak'ın kurban edilme kıssası (Tekvîn, 22/1-19) Elohist metnin anlatım sanatının güzel bir örneğidir. İman ve mutlak itaat bu kıssanın hâkim unsurlarıdır (IDB, II, 729). Yahudi bilginleri, Hz. İbrâhim'in bu emri ifaya hazır oluşunu ve itaatini övgüyle anarlar. Onun Tanrı tarafından istendiği için oğlunun ölümünü kabul etmesi hadisesi, şeriatı çiğnemektense ölmeyi tercih eden pek çok yahudiye örnek teşkil etmiştir. (<https://islamansiklopedisi.org.tr/ishak>).

İbranilerde yer alan ve ilk çocuğun kurban edilişi Hegel'in gözünde İbrahim peygamberi bir caniyeye dönüştürürken Kierkegaard için iman meselesidir.<sup>5</sup>

Nietzsche ateist varoluşçu filozoflar<sup>6</sup> tarafından merkeze alınan ve varoluşçuluğa nihilizm felsefesiyle katkı sunan önemli bir isimdir. Nietzsche nihilizmi yaşamın alçaldığı, insanların tür olarak yetkinsizliğe ve geriye doğru gittiği bir hâl olarak açıklar. “Yaşam, inkar edildiği, değersiz kılındığı ölçüde bir hiçlik kazanır. Değersizleştirme, her zaman bir kurmacayı varsayar: kurmaca aracılığıyla ki, sahteleştirir, değersiz kılarız; kurmaca aracılığıyla ki, bir şeyleri yaşama karşı çıkartırız” (Deleuze, 2001, s. 111). Böyle bir durum içinde ne mevcut değerler işlemekte ne de yerine yenileri gelmektedir. Dünya can sıkıcı bir yere dönüşür ve yaşam hiçliğin yerini alır, yaşama hiçlik değerini veren tüm üstün değerler kurmacaya dönüşür ve insanlar tekil yalnızlıkları içinde kaybolur. Yaşam değersizleştirilirken aynı zamanda değerlerin de değersizleştirildiği görülür. Değerlerin hiçleşmesiyle şeylerin özü de hiçleşeceği için Tanrı'da üstduyarlılığını yitirerek ölür. Kiliseler<sup>7</sup> tekil yalnızlığı içinde kaybolmuş insan için işlevini yitirir. Tanrı insan haline gelirken insan da Tanrı'ya dönüşür. Bu dönüşüm sonrasında sancılarını ve sıkıntılarını modern insanın aşması beklenir. Kendine acıyan bir Tanrı'nın varlığına katlanamayarak

<sup>5</sup> Morfolojik açıdan bakıldığında İbrahim'in oğlunu kurban edişi Eski – Doğu dünyasında sıkça uygulanan ve İbranilerin Peygamberler dönemine kadar sürdürdükleri, ilk çocuğun kurban edilişi pratiğinden başka bir şey değildir. İlk çocuk, çoğunlukla bir tanrının çocuğu olarak görülürdü; hatta, arkaik Doğu'da evlenmemiş kızların tapınakta bir gece geçirmeleri ve tanrı (onun temsilcisi, rahip ya da elçisi, ‘yabancı’) tarafından hamile bırakılmaları adet olmuştu. Bu ilk çocuğun kurban edilmesi tanrıya ait olanın ona geri verilmesi demektir. Böylece genç kan, tanrının tükenmiş enerjisini arttırıyordu (zira doğurganlık tanrıları dünyayı sürdürme ve bolluk sağlama çabasında kendi tözlerini tüketiyorlardı; dolayısıyla onların da periyodik olarak yenilenmeleri gerekiyordu) ve bir anlamda, İshak, Tanrı'nın oğluydu zira Sara doğurganlık çağını geçtikten çok sonra İbrahim ve Sara'ya verilmişti. Ama İshak inançları yoluyla verilmişti onlara; vaat ve inancın çocuğuydu. İbrahim tarafından kurban edilişi, biçim olarak Eski – Sami dünyasında yeni doğmuş bebeklerin kurban edilmesine benzese de içerik bakımından bunlardan farklıdır. Eski Sami dünyasının tümünde böyle bir kurban, dinsel işlevine rağmen, sadece bir anane, anlamı tümüyle kavranabilir bir ayinken İbrahim'in durumunda bir inanç eylemidir. Bu kurbanın neden istendiğini anlamaz, yine de bunu yerine getirir, çünkü Tanrı böyle istemiştir. Görünürde saçma olan bu eylemle İbrahim yeni bir dinsel deneyimi, imanı başlatmaktadır. Diğer hepsi (tüm Doğu dünyası) İbrahim ve izleyicileri tarafından açılacak olan bir kutsallık ekonomisi içinde davranmayı sürdürmüşlerdir. Kierkegaard'ın termonolijisini kullanacak olursak, bu kurban edişler “genel olan” a aitti; yani, sadece kozmostaki kutsal enerjinin dolaşımı (tanrıdan doğaya ve insana, sonra insandan –kurban aracılığıyla- tanrıya, vb.) ile ilgilenen arkaik tanrı tezahürleri üzerine kuruluydular. Bunlar haklılığı kendi içinde yatan eylemlerdi; mantıksal ve tutarlı bir sisteme girmektedirler: tanrı'ya ait olan ona dönmelidir. İbrahim için İshak doğrudan ve maddi bir gebeliğin ürünü değil Tanrı'dan gelen bir armağandı. Tanrı ile İbrahim arasında bir uçurum uzanıyordu; süreklilikte temel bir kopuş vardı. İbrahim'in dinsel eylemi yeni bir dinsel boyutu açmaktadır: tanrı hiç bir rasyonel (yani genel ve öngörülebilir) bir haklılaştırma olmaksızın belleyen, emreden, isteyen ve onu için her şeyin mümkün olduğu kişisel, “tümüyle ayrık” bir varoluş olarak göstermektedir kendini. Bu yeni dinsel boyut Musevi – Hristiyan anlamda “iman”ı mümkün kılmaktadır. (Eliade, 1994, s. 109-110).

<sup>6</sup> Varoluşçu filozoflar Hristiyan varoluşçular ve Ateist varoluşçular olmak üzere ikiye ayrılır: Hristiyan varoluşçular: Kierkegaard, Karl Barth, Karl Jaspers, Max Scheler, Blondel, Henri Bergson, Chestov ve Soloviev Ateist Varoluşçular: Nietzsche, Heidegger, J.P. Sartre, Simone de Beauvoir, Albert Camus (Bezirci, 1980, s. 11-12).

<sup>7</sup> Hristiyanlığın yüzyıllardır hüküm sürdüğü Batı Avrupa'da toplumun yüzde 27,5'i herhangi bir dine inanmıyor. Büyük bir çoğunluğu vaftiz edilen 15 Batı Avrupa ülkesinde yaşayan halkın yaklaşık üçte biri kendini ateist olarak tanımlarken, yüzde 46'sı kiliseye gitmediğini belirtiyor. 2017 yılında yapılan bir araştırma, kiliselerde yaşanan skandallar ile din adamlarının sosyal yaşama ilişkin takındıkları tutumun insanların dinden uzaklaşmalarında etkili olduğunu ortaya koyuyor. (<https://tr.euronews.com>)

Tanrı'nın ölümünü gerçekleştiren insan hâlâ kendine acıyan ötekinin acınası bakışından kurtulamamıştır.

Nietzsche nihilizmi etkin ve edilgen olarak ikiye ayırır. Etkin nihilizmde mükemmelliyetçi nihilist vardır. Mükemmel nihilist düşen şeyleri yaşatmaya, ölü olanları diriltmeye çalışmaz. Onu yıkma faaliyeti aynı zamanda yeniden değerlendirmedir. Yeniden değerlendirme yeni değer yaratmak değil, mevcut değerlere savaş açmaktır. Hristiyanlığın ortaya çıkışı ile antik değerler yeniden ele alınır. Fakat aydınlanma ile bu değerler yaşama hizmet etmez hale gelir. Sürekli gelişen, dönüşen, devingen dünyada yalnızca değişim vardır. Bu değişmeyi de sürdüren yaşamın kendisidir. Değişen yaşam içinde Tanrı da yeniden değerlendirmeye tabi tutulmalıdır. Tanrı bu nedenle ölmüştür. Yeni anlamları, değerleri insan kendi üzerine yüklemelidir. Salt akla ve tek gerçek içinde şekillenen tarih anlayışına yani Hegel diyalektiğine de nihilizm karşı çıkar. Tarihin karşısında boyuneğen insan devlet karşısında da boyunegecek ve böylece her çeşit güç karşısında silikleşecektir. Oysa ki Nietzsche'ye göre insan tepkisel güçlerin temsilcisidir. Tarihi yaşam için kullanan, başkaldıran, tarihin akışının tersine doğru yüzebilen insan üstün insandır. Bu üstün / soylu insanı Nietzsche 'köleleşmiş' insandan yeğ tutar. Köle insan durağanlığın insanıdır ve Hristiyanlık gibi temel bir din yaratmıştır.

Üstün insan yaşama güdülerini önde tutan kişidir. Yaşamdan korkmaz, onla çatışmaz, alışkanlıklarına hapsolmaz. Alışkanlıklarını değiştirerek yenilik yaratmanın peşindedir. Halbuki modern insan sürekliliğin, tek düzenin, standartın peşindedir. Yeniliğin, farklılığın karşısında olan modern hayat içinde bulunduğu sarmalın farkındalığı ile memnuniyetsiz hâlini aşamaz. İnsan etkin bir nihilist olduğunda mevcut durumun işlemeyen yönlerini, boşalmış anlamları ortadan kaldırmaya çabalar. Yaşamı körelten şeyleri düşünür ve edilgen nihilistin tutumunu aşar. Alışkanlıkların canlılığı ortadan kaldırması nedeniyle alışkanlıkların aşılması gerektiğini bilir ve rahatlık hapisanesinden kaçmanın yollarını arar. İçi boş toplum değerlerinden sıyrıldığında insan arınarak kendini gerçekleştirme yolunda büyük bir adım atmış olur. Nietzsche'nin ilerleme ve uygarlık tutkusuna, Aydınlanma düşüncesi'ne, bunların baş sorumlusu olarak nitelendirdiği Fransız Devrimi'ne karşı çıkması da bu nedenledir. Modernitenin hakim sınıfı olan burjuvaizme ve onun ahlakına karşı duruş vardır. Modernitenin ısrarla vurguladığı bireyselliğe farklı boyuttan bakan Nietzsche kitleleşmekten yanadır.

Nietzsche ileri sürdüğü görüşlerle varoluşçuluk arasında bir bağın kurulmasını sağlar. Tıpkı varoluşçular gibi insanı odağa alır. Bilhassa ateist varoluşçular Nietzsche'nin fikirlerinden yararlanır ve onu temel dayanak noktası olarak görür. Üstün insan öğretisiyle, değerlerin yeniden değerlendirilmesi fikirleri ile bir varoluşçu filozof olarak kabul edilir. Tanrı'nın ölmesi ve değerlerin değersizleştirilmesi sonucunda insan kendini yeniden inşa etme girişiminde bulunmalıdır. Kendi varoluşunu sorgulamaya başlayan insan yaşamına yeni bir pencere açarak yaşama tutunmaya çalışmalıdır. İnsan varlığının ne denli güvensiz olduğunu, yaşadığımız dünyada ölüme mahkum oluşumuz, küresel ve toplumsal ölçekte yaşanan savaşlar, kıtlıklar, salgın hastalıklar uzun depresyon dönemlerimizi oluşturur. Varoluşsal bu karmaşa Nietzsche'nin kaos fikrine denk düşer. İnsan karmaşa ve kaos içindeyken bile her şeye egemen olma isteğini sönmümlendiremez. Yaşamı kontrol etme hırsı kendine kendine yabancılaşmasına neden olur. İnsan böylece "özne- nesne dualizminin kurbanı" olur (Geçtan, 2013, s.36). Nietzsche'nin ve varoluşçuluğun aşmak istediği şey de bu dualizmdir.

Antik Çağ'da varlığın temelinde yer alan insan, Orta Çağ'da yerini Tanrı'ya bırakır. Yeni Çağ ile birlikte merkeze alınan akılla insan ve Tanrı ölür. Günümüzde de varlığın merkezine post- human / yapay zekânın yerleşmesi ile insan büyük bir kalabalığın içinde uyumlu, itaatkâr bir varlığa dönüştürülerek tüm kişiliği başkalarınca şekillendirilir. XXI. yüzyıl insanı için yaşamın gereksinimleri ve sahip olunması gereken özellikler sosyal medya tarafından belirlenir hale gelir. Aslında insanların bu talebi de Nietzsche'nin sözünü ettiği bir "güç istenci"<sup>8</sup>ni çağırıştırır. Güç istencinin sonsuz döngüsünde insan bakışını kendine çevirmeli ve kaderini sevmeye çalışmalıdır.

Varoluşçuluk öteki, varoluş ve öz arasındaki ilişkileri yeniden yorumlar. Bu ilişkiler arasındaki yenilenmeyi Husserl ve Heidegger başlatır. Duyumsal algı ile öze ulaşamayacağına inanan Husserl öz ile varoluş arasındaki farkın akıl tarafından ayırt edilebileceğini öne sürer. Bu ayırımı (fenomoloji) görüngübilimsel indirgeme yöntemi ile

<sup>8</sup> Güç istenci, ünlü Alman düşünürü Nietzsche'nin insanın daha yetkin bir duruma ulaşma dürtüsüne, güç elde etme ve iktidar uygulana arzusuna verdiği ad. Hayatın kendisinin güç isteminden ibaret olduğunu, insanlığın güç ve iktidar arzusu tarafından yönlendirildiğini ifade eden Nietzsche, söz konusu iradenin kendini aşma ve yüceltme eylemiyle karakterize olduğunu öne sürer. O, gerçek ifadesini veya tezahürünü öncelikle insanın kendi üzerinde güç elde etme, kendini aşma arzusunda ve sonra da sanat ve felsefede, yani yaratıcı faaliyet ve düşüncede bulur. Güç istemi, bu yüzden başkaları üzerinde bir tahakküm elde etme amacına yönelik bir güç olmaktan ziyade, olumsuz bir güç olmak durumundadır. Fakat Nietzsche, bu noktada kalmaz, bir hipotez olarak güç istemini, sadece beşeri gerçekliği değil, bir bütün olarak dünyayı açıklamak için de kullanır. Evrene devasa bir enerji kaynağı temin eden güç istemi, kendini sürekli olarak yeniden yaratma ve yok eden bir güçtür. Bütün değişimlerin kaynağında bulunan söz konusu güç istemi, dünyaya anlaşılabilir karakterini temin eden şeydir (Cevzici, 2012, s. 199).

yapar. Metafiziği sonlandırarak somuta, yaşantıya döner ve felsefeye yeni bir başlangıç yapmak iddiası ile ortaya çıkar. “Ahlakın ve toplumsal felsefenin geleneksel kavramlarının [Şem’lerinin] yerine geçen, öznelarasılık, birlikte - varlık (Mistein) ya da ötekiyle - birlikte - birvarlık (Miteimamdersein), bu alanda tam anlamıyla fenomenolojinin katkısı temsil eder” (Colette, 2006, s. 78). Fenemoloji her şeyden önce betimlemeye dayanan bir yöntemdir. Gerçekliğin kendisi diye bir şey olamaz. Çünkü gerçeklik her zaman kendine yönelmiş bir bilinç tarafından bilinen bir gerçekliktir. Yani dünya deneyimlerimizin tamamı bilinç tarafından kurulmuştur.

Heidegger varlık felsefesine yönelen düşünürlerden biridir. Varlığı varoluşta arayan filozof varoluştan öz çıkarılmalıdır fikrini öne sürer. “İnsanın özü varoluşundadır” görüşüyle varlık sorununa yeni bir bakış açısı kazandırır (Akarsu, 1979, s.119). İnsan yalnızca varolan değil aynı zamanda varoluşunu sorgulayandır. Bu özelliği ile insan özü ve öteki arasındaki farklılığı kavrayabilir. Ancak ben ve dış dünya birbirinden ayrılmaz çünkü insan varoluşunu bir dünya içinde gerçekleştirir. “İnsan Heidegger’e göre ‘varlığın çobanı’ (güdücüsü) varlıktan bir örnek, bir eşbaskıdır” (Akarsu, 1979, s. 120). Diğer varlıklar arasında kendi varlığının farkında olan ve bunu sorgulayan insan “Dasein”, burada olandır. Varlığa gelirken kimse insana bir şey sormamıştır. Yapılması gereken bundan sonra ölmek değildir; anlamaya çalışmak, hayatın ipini ele almaktır. İnsan yazgısını sevmeli ve onun bilincinde olmalıdır.

Varoluşçu filozoflar arasında isminden en çok söz ettiren Sartre bir filozof olmanın yanı sıra iyi bir eleştirmen, yetenekli bir oyun yazarı ve büyük bir entelektüeldir. Bu özellikleri ile Hippolyte Taine ve Zola’yı kendi kişiliğinde birleştirir. “Bunaltı” adlı eseri Sartre’in çok yönlü yazarlığının ispatı niteliğindedir. Sartre bu eseri ile kendine özgü bir evrenin kapılarını okurlarına açar. Bu evrende saçma ve iğrenç bir bir araya gelir ve varoluş anlamsızdır. “Sartre, başlangıçta, bir uyumsuzluk, bir kopuş, bir çatlak, kendinin hafifçe yokluğu tarafından etkilenen bir ‘kendinde mevcudiyet’ ortaya koyar” (Colette, 20006, s. 55). Bireyin kendi varlığını kendi benliğinden doğurmaya çalışması belli başlı baskılardan, normlardan dayatmalardan kurtulması ile başlar. Varlığın özgürlük çabaları sonucunda birey bunaltı içinde uyumsuz bir bireye evrilir.

“Bunaltı [b]ağlanan ve yalnızca olmak istediği kimseyi değil, bir yasa koyucu olarak bütün insanlığı seçen kişi, o derin ve tümel (küllî) sorumluluk duygusundan kurtulamaz. Doğrusu, birçokları bu sıkıntıyı (bu iç daralmasını, bu bungenluğu, bu boğuncu) yaşamazlar. Ama biz

yine de şunu öne süreceğiz: onlar, bunaltılarını maskeleyerek ondan kaçarlar. Nitekim, çoğu kimseler yaptıklarının yalnızca kendilerini bağladığına, yalnızca kendilerini sorumlu kıldığına inanırlar. Bu yüzden “her koyun kendi bacağından asılır” derler. Kalkıp da onlara, ‘ ya herkes de sizin gibi yapıyorsa, o zaman ne olur?’ diye sorarsanız, omuzlarını silkerek cevap verirler: ‘Herkes de böyle yapmaz ki’

Ne olursa olsun, biz yine de durmadan sormalıyız kendimize: ‘Ya herkes de bizim gibi yaparsa sonu nice olur?’ (Bezirci, 1980, s. 59-60).

Öz varoluştan önce gelir fikrini temel dayanak noktası yapan Sartre “varoluşçuluğun papası” olarak Tanrı’nın var olmadığını ve özün insan olduğunu fikrini savunur (Johnston, 2019, s.206). Kendi içinde varlığı oluşturmak bu varlığı hiçliğe götürmektedir. İnsan ne olması gerektiğine dair kesin bir plan ve bilgiye sahip olmadığından kendinde yarattıkları ne ise onun benzeri olacaklardır kısacası “varlık, ne ise odur” (Sartre, 2011, s. 134). Ancak öznenin kendiyile örtüşmesi kendini de yok eder. Diğer taraftan öznenin kendi olmaması da mümkün değildir. Bu tutarsız ve kaygan zemin kendinde mevcut olma durumudur. “Bilincin ontolojik temeli olarak kendi – için’in varlık yasası, kendine mevcut olma biçiminde kendisi olmaktır” (Sartre, 2011, s. 137). Varlığın kendiyile bire bir özdeş olması gerçekte varlığın yokluğunu gerektirir.

“Varlık kendine mevcutsa, bunun nedeni varlığın tümüyle kendi olmamasıdır. Mevcut olmak, örtüşmede dolaysız bir yozlaşmadır, çünkü ayrılığı varsayar. Ama şimdi de kendimize, ‘özneyi kendi kendisinden ayıran nedir?’ diye sorarsak, bunun hiç olduğunu itiraf etmek zorunda kalırız. Genelde bir ayrılmayı ifade eden şey, uzam içindeki bir mesafedir, bir zaman dilimidir, psikolojik bir çatışma ya da sadece aynı anda, aynı yerdeki iki mevcudiyetin bireyselliğidir, kısacası nitelenmiş bir gerçekliktir” (Sartre, 2011, s. 138).

Özneyi kendisinden ayıran hiçlik varlığın sahip olduğu bilinçtir. Hiçlik varlığa varlıkla beraber gelen ve varlığa özgü bir mutlak gerçektir. Hiçlik varlığa ait olduğundan hiçliği yine var eden varlığın kendisidir. Sartre bu varoluş biçimini “kendinde varlık” olarak tanımlar ve bu varlığın sonsuz olduğunu düşünür. İnsan bilincini de “kendisi için varlık” olarak tanımlar ve onu kendinde varlık ile ilişkilendirir. Bu ilişki içinde kendinde varlık olmadan kendisi için varlığın anlamsız kalacağını öne sürer. Kendisi için varlık özünü yine kendisi oluşturmak zorunda olduğundan bu varlık hiçliğe gider ve kesin gerçeklikten yoksun olması hiçliğin sarmalından çıkamamasına neden olur. Kısacası insan anlamsızlık

içinde kendini sürekli oluşturmaya çalışır ve ulaştığı nokta “yokluk”tur. Dolayısıyla Satre’in varoluş

fikrinde anlamsızlık, saçma ve absürdizm vardır. Hayatı boyunca saçmanın içinden kurtulamayacak insan için ölüm de saçmadır.

Sartre insanın dünyaya geldikten sonra kendi özünü ortaya çıkarması gerektiğine inan Tanrı tanımaz bir varoluşçu filozof olarak yalnız, birçok sorumluluğa sahip, terk edilmiş insana büyük sorumluluklar yükler. İnsan kendi edimleri ve eylemleri ile kendi varoluş değerlerini yaratmalıdır. Varoluş felsefesinin temelinde insana değer veren, saygı duyan ve insana nesne olarak değil özne olarak gören bir bakış açısı vardır. “İnsan var olduktan sonra kendini kavradığı gibidir, varlaşmaya doğru yaptığı bu atılımdan (hamleden) sonra olmak istediği gibidir. Kendini nasıl yapıyorsa öyledir yani” (Bezirci, 1980, s. 57). İnsan yaşamının tüm sorumluluğunu üstüne alarak kendi varoluş değerini yaratır. Ancak insan kendi özünü oluştururken sadece kendinden sorumlu değildir, tüm insanlardan sorumludur. Sartre göre bireysel edimler tüm insanlığı etkiler. Edimlerinden dolayı tüm insanlığa karşı sorumlu olan insan özgür olmak zorundadır. “İnsan-gerçekliği yeterince olmadığı için özgürdür, durmadan kendi-kendisinden koparıldığı ve olmuş olduğu şey olduğu ve olacağı şeyden bir hiçlikle ayrıldığı için özgürdür” (Satre, 2011, s. 559).

Sartre’a göre insan Tanrı’yı reddederek kendi varoluşunu gerçekleştirebilir. Tanrı’nın varlığı demek onun var olmadan önce de varlığını kabul etmek demektir. Bu durumda insan kendi varoluşunu gerçekleştiremez çünkü Tanrı insanın varoluşu önünde engeldir. İnsan kendisinin Tanrı olduğu iddiasına yaslanarak özgürlük yönünden sınırlar çizen ve insanın kendini oluşturma gayretlerine engel olan Tanrı’dan kurtulur. Tanrı’nın yok oluşu ile insan kendinde varlık anlayışı içinde etrafını saran tedirginlik ve korkunun atlatılması için tanrı olma isteğine kapılır. Kendini yaratma çabası içindeki insan eylemleri ile saçmadan kurtulmaya çalıştıkça içinde bulunduğu bulantı, anlamsızlık, uyumsuzluk daha da artacaktır. Kısır döngü içindeki insan Tanrı fikrine de sahip olmadığı için eylemlerinin kendine karşı sorumluluğu ile yapayalnız kalacaktır. Ancak insanın içinde bulunduğu anlamsızlık, uyumsuzluk onu varoluşa götürecektir.

Sartre varoluşçulukla beraber bireyin tarihle, toplumla ve kültürel değerlerle bağıni koparır. Bireyin toplumsal sorumluluktan, siyasal eylemlerden kaçınması gerektiğine inanır. İnsanı ussal değil içgüdüsel bir yaşayışa çağırır. Son tahlilde irrasyoneliteye, metafiziğe ve skolastik düşünceye bağlanır. Toplumsal sorunlara bireysel çözümler arar.

Sartre’ın bu görüşlerine ilk olarak öğrencisi Jean Kanapa karşı çıkar. Kanapa’ya göre varoluşçuluk burjuva felsefesidir. Varoluşçuluk insanın umutsuzluk ve terk edilmişliğini evrenselleştirir,

bütün insanlığa mâl eder. İnsanlığa çıkış yolunu göstermediğinden sömürü düzeninin değişmemesine neden olur. Sartre öğrencisi tarafından ağır bir şekilde eleştirilirken Avrupa’da yayılan ve popüler hale gelen varoluşçuluk bu anlayışın karşısında olan filozoflar tarafından insanlık ve özgürlük düşmanı olarak nitelendirilir.

İnsan doğaya yüzyıllar boyunca verdiği şekil ve biçim özelliklerine göre anlam yükler ve değerlendirme yapar. Bu değerlerin yitirilmesi ile dünya bizim için anlaşılabilir olur ve yaşam ile insan birbirinden uzaklaşır. İnsan çevresine yabancılaşmaya başlar, uyumsuzluğu ile doğanın dışına itilir. Gerçeklerin farkına varan insan us gücüyle dünyayı anlamak ve onu insanileştirmek ister. Ancak insan bunu başaramadığında “evreni sevip acı çekebileceğini benimsemediğinde” tam bir uyumsuzluk içinde kısırdöngüye girer ve umutları yok olur (Geçtan, 2013, s. 35). Dünyaya yabancılaşmaya başlayan insan uyumsuzluklar göstermeye başlar. Freud’a göre toplumsalıktan uzaklaşmak insan doğasına aykırıdır çünkü “insan daha çok insan sürüsünün bir hayvanı, önder tarafından yönetilen sürünün bireyidir” (Freud, 2014, s.77). Camus’ya göre ise uyumsuzluğun başlaması aynı zamanda bir uyanıştır. “Bu uyanışın ardından da sonuç gelir zamanla; intihar ya da iyileşme” (Camus, 2014, s.31). Sürüden ayrılan ve kendi varoluşunu anlamaya çalışan insan bu çabasına ve yakarışına rağmen cevapsız kalan soruları karşısında saçma ile yüz yüze kalır. Saçmanın karşısında insan intiharı ya da ölümü tercih etmemelidir. Yaşam her şeye rağmen yaşamaya değerdir. Yaşam mücadelesine devam etmemenin gerekliliğine örnek olarak Camus, Sisifos mitini gösterir. Sisifos<sup>9</sup> için yaşam her türlü hatayı haklı kılacak kadar değerlidir.

Sisifos bilginin peşinde boşa çaba harcayan insanı sembolize eder. Yaşamla mücadele eden insan, yaşamak için kendine neden arayandır. Geleceğe inanan insanlar içindeki yaşama ümidini canlı tutar. Yaşamın güçlüğüne karşı gelerek hayatı yaşamaya değer bulan insanın mücadelesi böylece anlam kazanır. Aksi söz konusu olduğunda Camus’nun “Uyumsuz ve İntihar” başlıklı denemesinin ana sorunsalı olan şu soru karşımıza çıkar: “Yaşamın yaşanmaya değip değmediği?” Bu soru felsefenin temel sorunu olduğundan düşünürler

<sup>9</sup> Tanrılar Sisifos’u bir kayayı durmamacasına bir dağın tepesine kadar yuvarlayıp çıkarmaya mahkum etmişlerdi; Sisifos kayayı tepeye kadar getirecek, kaya tepeye gelince kendi ağırlığıyla yeniden aşağı düşecekti hep. Yararsız ve umutsuz çabadan daha korkunç bir ceza olmadığını düşünmüşlerdi, o kadar haksız da sayılmazlardı (Camus, 2014, s. 137).

kendi cephesinden cevaplar verir. Bu bağlamda Camus hayatın tüm saçmalığı ve anlamsızlığı karşısında insana yaşama tutunmayı önerir. “Camus’nun mutlu hayal ettiği Sisyphos’u Kierkegaard umutsuzluk meydan - okuma figürü olarak görmüştü” (Colette, 2006, s.111).

Sisifos Camus’ya göre uyumsuz bir bireydir. “Tutkularıyla olduğu kadar sıkıntısıyla da uyumsuzdur. Tanrıları hor görmesi, ölüme kin duyması, yaşam tutkusu, tüm varlığı hiçbir şeyi bitirmemeye yönelttiği bu anlatılmaz işkenceye malolur. Yeryüzünün tutkuları için ödenmesi gereken ücrettir bu” (Camus, 2014, s.138). Günümüzün emekçisi hatta beyaz ya da mavi yakalısı da tüm gününü Sisifos gibi geçirir ve uyumsuzluk içinde birbirine benzer günleri yaşar. Kişisel yazgısını gözlemleyen ve kendi yaşamına yöneldiğinde saçmanın kendi varlığından bağımsız olduğunu anlar. Kendisi yok olduğunda saçma var olmaya devam edecektir. Öyleyse Camus’ya göre saçma varlıktan doğmaz. Dolayısıyla insanın yapabileceği tek şey kayanın her zaman yuvarlanacağına farkına varıp yaşamın değersizliği ve kısır döngüsünü hor görmektir. İnsan yaşam içinde, oyun içinde kalmaya çalışmalıdır. Yaşamdan çıkma isteği olan intihar Camus’ya göre bir başkaldırı değildir. “Çünkü intihar başkaldırının mantıksal sonucu değildir. İçerdiği boyun eğiş dolayısıyla onun tam tersidir. İntihar, sıçrama gibi en son noktasına götürülmüş kabullenmedir.[...] İntihar uyumsuzu kendince çözer” (Camus, 2014, s.68).

### **3. GELENEKLE BAĞLARINI KOPARAN BİR OYUN: “DİKKAT KÖPEK VAR”**

Dikkat Köpek Var adlı oyun Absürt tiyatroya özgü nitelikleri ile Türk tiyatrosunun özgün ürünlerinden biridir. Oyun tek perde ve tek sahneden oluşur. Oyun kişileri Delikanlı, Adam (Baba), Kadın (Anne), Doktor ve Genç Kız’dır. Oyunda zaman ve mekân öğeleri belirsizdir. Anday eserindeki yer alan birçok temaya nazaran “Bu dünya mantıkla yürümüyor” düşüncesini öne çıkararak Delikanlı’nın aykırı ve uyumsuz yaşamına okuyucuların/izleyicilerin bir an için durup bakmasını ister.

Oyunda yer alan kişilerin her birisinin isimsiz oluşu Absürt tiyatronun evrensel niteliğine uygundur. Bu oyunlarda yer alanlar tipik özelliklere sahip, her yerde görülebilecek insan profili yansıtılır. Doktor yasakları, Anne yasakların altında ezilenleri temsil ederken Baba da yasaklara boyun eğen ve düzenin uyumlu insanını simgeler. Oyunda yer alan isimsiz kişiler, zaman ve mekân öğelerinin sahip olduğu özellikler ile sınırları ve kalıpları yıkar. Absürt tiyatrodaki zaman mekân belirsizliği, kişi kullanımından kaçınmak, kişi

betimlemelerine yer vermemek en sık rastlanan özelliklerdendir. Oyun kişileri belli bir zümreyi değil tüm insanlığı temsil eder. Çünkü oyundaki karakterlerin iç yaşantılarına ilişkin herhangi bir ipucu yoktur. Karakterlerin sürekli kafalarında açıkça ifade edemedikleri ya da ifade etmek istemedikleri konular bulunması karakterlerin ortak özelliklerindedir.

Adam: “İyi bildiniz, karım yatalaktı. Nikahımız yatak odasında kıyıldı. Düğünümüz de yatak odasında yapıldı. Çok güzel bir düğün oldu. Maskeli idi davetlilerimiz... İçki içilmedi, yemek yenilmedi, konuşulmadı. Hiç konuşulmadı. Çünkü kimse kimseyi tanııyordu. Kimseye davetiye yollamamıştık. Ama birden öyle bir kalabalık bastırdı ki, cehenneme döndü evin içi. Evet cehenneme döndü. Anlıyor musunuz?” (Anday, 2014, s.106).

Absürt tiyatrodaki grotesk özelliklerden dolayı oyun kişileri abartılmış hareketler sergiler, sürekli kendilerini tekrar eder ve gezevelik ederek, evelme – geveleme düzeyindeki ‘çok sesli’ diyaloglarla anlamsızlığın temelini oluşturan doğal bir dil kullanılır. Oyunlarda kaba güldürü kendini hissettirir. Alaycı etkiyi arttırmak için normal aile bireylerinden uzak, geleneksel mekânlardan ayrı bir yapı kurgulanır. Törenelliğe tepki, klişelere karşı çıkış, mantık ve düzen çerçevesine uymayan duygular vardır.

Delikanlı: “Hayır. Ben işsizim, onun için gündüzleri bol bol dolaşabiliyorum. Elime bir kitap alıp hoşlandığım bir yerde oturuyorum. Bugün de yolum buraya düştü. Çok güzel bir yer doğrusu... Bu yol, bu ağaçlar, bu parmaklı kapı, bahçeniz... Fırsatı kaçırmayayım dedim. (Durur.) İyi etmedim mi?”

Kadın (Sert): Kızım, kendisine sokakta evlenme teklif edilmesinden hiç hoşlanmaz.” (Anday, 2014, s.103).

Oyun kişilerinin isimleri olmadığı gibi fiziki ve psikolojik hiçbir özelliğine değinilmez. Kişiler derinlikli olarak çizilmeyerek kuklalaştırılır. Mekanik hareketlere sahip kişiler ya evden çıkar ya da eve girer. Delikanlı da bir sırada oturarak kitap okur, oturduğu sıranın arkasında bulunan bahçeli evden çıkan Genç Kız, Adam ve Kadın’la konuşur. Oyundaki devinimi sağlayan diyaloglar dışında Delikanlı’nın birkaç eylemi ile dramatik aksiyon hareketlenir. Delikanlı’nın Genç Kız’ı gördükten sonra evlenmeye, iş bulmaya karar vermesi, levhayı ters çevirmesi bunlardan birkaçıdır.

Delikanlı: “Demin bu evden genç bir hanım çıktı, kendisine evlenme teklif ettim, babamla konuşun dedi. Siz o genç hanımın annesi misiniz?”

Kadın: Evet, ne olacak?

Delikanlı: Kızınızla evlenebilir miyim?

Kadın: Kızım, babamla konuşun dediğine göre neden babasına sormadınız?

Delikanlı: Babasına sordum, sizinle konuşmamı söyledi.

Kadın: Bana sormanızı mı söyledi? Çok tuhaf doğrusu.

.....

Delikanlı (Kitabını koltuğunun arasına sıkıştırır): Ben de gideyim, kendime bir iş arayayım. (Durur, göğüs geçirir.) Nerde arayayım? Hiç bilmiyorum. “Dikkat köpek var” diye levha asmasını biliyorlar da, “Dikkat iş var” diye levha asmıyorlar hiçbir yere. (seyircilere doğru gelir.) Bana ‘Ne iş yaparsın?’ diye sorsalar, ne derim ben? Çok canm sıkılıyor buna!” (Anday, 2014, s. 102-109).

Oyun kişilerinin eylemleri ve söylemleri birbirini tutmaz. Kişiler eylemsizdir ya da çok az eylemde bulunur. Kadın’ın, Genç Adam’dan istediği şey oturduğu sırada beklemesidir yani eylemsiz kalmasıdır. Oysaki Delikanlı harekete geçip kendine iş bulmak ister. Delikanlı’nın iş aradığı sırada annesi kızının doktorla evlendiğini söyler. Doktor maskesiyle ve sahip olduğu ev ile aileyi sınırlar ve eve hapseder. Yine ev sahibi Doktor tarafından asılan Dikkat Köpek Var levhası absürt özelliği ile dikkati çeker. Aynı zamanda bu levha tehdit ve baskı unsurudur. Kızla evlenmek isteyen erkekleri evden uzak tutar.

Delikanlı: Ben bu işlerin acemisiyim. Ne yapayım?

Adam: Ben değilim. Yüzlerce kişi geldi buraya, kızımı istemeye. Hepsi ile konuştum. Hepsine söyledim, dinletemedim.

Delikanlı: Bana da söyleyin, hangi yolu tutayım?

Adam: Önce köpeğe alışın, köpeğe! [...] (Anday, 2014, s. 108).

Oyun kişilerinin ortak özelliği topluma yabancılaşmış toplumdaki uzak kimseler olmalarıdır. Oyunda kadın ve adamın evlilik törenindeki gariplikler topluma yabancılaşmış insanların varlığını belirginleştirir. Düğüne gelenlerin maskeli olması, davetlilerin kimler olduğunun bilinmemesi, düğünün yatak odasında yapılması ve düğünün cehenneme dönüşmesi yabancılaşmaya, uyumsuzluğa örnektir.

### **Uzaman ve Zamanın Belirsizliği**

Oyunda zamana ve mekâna dair netlik yoktur. Zamana dair en net ifadelerden biri adam ve kadının 40 yıldır evli olmasıdır. Diğer zamansal ifade Delikanlı’nın kapı önünde geçirdiği yarım saatlik ara zamandır. Kısa sürede birbirlerini tanımaya çalışan oyun kişileri diyalog

halinde konuşma görüntüsü içinde kendi problemlerini genele yayar. Cehenneme benzeyen bir törenle evliliğe adım atan Kadın evliliği boyunca bir gün bile mutlu olamadığından bahseder. Hiçbir kadının evliliğinde mutlu olamayacağına dair bir genelleme yapar ve kızını bu genellenenin dışında tutmak ister.

Ailenin kiracı olarak yaşadığı ve kapısında “Dikkat Köpek Var” levhası asılı olan ev oyunda yer alan tek uzamdır. Bu uzam içinde hapsolmuş aile bireyleri içeriye girilmesi yasak bir eve sahiptir. Bu özelliği ile ev dışarıdan gelen herkese kapalıdır, iletişimsizliğin ana mekânıdır. Ayrıca dışarıdan gelecek belirsiz tehlikelere karşı tedirginlik ve korkuyla bekleyen aile karşılaştıkları tehlikeyle beraber varoluş güvencesini kaybeden insanlığı temsil etmesi bakımından mekânın işlevselliğine katkı sunar. Korkunun gölgesinde yaşanan hayat zamanla çekilmez ve anlamsız olur.

Delikanlı: Ya bu bağıran?

Kadın: Kocam... Evet, kocam. Kızımıza ne zaman bir kısmet çıksa da gelip şu sırada otursa, kocam köpek gibi havlamaya başlar. (Köpek havlarken sıraya oturur ve ağlamaya başlar, konuşurken mendiliyle burnunu siler.)

Delikanlı: Birden her şey aydınlığa kavuşuyor öyle ise. Kocanız bana köpeğe alışın demişti. Demek kendisine alışmamı istiyor.

Kadın: (Ağlayarak): Bir gün bile mutlu olmadım kocamla. Gerçekte hiçbir kadın mutlu olamaz, bunu da bilmiyor değilim. Ama ben çabaladım mutluluğumuz için, hasta oldum. Yatakta yattım, düşünün kırk yıl hep o doktorun yüzüne baktım, gece gündüz. Evet, gece gündüz ya... Siz ne sanıyorsunuz? (Anday, 2014, s. 111)

Dar mekân özelliğine sahip olan yatak odası kadının ev içindeki hücrelidir. Bu hücre içinde kadın bunaltı içindedir ve zoraki bir yaşama mahkum edilir. Kiracı olarak uzun süredir aynı evde yaşayan aile bireylerinin hayatı dış dünyadan soyutlanır. Bu yaşam biçimi Kadın’ın hayatını ‘felce’ uğratar. Cehenneme benzeyen düğünle başlayan evlilik hayatı yıllarca aynı durağanlıkla devam eder. Yaşamdaki sıradanlığın nedeni bahçe kapısındaki levhadır. Çünkü bu levha tehdit unsuru olarak eve girmek isteyenleri korkutur, kurulan düzenin devamını sağlar. Levhanın kaldırılması ya da Delikanlı’nın yaptığı gibi levhanın ters çevrilmesi bir eşiğin geçilmesini, bireylerin özgürleşmesini ve

mutluluğa erişmeyi sağlar. Delikanlı'nın kararlı ve cesur tavrı Doktor'un otoristesini, kurulan düzeni yıkar.

Delikanlı: “ Beni bu levha ile korkutamazsınız.

Doktor: Dinleyin, dinleyin! Bu levhayı gördüğünüz halde gene de kıza âşık olmadınız mı?

Delikanlı: Oldum, evet. Bunu saklamıyorum ki... Ancak siz de şunu unutmayın, köpeğin sesini duymadan âşık oldum.

Doktor: O ses sizin içinizden geliyordu. Bahçede köpek olmadığını pekala biliyorsunuz.

Delikanlı: Beni kandıramazsınız. Hiçbir engelden yılmayacağım. Kızı bekleyeceğim burada

Doktor: Yanlış, çok yanlış. Kızı beklerseniz annesi ölür. Seçin birinden birini. Aşk mı, ölüm mü?

Delikanlı: Maskeni çıkar şeytan!

Doktor: Peki. (Maskesini çıkarır, altından başka bir maske, bir köpek maskesi çıkar.) İşte çıkardım. Dikkat!

Delikanlı: Köpek!

Doktor: Git burdan, düzeni bozma! İçerde hastam var.

Delikanlı: Sen bana karışamazsın.

Doktor: Bu evin sahibi benim.

Delikanlı: Yolun da sahibi değilsin ya...

Doktor: Kız dönmeden git diyorum sana.

Delikanlı: Gitmiyorum.

Doktor: (Havlamaya başlar.): hav hav hav..

Delikanlı: (Geriler): Gitmiyorum.

(Doktor havlaya havlaya behçeden içeriye girer)

Delikanlı: Bugünü kendimden yana çevirmek elimde benim. Nasıl mı? Bakın! (Gider, “Dikkat köpek var!” levhasını tersine çevirir) İşte bu kadar kolay.

(Kıza koşa koşa gelir. Delikanlı'yı görünce bir an durular. Sonra onun boynuna atılır, sarılırlar, böyle sarmaş dolaş sallanırlar kendi çevrelerinde)” (Anday, 2014, s. 114-115).

### **Yasağın Çiğnenmesi ve Kaderin Dönüşümü**

Kişi haklarına, siyasal ve sosyal olaylara yönelik göndermeler de sahip olan oyun bu özellikleri ile toplumsal eleştirileri de dile getirir. Bu eleştiriler Absürt tiyatro'nun özellikleri bağlamında absürt bir şekilde aktarılır. Delikanlının işsiz, parasız ve umutsuz

olması ile övünmesi ve bu özelliği ile ideal damat adayı olduğunu söylemesi, hakkını arayan kiracılara sendikanın sahip çıkmaması, evlilikle ilgili töresel düzenin devam etmesi, Delikanlı'nın baskı unsuru otoriteriye karşı tepki vermesi oyunun yazıldığı 70'li yıllara dair toplumsal problemlere göndermelerdir. Ayrıca oyunda 'kendinizi üstün insan sanıyorsunuz' ifadesi Nietzsche'ye bir gönderme olarak okunabilir.

Oyunda yer alan çelişkili durumlar da oyunun Absürt tiyatro bağlamında değerlendirilmesine katkı sunan diğer özelliklerdir. Kadının kocası tarafından yatalak olarak nitelendirilmesi ancak kadının her gün jimnastik yapması, yemek pişirip ortalığı topladıktan sonra yatağa girip doktoru beklemesi, Kadın'ın kocasının uzun yıllardır görmediğini

söylenmesine rağmen Adam'da öyle bir problemin olmaması, levhada bir köpeğin olduğunu yazmasına rağmen bahçede köpeğin olmaması oyundaki çelişkiler olup oyunun absürt yönlerini destekler. Kadının yatalak olması onun pasif bir direniş içinde olduğunu, Adam'ın yaşadığı düzen içinde hiçbir şeye ses çıkarmaması, yaşananları görmemesi olaylara karşı kör olduğunu imler.

Levhadan kurtulmak demek Doktor'dan, maskeli yüzlerden, sahte insanlardan, baskıdan kurtulmak olacağı için harekete geçip levhayı ters çevirmek bile alışılmış olanı değiştirir. Delikanlı Camus'un insanlara önerdiği harekete geç ve kaderini değiştir inanışına göre hareket ederek hem kendi hem de başkalarının hayat akışını değiştirir. Yaşığı çiğneyerek yalnızlıktan kurtulur. Levhanın ters çevrilmesiyle "kısacık bir an içinde 'geçmiş'in tutsaklığından 'gelecek'in özgürlüğüne geçilir" (Yüksel, 1997, s. 59).

#### **4. SONUÇ VE DEĞERLENDİRME**

Melih Cevdet Anday yazdığı on oyun ile Türk tiyatrosunun gelişimine katkı sunan isimlerden biridir. "Dikkat Köpek Var" adlı oyun ile geleneksel tiyatro anlayışının dışına çıkan ve tiyatromuza farklı bir perspektif kazandıran yazar, sevginin önündeki engeli aşmada insanları cesaretlendirmeye çalışır. Topluma yabancılaşmış, uyumsuz, mutsuz bireyleri eylemsizliklerinden, iletişimsizlikten uzaklaştıklarında mutlu olabileceklerine inandırma gayretindedir. Mekânı ve zamanı belirsizleştirerek okuyucuya/izleyiciye evrensel olanı sunarken isimsiz kişilerle de izleyiciyi oyunla bütünleştirir, insana ait varoluş probleminin sürekliliğine dikkat çeker. İzleyicinin gündelik hayatında yaşadığı varoluşsal sıkıntılarla ve zamanın ruhundan kaynaklı problemlerle yüz yüze gelmesini

sağlayarak oyun içinde izleyecinin çözüm yollarını aramasına olanak tanınması eserin Absürt tiyatrodan ayrılan yönünü ortaya koyar. Yabancılaşan ve iletişimsizlikle başbaşa olan insana varoluşunu hatırlatır ve insana kendi özüne, ben'ine döndüğünde yaşadığı problemlerin üstesinden gelebileceğini hatırlatır. Oyunda kullanılan doğal, akıcı ve göndermelerle dolu dil yazarın birçok türde yetkin eserler vermesinin neticesinde ortaya çıkar. Gerçekçi oyun kişilerinin canlı bir söyleşim düzeni içindeki diyalogları oyunun biçimsel niteliğine katkı sunar. Sahip olduğu bu özelliklerle sahnelenme tekniğine de uygun olan oyun, Türk rejisölerinin ilgisini beklemektedir.

**Doç. Dr. Nurten Ayten UYANIK (Orcid ID: 0000-0002-8912-0361)**

Isparta Uygulamalı Bilimler Üniversitesi, Teknik Bilimler Meslek Yüksekokulu

### **ÖZET**

Yöne bağlı özelliklerin değişimini gösteren anizotropi kavramı betonun en önemli özelliği olan dayanımının belirlenmesi açısından önemli bir parametredir. Zira betonun dayanımı ölçü alım yönüne bağlı olarak farklılık göstermektedir. Beton dayanımı tahribatlı olarak Tek Eksenli Basınç Dayanım Testi (TEBD) ile belirlenmesinin yanı sıra tahribatsız test teknikleri ile de belirlenebilmektedir. Bu amaçla yapılan çalışmada farklı mukavemet özellikleri gösteren beton tasarımlarına ait hazırlanan küp numuneler üzerinde jeofizik yöntemlerden Sismik Ultrasonik yöntem ve Elektrik Özdirenç yöntemleri uygulanmıştır. Bu amaçla kübik numunelerin karşılıklı iki yüzeyinden Sismik Ultrasonik P dalga ölçümleri yapılmıştır. Ayrıca numunenin her yüzeyde iki diyagonal özdirenç ölçümü

yapılmıştır. Hazırlanan numuneler su ve hava kürüne tabi tutulmuştur. Beton numunelerinin sismik hız ve özdirenç anizotropileri literatürde verilen anizotropi bağıntıları kullanılarak belirlenmiştir. Sonuç olarak, özellikle özdirenç anizotropisi üzerinde kür koşullarının çok etkili olduğu belirlenmiştir.

**Anahtar Kelimeler:** Beton, Anizotropi, Sismik Ultrasonik Yöntem, Özdirenç Yöntemi, Tek Eksenli Basınç Dayanımı Testi

## **THE ANISOTROPY OF CONCRETE FROM GEOPHYSICAL METHODS**

### **ABSTRACT**

The concept of anisotropy, which shows the change of properties depending on the direction, is an important parameter in terms of determining the strength, which is the most important property of concrete. In as much as the strength of concrete differs depending on the direction of measurement. Concrete strength can be determined destructively with the Uniaxial Compressive Strength (UCS) Test, as well as by non-destructive testing techniques. For this purpose, Seismic Ultrasonic method and Electrical Resistivity methods, which are geophysical methods, were applied on cube samples prepared for concrete designs with different strength properties. For this purpose, Seismic Ultrasonic P wave measurements were made from the two opposite surfaces of the cubic samples. In addition, two diagonal resistivity measurements were made on each surface of the sample. The prepared samples were subjected to water and air curing. The seismic velocity and resistivity anisotropies of concrete samples were determined using the anisotropy relations given in the literature. As a result, it was determined that curing conditions were very effective especially on resistivity anisotropy.

**Keywords:** Concrete, Anisotropy, Seismic Ultrasonic Method, Resistivity Method, Uniaxial Compressive Strength Test

## 1. GİRİŞ

Jeofizik yöntemler, betonun fiziksel özelliklerinin belirlenmesinde betona hiçbir zarar vermediği için akademik çalışmalarda etkin bir biçimde kullanılmaktadır (Uyanık, (1999; 2012); Uyanık vd. (2012a; 2012b; 2012c; 2013; 2019); Uyanık ve Tezcan, 2012; Öziçer ve Uyanık, 2017; Sabbağ ve Uyanık, (2016; 2017; 2018a; 2018b; 2018c; 2020); Ekin, (2021a; 2021b); Ekin ve Uyanık, (2021a; 2021b)). Bu yöntemlerle, beton dayanımının belirlenmesi, donatı yerleşiminin veya sayısının tespiti ve ayrıca malzemelerin imalat sırasında veya belirli bir kullanım süresinden sonra içyapısındaki çatlak, kırık veya boşlukların tespiti yapılabilmektedir. Yapı ile ilgili sorunlar yapı analizinin önemini artırmıştır (Sabbağ ve Uyanık, 2017; Ekin, (2021a; 2021b); Ekin ve Uyanık, 2021b). Kompozit bir malzeme olan ve yapay kaya olarak kabul edilen beton, yapısı ve bileşenleri itibariyle heterojen bir yapıya sahiptir. Bu durumda tahribatsız muayene teknikleri ile beton üzerinde alınan ölçümler, yönlere bağlı olarak farklı değerler alabilmektedir. Bu nedenle ultrasonik ve elektriksel yöntemler gibi jeofizik yöntemler kullanılarak betondaki anizotropiyi belirlemek mümkündür (Ekin ve Uyanık, 2021b).

Elektrik özdirenç yöntemi, betondaki kırık ve çatlaklar, hasarın derecesi ve nem hakkında bilgi verebilen tahribatsız bir değerlendirme yöntemidir. Ultrasonik yöntemler ise kompozit malzemelerin anizotropik ve doğrusal olmayan elastik davranışlarından dolayı bu malzemelerin yapısal özelliklerini araştırmak amacıyla kullanılabilir (Bucur ve Rasolofosaon, 1998). Suya doymuş kayaçlardaki P dalga hızı anizotropisi, basınçtaki büyük değişiklikler nedeniyle kuru kayalarda daha zayıftır (Beres vd., 2013).

Kırık yoğunluğuna bağlı olarak suya doymuş numunelerdeki hızların kuru numunelere göre daha büyük olduğu görülmüştür (Prasad ve Nur, 2003; Best vd., 2007). Kırık yoğunluğu arttıkça, suya doymuş ve kuru numuneler arasındaki fark daha büyük olur (Beres vd., 2013). Anizotropi miktarı, kayadaki kırık yoğunluğuna ve kırık içeren kayanın mekanik özelliklerinden dolayı su içeriğindeki farklılıklara ve kırık içerisindeki dolgularla etkilenen ve birbirine bağlı olan kırıkların varlığına bağlıdır (Rüger ve Tsvankin, 1997; Chapman vd., 2003).

Bu çalışmada, anizotropinin beton üzerindeki ölçümlere etkisini ortaya çıkarmak için kullanılan 150 mm<sup>3</sup> boyutundaki küp numuneler düşük, orta ve yüksek dayanım özelliklerine sahip 3 farklı beton olarak tasarlanmış ve hazırlanmıştır. Kür koşulları ultrasonik hızlar, elektrik özdirenç değerleri ve aynı zamanda anizotropi üzerinde çok

etkilidir. Bu nedenle numuneler su ve hava kürüne tabi tutulmuştur. Numunelerin karşılıklı iki tarafından ultrasonik P dalga ölçümleri uygulanmış ve 4 yüzeyinden ikisi birbirine diyagonal (90°) olmak üzere toplam 8 görünür özdirenç değeri elde edilecek şekilde elektrik özdirenç yöntemi uygulanmıştır. Kür koşullarının farklılığına bağlı olarak beton numuneler üzerinde anizotropinin etkileri jeofizik yöntemler ile belirlenmiştir.

## 2. YÖNTEM

### 2.1. Sismik Hızlardan Anizotropi

Sismik hızlardan anizotropi derecesi ( $A_n$ ) aşağıdaki bağıntıdan hesaplanabilmektedir.

$$\% \text{ Anizotropi } (A_n) = \left[ \frac{V_{max} - V_{min}}{V_{ort}} \right] \times 100$$

(1)

Buna göre P dalga hızı anizotropisi aşağıdaki bağıntıdan hesaplanabilir.

$$\% (A_p) = \left[ \frac{V_{Pmax} - V_{Pmin}}{V_{POrt}} \right] \times 100$$

(2)

Burada P dalga hızları için ortalama hız aşağıdaki bağıntıdan hızların maksimum ve minimum değerlerinin ortalamaları alınarak belirlenebilir (Walker ve Wookey, 2012; Chen vd., 2017).

$$V_{POrt} = \frac{V_{Pmax} + V_{Pmin}}{2}$$

(3)

### 2.2. Özdirenç Yönteminde Anizotropi

Anizotropi, ölçüm yönüne göre elektriksel farklılıklar sergilemektedir. Dolayısıyla belirli bir noktada ( $R_{max}$  ve  $R_{min}$ ) birbirine dik olarak yapılan ölçümlerden elde edilen görünür özdirenç değerlerinin oranlanmasıyla Özdirenç Anizotropi derecesi ( $A_R$ ) elde edilmektedir (Lataste vd., 2008). Bu çalışmada, özdirenç anizotropisi ( $A_R$ ) aşağıdaki denklem kullanılarak belirlenmiştir (Udosen ve George, 2018).

$$\% (A_R) = \frac{1}{2} \frac{(R_{max} - R_{min})}{R_{Ort}} \times 100$$

(4)

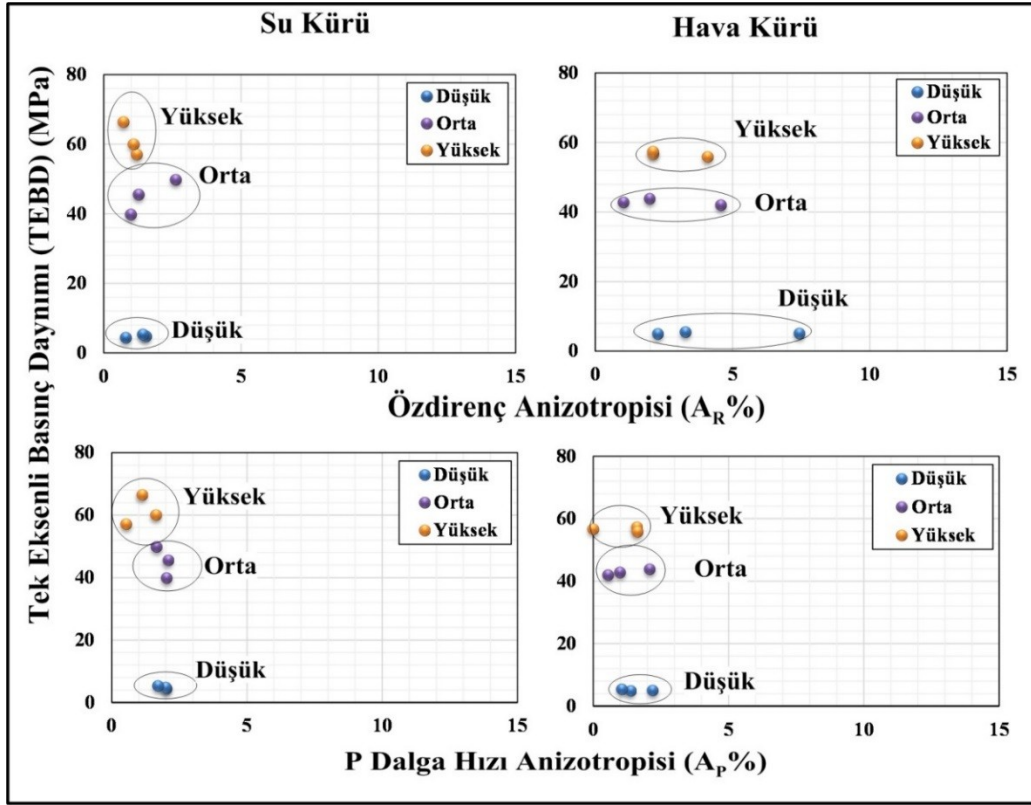

Ortalama özdirenç ( $R_{Ort}$ ), maksimum ( $R_{max}$ ) ve minimum ( $R_{min}$ ) özdirenç değerlerinin ortalamaları alınarak belirlenebilir.

$$R_{Ort} = \frac{R_{max} + R_{min}}{2}$$

(5)

### 3. BULGULAR

Düşük, orta ve yüksek dayanımlı betonların sismik P dalga ve özdirenç anizotropileri sırasıyla Eşitlik 2 ve Eşitlik 4 kullanılarak hesaplanmıştır (Şekil 1).

Şekil 1. Düşük, orta ve yüksek dayanımlı betonların sismik P dalga ve özdirenç anizotropileri

Buna göre özdirenç anizotropisi su küründeki numunelerde %0-3 ve hava kürü numunelerinde %1-8 arasında elde edilmiştir. Benzer şekilde P dalga hızı anizotropisi %0-2.2 aralığında değişmektedir. Su kürü için özdirenç ve P hızı anizotropi sınır değerleri %0.8-2.6 ve %0.5-2.07 ve hava kürü için %1.03-8.18 ve %0.0-2.20 arasında elde edilmiştir.

### 4. SONUÇ VE DEĞERLENDİRME

Betonarme içindeki anizotropi, jeofizik yöntemlerle tahribatsız olarak belirlenebilir. Betonun kür koşulları ve dayanımlarındaki farklılık anizotropi üzerinde çok etkili olmakla birlikte sismik yöntemle belirlenen etki özdirenç ile belirlenenden farklıdır. Betonarme numunelerin farklı yüzeylerinden elde edilen sismik hızlar su ve hava küründe önemli ölçüde değişmezken, özellikle hava kürü numunelerinde aynı numunelerin farklı yönlerinden elde edilen özdirenç değerleri oldukça farklı elde edilmiştir. Bunun nedeni

numunelerdeki gözeneklerin hava ile dolması ve gözeneklerin dağılım yönüne daha duyarlı olması olabilir. Sonuç olarak, jeofizik yöntemler gözeneklerin yönü ve doygunluğu açısından değerli sonuçlar vermektedir.

Özdirençten elde edilen anizotropi değerleri, su kürü numunelerinde sismik hızlardan elde edilen değerlerden daha düşük iken, hava küründeki numuneler için tam tersi bir durumdur. Bu, özdirençin gözeneklerdeki hava dolgusuna karşı daha duyarlı olduğunun bir göstergesidir. Bu nedenle özdirenç yöntemi anizotropiyi belirlemede ultrasonik yöntemle göre daha iyi sonuçlar vermiştir. Hava küründe betonarme dayanımının azalmasıyla özdirenç anizotropisi (%1.03-8.18) artmıştır.

Anizotropi değerinin yüksek olduğu beton numunelerinin tek bir yönde yapılan tek eksenli basınç test sonucunun güvenilirliğini artırmak için çok fazla numune alınmalı ve deney yapılmalıdır. Bu durum fazla maliyet ve hasarlı yapıların oluşmasını sağlamaktadır. Bu yüzden jeofizik yöntemler hem maliyet hem de yapıya zarar vermemesinden dolayı ayrıca beton dayanımı yanı sıra betonun diğer fiziksel özelliklerini de belirlemesi açısından yapı analizlerinde etkin bir biçimde uygulanması önerilmektedir.

## **ULTRASONİK VERİLERE BAĞLI YAPAY SİNİR AĞLARI (YSA) İLE BETON DAYANIMININ BELİRLENMESİ**

**Doç. Dr. Nevbahar EKİN (Orcid ID: 0000-0003-4959-8077)**

Süleyman Demirel Üniversitesi, Mühendislik Fakültesi Jeofizik Mühendisliği Bölümü

### **ÖZET**

Bu çalışmada, beton mukavemetlerindeki farklılık, donatı çapı, kür koşulları, zaman, öz direnç ve sismik hız verileri gibi parametreler kullanılarak Yapay Sinir Ağları (YSA) yöntemi ile beton dayanımı tahmin edilmeye çalışılmıştır. Bu amaçla donatısız ve içerisinde bir adet 10, 14 veya 20 mm çapında donatı bulunduran beton numuneleri üzerinde 90 gün boyunca belirli aralıklarla ölçümler yapılmıştır. Numunelerin bir kısmı su kürüne bir kısmı da hava kürüne tabi tutulmuştur. Yapılan çalışmada beton numuneler üzerinde Jeofizik yöntemlerden Elektrik ve Sismik Ultrasonik yöntemler uygulanarak elde edilen verilerden yararlanılmıştır. Ayrıca tahribatlı bir yöntem olan Tek Eksenli Basınç Dayanım (TEBD) Testi sonucunda elde edilen beton basınç dayanım değerleri de değerlendirmede kullanılmıştır. Böylece elde edilen bütün parametreler göz önünde bulundurularak YSA yönteminde çapraz geçerlilik tekniği kullanılarak yapılan değerlendirmeler sonucunda beton dayanımı tahmin edilmeye çalışılmıştır.

**Anahtar Kelimeler:** Beton, Dayanım, Donatı, Yapay Sinir Ağları (YSA), Elektrik Yöntem, Sismik Ultrasonik Yöntem

**DETERMINATION OF CONCRETE STRENGTH WITH ARTIFICIAL NEURAL NETWORKS (ANN) DEPENDENT ON ULTRASONIC DATA**

**ABSTRACT**

In this study, concrete strength was tried to be estimated by Artificial Neural Networks (ANN) method by using parameters such as difference in concrete strength, reinforcement diameter, curing conditions, time, resistivity and seismic velocity data. For this purpose, measurements were made at regular intervals for 90 days on reinforced concrete samples without reinforcement and containing a 10, 14 or 20 mm diameter reinforcement. Some of the samples were water cured and some were air cured. In the study, the data obtained by applying electrical and seismic ultrasonic methods from non-destructive geophysical methods on concrete samples were used. In addition, the concrete compressive strength values obtained as a result of the Uniaxial Compressive Strength (UCS) Test, which is a destructive method, were also used in the evaluation. Considering all the parameters obtained in this way, the concrete strength was tried to be estimated as a result of the evaluations made using the cross validation technique in the ANN method.

**Keywords:** Concrete, Strength, Reinforcement, Artificial Neural Networks (ANN), Electricity Method, Seismic Ultrasonic method

## 1. GİRİŞ

Betonun kalite kontrolünün bir göstergesi olan dayanımının belirlenmesi oldukça önemlidir. Günümüzde tahribatsız test teknikleri sayesinde yapıya veya üzerinde ölçü alınacak betona herhangi bir zarar vermeden dayanımını belirlemek kolay ve hızlı olmaktadır (Uyanık, (1999; 2012); Uyanık vd. (2012a; 2012b; 2012c; 2013; 2019); Öziçer ve Uyanık, 2017; Ekin ve Uyanık, (2021a; 2021b); Uyanık ve Tezcan, 2012; Sabbağ ve Uyanık, (2016; 2017; 2018a; 2018b; 2018c; 2020); Ekin, (2021a; 2021b)). Gelişen bilgisayar teknolojisi sayesinde ise bu durum bir adım daha ileriye taşınarak yapay zeka teknikleri ile daha güvenilir sonuçlar elde edilmesi sağlanmaktadır. Yapay zeka yöntemlerinden Yapay Sinir Ağları (YSA) yöntemi bu anlamda oldukça kullanışlıdır (Acır, 2007; Albayrak vd., 2013; Sabbağ, 2016). YSA yöntemi başta inşaat mühendisliği olmak üzere bir çok mühendislik dalında yaygın bir şekilde kullanılmaktadır (Cladera ve Mari, 2004; Zhao vd., 2005; Chiang ve Yang, 2005; Yüzer vd., 2007).

Bu kapsamda yapılan çalışmada, Jeofizik yöntemlerden Sismik ve Elektrik yöntemler kullanılarak hazırlanan donatılı ve donatısız beton numuneler üzerinde ölçümler alınmıştır. Elde edilen Sismik hız ve Özdirenç değerlerinin yanı sıra Tek Eksenli Basınç Dayanım (TEBD) ile belirlenen beton dayanımları, donatı çapı, kür koşulları ve zaman gibi parametreler de kullanılarak Yapay Sinir Ağları (YSA) yöntemi ile beton dayanımı tahmin edilmeye çalışılmıştır. Hazırlanan donatılı numunelerin içerisinde birer adet 10, 14 veya 20 mm çapında donatı bulunmaktadır. Numunelerin bir kısmı su kürüne bir kısmı da hava kürüne tabi tutulmuştur. Tahribatsız ölçümler 90 gün boyunca belirli aralıklarda devam etmiş, 7., 28. ve 90. gün sonlarında TEBD testi ile beton dayanımları belirlenmiştir. YSA yönteminde çapraz geçerlilik tekniği kullanılarak yapılan değerlendirmeler sonucunda beton dayanımı tahmin edilmeye çalışılmıştır.

## 2. YÖNTEM

### 2.1. Yapay Sinir Ağları (YSA)

Yapay Sinir Ağları tekniği insan beyni çalışma prensibini kendine model edinerek öğrenme yolu ile otomatik olarak yeni bilgiler oluşturma amacı ile geliştirilen bilgisayar sistemleridir. Biyolojik bir nöron sinir hücresi, çekirdek, gövde, dentrit ve akson olmak üzere 4 ana kısımdan oluşmaktadır (Şekil 1). Kısa ve dallanmış bir uzantı olan dentrit giriş bilgilerini alırken, uzun ve tek bir uzantı şeklinde olan akson ise çıktı bilgilerini diğer sinir hücrelerine

taşımaktadır. Akson ve dentritin birleşim yeri olan sinaps ise sinir hücrelerinden aldığı sinyalleri değerlendirerek ve eşik değeri üzerinde bir girdi varsa bir sonraki hücreye iletmektedir (Sabbağ, 2016).

Şekil 1. Biyolojik sinir hücresi ve çalışma prensibi (www.biyodoc.com)

Yapay sinir ağlarında yeterli miktarda giriş ve çıkış parametresinin olması gerekmektedir. YSA'da biyolojik sinir ağlarının sinir hücrelerine benzer yapay sinir hücreleri mevcuttur. Biyolojik sinir sistemindeki nöron YSA'daki işlem elemanına, dentrit toplam fonksiyonuna, sinapslar ağırlıklara, akson nöron çıktısına ve hücre yapısı transfer fonksiyonuna karşılık gelmektedir. Yapay sinir hücresi; girdiler ( $X_n$ ), ağırlıklar ( $W_n$ ), toplam fonksiyonu ( $\Sigma$ ), transfer fonksiyonu  $F(\Sigma)$  ve çıktı ( $y$ ) olmak üzere beş ana kısımdan oluşmaktadır (Tsoukalas ve Uhrig, 1997; Kızıllan vd., 2006).

## 2.2. Çapraz Geçerlilik (Cross-Validation) Tekniği

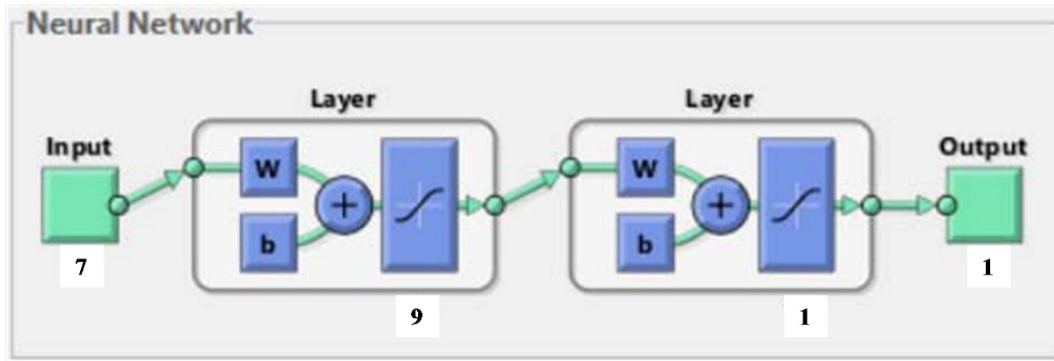

Sınırlı sayıda veri bulunması durumunda çapraz geçerlilik (cross validation) yöntemi kullanılabilir (Lee vd., 2007). Bu yöntemde veriler rasgele eşit 5 parçaya ayrılmıştır. İlk olarak 1. parça üzerinden model tespiti, diğer parçaların bütünü üzerinden test işlemi; daha sonra da sırasıyla diğer parçalar (2., 3., 4. ve 5.) üzerinden model tespiti, kalan parçaların bütünü üzerinden test işlemi yapılarak hata oranlarının ortalaması kullanılmıştır.

## 3. BULGULAR

Yapılan çalışmada, Matlab 2014b Toolbox kullanılarak YSA analizi ile beton dayanımının tahmin edilmesine çalışılmıştır. Buna göre 3 ayrı ağ modeli oluşturularak sonuçlar karşılaştırılarak yorumlanmıştır. Gizli tabaka sayısı 1 adet olarak belirlenmiş, öğrenme algoritması olarak ise Resilient backpropagation (esnek geri yayılım) algoritması

kullanılmıştır. Çapraz geçerlilik (cross validation) tekniğine göre veriler 5 gruba ayrılmıştır. Her defasında bir gruptaki veri seti test için (67 adet) geri kalan 4 gruptaki veriler ise eğitim için (67x4=268) ayrılarak ağ geliştirilmiştir. Dolayısıyla verilerin %80'i eğitim verisi, %20'si ise test verisi olarak ayrılmıştır.

Bu ağın içerisinde bütün giriş parametreleri olarak kür çeşidi, kür süresi, donatı çapı, tasarım çeşidi, basınç (P) dalga hızı, kayma (S) dalga hızı, özdirenç; çıkış parametresi olarak ise beton numunelerinin dayanımı kullanılmıştır. Öğrenme fonksiyonu olarak ileri beslemeli esnek geri yayılım algoritması kullanılmıştır. Nöron sayısı 9, gizli tabaka sayısı 1 olarak alınarak ağ oluşturulmuştur (Katman Sayısı (7-9-1); Öğrenme Algoritması: trainrp, Resilient backpropagation; Lr, Öğrenme Oranı: 0.01; Transfer Fonksiyonu: tansig; İterasyon (Yenileme: 25000)) (Şekil 2).

Şekil 2. Çalışma kapsamında elde edilen yapay sinir ağı modeli

Tablo 1'de YSA'da elde edilen ağdaki 5 modele ait sonucun ilişki katsayıları ( $R^2$ ) ve hata oranlarının (RMSE) ortalamaları alınarak ayrı ayrı sunulmuştur.

**Tablo 1.** YSA sonuçlarına göre elde edilen ağa ait ilişki katsayıları ( $R^2$ ) ve hata oranlarının (RMSE) ortalamaları

YSA	Model No					Ortalama
	1	2	3	4	5	
$R^2$	0.67	0.72	0.78	0.80	0.90	0.77
RMSE	12.78	12.72	9.90	11.22	7.44	10.81MPa

YSA yöntemi ile çapraz geçerlilik tekniği kullanılarak elde edilen betonların hesaplanan tek eksenli basınç dayanımı değerleri ile ölçülen tek eksenli basınç dayanımı değerlerinin karşılaştırılması MPa cinsinden Şekil 3'te sunulmuştur.

Şekil 3'ten de görüldüğü gibi ölçülen ve hesaplanan değerlerin büyük çoğunluğu birbirine oldukça yakın bulunmuştur.

Şekil 3. YSA yöntemi ile çapraz geçerlilik tekniği kullanılarak elde edilen hesaplanan beton dayanımı ile ölçülen beton dayanımının karşılaştırılması

#### 4. SONUÇ VE DEĞERLENDİRME

Yapılan çalışmada YSA yönteminde çapraz geçerlilik tekniği kullanılarak yapılan değerlendirmeler sonucunda beton dayanımı tahmin edilmeye çalışılmıştır. Buna göre 7 adet giriş parametresiyle oluşturulan YSA modeli beton dayanımının tahmin edilmesinde iyi sonuçlar üretmiştir.

YSA ile yapılan veri analizinde giriş parametrelerinin daha çok olması, tasarlanan ağırlık daha iyi öğrenmesini sağlamıştır. Elde edilen bütün parametreler (kür çeşidi, kür süresi, donatı çapı, tasarım çeşidi, P ve S dalga hızları, elektrik özdirenç değerleri ) göz önünde bulundurularak YSA yöntemi ile çapraz geçerlilik tekniği kullanılarak yapılan değerlendirmeler sonucunda elde edilen tahmini beton dayanımı %77 doğrulukla hesaplanmıştır.

Bölümü

### **ÖZET**

Sınırlı doğal kaynaklardan biri olan su varlığını korumak son yıllarda gittikçe artan küresel bir talep haline gelmiştir. Endüstriyel kaynaklı boya kirliliği başta insan sağlığı olmak üzere yüzey ve yeraltı su kütleleri üzerindeki olumsuz etkilerinin yanı sıra çeşitli çevresel sorunlara da neden olmaktadır. Bazı sentetik boya grupları bünyesinde cıva, krom, kadmiyum, kurşun ve arsenik gibi ağır metalleri de içerebilmektedir. Bu nedenle çeşitli endüstrilerden kaynaklanan sentetik boya kirliliği, beraberinde ağır metal kirliliğini de meydana getirmektedir. Atıksuların göller, nehirler, akarsular ve göletler gibi sucul ortamlara arıtılmadan deşarj edilmesi canlı organizmalar üzerinde ciddi ekotoksikolojik tehditler oluşturmaktadır. Sucul ortama arıtılmadan deşarj edilen renkli atıksular, ışık penetrasyonunu azaltarak alglerin ve su bitkilerinin performansını olumsuz etkilemektedir. Hem ekonomik hem de ekolojik olarak faydalı bir tür olan ve birincil üreticiler olarak kabul edilen mikroalgler sucul ekosistemlerde önemli bir role sahiptir. Atıksulardaki sentetik boya kontaminasyonu mikroalgal büyümeyi engellemekte ve su ekosistemlerinde enerji ve besinlerin trofik iletimini bozmaktadır. Ayrıca, balıklar ve sucul organizmalar sentetik boyaları biyodegradasyon yoluyla toksik ara ürünlere metabolize edebilmektedir. Bağışıklık sistemleri ve fizyolojik tepkileri üzerindeki hipoksik etkilerinden dolayı çeşitli hastalıklara karşı hassas olan balıkların kontamine olması tüketici üzerinde kramp, ateş ve hipertansiyon gibi çeşitli semptomlara yol açabilmektedir. Kontamine balık tüketimine bağlı olarak insan bağırsak mikroflorası, boyaları insan vücudundaki çeşitli dokular üzerinde olumsuz etkisi olan toksik amin gruplarına dönüştürebilmektedir. Ayrıca arıtılmadan deşarj edilen renkli atıksulara temas durumunda insanlarda alerji, dermatit, cilt tahrişleri, maligniteler ve mutasyonlara yol açabilmesinin yanısıra renk ve koku gibi su kalitesinin bozulması ve dolayısıyla toksik hale getirilmesi dahil olmak üzere çeşitli çevresel sorunlara neden olabilmektedir. Sentetik boya içeren endüstriyel atıksularının başta insan sağlığı olmak üzere çeşitli canlı grupları üzerine olan zararlı etkileri göz önüne alındığında arıtılmamış endüstriyel atıksuların bertarafı, birçok ülkede büyük bir araştırma konusu haline gelmiştir. Bu nedenle boya içeren atıksuların çevre, insan sağlığı ve doğal su kaynakları üzerindeki olumsuz etkilerini önlemek için çevre dostu teknolojiler kullanılarak etkin bir şekilde arıtılması gerekmektedir.

**Anahtar Kelimeler:** Sucul Ekosistem, Boya Kirliliği, Sentetik boyalar, Endüstriyel Atıksu

### **THE EFFECTS OF SYNTHETIC DYE POLLUTION ON THE AQUATIC ENVIRONMENT AND HUMAN HEALTH**

#### **ABSTRACT**

Protecting the presence of water which is one of the limited natural resources has become an increasing global demand in recent years. Industrial dye pollution causes various environmental problems as well as its negative effects on surface and underground water bodies, especially on human health. Some synthetic dye groups may also contain heavy metals such as mercury, chromium, cadmium, lead and arsenic. For this reason, synthetic dye pollution originating from various industries also creates heavy metal pollution. Discharge of wastewater into aquatic environments such as lakes, rivers, streams and ponds without treatment poses serious ecotoxicological threats to living organisms. Colored wastewater discharged into the aquatic environment without treatment affects the performance of algae and aquatic plants negatively by reducing light penetration. Microalgae which is both an economically and ecologically beneficial species and accepted as primary producers has an important role in aquatic ecosystems. Contamination of synthetic dyes in wastewater inhibits microalgal growth and impairs the trophic transport of energy and nutrients in aquatic ecosystems. In addition, fish and aquatic organisms can metabolize synthetic dyes into toxic intermediates through biodegradation. Contamination of fish which is susceptible to various diseases due to its hypoxic effects on the immune systems and physiological responses, can cause various symptoms such as cramps, fever and hypertension on the consumer. Due to the consumption of contaminated fish, the human intestinal microflora can convert dyes into toxic amine groups that have adverse effects on various tissues in the human body. In addition, in case of contact with colored wastewater discharged without treatment, it can cause allergies, dermatitis, skin irritations, malignancies and mutations in humans, as well as various environmental problems, including deterioration of water quality such as color and odor, and thus rendering it toxic. Considering the harmful effects of industrial wastewater, the majority of which are synthetic dyes, on various living groups, especially human health, the disposal of untreated industrial wastewater has become a major research topic in many countries. In order to prevent the negative effects of synthetic dye-containing wastewater on the environment, human health and natural water resources, it should be treated effectively using environmentally friendly technologies.

**Keywords:** Aquatic Ecosystem, Dye Pollution, Synthetic dyes, Wastewater

## **1. GİRİŞ**

Artan insan nüfusu, hızlı sanayileşme, yüksek yaşam standardı ve kentleşmeyle birlikte en çok kullanılan doğal kaynaklardan birisi olan su varlığı, günümüzde sınırsız ve aşırı kullanımı nedeniyle tüm dünyayı su kriziyle karşı karşıya bırakmaktadır. Başta tekstil sanayi olmak üzere çeşitli endüstriyel kuruluşların çeşitli zararlı ve toksik bileşenlere sahip deşarj atıksuları doğal su kütleleri üzerinde güçlü bir tehdit oluşturmaktadır. Bu, suyun kalitesini ve miktarını bozmakta ve suyu daha fazla kullanım için güvensiz hale getirmektedir (Gupta ve ark., 2015). Tekstil atıksuları, alıcı su sisteminin toplam ekolojik dengesinin bozulmasına yol açan organik yük ile birleştiğinde rengi indükleyen boyalar da dahil olmak üzere birçok kirlenici maddenin karmaşık ve oldukça değişken bir karışımı olarak tanımlanabilmektedir (Hassani ve ark., 2008).

Tekstil endüstrilerinde yüksek konsantrasyonlarda organik bileşik ve ağır metal içeren boyalar nedeniyle alınan suyun %93'ü renkli atık su olarak deşarj edilmektedir (Wijannarong ve ark., 2013; Gupta ve ark., 2014). Tekstil endüstrisinde yaygın olarak kullanılan boyaların birçoğu biyolojik olarak parçalanamayan yapısı nedeniyle ciddi bir çevre kirliliği oluşturmaktadır. Atık suyun rengi, suyun oksijenlenme kabiliyetini azaltmakta, sucul ekosistem dengesini ve sucul organizmaların besin iletimini engellemekte ve estetik açıdan istenmeyen görüntüler ortaya çıkarmaktadır (Gupta ve ark., 2015).

## **2. ENDÜSTRİYEL ATIKSU KARAKTERİSTİĞİ**

Endüstriyel atıksularının karakteristiği fabrikaların üretim amacına veya bir prosesten diğerine göre değişmektedir. Bazı karmaşık proseslere sahip fabrikalar daha fazla su tüketebilmektedir. Örneğin günde 60.000 m kumaş üreten ortalama bir fabrikanın günlük yaklaşık 1.5 milyon litre atıksu tahliye etmesi muhtemeldir (COINDS,1999-2000). Kimyasal oksijen ihtiyacı (KOİ), Biyolojik Oksijen İhtiyacı (BOİ), pH, renk ve tuzluluk gibi farklı parametreler, endüstriyel kuru ve ıslak işleme adımlarında kullanılan farklı organik bazlı bileşiklere, kimyasallara ve boyalara bağlı olarak işlem türüne göre değişiklik göstermektedir (Senthilkumar ve ark., 2011). Kompozit tekstil sektörü, elyafların temizlenmesinden başlayarak kumaşların boyanmasına, basılmasına ve terbiyesine kadar tüm proses operasyonlarını bünyesinde barındırmaktadır. Tekstil işleme endüstrisi,

hammadde olarak gri kumaş alan ve bunları işleyerek bitmiş kumaş elde eden kuruluşlardır. Bu nedenle çıkış atıksu karakteristiklerinde farklılıklar görülmektedir. Kompozit, işleme ve yün endüstrileri tarafından üretilen atıksuların karakteristikleri Tablo 1'de verilmiştir.

**Tablo 1.** Bazı endüstrilerin atıksu karakteristiği (COINDS,1999-2000)

PARAMETRE	KOMPOZİT ENDÜSTRİLER	İŞLEME ENDÜSTRİLERİ	YÜN İŞLEME ENDÜSTRİLERİ
pH	5.5-11.0	7.0-8.5	7.0-11.0
SS (mg/l)	300-500	300-500	160-380
BOİ (mg/l)	350-600	230-450	160-350
KOİ (mg/l)	600-1,400	470-900	220-700
Klor (mg/l)	700-1,200	300-900	-
Sülfat (mg/l)	300-700	200-1,000	-
Fenol (mg/l)	0.5-2.0	0.5-2.0	-
Yağ ve Gres (mg/l)	5-15	5-10	-
Sodyum (mg/l)	-	600-870	-

Atıksu bünyesinde pamuk veya yün depolamada kullanılan biyositler (ör., klorlu aromatikler), cilalama ürünleri (ör. sentetik reçineler), yüzey aktif maddeleri (ör. alkil fenol etoksilatlar), polyester elyafların boyanması için kullanılan boya çözücülerini (ör., triklorobenzen ve bütilbenzoat), indirgeyici ajanlar (ör., sodyum sülfür veya sodyum hidrosülfid), metal kompleks boyalardaki (ör., bakır) ağır metaller veya yün boyamada boya fiksasyonu için kullanılan (ör., krom), boya banyosu katkı maddesi olarak kullanılan sülfat tuzları, oksitleyici maddeler (ör., dikromat) ve ağartıcı maddeler (ör., hipoklorit ve hidrojen peroksit) potansiyel tehlikeli bileşikler olarak karşımıza çıkmaktadır (Sandhya ve ark., 2012).

Tekstil işleme atıksularında ortaya çıkan başlıca kirletici grupları ve kirleticilerin kaynaklandığı prosesler Tablo 2'de özetlenmiştir.

**Tablo 2.** Tekstil işleme atıksularında bulunabilen kirletici grupları

KİRLETİCİ GRUBU	SUYLA TAŞINABİLİR KİMYASALLAR	İLGİLİ PROSES
Organik yük	Niştastalar, enzimler, yağlar, gresler, mumlar, yüzey aktif maddeler, asetik asit	Haşıl sökme, ovma, yıkama, boyama
Renk	Boyalar, temizlenmiş safsızlıklar	Boyama, ovma
Nütrientler (N, P)	Amonyum tuzları, üre, fosfat bazı tamponlar ve sekestranlar	Boyama
pH ve tuz etkileri	NaOH, mineral/organik asitler, sodyum klorür, silikat, sülfat, karbonat	Ovma, haşıl sökme, ağartma, merserize, boyama, nötralizasyon
Sülfür	Sülfat, sülfür, hidrosülfid tuzu, sülfürik asit	Boyama
Toksik maddeler	Ağır metaller, indirgeyici maddeler,	Haşıl sökme, ağartma, boyama,

	biyositler, kuaterner amonyum tuzları, oksitleyici maddeler	apre
Ateşe dayanıklı organikler	Yüzey aktif maddeler, boyalar, reçineler, sentetik boyutlar, klorlu organik bileşikler, taşıyıcı organik çözücüler	Ovma, haşıl sökme, ağartma, boyama, yıkama, bitirme

### **3. SENTETİK BOYALARIN SUCUL EKOSİSTEM ÜZERİNE ETKİSİ**

Sentetik boyaların su ekosistemlerindeki varlığı, serbest boyaların toksikliği ve toksik, mutajenik ve kanserojen transformasyon ürünleri nedeniyle ciddi çevre ve sağlık sorunları yaratmaktadır. Sucul bitkilerin ve alglerin fotosentetik mekanizması, boya prosesi atık sularının yüksek renk içeriğinden dolayı ışığın absorpsiyonu ile engellenmektedir (Franciscon ve ark., 2012). Boya içeren atıksuların doğal akarsulara ve nehirlere doğrudan deşarjı, su yaşamı ve besin zinciri ile ilgili ciddi problemler yaratmakta ve nihayetinde çevresel ekosistemin doğasına zarar vermektedir (Bharathi ve ark., 2013). Sentetik boyalar, sucul faunanın besin zinciri boyunca birikmekte ve sucul ortamlarda oksijen sirkülasyonu ve ışık absorpsiyonunu engellemesi nedeniyle sucul floranın (bitkiler, diatomlar ve algler) fotosentetik mekanizmalarını inhibe ederek fizyolojik süreçlerini bozmaktadır (Berradi ve ark., 2019). Azo boyalar suda yaşayan organizmalar için toksisite (ölümcül etki, genotoksisite, mutajenite ve kanserojenite) oluşturmaktadır (Puvaneswari ve ark., 2006). Suda son derece az miktarlarda (bazı boyalar için <1 mg/L) boya bulunması bile göller ve nehirler gibi su kütlelerinin görsel kalitesini ve şeffaflığını kötü bir şekilde etkilemektedir (Chequer ve ark., 2013).

### **4. SENTETİK BOYALARIN İNSAN SAĞLIĞI ÜZERİNE ETKİSİ**

Sentetik boyalar, temas süresine ve boya konsantrasyonuna bağlı olarak maruz kalan organizmalar üzerinde yoğun ve kalıcı etkilere sahip olabilmektedir. İnsanlarda alerjik dermatite ve cilt tahrişine, kansere, mutasyona vb. neden olabilmektedir (Bharathi ve ark., 2013). En toksik sentetik organik boyaların azo grubu boyalar ve bunlar arasında daha baskın olan diazo ve katyonik boyalar olduğu bilinmektedir. Bu boyalar elektron çekme özelliklerine sahip oldukları için insanlar ve hayvanlar üzerinde kanserojenik etki gösterebilmektedir (Berradi ve ark., 2019).

Toksik tartrazinin hiperaktivitesi insanlarda astım, migren, egzama, tiroid kanseri ve diğer davranış sorunlarına yol açabilmektedir (Albroomi ve ark., 2017). Sentetik boya kaynaklı toksik bileşenler sucul ortamda organizmaların bünyesine alınıp besin zinciri vasıtasıyla insanlara ulaşarak hipertansiyon, kramplar, sporadik ateş ve böbrek hasarı gibi çeşitli fizyolojik rahatsızlıklara neden olmaktadır. Bunların çok az bir bölümü ayrıca insanda mesane kanserine, dalak sarkomlarına, hepatokarsinomlara ve kromozomal anormalliklere yol açmaktadır (Puvaneswari ve ark., 2006).

Vücudumuz tarafından sindirilen azo boyalar, bağırsak mikroorganizmalarının azoredüktaz enzimleri etkisiyle aromatik toksik aminlere dönüştürülebilmektedir. Nitro grubu bazı boyalar, etkilenen mikroorganizmalar tarafından üretilen nitroreduktazlar tarafından metabolize edilebilir. Memeli karaciğeri tarafından üretilen enzimler, nitro grubunun nitro-indirgemesinin yanı sıra azo bağının indirgeyici bölünmesini de katalize edebilir. Her iki işlem de DNA'ya zarar vermek için gerekli olan yetenekli bir element olan N-hidroksilaminleri oluşturabilir. Öte yandan, azo boyaların parçalanması da 1,4-fenilendiamin, o-tolidin, aromatik amin ve 3-met-oksi-4-aminoazobenzen gibi güçlü bir hepatokanserojen olarak hareket eden toksik ürünler üretmektedir. Bir başka ticari tekstil azo boyası olan Asidik Mor 7, lipid peroksidasyonunu, kromozomal anormallikleri ve asetil kolinesteraz enziminin inhibisyonunu indüklemeye kabiliyetine sahiptir. Benzer şekilde, Metil Kırmızısı ve mikrobiyal bozunma ürünü olan N,N-dimetilfenilendiamin (DMPD) değişime uğramayan kalıcı bir mutajenik bir boya olarak bilinmektedir. Disperse Blue 291'in insan hepatom hücrelerinde mikronükleus oluşumuna ve DNA parçalanmasına yol açan genotoksik, mutajenik ve sitotoksik etkiye sahip olduğu da bildirilmiştir. Bazı boyalar ayrıca insanlarda mesane kanserine ve hayvanlarda dalak sarkomlarına, hepatokarsinomlara ve nükleer anormalliklere neden olabilmektedir (Singh ve ark., 2007; Verma et al., 2022).

## **5. SONUÇ VE DEĞERLENDİRME**

Sentetik boyaların toksik etkileri derinlemesine çalışılmamıştır. Sıklıkla, renkli suların hoş olmayan estetik etkisine daha fazla dikkat edilir, ancak sucul biyota üzerindeki toksisite tam olarak belgelenmemiştir. Sucul ekosistemlerdeki farklı topluluklarda toksik tepkilerin farklı olması beklendiğinden, tek tür toksisite testlerinin kullanılması sınırlı bilgi sağlayacaktır; sonuç olarak, farklı trofik seviyeleri temsil eden bir dizi tür, şüphesiz, sentetik boyaların hidrobiyontlardaki olumsuz etkisinin daha iyi anlaşılmasını sağlayan kanıtlar sağlayabilir (Hernández-Zamora & Martínez-Jerónimo, 2019).

Tekstil boyalarının atıksulardan uzaklaştırılması, sucul ekosistemin korunması için oldukça önemli bir sorun haline gelmiştir. Boyaların uzaklaştırılması için adsorpsiyon, membran filtrasyonu, iyon değişimi, koagülasyon-flokülasyon ve ileri oksidasyon prosesleri gibi çeşitli fiziksel, biyolojik ve kimyasal yöntemler kullanılmaktadır (Qu ve ark., 2015; Buthiyappan ve ark., 2016).

Tekstil ve boyama endüstrileri birçok ülkenin ekonomisinde önemli bir rol oynamakla birlikte, diğer yandan su kirliliğinin ciddi nedenlerinden biri haline gelmiştir. Trofik zincirin çeşitli seviyelerindeki organizmalar üzerinde olumsuz bir etkisi vardır. Uygun olmayan arıtma sonrası deşarj edilen boya atıksuları çevreye ve canlılara çok zararlıdır. Bu nedenle, büyük hacimli atık sulardan boya ve renklendirici gideriminde çok daha verimli, uygun maliyetli ve çevre dostu alternatif ve sürdürülebilir çözümler bulmaya acil bir ihtiyaç vardır (Verma ve ark., 2022).

### **ÖZET**

Atıksulardan renk giderimi çalışmaları sentetik boyaların hem potansiyel toksisitesi hem de çevrede oluşturdukları estetik problemleri nedeniyle son birkaç yılda büyük ilgi görmektedir. Sucul ortamdaki boya kontaminasyonu güneş ışığının suya ulaşmasını engellemekte ve su bitkileri başta olmak üzere fotosentez süreçlerini ve sucul organizmaların besin iletimlerini inhibe etmektedir. Boyaların kompleks aromatik yapılarının onları ısı, ışık, mikrop ve hatta oksitleyici ajanlar varlığında etkisiz hale getirmesi ve boyaların bozunmasını zorlaştırması nedeniyle çevreye verdiği zararlar ciddi boyutlara ulaşabilmektedir. Boyalara temas süresine ve boya konsantrasyonuna bağlı olarak maruz kalan organizmalar ve insanlar üzerinde alerjik dermatit, cilt tahrişi, kanser, mutasyon vb. gibi akut ve/veya kronik etkileri neden olabilmektedir. Renkli atıksular kirlilik yükünün türüne ve miktarına bağlı olarak fiziksel, kimyasal ve biyolojik proseslerin yanısıra çeşitli yöntemlerin bir kombinasyonu ile giderilebilmektedir.

**Anahtar Kelimeler:** Sentetik boya kirliliği, Atıksu arıtım yöntemleri, Sucul ekosistem

## **TREATMENT METHODS USING FOR DYES REMOVAL FROM WASTEWATER**

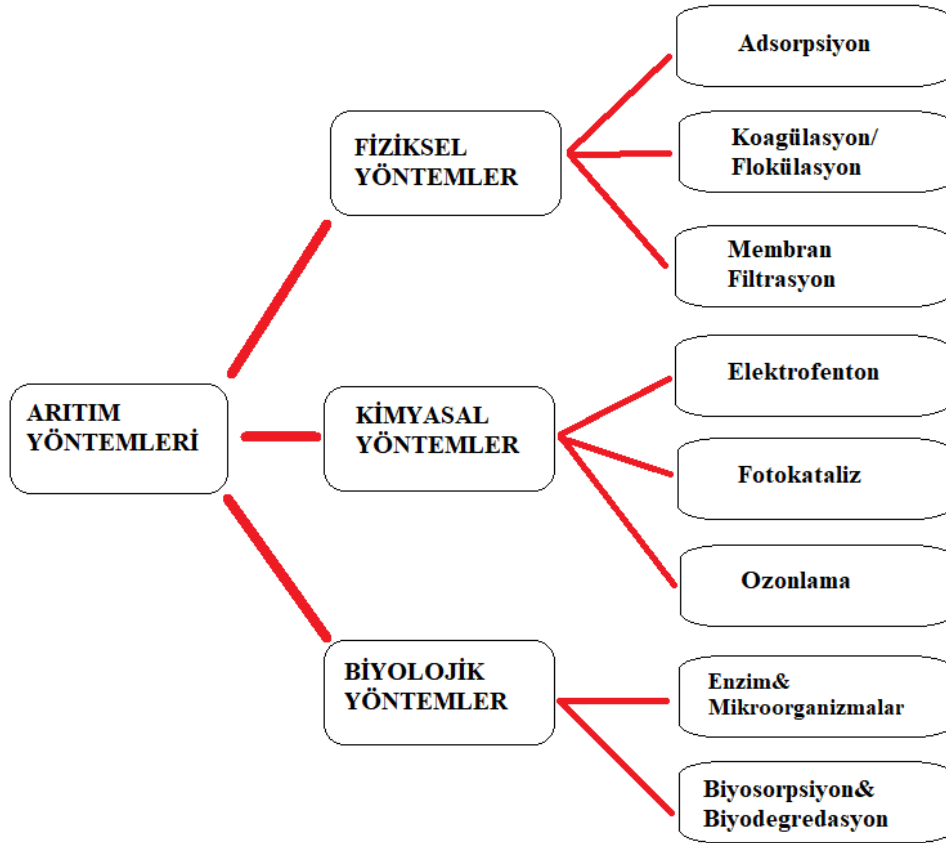

### **ABSTRACT**

Color removal from wastewater has attracted great interest in the last few years due to both the potential toxicity of industrial dyes and the aesthetic problems they cause in the environment. Dye contamination in the aquatic environment prevents sunlight from reaching the water and inhibits photosynthesis processes and nutrient transmission of aquatic organisms, especially aquatic plants. Since the complex aromatic structures of dyes make them ineffective in the presence of heat, light, microbes and even oxidizing agents and make it difficult for dyes to degrade, the damage they cause to the environment can reach serious dimensions. Depending on the contact time and dye concentration, the dyes may cause acute and/or chronic effects such as allergic dermatitis, skin irritation, cancer, mutation, etc. on the organisms and humans exposed. Colored wastewater can be treated with a combination of various methods also physical, chemical and biological processes, depending on the type and amount of pollution load.

**Keywords:** Synthetic dye pollution, Wastewater treatment methods, Aquatic media

## **GİRİŞ**

Sentetik boyalar çoğunlukla petrokimyasal bileşiklerden elde edilip sıvı, toz, macun veya granül formlarında ticarileştirilmektedir (Gita ve ark., 2017). Boyalar farklı kumaş sınıflarıyla hızlı ve tutarlı bir renklendirme, çok çeşitli renk pigmentleri ve renk tonları, manipülasyon kolaylığı, çeşitli dış etkenlere karşı kararlılık ve ekonomik enerji tüketimi gibi birçok potansiyele sahiptirler (Hossen ve ark.,2019). Bu nedenle sentetik boyaların büyük bir kısmı, işlem görmemiş veya kısmen işlem görmüş formlarda çevreye bırakıldığında zararlı etkilere neden olmaktadır. Boya atıksuları yüksek biyolojik ve kimyasal oksijen ihtiyacı (BOİ ve KOİ) içermekte ve klorlu bileşikler, ağır metaller, kükürt, nitratlar, naftol, sabunlar, krom bileşikleri, formaldehit, benzidin gibi ayırıcı maddeler, boyalar ve pigmentler gibi organik ve inorganik kirleticiler açısından oldukça zengindir. Suda bulunan boya miktarı, deşaj edilmeden önce elimine edilmeli veya uygun bir konsantrasyona düşürülmelidir. Adsorpsiyon, membran filtrasyon, foto-oksidasyon, koagülasyon/flokülasyon, kimyasal oksidasyon, ileri oksidasyon prosesi (AOP), biyolojik bozunma, biyosorpsiyon gibi tekniklerin atık sudaki boya içeriğini azaltmak için çeşitli diğer proseslerle birlikte konfigüre sistemler gittikçe öne çıkmaktadır (Cai ve ark.,2017). Atıksulardan boya gideriminde kullanılan prosesler Şekil 1’de şematize edilmiştir.

Şekil 1. Arıtım metotlarının şematik diyagramı (Bal ve Thakur, 2021)

## 1. ADSORPSİYON

Adsorbanın yüzeyindeki moleküllerin adsorpsiyonu, katı yüzey ile adsorbe edilen molekül arasındaki etkileşime bağlı olarak fiziksel ve kimyasal sorpsiyon olarak iki aşamada gerçekleşebilmektedir. Fiziksel adsorpsiyonda, tersinir işlemle sonuçlanan elektrostatik etkileşimler ve Van der Waals kuvvetleri yer alırken kimyasal süreçte, güçlü kovalent bağlar, adsorban ve adsorbat arasındaki ana etkileşim modunu göstermekte ve yüzeyden malzemenin iç kısmına difüzyon genellikle tek tabaka ile gerçekleşmektedir (De Gisi ve ark., 2016). Adsorpsiyon prosesinin şematik gösterimi Şekil 2’de gösterilmiştir.

**Şekil 2.** Adsorpsiyonun şematik diyagramı (Pavithra ve ark., 2019)

Her iki süreç de uygun koşullar altında aynı anda gerçekleşmektedir. Boya adsorpsiyon performansı çözelti pH'ından, sıcaklıktan, sorbent dozundan, ilk boya konsantrasyonundan, adsorban yapısından, boyutundan ve yüzey morfolojisinden etkilenebilen bir prosestir (Pavithra ve ark., 2019).

## **2. KOAGÜLASYON/FLOKÜLASYON**

Pıhtılaştırma, atık suların boyanması için kullanılan yaygın bir prosedürdür ve en popüler metotlar arasında göze çarpmaktadır. Koagülasyon prosesinde gerekli pıhtılaştırıcıların (alüminyum (III) veya demir (III) tuzları) masrafları ve önemli ölçüde çamur üretimi, atıksuların rengini gidermek için kimyasal pıhtılaştırma çalışmalarının finansal olarak desteklenmemesine neden olmaktadır. İşletimi basit ve yüksek giriş konsantrasyonlarında iyi performans sergilemekte ve diğer metotlara kıyasla daha ucuz olduğu görülmektedir. Pıhtılaştırıcılar inorganik pıhtılaştırıcılar ve organik pıhtılaştırıcılar olmak üzere özelliklerine göre sınıflandırılmaktadır. Alüminyum sülfat, alüminyum klorür, demir klorür, demir sülfat, kalsiyum oksit ve magnezyum oksit inorganik pıhtılaştırıcılar olarak kullanılmaktadır. Negatif yükün nötralizasyonu, katyonlar tarafından dengelenmekte ve üç değerlikli katyonun, iki değerlikli katyona kıyasla daha güçlü bir yeteneğe sahip olduğu kabul edilmektedir. İnorganik kirleticilerin kullanımı sırasında oluşan yumakların daha küçük ve daha hafif olduğu ve yerleşmesinin daha uzun sürdüğü tespit edilmiştir. Tuzlar atıksuya eklendiği anda iyonlarına ayrıştığı ve ortaya çıkan katyonik türlerin hidratlı formlarda olduğu bulunmuştur (Merzouk ve ark., 2011; Merzouk ve ark., 2013).

### 3. MEMBRAN TEKNOLOJİLERİ

Yüksek verimliliği, gelişmiş oksidasyon prosesine göre düşük maliyeti ve kolay endüstriyel ölçek büyütme gibi avantajlara sahip olması nedeniyle membran teknolojileri atıksulardan renk gideriminde kullanılmaktadır. Nanofiltrasyon membranları, elektrostatik itme içeren ayırma mekanizmaları nedeniyle boyaların uzaklaştırılmasında kullanılır. Son yıllarda nanoteknoloji ve malzeme bilimindeki gelişmelere bağlı olarak membran teknolojisi alanında birçok değişiklik görülmektedir. Membranların üzerinde veya içinde kirlilik birikmesi polimerik membranların seçiciliğini ve geçirgenliğini bozmakta ve bu yöntemin en temel sorunu olarak kabul edilmektedir (An ve ark., 2016; Wang ve ark., 2017).

### 4. FENTON PROSESİ

Biyolojik olarak bozunmaya dirençli olan kompleks organik kirleticilerin H<sub>2</sub>O<sub>2</sub> ayrışmasını hızlandırarak oksidasyonunu arttırmak için bir demir tuzu olan Fenton reaktif kimyasalları uygulanmaktadır. Fenton prosesinin birleşik flokülasyon dezavantajı, reaktif ve boya moleküllerinin kombine bir flokülasyonundan dolayı yan ürün olarak demir çamurunun üretilmesidir (Ayyaru ve Dharmalingam, 2014). Fe bazlı katalizörler, özellikle Fe<sub>3</sub>O<sub>4</sub>, Fenton AOP'lerin (İleri Oksidasyon Prosesleri) bu sorununu çözmekte, iyi tasarlanmış morfolojik, elektriksel ve katalitik özelliklere sahip manyetik özellikleri bu malzemeyi Fenton işleminde bir katalizör olarak uygun hale getirmektedir (Wan ve ark., 2015).

### 5. FOTOKATALİZ

Boya molekülünün mekanizması, farklı ışık kaynaklarına ve gelen fotonların enerjisine göre değişmektedir. Bu işlem, UV fotonu veya düşük enerjili görünür fotonları yarı iletken malzeme ile birleştirmektedir. Hidroksil radikali (HO<sup>•</sup>) üretmek için foto katalizör görevi gören yarı iletken, elektron uyarılmasından sonra elektron-delik çifti oluşturmaktadır. Geleneksel fotokatalitik mekanizması aşağıdaki gibidir:

(1)

(4)

Cr, Pb, As ve Hg vb. gibi metallerin ve metaloidlerin heterojen fotokatalitik işlemleri, pahalı reaktifler veya ekipman gerektirmeyen kirleticilerin sudan uzaklaştırılması için değerli bir seçenek olabilmektedir (Pavithra ve ark., 2019).

## **6. OZONLAMA**

Oksijenden üretilen ozonla gerçekleştirilen ozonlama, birçok araştırmacılar tarafından çalışılmış ve atıksuların rengini gidermenin çok etkili bir yol olduğu bulunmuştur ( Gupta ve Suhas, 2009). Ozon esas olarak atıksuların rengini gidermek için kullanılan bir prosestir. pH'a bağlı olarak, muamele türü yani moleküler ozon (doğrudan reaksiyon) veya hidroksil radikalleri (dolaylı reaksiyon) veya her ikisi de reaksiyon işlemi sırasında aynı anda gerçekleştirilebilir. Buna ek olarak, ozon, organik bileşikleri daha yüksek bir şekilde parçalamasına izin veren yüksek oksidasyon potansiyeline sahiptir (Pavithra ve ark., 2019).

## **7. ENZİM VE MİKROORGANİZMALARLA BOYA GİDERİMİ**

Birçok biyolojik yöntem, yüksek boya konsantrasyonlarında ve geniş bir sıcaklık, pH ve tuzluluk aralığında gerçekleştirilebilen enzim tedavisini içermektedir. Yüksek özgülüğe sahip enzimler, atık sudaki bazı kalıcı boya renkleri etkili bir şekilde ayrıştırabilir. Örnek olarak peroksidaz enzimi hayvanlarda, bitkilerde ve mikroorganizmalarda yaygın olarak bulunur ve bitki peroksidazının boya renkleri renksizleştirdiği araştırmalar sonucu bildirilmiş ve düşük maliyetli bir yöntem olarak çok ilgi görmüştür (Gholami-borujeni ve ark., 2011; Chiong ve ark., 2016). Algler, mayalar, bakteriler ve mantarlar gibi birçok mikroorganizma çeşitli boya giderimi için rapor edilmiş, boya renklerinin atıksudan uzaklaştırılması için saf kültürler veya karışık mikrobiyal kültürler kullanılarak gerçekleştirilmiştir (Varjani ve ark., 2020).

## **8. BİYOSORPSİYON VE BİYODEGREDASYON**

Biyolojik yöntemler, endüstriyel bazlı atıksuların arıtımı için uygulanabilir, ekonomik olarak uygulanabilir ve çevre dostu alternatifler olarak kabul edilmektedir. Bu yöntemler, mikroorganizmaların, bakterilerin, mantarların, mayaların, alglerin ve enzimlerin aerobik, anaerobik veya kombine süreçler yoluyla biyolojik olarak parçalanmasını gerektiren düşük maliyetli süreçlerdir (Yien ve ark., 2019).

Biyosorpsiyon, biyolojik materyallerin ve boya renklerinin biyokütle yüzeyine fiziksel veya kimyasal yollarla etkileşiminin esas alan bir prosestir. Adsorpsiyon, adsorpsiyon, yüzey

kompleksleşmesi, difüzyon, iyon değişimi, şelasyon ve çökelme bu tür etkileşimlere dahildir. Ek olarak, biyolojik materyallerin yüzeyinde ve karboksil, karbonil, hidroksil, amino, fosfat ve sülfon grupları gibi boyaların yapısında boya biyosorpsiyonunda yer alan çeşitli ligandlarla etkileşimler mevcut olabilmektedir (Deniz ve Tezel, 2016; Rybczyn, 2016).

Biyodegradasyon sürecinde, çeşitli mantar veya bakteri biyokütlelerinde bulunan enzimler kirleticileri ayrıştırmaktadır. Doğal boyaların giderilmesini etkileyen ana faktör, mikroorganizmaların uyum yetenekleri ile ilişkilendirilmiştir (Ahmad ve ark., 2019). Örneğin, azo boyaların atıksudan uzaklaştırılması ilk olarak azo boyalardaki N-N bağlarının anaerobik koşullar altında parçalanması, ardından üretilen aromatik ayrıştırılmış aminlerin aerobik ortamda CO<sub>2</sub> ve H<sub>2</sub>O son ürünlerine dönüşmesi gibi bir dizi biyokimyasal bir süreçle tamamlanabilmektedir (Zhu ve ark.,2020).

### **SONUÇ VE DEĞERLENDİRME**

Sadece boya konsantrasyonu ve KOİ'nin azaltılması açısından değil, aynı zamanda pH, BOİ ve toksisitenin düşürülmesi açısından da başarılı bir arıtma gerçekleştirmek için fiziksel, kimyasal ve biyolojik yöntemlerin kombinasyonunun kullanılması gerekmektedir. Tüm bu hedeflere ancak çalışmanın disiplinler arası bir şekilde, bilimsel kanıtların, mühendislik boyutlarının yanı sıra ekonomik ve politik boyutların da dikkate alındığı bir şekilde yürütülmesi halinde ulaşılabilir. Bu tür alternatiflerin uygulanması, ancak çevre korumaya yönelik atık arıtma stratejilerinin uygulanmasına değer veren ve eşlik eden kamu politikalarının desteği ile gerçekleşmesi mümkün olabilir (Ceretta ve ark., 2021).

**ABSTRACT**

The selective catalytic reduction (SCR) system is an exhaust emission control system used to reduce nitrogen oxide (NO<sub>x</sub>) emissions in diesel engines with the help of catalysts and reductants. In this study, copper (II) chloride (CuCl<sub>2</sub>), titanium dioxide (TiO<sub>2</sub>), and calcium hydroxide (Ca (OH)<sub>2</sub>) nanoparticles were used to produce powder catalysts. While copper was used as an active metal particle, titanium dioxide was preferred as a wash coat material. Calcium is known as a critical poison that causes the deactivation of the SCR catalyst. The purpose of this study is effects of calcium (Ca) addition and calcination temperature on thermogravimetric analysis (TGA) of copper-based catalyst. TGA analysis of the catalyst samples were conducted by heating at a rate of 20 °C/min from 25 °C to 1100 °C temperature at nitrogen ambient, before and after calcination process. In view of thermogravimetric analysis, the weight loss of samples was determined. The analysis results show that the addition of Ca nanoparticles to the catalyst raises the weight loss approximately two times.

**Keywords:** Thermogravimetric analysis, Selective catalytic reduction, Catalyst, Nanoparticles

## 1. INTRODUCTION

Nitrous oxide ( $\text{NO}_x$ ) emissions are an emission resulting from the combustion of fuel in diesel engines. These emissions are among the disadvantages of diesel vehicles as they are not an environmentally friendly product due to their harmful properties. Diesel engines can get rid of this disadvantage, thanks to selective catalytic reduction (SCR) technology, which is an effective and efficient system. The SCR system has a structure consisting of catalyst and reductant. By using ammonia ( $\text{NH}_3$ ) which is the most familiar reductant that takes an active role in this structure, it transforms  $\text{NO}_x$  emissions into  $\text{H}_2\text{O}$  and  $\text{N}_2$  with the help of a catalyst and renders them harmless.  $\text{V}_2\text{O}_5\text{-WO}_3/\text{TiO}_2$  catalyst is commercially used in this system. However, fly-ash emitted from combustion comprises various poisonous substances, such as  $\text{SO}_2$ , alkali metals and alkaline-earth metals. They are in tendency to reduce gradually the effectiveness of  $\text{NO}_x$  removal and restrict the operating life-time of the SCR catalyst (Li et al., 2017; Nicosia, Czekaj, and Kröcher, 2008). It is generally accepted that lubricating oil and its additives, engine corrosion and wear, metals mainly cause fly ash in diesel fuel (Tornehed and Olofsson, 2011; Wang et al., 2019; Sappok and Wong, 2007). Among these sources, lubricating oil is considered the primary source and makes up the majority of the ash (Bagi, Bowker, and Andrew, 2016; Van Kooten et al., 2000). The chemical composition of ash stemmed from lubricating oil principally consists of Mg, Ca, S, and P (Liati et al., 2012; Nemoto et al., 2004). The calcium forms deposits in the combustion systems and thus, it is known as a fly ash that causes the deactivation of the SCR catalyst (Xiang Li et al., 2017; Shu-ming Liu et al., 2017, Albert et al., 2019). Many researchers have conducted studies by using thermogravimetric analysis (TGA) analysis method to investigate the thermal stability and decomposition, weight loss of the catalyst produced with different nanoparticles (Du et al., 2021; X. Liu et al., 2020; Putluru et al., 2015; Shi et al., 2021). Pang et al. synthesized a series of Ce doping Copper/zeolite and Copper/zeolite catalysts utilizing impregnation of wetness process. They performed the TGA to define the passivate factors composed on face of the sulfated Copper cerium-2/zeolite and Copper/zeolite catalysts. The weight losses of the both sulfated catalysts were observed over three temperature regions. They thought that above  $500\text{ }^\circ\text{C}$ , which is the final temperature region, may be the result of the separation of Copper (II)sulfate composed on the face of catalyst. In addition, they reported that for the sulfated CuCe-2/ZSM-5 catalyst, the loss of weight in the final temperature region were surplus lesser than that of the sulfated Copper/Zeolite catalyst,

due to forming of more  $\text{CuSO}_4$  on the face of Copper/Zeolite catalyst. As a result of TGA, they asserted that in the presence of  $\text{SO}_2$ , the formation of Copper(II)sulfate on the face of Ce doping Cu/ZSM-5 catalysts could be hindered (Pang et al., 2014). Thermogravimetric analysis (TGA) comes to the fore in determining thermal reaction characterization with its precision in temperature control and mass measurement, and ease of use. TGA analysis helps to determine weight losses over a wide temperature range in an  $\text{O}_2$  or  $\text{N}_2$  atmosphere and also to observe both the pyrolysis and combustion profiles of the analyzed material. Its greatest advantages include reduced sample sizes and relative speed. With the result of thermogravimetric analysis, a data is obtained about how the weight of a sample changes with temperature. TGA analysis results allow for use in the analysis of reaction kinetics and in proposing reaction mechanisms (Fang et al., 2019; Shen et al, 2021; Toniolo et al., 2008; Xiang et al., 2018). Zhang et al. (Zhang et al., 2020) investigated the thermal characteristics of the materials by applying TGA analysis to Cu-BTC (benzene-1,3,5-tricarboxylate) and Ce-Cu-BTC materials. At temperatures above 300 °C, weight losses were found to be approximately 41% for Cu-BTC and 28% for Ce-Cu-BTC. They noted that when the temperature exceeded 400 °C, the organic materials were completely thermally separated in three stages. In the thermal gravimetric analysis study examining the thermal behavior of NiMn-MOF (Metal-organic frameworks)-74 particulate matter (Shi et al., 2021), it was determined that there was mass loss in four regions in the samples in the temperature range of 50 to 600 °C in the TGA graphs. It was observed that the increase of Mn content in the samples provided a higher decomposition temperature. Rami et al. (Rami et al., 2020) investigated the thermal characteristics of these materials by forming nanoparticles with  $\text{Fe}_2\text{O}_3$ , CuO, ZnO and  $\text{Co}_2\text{O}_3$  materials. Thermal analysis results revealed that  $\text{Fe}_2\text{O}_3$  lost weight between 127 °C and 227 °C, while other materials decomposed at higher temperatures. In their study using  $\text{Fe}_2\text{O}_3$  material, Liao et al. (Liao et al., 2001) found that a high rate of weight loss was experienced in particulate material between 50 °C and 200 °C.

In this study, Ca-Cu/ $\text{TiO}_2$  and Cu/ $\text{TiO}_2$  catalysts were used. The effect of Ca poisoned Cu/ $\text{TiO}_2$  catalyst on its thermal stability and decomposition temperatures was studied through TGA analysis for situations of before and after calcination process.

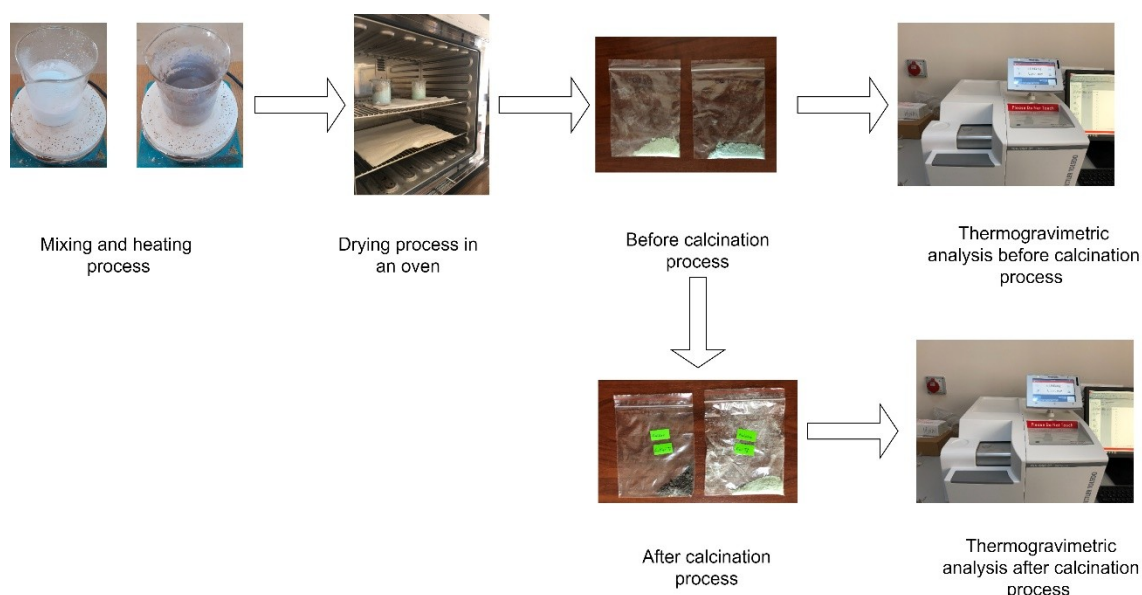

## **2. MATERIAL AND METHODS**

Among of nanoparticles used in catalyst production includes copper (II) chloride ( $\text{CuCl}_2$ ), titanium dioxide ( $\text{TiO}_2$ ) and calcium hydroxide ( $\text{Ca}(\text{OH})_2$ ). It was also used in the amounts given in the Table 1. The necessary amounts of materials were mixed in 150 mL distilled water by heating with a magnetic stirrer to prepare the solution. Excess water of the solution was evaporated during mixing. Then, a mud-like slurry was formed in the beaker. Last, it was dried in an oven at 130 °C for 12 h (Figure 1).

**Table 1.** Amounts of material in catalyst preparation

Catalysts	Materials		
	$\text{CuCl}_2$	$\text{Ca}(\text{OH})_2$	$\text{TiO}_2$
$\text{Cu/TiO}_2$	0.01 mol	-	0.1 mol
$\text{Ca-Cu/TiO}_2$	0.01 mol	0.01 mol	0.1 mol

After these procedures, TGA analysis was performed for both samples. TGA analysis conditions of the samples were carried out heating from 25 °C to 1100 °C at a rate of 20 °C/min in nitrogen ambient. According to the results of TGA analysis, catalyst samples were calcined at 400 °C for 2 hours. And then TGA analyzes were performed again under the same conditions.

**Figure 1.** Preparing and analysis of the catalyst samples

### 3. RESULTS AND DISCUSSION

TGA analysis results of  $\text{Cu/TiO}_2$  and  $\text{Ca-Cu/TiO}_2$  specimen before calcination are indicated in Figure 2. Initial weight drop was detected in both samples at approximately

110 °C. While the Ca-Cu/TiO<sub>2</sub> sample exhibited a thermally stable behavior up to a temperature of about 600 °C, a deterioration was noticed in the Cu/TiO<sub>2</sub> sample at a temperature of around 440 °C. After 600 °C, the Cu/TiO<sub>2</sub> specimen indicated weight loss at 610 °C and 960°C temperatures, while the Ca-Cu/TiO<sub>2</sub> specimen indicated a weight loss of around 700 °C and 830 °C.

**Figure 2.** Before the calcination process TGA graph of Cu/TiO<sub>2</sub> and Ca-Cu/TiO<sub>2</sub> specimens

Table 2 indicates the initial and final weights and decomposition temperatures of the samples before the calcination process. While the weight loss was 11.55% in Cu/TiO<sub>2</sub> samples, this loss rate was 23.46% in Ca-Cu/TiO<sub>2</sub> samples. The addition of Ca to Cu/TiO<sub>2</sub> samples increased the weight loss approximately 2 times. However, the final decomposition temperature reached 962 °C without the addition of Ca, and the amount of sample remaining after combustion is higher.

**Table 2.** Initial weight, final weight and onset temperatures of samples before calcination process

Samples	Initial weight(mg)	Final weight(mg)	Onset temperatures(°C)
Cu/TiO <sub>2</sub>	12.12	10.72	110/430/615/962
Ca-Cu/TiO <sub>2</sub>	15.26	11.68	105/152/304/698/829

The TGA graph of the samples after the calcination process is shown in figure 3. As before the calcination process, a weight decrease is observed due to the removal of H<sub>2</sub>O in the samples between 100-150 °C temperatures. Weight reduction was detected in Cu/TiO<sub>2</sub> samples up to approximately 850 °C. In the Ca-added Cu/TiO<sub>2</sub> samples, on the other hand, thermal stability was achieved up to about 700 °C, and a weight decrease was detected in the sample near 690 °C and 850 °C. It is seen that thermal stabilization is achieved after 850 °C in both samples. When compared with the temperature data in figure 2 before calcination, the point that it was seen that there was no weight loss in Cu/TiO<sub>2</sub> samples and where the thermal stabilized temperature started was determined at 860 °C before 960 °C. In Ca-Cu/TiO<sub>2</sub> samples, nevertheless, it was determined that the temperature at which thermal stabilization started increased by 25 °C from 830 °C to 855 °C after the calcination process.

**Figure 3.** After the calcination process TGA graph of Cu/TiO<sub>2</sub> and Ca-Cu/TiO<sub>2</sub> specimens

The initial and final weights and decomposition temperatures of the samples after the calcination process are given in Table 3. While there was a 7.42% weight reduction in Cu/TiO<sub>2</sub> samples, a 25.82% weight loss was detected in Ca-Cu/TiO<sub>2</sub> samples. The addition of Ca after the calcination process increased the weight loss approximately 3.48 times. Parallel to the change in thermal stabilization temperatures, while the weight loss rate in

Cu/TiO<sub>2</sub> samples decreased, the weight loss amount increased in Ca-Cu/TiO<sub>2</sub> samples. After the calcination process, the maximum decomposition temperatures of both samples were almost the same.

**Table 3.** Initial weight, final weight and onset temperatures of samples after calcination process

Samples	Initial weight(mg)	Final weight(mg)	Onset temperatures(°C)
Cu/TiO <sub>2</sub>	16.58	15.35	135/259/439/632/853
Ca-Cu/TiO <sub>2</sub>	15.45	11.46	110/158/691/852

#### 4.CONCLUSION

In this study, the thermal performance of copper-based catalysts used in exhaust emission systems was investigated. The effect of the calcination process on this thermal performance comparison is also given in the study results. In the thermal tests of Cu/TiO<sub>2</sub> and Ca-Cu/TiO<sub>2</sub> samples up to 1100 °C, it was determined that the addition of Ca increased the weight loss both before and after the calcination process. While the calcination process has a negative effect by decreasing the final thermal stability temperature in the Cu/TiO<sub>2</sub> sample, it has a positive effect on this sample by increasing the final thermal stability temperature in the Ca-Cu/TiO<sub>2</sub> sample.

### ÖZET

Sandviç kompozitler, havacılık, uzay, ulaşım, inşaat, elektronik, gıda endüstrisi gibi hafiflik, yüksek mukavemet, şekil koruma, yapısal ve darbe dayanımının gerekli olduğu modern mühendislik ve malzeme uygulamalarında geniş bir kullanım alanına sahiptirler. Sandviç kompozit yapıların mekanik davranışı ve performansı, ihtiva ettiği malzeme özelliklerine ve ilgili sandviç kompozit bileşenlerin geometrisine bağlıdır. Tasarlanan sandviç kompozit malzemenin içeriği üst ve alt levha olarak paslanmaz çelik-316, çekirdek malzemesi alüminyum 1050A-0 ve bağlayıcı eleman olarak DP-460 epoksi yapıştırıcı kullanılmaktadır. Bu çalışmada kullanılan özgün çekirdek tasarımına sahip s-şekilli çekirdek kompozit sandviçlerin R10mm yarıçapında değişken et kalınlıkları ve çekirdek yükseklikleri ile oluşturulan varyasyonları ANSYS mechanical analiz programı, üç nokta eğme testi analizi kullanılarak analiz edilmiştir. Üç farklı çekirdek yüksekliği  $h=50\text{mm}$ ,  $60\text{mm}$ ,  $70\text{mm}$  ve üç farklı çekirdek et kalınlığı  $t=0.6\text{mm}$ ,  $0.7\text{mm}$ ,  $0.8\text{mm}$  ile oluşturulan varyasyonlarda hasar yükleri incelendiğinde, S-şekilli çekirdeğin et kalınlığı arttıkça kompozit panelin yük taşıma kapasitesi artmıştır. Sandviç kompozitlerin üç nokta eğme testi analizi sonucu yapıştırıcı eleman olan DP-460 üzerinde hasar oluşturmadığı görülmektedir. Bununla beraber s-şekilli çekirdek yüksekliğindeki artışla beraber sandviç kompozitin yük taşıma kapasitesinin azaldığı sonucuna varılmıştır. Çekirdek et kalınlıkları arttıkça hasar yüklerinin ve eğilme rijitliklerin arttığı görülmektedir bu durum levhalarda oluşan çökmeyi giderek azaltmaktadır. Çekirdeklerde yükseklik artışı ile oluşturulan sandviç kompozit varyasyonların analizinde çökme miktarını artırdığı görülmektedir.

**Anahtar kelimeler:** Sandviç kompozitler, s-şekilli çekirdek, üç nokta eğme, sonlu elemanlar analizi, mekanik davranışlar

**THREE-POINT BENDING BEHAVIORS OF S-SHAPED CORE SANDWICH COMPOSITES WITH DIFFERENT CORE HEIGHTS****ABSTRACT**

Sandwich composites have a wide range of uses in modern engineering and material applications. Lightness, high strength, shape preservation, and structural and impact resistance are required, such as aviation, space, transportation, construction, electronics, and the food industry. The mechanical behavior and performance of sandwich composite structures depend on their material properties and the geometry of the respective sandwich composite components. The content of the designed sandwich composite material is stainless steel-316 as the upper and lower plates, aluminum 1050A-0 as the core material, and DP-460 epoxy adhesive as the binding element. Variations of s-shaped core composite sandwiches with a unique core design used in this study, with varying wall thicknesses and core heights at a radius of R10mm, were analyzed using ANSYS mechanical analysis program, three-point bending test analysis. When the damage loads were examined in the variations created with three different core heights  $h=50\text{mm}$ ,  $60\text{mm}$ ,  $70\text{mm}$  and three different core wall thicknesses  $t=0.6\text{mm}$ ,  $0.7\text{mm}$ ,  $0.8\text{mm}$ , the load carrying capacity of the composite panel increased as the wall thickness of the S-shaped core increased. As a result of the three-point bending test analysis of the sandwich composites, it is seen that there is no damage to the adhesive element DP-460. However, it was concluded that the load-carrying capacity of the sandwich composite decreased with the increase in the s-shaped core height. As the core wall thickness increases, the damage loads and bending stiffness increase, gradually reducing the plates' deflection. In the analysis of composite sandwich variations formed by the increase in height in the cores, it is seen that the number of deflections increases.

**Keywords:** Sandwich composites, s-shaped cores, three-point bending, finite element analysis, mechanical behaviors

## **1. GİRİŞ**

Kompozit malzemeler modern mühendislik uygulamalarında, havacılık, uzay, taşımacılık, konstrüksiyon, elektronik, yemek endüstrisi gibi hafiflik yüksek dayanım ve şekil koruma, yapısal ve darbe dayanımı, yüksek bükülme sertliği, mukavemet ve enerji emme kapasitesi, dinamik darbe olaylarında daha iyi direnç, düşük yoğunluk, yüksek aşınma ve korozyon direnci, karmaşık şekiller elde etmek için esneklik gerektiren uygulamalarda geleneksel malzemelerin yerine tercih edilmektedir.[1-7] Sandviç kompozitler zemin panelleri, iç duvarlar, yiyecek işleme mutfakları ve yolcu saklama rafları gibi uçak iç mekanlarında tercih edilmektedir.[8] Çekirdek yapısında malzeme ve geometrik düzen, sıkıştırma özelliklerini (eğilme ve burkulma direnci), kesme sertliğini ve enerji soğurma yeteneğini artırmak mümkündür.[6-9] Özellikle sandviç kompozit paneller, yüksek enerji sönümlenebilirliği, hafiflik ve yüksek eğilme mukavemetleri nedeniyle yaygın bir şekilde kullanılmaktadır. Bu bileşenlerin (sandviç panellerin) çoğu, çeşitli yüzey malzemeleriyle bal peteği ve köpük çekirdek malzemelerinin bir araya gelmesiyle oluşmaktadır. [9-11] Bilhassa, açık hücreli çekirdek malzemeye sahip sandviç kompozit paneller, kompozit malzemeye, yüksek rijitlik ve özgül mukavemet gibi çok fonksiyonlu yararlar sağlamaktadır.[12-13] Çekirdek yapı geometrisi balpeteği profilinde olabileceği gibi zincir, piramit oluklu, x tipi, kagome tipi, hibrit ve özgün tasarımlarda da kendini gösterebilmektedir. [14-17]

Bu çalışmada özgün çekirdek tasarımına sahip balpeteği kompozit levhanın mekanik davranışları incelenmiştir. S formulu 1050-O serisi alüminyum çekirdek yapısına sahip alt üst levha 316 paslanmaz çelik olan sandviç kompozit levhanın farklı varyasyonlarının ANSYS paket programı kullanılarak sonlu elemanlar metodu ile üç nokta eğilme analizi yapılmış ve analiz sonuçları karşılaştırılarak eğilmeye karşı en iyi dayanım ve rijitlik özelliği gösteren levhaların belirlenmesi amaçlanmıştır.

## **2. MATERYAL VE METOT**
